
i.MX 6SLL Applications Processor Reference Manual

Document Number: IMX6SLLRM
Rev. 0, 06/2017

Contents

Section number	Title	Page
----------------	-------	------

Chapter 1 Introduction

1.1	About This Document.....	127
1.1.1	Audience.....	127
1.1.2	Organization.....	127
1.1.3	Suggested Reading.....	128
1.1.3.1	General Information.....	128
1.1.3.2	Related Documentation.....	128
1.1.4	Conventions.....	128
1.1.5	Register Access.....	130
1.1.5.1	Register Diagram Field Access Type Legend.....	130
1.1.5.2	Register Macro Usage.....	131
1.1.6	Signal Conventions.....	132
1.1.7	Acronyms and Abbreviations.....	132
1.2	Introduction.....	135
1.3	Target Applications.....	135
1.4	Features.....	135
1.5	Architectural Overview.....	138
1.5.1	Simplified Block Diagram.....	138
1.5.2	Architectural Partitioning.....	139
1.5.3	Endianness Support.....	141
1.5.4	Memory Interfaces.....	141

Chapter 2 Memory Maps

2.1	Memory system overview.....	143
2.2	ARM Platform Memory Map.....	143
2.3	DMA memory map.....	147

Chapter 3

Section number	Title	Page
Interrupts and DMA Events		
3.1	Overview.....	149
3.2	Cortex A9 interrupts.....	149
3.3	SDMA event mapping.....	153
Chapter 4		
External Signals and Pin Multiplexing		
4.1	Overview.....	155
4.1.1	Pin Assignments.....	155
4.1.2	Muxing Options.....	208
Chapter 5		
Fusemap		
5.1	Boot Fusemap.....	245
5.2	Lock Fusemap.....	252
5.3	Fusemap Descriptions Table.....	253
Chapter 6		
External Memory Controllers		
6.1	Overview.....	263
6.2	Multi-mode DDR controller (MMDC) overview and feature summary.....	263
Chapter 7		
System Debug		
7.1	Overview.....	265
7.2	Chip and ARM Platform Debug Architecture.....	265
7.2.1	Debug Features.....	266
7.2.2	Debug system components.....	267
7.2.2.1	AMBA Trace Bus (ATB).....	268
7.2.2.2	ATB replicator.....	268
7.2.2.3	Embedded Cross Triggering.....	268
7.2.2.3.1	Cross-Trigger Matrix (CTM).....	269
7.2.2.3.2	Cross-Trigger Interface (CTI).....	270
7.2.2.4	Debug Access Port (DAP).....	270

Section number	Title	Page
7.2.3	Chip-Specific SJC Features.....	271
7.2.3.1	JTAG Disable Mode.....	271
7.2.3.2	JTAG ID.....	271
7.2.4	System JTAG Controller - SJC.....	271
7.2.5	System JTAG controller main features.....	272
7.2.6	SJC TAP Port.....	272
7.2.7	SJC main blocks.....	272
7.3	Smart DMA (SDMA) core.....	273
7.3.1	SDMA On Chip Emulation Module (OnCE) Feature Summary.....	273
7.3.1.1	Other SDMA Debug Functionality.....	274
7.3.1.2	SDMA ROM Patching.....	275
7.4	Miscellaneous.....	275
7.4.1	Clock/Reset/Power.....	275
7.5	Supported tools.....	275

Chapter 8 System Boot

8.1	Overview.....	277
8.2	Boot modes.....	278
8.2.1	Boot mode pin settings.....	278
8.2.2	High-level boot sequence.....	279
8.2.3	Boot From Fuses mode (BOOT_MODE[1:0] = 00b).....	280
8.2.4	Serial Downloader.....	281
8.2.5	Internal Boot mode (BOOT_MODE[1:0] = 0b10).....	282
8.2.6	Boot security settings.....	283
8.3	Device configuration.....	283
8.3.1	Boot eFUSE descriptions.....	284
8.3.2	GPIO boot overrides.....	286
8.3.3	Device Configuration Data (DCD).....	287
8.4	Device initialization.....	287

Section number	Title	Page
8.4.1	Internal ROM/RAM memory map.....	288
8.4.2	Boot block activation	288
8.4.3	Clocks at boot time.....	289
8.4.4	Enabling MMU and caches.....	290
8.4.5	Exception handling.....	291
8.4.6	Interrupt handling during boot.....	291
8.4.7	Persistent bits.....	292
8.5	Boot devices (internal boot).....	292
8.5.1	Expansion device.....	293
8.5.1.1	Expansion device eFUSE configuration.....	293
8.5.1.2	MMC and eMMC boot.....	295
8.5.1.3	SD, eSD, and SDXC.....	304
8.5.1.4	IOMUX configuration for SD/MMC.....	304
8.5.1.5	Redundant boot support for expansion device.....	305
8.5.2	Serial ROM through SPI.....	307
8.5.2.1	Serial ROM eFUSE configuration.....	307
8.5.2.2	ECSPI boot.....	308
8.5.2.2.1	ECSPI IOMUX pin configuration.....	309
8.6	Program image.....	310
8.6.1	Image Vector Table and Boot Data.....	310
8.6.1.1	Image vector table structure.....	311
8.6.1.2	Boot data structure.....	312
8.6.2	Device Configuration Data (DCD).....	312
8.6.2.1	Write data command.....	314
8.6.2.2	Check data command.....	315
8.6.2.3	NOP command.....	317
8.6.2.4	Unlock command.....	317
8.7	Plugin image.....	318
8.8	Serial Downloader.....	319

Section number	Title	Page
8.8.1	USB.....	320
8.8.1.1	USB configuration details.....	320
8.8.1.2	IOMUX configuration for USB.....	321
8.8.2	Serial Download Protocol (SDP).....	321
8.8.2.1	SDP commands.....	322
8.8.2.1.1	READ_REGISTER.....	322
8.8.2.1.2	WRITE_REGISTER.....	323
8.8.2.1.3	WRITE_FILE.....	323
8.8.2.1.4	ERROR_STATUS.....	325
8.8.2.1.5	DCD_WRITE.....	325
8.8.2.1.6	JUMP_ADDRESS.....	326
8.9	Recovery devices.....	327
8.10	USB low-power boot.....	327
8.11	SD/MMC manufacture mode.....	329
8.12	High-Assurance Boot (HAB).....	330
8.12.1	HAB API vector table addresses.....	331

Chapter 9 Multimedia

9.1	Display and graphics subsystem.....	333
9.1.1	Electrophoretic Display Controller.....	334
9.1.2	PiXeL Processing Pipeline (PXP).....	335
9.1.3	LCD Interface (LCDIF).....	335
9.1.4	CMOS Sensor Interface (CSI).....	335
9.2	Audio subsystem.....	336
9.2.1	Audio Subsystem Module Overview.....	337
9.2.2	Synchronous Serial Interface (SSI).....	339
9.2.3	Sony/Philips Digital Interface (SPDIF).....	339

Chapter 10 Clock and Power Management

Section number	Title	Page
10.1	Introduction.....	343
10.2	Device Power Management Architecture Components.....	343
10.2.1	Centralized components of clock generation and management.....	344
10.2.2	Centralized components of power generation, distribution and management.....	345
10.2.3	Reset generation and distribution system.....	345
10.2.4	Power and clock management framework.....	345
10.3	Clock Management.....	346
10.3.1	Centralized components of clock management system.....	346
10.3.2	Clock generation.....	348
10.3.2.1	Crystal Oscillator (XTALOSC)	349
10.3.2.2	Low Voltage Differential Signaling (LVDS) I/O ports.....	349
10.3.2.3	PLLs.....	349
10.3.2.3.1	General PLL Control and Status Functions.....	351
10.3.2.4	CCM	352
10.3.2.5	Low Power Clock Gating unit (LPCG).....	352
10.3.3	Peripheral components of clock management system.....	353
10.3.3.1	Interface and functional clock.....	353
10.3.3.2	Block level clock management.....	354
10.3.3.2.1	Master clock protocol.....	355
10.3.3.2.2	Slave clock protocol.....	355
10.3.3.3	Clock Domain(s).....	355
10.3.3.4	Domain level clock management.....	356
10.3.3.5	Domain dependencies.....	356
10.4	Power management.....	356
10.4.1	Centralized Components of Power Management System.....	356
10.4.1.1	Integrated PMU.....	357
10.4.1.1.1	Digital LDO Regulators.....	358
10.4.1.1.2	Analog LDO regulators.....	359
10.4.1.1.3	USB LDO.....	359

Section number	Title	Page
10.4.1.1.4	SNVS regulator.....	360
10.4.1.1.5	Reverse well biasing.....	360
10.4.1.2	GPC - General Power Controller.....	360
10.4.1.3	SRC - System reset Controller.....	361
10.4.1.4	Power domain(s).....	361
10.4.1.4.1	Power distribution	362
10.4.1.4.2	Domain Memory and domain logic state retention in case of Power Gating.	363
10.4.1.4.3	Power Gating Domain Management.....	363
10.4.1.4.3.1	ARM Core Platform.....	364
10.4.1.4.3.2	SoC.....	364
10.4.1.4.4	Power Gating domain dependencies.....	364
10.4.1.5	Voltage domains.....	365
10.4.1.6	Voltage domain management.....	366
10.4.1.6.1	Dynamic.....	366
10.4.1.6.1.1	Voltage Scaling.....	366
10.4.1.6.2	Static	366
10.4.1.6.2.1	Standby Leakage reduction (SLR).....	366
10.4.1.6.3	Voltage domain dependencies.....	367
10.4.1.6.4	IO voltage	367
10.4.1.7	System domains layout.....	367
10.4.2	Power management techniques.....	369
10.4.2.1	Power saving techniques.....	369
10.4.2.2	Thermal-aware power management.....	370
10.4.2.3	Peripheral Power management.....	370
10.4.2.3.1	Main memory power management.....	370
10.4.2.3.2	Video-Graphics system power management.....	371
10.4.2.3.3	IO power reduction.....	372
10.4.3	Examples of External Power Supply Interface.....	372
10.5	ONOFF (Button).....	373

Section number	Title	Page
Chapter 11		
System Security		
11.1	Overview.....	375
11.2	Central Security Unit (CSU).....	377
11.2.1	CSU Overview.....	377
11.2.2	CSU Features.....	377
11.2.3	CSU Functional Description.....	378
11.2.3.1	CSU Peripheral Access Policy.....	378
11.3	Secure Non-Volatile Storage (SNVS).....	379
11.3.1	SNVS Overview.....	379
11.3.2	Tamper Detection.....	380
11.4	Data Co-Processor (DCP).....	380
11.5	High-Assurance Boot (HAB).....	380
11.6	System JTAG Controller (SJC).....	381

Chapter 12

ARM Cortex A9 MPCore Platform (ARM)

12.1	Overview.....	383
12.2	External Signals.....	383
12.3	Platform configuration.....	384
12.3.1	Platform and SCU configuration.....	384
12.3.2	Core configuration.....	385
12.3.3	PL310 L2 Cache configuration.....	385
12.3.4	Endian Modes.....	386
12.3.5	Memory Parity error support	386
12.4	Performance and Power.....	386
12.4.1	Low-Power design.....	386
12.4.1.1	SRPG (State Retention Power Gating).....	387
12.4.1.2	Dynamic Voltage and Frequency Scaling (DVFS).....	387
12.4.2	Clocks, frequency goals.....	387

Section number	Title	Page
12.4.2.1	ARM Clock.....	387
12.4.2.2	Bus Clocks.....	388
12.4.2.3	Debug Clocks.....	388
12.5	Core Platform Sub-Blocks details.....	388
12.5.1	ARM Cortex A9 MPCore Processor.....	388
12.5.2	Media Processing Engine (MPE - NEON).....	389
12.5.3	Generic Interrupt Controller (GIC).....	389
12.5.3.1	Interrupt Controller Features.....	389
12.5.3.2	About the Interrupt Controller.....	389
12.5.3.3	Interrupt Controller Clock frequency.....	390
12.5.3.4	TrustZone support.....	390
12.5.4	Instruction and data caches (L1).....	390
12.5.4.1	L1 features.....	390
12.5.5	L2 Cache and controller (PL310).....	390
12.6	Debug and Trace Sub-blocks (CoreSight components).....	391
12.6.1	Debug Access Port (DAP)	391
12.6.2	Program Trace Macrocell (PTM).....	392
12.6.2.1	Program Flow Trace (PFT).....	392
12.6.3	Cross Trigger Interface (CTI).....	393
12.6.4	Embedded Trace Buffer (ETB).....	393
12.6.4.1	AMBA Trace Bus (ATB) Replicator	394

Chapter 13 AHB to IP Bridge (AIPSTZ)

13.1	Overview.....	395
13.1.1	Features.....	395
13.2	Clocks.....	395
13.3	Functional Description.....	396
13.4	Access Protections.....	397
13.5	Access Support.....	397

Section number	Title	Page
13.6	Initialization Information.....	398
13.6.1	Security Block.....	398
13.7	AIPSTZ Memory Map/Register Definition.....	399
13.7.1	Master Privilege Registers (AIPSTZ _x _MPR).....	400
13.7.2	Off-Platform Peripheral Access Control Registers (AIPSTZ _x _OPACR).....	402
13.7.3	Off-Platform Peripheral Access Control Registers (AIPSTZ _x _OPACR1).....	405
13.7.4	Off-Platform Peripheral Access Control Registers (AIPSTZ _x _OPACR2).....	408
13.7.5	Off-Platform Peripheral Access Control Registers (AIPSTZ _x _OPACR3).....	411
13.7.6	Off-Platform Peripheral Access Control Registers (AIPSTZ _x _OPACR4).....	414

Chapter 14

Digital Audio Multiplexer (AUDMUX)

14.1	Overview.....	417
14.1.1	Features.....	419
14.1.2	Modes and Operations.....	419
14.2	External Signals.....	419
14.3	Clocks.....	421
14.3.1	Clock Inputs.....	421
14.3.2	Clock Diagram.....	421
14.3.3	Clocking Restrictions.....	422
14.4	Default Register Configuration.....	422
14.4.1	Default Port Configuration.....	422
14.5	Functional Description.....	423
14.5.1	Operating Modes.....	423
14.5.1.1	Port Receive Data Modes.....	424
14.5.1.1.1	Normal Mode.....	425
14.5.1.1.2	Internal Network Mode.....	426
14.5.1.1.3	Transmit Data Output Enable Assertion.....	432
14.5.1.2	Tx/Rx Switch and External Network Mode.....	433
14.5.1.3	Timing Modes.....	434

Section number	Title	Page
14.5.1.3.1	Synchronous Mode (4-Wire Interface).....	434
14.5.1.3.2	Asynchronous Mode (6-Wire Interface).....	436
14.5.2	Connectivity Between Ports.....	439
14.5.2.1	Internal Port to External Port Connectivity.....	440
14.5.2.2	External Port to External Port Connectivity.....	441
14.5.2.3	Internal Port to Internal Port Connectivity.....	441
14.5.2.4	Loopback Connectivity.....	442
14.6	AUDMUX Memory Map/Register Definition.....	442
14.6.1	Port Timing Control Register 1 (AUDMUX_PTCR1).....	443
14.6.2	Port Data Control Register 1 (AUDMUX_PDCR1).....	445
14.6.3	Port Timing Control Register 2 (AUDMUX_PTCR2).....	446
14.6.4	Port Data Control Register 2 (AUDMUX_PDCR2).....	448
14.6.5	Port Timing Control Register 3 (AUDMUX_PTCR3).....	449
14.6.6	Port Data Control Register 3 (AUDMUX_PDCR3).....	451
14.6.7	Port Timing Control Register 4 (AUDMUX_PTCR4).....	452
14.6.8	Port Data Control Register 4 (AUDMUX_PDCR4).....	454
14.6.9	Port Timing Control Register 5 (AUDMUX_PTCR5).....	455
14.6.10	Port Data Control Register 5 (AUDMUX_PDCR5).....	457
14.6.11	Port Timing Control Register 6 (AUDMUX_PTCR6).....	458
14.6.12	Port Data Control Register 6 (AUDMUX_PDCR6).....	460
14.6.13	Port Timing Control Register 7 (AUDMUX_PTCR7).....	461
14.6.14	Port Data Control Register 7 (AUDMUX_PDCR7).....	463

Chapter 15

Clock Controller Module (CCM)

15.1	Overview.....	465
15.1.1	Features.....	465
15.1.2	CCM Block Diagram.....	466
15.2	External Signals.....	468
15.3	CCM Clock Tree.....	468

Section number	Title	Page
15.4	System Clocks.....	471
15.5	Functional Description.....	478
15.5.1	Clock Generation.....	478
15.5.1.1	External Low Frequency Clock - CKIL	479
15.5.1.1.1	CKIL synchronizing to IPG_CLK.....	479
15.5.1.2	External High Frequency Clock - CKIH and internal oscillator.....	479
15.5.1.3	PLL reference clock.....	479
15.5.1.3.1	ARM PLL.....	480
15.5.1.3.2	USB PLLs.....	480
15.5.1.3.3	System PLL.....	480
15.5.1.3.4	Audio / Video PLL.....	481
15.5.1.3.5	Ethernet PLL.....	481
15.5.1.4	Phase Fractional Dividers (PFD).....	481
15.5.1.5	CCM internal clock generation.....	482
15.5.1.5.1	Clock Switcher.....	482
15.5.1.5.2	PLL bypass procedure.....	484
15.5.1.5.3	PLL clock change.....	484
15.5.1.5.4	Clock Root Generator.....	484
15.5.1.5.5	Initial values controlled by the System JTAG Controller (SJC).....	486
15.5.1.5.6	Divider change handshake.....	486
15.5.1.6	Disabling / Enabling PLLs.....	486
15.5.1.7	Clock Switching Multiplexers.....	487
15.5.1.8	Low Power Clock Gating module (LPCG).....	488
15.5.1.9	MMDC handshake.....	489
15.5.2	DVFS support.....	490
15.5.3	Power modes.....	490
15.5.3.1	RUN mode.....	490
15.5.3.2	WAIT mode.....	490
15.5.3.2.1	Entering WAIT mode	490

Section number	Title	Page
15.5.3.2.2	Exiting WAIT mode	491
15.5.3.3	STOP mode.....	491
15.5.3.3.1	Entering STOP mode	491
15.5.3.3.2	Exiting STOP mode.....	492
15.6	CCM Memory Map/Register Definition.....	493
15.6.1	CCM Control Register (CCM_CCR).....	494
15.6.2	CCM Control Divider Register (CCM_CCDR).....	496
15.6.3	CCM Status Register (CCM_CSR).....	497
15.6.4	CCM Clock Switcher Register (CCM_CCSR).....	498
15.6.5	CCM Arm Clock Root Register (CCM_CACRR).....	499
15.6.6	CCM Bus Clock Divider Register (CCM_CBCDR).....	500
15.6.7	CCM Bus Clock Multiplexer Register (CCM_CBCMR).....	503
15.6.8	CCM Serial Clock Multiplexer Register 1 (CCM_CSCMR1).....	504
15.6.9	CCM Serial Clock Multiplexer Register 2 (CCM_CSCMR2).....	506
15.6.10	CCM Serial Clock Divider Register 1 (CCM_CSCDR1).....	507
15.6.11	CCM SSI1 Clock Divider Register (CCM_CS1CDR).....	509
15.6.12	CCM SSI2 Clock Divider Register (CCM_CS2CDR).....	510
15.6.13	CCM D1 Clock Divider Register (CCM_CDCDR).....	512
15.6.14	CCM HSC Clock Divider Register (CCM_CHSCCDR).....	513
15.6.15	CCM Serial Clock Divider Register 2 (CCM_CSCDR2).....	515
15.6.16	CCM Divider Handshake In-Process Register (CCM_CDHIPR).....	517
15.6.17	CCM Low Power Control Register (CCM_CLPCR).....	520
15.6.18	CCM Interrupt Status Register (CCM_CISR).....	522
15.6.19	CCM Interrupt Mask Register (CCM_CIMR).....	525
15.6.20	CCM Clock Output Source Register (CCM_CCOSR).....	527
15.6.21	CCM General Purpose Register (CCM_CGPR).....	529
15.6.22	CCM Clock Gating Register 0 (CCM_CCGR0).....	530
15.6.23	CCM Clock Gating Register 1 (CCM_CCGR1).....	532
15.6.24	CCM Clock Gating Register 2 (CCM_CCGR2).....	534

Section number	Title	Page
15.6.25	CCM Clock Gating Register 3 (CCM_CCGR3).....	535
15.6.26	CCM Clock Gating Register 4 (CCM_CCGR4).....	536
15.6.27	CCM Clock Gating Register 5 (CCM_CCGR5).....	538
15.6.28	CCM Clock Gating Register 6 (CCM_CCGR6).....	539
15.6.29	CCM Module Enable Override Register (CCM_CMEOR).....	540
15.7	CCM Analog Memory Map/Register Definition.....	541
15.7.1	Analog ARM PLL control Register (CCM_ANALOG_PLL_ARMn).....	545
15.7.2	Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1n).....	547
15.7.3	Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2n).....	549
15.7.4	Analog System PLL Control Register (CCM_ANALOG_PLL_SYSn).....	551
15.7.5	528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS).....	553
15.7.6	Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_NUM).....	553
15.7.7	Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_DENOM).....	554
15.7.8	Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDIOn).....	555
15.7.9	Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM)..	557
15.7.10	Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM).....	558
15.7.11	Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEOn).....	559
15.7.12	Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM)...	561
15.7.13	Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM).....	562
15.7.14	Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENETn).....	563
15.7.15	480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480n).....	565
15.7.16	528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528n).....	567
15.7.17	Miscellaneous Register 0 (CCM_ANALOG_MISC0n).....	570
15.7.18	Miscellaneous Register 1 (CCM_ANALOG_MISC1n).....	574
15.7.19	Miscellaneous Register 2 (CCM_ANALOG_MISC2n).....	577

Chapter 16

Section number	Title	Page
	CMOS Sensor Interface (CSI)	
16.1	Overview.....	583
16.2	External Signals.....	584
16.3	Clocks.....	586
16.4	Principles of Operation.....	586
16.4.1	Data Transfer with the Embedded DMA Controllers.....	588
16.4.2	Gated Clock Mode.....	589
16.4.3	Non-Gated Clock Mode.....	589
16.4.4	CCIR656 Interlace Mode.....	590
16.4.5	CCIR656 Progressive Mode.....	593
16.4.6	Error Correction for CCIR656 Coding.....	594
16.4.7	Deinterlacer.....	594
16.5	Interrupt Generation.....	594
16.5.1	Start Of Frame Interrupt (SOF_INT).....	594
16.5.2	End Of Frame Interrupt (EOF_INT).....	595
16.5.3	Change Of Field Interrupt (COF_INT).....	595
16.5.4	CCIR Error Interrupt (ECC_INT).....	595
16.5.5	RxFIFO Full Interrupt (RxFF_INT).....	595
16.5.6	Statistic FIFO Full Interrupt (STATFF_INT).....	596
16.5.7	RxFIFO Overrun Interrupt (RFF_OR_INT).....	596
16.5.8	Statistic FIFO Overrun Interrupt (SFF_OR_INT).....	596
16.5.9	Frame Buffer1 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB1).....	596
16.5.10	Frame Buffer2 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB2).....	596
16.5.11	Statistic FIFO DMA Transfer Done Interrupt (DMA_TSF_DONE_SFF).....	596
16.5.12	AHB Bus Response Error Interrupt (HRESP_ERR_INT).....	597
16.5.13	DMA Field 0 Transfer Done Interrupt (DMA_FIELD0_DONE).....	597
16.5.14	DMA Field 1 Transfer Done Interrupt (DMA_FIELD1_DONE).....	597
16.5.15	Base Address Change Error Interrupt (BASEADDR_CHANGE_ERROR).....	597
16.6	Data Packing Style.....	597

Section number	Title	Page
16.6.1	RX FIFO Path.....	598
16.6.1.1	Bayer Data.....	598
16.6.1.2	RGB565 Data.....	598
16.6.1.3	RGB888 Data.....	599
16.6.2	STAT FIFO Path.....	601
16.7	CSI Memory Map/Register Definition.....	601
16.7.1	CSI Control Register 1 (CSI_CSICR1).....	603
16.7.2	CSI Control Register 2 (CSI_CSICR2).....	607
16.7.3	CSI Control Register 3 (CSI_CSICR3).....	609
16.7.4	CSI Statistic FIFO Register (CSI_CSISTATFIFO).....	611
16.7.5	CSI RX FIFO Register (CSI_CSIRFIFO).....	612
16.7.6	CSI RX Count Register (CSI_CSIRXCNT).....	612
16.7.7	CSI Status Register (CSI_CSISR).....	613
16.7.8	CSI DMA Start Address Register - for STATFIFO (CSI_CSIDMASA_STATFIFO).....	616
16.7.9	CSI DMA Transfer Size Register - for STATFIFO (CSI_CSIDMATS_STATFIFO).....	616
16.7.10	CSI DMA Start Address Register - for Frame Buffer1 (CSI_CSIDMASA_FB1).....	617
16.7.11	CSI DMA Transfer Size Register - for Frame Buffer2 (CSI_CSIDMASA_FB2).....	618
16.7.12	CSI Frame Buffer Parameter Register (CSI_CSIFBUF_PARA).....	618
16.7.13	CSI Image Parameter Register (CSI_CSIIMAG_PARA).....	619
16.7.14	CSI Control Register 18 (CSI_CSICR18).....	620
16.7.15	CSI Control Register 19 (CSI_CSICR19).....	622

Chapter 17

Enhanced Configurable SPI (ECSPI)

17.1	Overview.....	623
17.1.1	Features.....	624
17.1.2	Modes and Operations.....	624
17.2	External Signals.....	625
17.3	Clocks.....	628
17.4	Functional Description.....	628

Section number	Title	Page
17.4.1	Master Mode.....	629
17.4.2	Slave Mode.....	629
17.4.3	Low Power Modes.....	630
17.4.4	Operations.....	630
17.4.4.1	Typical Master Mode.....	630
17.4.4.1.1	Master Mode with SPI_RDY.....	631
17.4.4.1.2	Master Mode with Wait States.....	633
17.4.4.1.3	Master Mode with SS_CTL[3:0] Control.....	633
17.4.4.1.4	Master Mode with Phase Control.....	634
17.4.4.2	Typical Slave Mode.....	635
17.4.5	Reset.....	636
17.4.6	Interrupts.....	636
17.4.7	DMA	637
17.4.8	Byte Order.....	638
17.5	Initialization.....	639
17.6	Applications.....	639
17.7	ECSPI Memory Map/Register Definition.....	640
17.7.1	Receive Data Register (ECSPIx_RXDATA).....	641
17.7.2	Transmit Data Register (ECSPIx_TXDATA).....	642
17.7.3	Control Register (ECSPIx_CONREG).....	642
17.7.4	Config Register (ECSPIx_CONFIGREG).....	645
17.7.5	Interrupt Control Register (ECSPIx_INTREG).....	647
17.7.6	DMA Control Register (ECSPIx_DMAREG).....	648
17.7.7	Status Register (ECSPIx_STATREG).....	650
17.7.8	Sample Period Control Register (ECSPIx_PERIODREG).....	651
17.7.9	Test Control Register (ECSPIx_TESTREG).....	653
17.7.10	Message Data Register (ECSPIx_MSGDATA).....	654

Chapter 18

Enhanced LCD Interface (eLCDIF)

Section number	Title	Page
18.1	Overview.....	655
18.2	External Signals.....	655
18.3	Clocks.....	657
18.4	Functional Description.....	658
18.4.1	Bus Interface Mechanisms.....	659
18.4.1.1	Bus Master Operation in Write/Display Modes.....	660
18.4.1.2	System Bus Master Performance.....	660
18.4.2	Write Data Path.....	661
18.4.3	Read Data Path.....	668
18.4.4	eLCDIF Interrupts.....	673
18.4.5	Initializing the eLCDIF.....	673
18.4.5.1	Write Modes.....	673
18.4.5.2	MPU Read Mode.....	674
18.4.6	MPU Interface.....	675
18.4.6.1	Code Example to Initialize the eLCDIF in MPU Write Mode.....	677
18.4.7	VSYNC Interface.....	677
18.4.7.1	Code Example to Initialize eLCDIF in VSYNC Mode.....	678
18.4.8	DOTCLK Interface.....	679
18.4.8.1	Code Example.....	681
18.4.9	CSI HANDSHAKE INTERFACE.....	681
18.4.10	Alpha Blending Interface.....	682
18.4.11	ITU-R BT.656 Digital Video Interface (DVI).....	682
18.4.12	LUT.....	684
18.4.13	eLCDIF Pin Usage by Interface Mode.....	684
18.5	Behavior During Reset.....	690
18.6	ELCDIF Memory Map/Register Definition.....	690
18.6.1	eLCDIF General Control Register (LCDIF_CTRL n).....	693
18.6.2	eLCDIF General Control1 Register (LCDIF_CTRL1 n).....	696
18.6.3	eLCDIF General Control2 Register (LCDIF_CTRL2 n).....	699

Section number	Title	Page
18.6.4	eLCDIF Horizontal and Vertical Valid Data Count Register (LCDIF_TRANSFER_COUNT).....	701
18.6.5	LCD Interface Current Buffer Address Register (LCDIF_CUR_BUF).....	701
18.6.6	LCD Interface Next Buffer Address Register (LCDIF_NEXT_BUF).....	702
18.6.7	LCD Interface Timing Register (LCDIF_TIMING).....	702
18.6.8	eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF_VDCTRL0n).....	703
18.6.9	eLCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIF_VDCTRL1).....	705
18.6.10	LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIF_VDCTRL2).....	705
18.6.11	eLCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIF_VDCTRL3).....	706
18.6.12	eLCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIF_VDCTRL4).....	707
18.6.13	Digital Video Interface Control0 Register (LCDIF_DVICTRL0).....	708
18.6.14	Digital Video Interface Control1 Register (LCDIF_DVICTRL1).....	708
18.6.15	Digital Video Interface Control2 Register (LCDIF_DVICTRL2).....	709
18.6.16	Digital Video Interface Control3 Register (LCDIF_DVICTRL3).....	710
18.6.17	Digital Video Interface Control4 Register (LCDIF_DVICTRL4).....	711
18.6.18	RGB to YCbCr 4:2:2 CSC Coefficient0 Register (LCDIF_CSC_COEFF0).....	712
18.6.19	RGB to YCbCr 4:2:2 CSC Coefficient1 Register (LCDIF_CSC_COEFF1).....	713
18.6.20	RGB to YCbCr 4:2:2 CSC Coefficient2 Register (LCDIF_CSC_COEFF2).....	714
18.6.21	RGB to YCbCr 4:2:2 CSC Coefficient3 Register (LCDIF_CSC_COEFF3).....	714
18.6.22	RGB to YCbCr 4:2:2 CSC Coefficient4 Register (LCDIF_CSC_COEFF4).....	715
18.6.23	RGB to YCbCr 4:2:2 CSC Offset Register (LCDIF_CSC_OFFSET).....	716
18.6.24	RGB to YCbCr 4:2:2 CSC Limit Register (LCDIF_CSC_LIMIT).....	716
18.6.25	LCD Interface Data Register (LCDIF_DATA).....	717
18.6.26	Bus Master Error Status Register (LCDIF_BM_ERROR_STAT).....	718
18.6.27	CRC Status Register (LCDIF_CRC_STAT).....	718
18.6.28	LCD Interface Status Register (LCDIF_STAT).....	719
18.6.29	eLCDIF Threshold Register (LCDIF_THRES).....	721
18.6.30	eLCDIF AS Buffer Control Register (LCDIF_AS_CTRL).....	722
18.6.31	Alpha Surface Buffer Pointer (LCDIF_AS_BUF).....	724
18.6.32	LCDIF_AS_NEXT_BUF.....	725

Section number	Title	Page
18.6.33	eLCDIF Overlay Color Key Low (LCDIF_AS_CLRKEYLOW).....	725
18.6.34	eLCDIF Overlay Color Key High (LCDIF_AS_CLRKEYHIGH).....	726
18.6.35	LCD working insync mode with CSI for VSYNC delay (LCDIF_SYNC_DELAY).....	726

Chapter 19 Electrophoretic Display Controller (EPDC)

19.1	Overview	727
19.1.1	EPDC Block Diagram.....	728
19.2	External Signals.....	729
19.3	Programming Model.....	731
19.3.1	Assumptions.....	732
19.3.2	Register Space (Write/Set/Clear/Toggle).....	732
19.3.3	Interrupts.....	733
19.3.3.1	Interrupt Sources.....	733
19.3.3.2	Enabling/Masking Interrupts.....	733
19.3.3.3	Handling/Clearing Interrupts.....	734
19.3.4	Controller Setup.....	734
19.3.4.1	Memory Requirements.....	734
19.3.4.2	Panel Architecture Configuration.....	735
19.3.4.3	TFT Panel Timing Configuration	738
19.3.4.4	Source Driver and Pixel Clock Configuration.....	744
19.3.4.5	Initializing the Display.....	745
19.3.4.5.1	Reset/Clocks and Buffer Preparation.....	745
19.3.4.5.2	Performing an Initialization Display Update.....	746
19.3.5	Update Buffer Analysis Functions.....	746
19.3.6	Waveform Mode Selection (AUTOWV).....	747
19.3.7	Panel Interface Generator (Pigeon Mode).....	748
19.3.8	Display Update Programming.....	752
19.3.8.1	Initiating a Display Update.....	752
19.3.8.2	Update Processing and Collisions.....	753

Section number	Title	Page
19.3.8.3	Multiple Update Flow.....	757
19.3.9	Architectural Clock Gating (Low Power Mode).....	760
19.3.10	Performance Tuning and Considerations.....	762
19.3.10.1	Memory and Bus Bandwidth Requirements.....	762
19.3.10.2	Pixel Latency FIFO.....	763
19.3.10.3	Basic Watermarking Control.....	763
19.3.10.4	Update/Refresh Tuning (VSCAN_HOLD OFF).....	764
19.3.10.5	System-Level Arbitration Control.....	764
19.4	EPDC Memory Map/Register Definition.....	766
19.4.1	EPDC Control Register (EPDC_CTRL _n).....	775
19.4.2	EPDC Working Buffer Address for TCE (EPDC_WB_ADDR_TCE).....	777
19.4.3	EPDC Waveform Address Pointer (EPDC_WVADDR).....	777
19.4.4	EPDC Working Buffer Address (EPDC_WB_ADDR).....	778
19.4.5	EPDC Screen Resolution (EPDC_RES).....	778
19.4.6	EPDC Format Control Register (EPDC_FORMAT _n).....	779
19.4.7	Working Buffer Field Setting (EPDC_WB_FIELD0).....	781
19.4.8	Working Buffer Field Setting (EPDC_WB_FIELD1).....	782
19.4.9	Working Buffer Field Setting (EPDC_WB_FIELD2).....	783
19.4.10	Working Buffer Field Setting (EPDC_WB_FIELD3).....	784
19.4.11	EPDC FIFO control register (EPDC_FIFOCTRL _n).....	784
19.4.12	EPDC Update Region Address (EPDC_UPD_ADDR).....	785
19.4.13	EPDC Update Region Stride (EPDC_UPD_STRIDE).....	786
19.4.14	EPDC Update Command Co-ordinate (EPDC_UPD_CORD).....	787
19.4.15	EPDC Update Command Size (EPDC_UPD_SIZE).....	787
19.4.16	EPDC Update Command Control (EPDC_UPD_CTRL _n).....	788
19.4.17	EPDC Update Fixed Pixel Control (EPDC_UPD_FIXED _n).....	789
19.4.18	EPDC Temperature Register (EPDC_TEMP).....	790
19.4.19	Waveform Mode Lookup Table Control Register. (EPDC_AUTOWV_LUT).....	790
19.4.20	EPDC LUT Standby Register for LUT 31~0 (EPDC_LUT_STANDBY1 _n).....	791

Section number	Title	Page
19.4.21	EPDC LUT Standby Register for LUT 63~32 (EPDC_LUT_STANDBY2n).....	791
19.4.22	EPDC Timing Control Engine Control Register (EPDC_TCE_CTRLn).....	791
19.4.23	EPDC Timing Control Engine Source-Driver Config Register (EPDC_TCE_SDCFGn).....	794
19.4.24	EPDC Timing Control Engine Gate-Driver Config Register (EPDC_TCE_GDCFGn).....	795
19.4.25	EPDC Timing Control Engine Horizontal Timing Register 1 (EPDC_TCE_HSCAN1n).....	796
19.4.26	EPDC Timing Control Engine Horizontal Timing Register 2 (EPDC_TCE_HSCAN2n).....	796
19.4.27	EPDC Timing Control Engine Vertical Timing Register (EPDC_TCE_VSCANn).....	797
19.4.28	EPDC Timing Control Engine OE timing control Register (EPDC_TCE_OEn).....	797
19.4.29	EPDC Timing Control Engine Driver Polarity Register (EPDC_TCE_POLARITYn).....	798
19.4.30	EPDC Timing Control Engine Timing Register 1 (EPDC_TCE_TIMING1n).....	799
19.4.31	EPDC Timing Control Engine Timing Register 2 (EPDC_TCE_TIMING2n).....	800
19.4.32	EPDC Timing Control Engine Timing Register 3 (EPDC_TCE_TIMING3n).....	801
19.4.33	EPDC Pigeon Mode Control Register 0 (EPDC_PIGEON_CTRL0n).....	801
19.4.34	EPDC Pigeon Mode Control Register 1 (EPDC_PIGEON_CTRL1n).....	802
19.4.35	EPDC IRQ Mask Register for LUT 0~31 (EPDC_IRQ_MASK1n).....	802
19.4.36	EPDC IRQ Mask Register for LUT 32~63 (EPDC_IRQ_MASK2n).....	803
19.4.37	EPDC Interrupt Register for LUT 0~31 (EPDC_IRQ1n).....	803
19.4.38	EPDC Interrupt Register for LUT 32~63 (EPDC_IRQ2n).....	803
19.4.39	EPDC IRQ Mask Register (EPDC_IRQ_MASKn).....	804
19.4.40	EPDC Interrupt Register (EPDC_IRQn).....	805
19.4.41	EPDC Status Register - LUTs (EPDC_STATUS_LUTS1n).....	806
19.4.42	EPDC Status Register - LUTs (EPDC_STATUS_LUTS2n).....	807
19.4.43	EPDC Status Register - Next Available LUT (EPDC_STATUS_NEXTLUT).....	807
19.4.44	EPDC LUT Collision Status (EPDC_STATUS_COL1n).....	809
19.4.45	EPDC LUT Collision Status (EPDC_STATUS_COL2n).....	809
19.4.46	EPDC General Status Register (EPDC_STATUSn).....	810
19.4.47	EPDC Collision Region Co-ordinate (EPDC_UPD_COL_CORD).....	811
19.4.48	EPDC Collision Region Size (EPDC_UPD_COL_SIZE).....	812
19.4.49	1-level Histogram Parameter Register. (EPDC_HIST1_PARAM).....	812

Section number	Title	Page
19.4.50	2-level Histogram Parameter Register. (EPDC_HIST2_PARAM).....	813
19.4.51	4-level Histogram Parameter Register. (EPDC_HIST4_PARAM).....	814
19.4.52	8-level Histogram Parameter 0 Register. (EPDC_HIST8_PARAM0).....	814
19.4.53	8-level Histogram Parameter 1 Register. (EPDC_HIST8_PARAM1).....	815
19.4.54	16-level Histogram Parameter 0 Register. (EPDC_HIST16_PARAM0).....	816
19.4.55	16-level Histogram Parameter Register. (EPDC_HIST16_PARAM1).....	817
19.4.56	16-level Histogram Parameter Register. (EPDC_HIST16_PARAM2).....	818
19.4.57	16-level Histogram Parameter Register. (EPDC_HIST16_PARAM3).....	818
19.4.58	EPDC General Purpose I/O Debug register (EPDC_GPIOn).....	819
19.4.59	EPDC Version Register (EPDC_VERSION).....	820
19.4.60	Panel Interface Signal Generator Register 0_0 (EPDC_PIGEON_0_0).....	821
19.4.61	Panel Interface Signal Generator Register 0_1 (EPDC_PIGEON_0_1).....	822
19.4.62	Panel Interface Signal Generator Register 0_1 (EPDC_PIGEON_0_2).....	822
19.4.63	Panel Interface Signal Generator Register 1_0 (EPDC_PIGEON_1_0).....	823
19.4.64	Panel Interface Signal Generator Register 1_1 (EPDC_PIGEON_1_1).....	824
19.4.65	Panel Interface Signal Generator Register 1_1 (EPDC_PIGEON_1_2).....	825
19.4.66	Panel Interface Signal Generator Register 2_0 (EPDC_PIGEON_2_0).....	825
19.4.67	Panel Interface Signal Generator Register 2_1 (EPDC_PIGEON_2_1).....	827
19.4.68	Panel Interface Signal Generator Register 2_1 (EPDC_PIGEON_2_2).....	827
19.4.69	Panel Interface Signal Generator Register 3_0 (EPDC_PIGEON_3_0).....	828
19.4.70	Panel Interface Signal Generator Register 3_1 (EPDC_PIGEON_3_1).....	829
19.4.71	Panel Interface Signal Generator Register 3_1 (EPDC_PIGEON_3_2).....	830
19.4.72	Panel Interface Signal Generator Register 4_0 (EPDC_PIGEON_4_0).....	830
19.4.73	Panel Interface Signal Generator Register 4_1 (EPDC_PIGEON_4_1).....	831
19.4.74	Panel Interface Signal Generator Register 4_1 (EPDC_PIGEON_4_2).....	832
19.4.75	Panel Interface Signal Generator Register 5_0 (EPDC_PIGEON_5_0).....	833
19.4.76	Panel Interface Signal Generator Register 5_1 (EPDC_PIGEON_5_1).....	834
19.4.77	Panel Interface Signal Generator Register 5_1 (EPDC_PIGEON_5_2).....	834
19.4.78	Panel Interface Signal Generator Register 6_0 (EPDC_PIGEON_6_0).....	835

Section number	Title	Page
19.4.79	Panel Interface Signal Generator Register 6_1 (EPDC_PIGEON_6_1).....	836
19.4.80	Panel Interface Signal Generator Register 6_1 (EPDC_PIGEON_6_2).....	837
19.4.81	Panel Interface Signal Generator Register 7_0 (EPDC_PIGEON_7_0).....	837
19.4.82	Panel Interface Signal Generator Register 7_1 (EPDC_PIGEON_7_1).....	839
19.4.83	Panel Interface Signal Generator Register 7_1 (EPDC_PIGEON_7_2).....	839
19.4.84	Panel Interface Signal Generator Register 8_0 (EPDC_PIGEON_8_0).....	840
19.4.85	Panel Interface Signal Generator Register 8_1 (EPDC_PIGEON_8_1).....	841
19.4.86	Panel Interface Signal Generator Register 8_1 (EPDC_PIGEON_8_2).....	842
19.4.87	Panel Interface Signal Generator Register 9_0 (EPDC_PIGEON_9_0).....	842
19.4.88	Panel Interface Signal Generator Register 9_1 (EPDC_PIGEON_9_1).....	843
19.4.89	Panel Interface Signal Generator Register 9_1 (EPDC_PIGEON_9_2).....	844
19.4.90	Panel Interface Signal Generator Register 10_0 (EPDC_PIGEON_10_0).....	845
19.4.91	Panel Interface Signal Generator Register 10_1 (EPDC_PIGEON_10_1).....	846
19.4.92	Panel Interface Signal Generator Register 10_1 (EPDC_PIGEON_10_2).....	846
19.4.93	Panel Interface Signal Generator Register 11_0 (EPDC_PIGEON_11_0).....	847
19.4.94	Panel Interface Signal Generator Register 11_1 (EPDC_PIGEON_11_1).....	848
19.4.95	Panel Interface Signal Generator Register 11_1 (EPDC_PIGEON_11_2).....	849
19.4.96	Panel Interface Signal Generator Register 12_0 (EPDC_PIGEON_12_0).....	849
19.4.97	Panel Interface Signal Generator Register 12_1 (EPDC_PIGEON_12_1).....	851
19.4.98	Panel Interface Signal Generator Register 12_1 (EPDC_PIGEON_12_2).....	851
19.4.99	Panel Interface Signal Generator Register 13_0 (EPDC_PIGEON_13_0).....	852
19.4.100	Panel Interface Signal Generator Register 13_1 (EPDC_PIGEON_13_1).....	853
19.4.101	Panel Interface Signal Generator Register 13_1 (EPDC_PIGEON_13_2).....	854
19.4.102	Panel Interface Signal Generator Register 14_0 (EPDC_PIGEON_14_0).....	854
19.4.103	Panel Interface Signal Generator Register 14_1 (EPDC_PIGEON_14_1).....	855
19.4.104	Panel Interface Signal Generator Register 14_1 (EPDC_PIGEON_14_2).....	856
19.4.105	Panel Interface Signal Generator Register 15_0 (EPDC_PIGEON_15_0).....	857
19.4.106	Panel Interface Signal Generator Register 15_1 (EPDC_PIGEON_15_1).....	858
19.4.107	Panel Interface Signal Generator Register 15_1 (EPDC_PIGEON_15_2).....	858

Section number	Title	Page
19.4.108	Panel Interface Signal Generator Register 16_0 (EPDC_PIGEON_16_0).....	859
19.4.109	Panel Interface Signal Generator Register 16_1 (EPDC_PIGEON_16_1).....	860
19.4.110	Panel Interface Signal Generator Register 16_1 (EPDC_PIGEON_16_2).....	861

Chapter 20 Enhanced Periodic Interrupt Timer (EPIT)

20.1	Overview.....	863
20.1.1	EPIT features.....	863
20.1.2	EPIT modes and operations.....	864
20.2	External signals.....	864
20.3	Clocks.....	864
20.4	Functional Description.....	866
20.4.1	Operating modes.....	866
20.4.1.1	Operating in set-and-forget mode.....	866
20.4.1.2	Operating in free-running mode.....	866
20.4.2	Operations.....	867
20.4.3	Compare Event.....	867
20.4.3.1	Counter Value Overwrite.....	868
20.4.3.2	Low-Power Mode Behavior.....	869
20.4.3.3	Debug Mode Behavior.....	869
20.5	Initialization/ Application Information.....	869
20.5.1	Change of Clock Source.....	869
20.6	EPIT Memory Map/Register Definition.....	870
20.6.1	Control register (EPITx_CR).....	870
20.6.2	Status register (EPITx_SR).....	873
20.6.3	Load register (EPITx_LR).....	873
20.6.4	Compare register (EPITx_CMPR).....	874
20.6.5	Counter register (EPITx_CNR).....	874

Chapter 21 General Power Controller (GPC)

Section number	Title	Page
21.1	Overview.....	875
21.2	Clocks.....	876
21.3	Power Gating Control (PGC).....	876
21.3.1	Overview.....	877
21.3.1.1	Features.....	878
21.4	GPC Interrupt Controller (INTC).....	878
21.4.1	Interrupt Controller features.....	878
21.5	GPC Memory Map/Register Definition.....	879
21.5.1	GPC Interface control register (GPC_CNTR).....	879
21.5.2	GPC Power Gating Register (GPC_PGR).....	881
21.5.3	IRQ masking register 1 (GPC_IMR1).....	882
21.5.4	IRQ masking register 2 (GPC_IMR2).....	882
21.5.5	IRQ masking register 3 (GPC_IMR3).....	882
21.5.6	IRQ masking register 4 (GPC_IMR4).....	883
21.5.7	IRQ status resister 1 (GPC_ISR1).....	883
21.5.8	IRQ status resister 2 (GPC_ISR2).....	884
21.5.9	IRQ status resister 3 (GPC_ISR3).....	884
21.5.10	IRQ status resister 4 (GPC_ISR4).....	885
21.6	PGC Memory Map/Register Definition.....	885
21.6.1	PGC Mega Control Register (PGC_MEGA_CTRL).....	887
21.6.2	PGC Mega Power Up Sequence Control Register (PGC_MEGA_PUPSCR).....	887
21.6.3	PGC Mega Pull Down Sequence Control Register (PGC_MEGA_PDNSCR).....	888
21.6.4	PGC Mega Power Gating Controller Status Register (PGC_MEGA_SR).....	889
21.6.5	PGC Display Control Register (PGC_DISPLAY_CTRL).....	889
21.6.6	PGC Display Power Up Sequence Control Register (PGC_DISPLAY_PUPSCR).....	890
21.6.7	PGC Display Pull Down Sequence Control Register (PGC_DISPLAY_PDNSCR).....	891
21.6.8	GPU Display Power Gating Controller Status Register (PGC_DISPLAY_SR).....	891
21.6.9	PGC GPU PGC Control Register (PGC_GPU_CTRL).....	892
21.6.10	PGC GPU Power Up Sequence Control Register (PGC_GPU_PUPSCR).....	893

Section number	Title	Page
21.6.11	PGC GPU Pull Down Sequence Control Register (PGC_GPU_PDNSCR).....	893
21.6.12	PGC GPU Power Gating Controller Status Register (PGC_GPU_SR).....	894
21.6.13	PGC CPU Control Register (PGC_CPU_CTRL).....	895
21.6.14	PGC CPU Power Up Sequence Control Register (PGC_CPU_PUPSCR).....	895
21.6.15	PGC CPU Pull Down Sequence Control Register (PGC_CPU_PDNSCR).....	896
21.6.16	PGC CPU Power Gating Controller Status Register (PGC_CPU_SR).....	897

Chapter 22

General Purpose Input/Output (GPIO)

22.1	Overview.....	899
22.1.1	Block Diagram.....	901
22.1.2	Features.....	902
22.2	External Signals.....	902
22.3	Clocks.....	907
22.4	GPIO Functional Description.....	907
22.4.1	GPIO Function.....	907
22.4.2	GPIO pad structure.....	908
22.4.2.1	Input Driver.....	908
22.4.2.1.1	Schmitt trigger.....	909
22.4.2.1.2	Input keeper.....	909
22.4.2.2	Output Driver.....	909
22.4.2.2.1	Drive strength.....	910
22.4.2.2.2	Output keeper.....	910
22.4.2.2.3	PU / PD / Keeper Logic.....	911
22.4.2.2.4	Open drain.....	911
22.4.3	GPIO Programming.....	912
22.4.3.1	GPIO Read Mode.....	912
22.4.3.2	GPIO Write Mode.....	913
22.4.4	Interrupt Control Unit.....	913
22.5	GPIO Memory Map/Register Definition.....	913

Section number	Title	Page
22.5.1	GPIO data register (GPIOx_DR).....	915
22.5.2	GPIO direction register (GPIOx_GDIR).....	916
22.5.3	GPIO pad status register (GPIOx_PSR).....	917
22.5.4	GPIO interrupt configuration register1 (GPIOx_ICR1).....	917
22.5.5	GPIO interrupt configuration register2 (GPIOx_ICR2).....	921
22.5.6	GPIO interrupt mask register (GPIOx_IMR).....	924
22.5.7	GPIO interrupt status register (GPIOx_ISR).....	925
22.5.8	GPIO edge select register (GPIOx_EDGE_SEL).....	926

Chapter 23 General Purpose Timer (GPT)

23.1	Overview.....	927
23.1.1	Features.....	929
23.1.2	Modes and Operation.....	929
23.2	External Signals.....	929
23.2.1	External Clock Input	930
23.2.2	Input Capture Trigger Signals	930
23.2.3	Output Compare Signals.....	931
23.3	Clocks.....	931
23.4	Functional Description.....	933
23.4.1	Operating Modes.....	933
23.4.1.1	Restart Mode.....	933
23.4.1.2	Free-Run Mode.....	933
23.4.2	Operation.....	934
23.4.2.1	Input Capture.....	934
23.4.2.2	Output Compare.....	935
23.4.2.3	Interrupts.....	936
23.4.2.4	Low Power Mode Behavior.....	937
23.4.2.5	Debug Mode Behavior.....	937
23.5	Initialization/ Application Information	937

Section number	Title	Page
23.5.1	Selecting the Clock Source	937
23.6	GPT Memory Map/Register Definition.....	938
23.6.1	GPT Control Register (GPT_CR).....	939
23.6.2	GPT Prescaler Register (GPT_PR).....	943
23.6.3	GPT Status Register (GPT_SR).....	944
23.6.4	GPT Interrupt Register (GPT_IR).....	945
23.6.5	GPT Output Compare Register 1 (GPT_OCR1).....	946
23.6.6	GPT Output Compare Register 2 (GPT_OCR2).....	947
23.6.7	GPT Output Compare Register 3 (GPT_OCR3).....	947
23.6.8	GPT Input Capture Register 1 (GPT_ICR1).....	948
23.6.9	GPT Input Capture Register 2 (GPT_ICR2).....	948
23.6.10	GPT Counter Register (GPT_CNT).....	949

Chapter 24 I2C Controller (I2C)

24.1	Overview.....	951
24.1.1	Features.....	953
24.1.2	Modes and operations.....	954
24.2	External Signals.....	954
24.3	Clocks.....	955
24.4	Functional description.....	955
24.4.1	I2C system configuration.....	955
24.4.2	Arbitration procedure.....	956
24.4.3	Clock synchronization.....	956
24.4.4	Handshaking.....	957
24.4.5	Clock stretching.....	957
24.4.6	Peripheral bus accesses.....	958
24.4.7	Generation of transfer error on IP bus.....	958
24.4.8	Reset.....	958
24.4.9	Interrupts.....	958

Section number	Title	Page
24.4.10	Byte order.....	958
24.5	Initialization.....	959
24.5.1	Initialization sequence.....	959
24.5.2	Generation of Start.....	959
24.5.3	Post-transfer software response.....	959
24.5.4	Generation of Stop.....	960
24.5.5	Generation of Repeated Start.....	960
24.5.6	Slave mode.....	961
24.5.7	Arbitration lost.....	961
24.6	Software restriction.....	967
24.7	I2C Memory Map/Register Definition.....	968
24.7.1	I2C Address Register (I2Cx_IADR).....	969
24.7.2	I2C Frequency Divider Register (I2Cx_IFDR).....	969
24.7.3	I2C Control Register (I2Cx_I2CR).....	971
24.7.4	I2C Status Register (I2Cx_I2SR).....	972
24.7.5	I2C Data I/O Register (I2Cx_I2DR).....	974
24.7.6	I2C Clock Duty-cycle Adjust Register (I2Cx_DCA).....	975

Chapter 25 IOMUX Controller (IOMUXC)

25.1	Overview.....	977
25.1.1	Features.....	978
25.2	Clocks.....	979
25.3	Functional description.....	979
25.3.1	ALT6 and ALT7 extended muxing modes.....	980
25.3.2	SW Loopback through SION bit.....	981
25.3.3	Daisy chain - multi pads driving same module input pin.....	981
25.4	IOMUXC SNVS Memory Map/Register Definition.....	982
25.4.1	SW_MUX_CTL_PAD_TAMPER SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_TAMPER).....	983

Section number	Title	Page
25.4.2	SW_MUX_CTL_PAD_PMIC_ON_REQ SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_PMIC_ON_REQ).....	984
25.4.3	SW_MUX_CTL_PAD_PMIC_STBY_REQ SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_PMIC_STBY_REQ).....	985
25.4.4	SW_MUX_CTL_PAD_BOOT_MODE0 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_BOOT_MODE0).....	985
25.4.5	SW_MUX_CTL_PAD_BOOT_MODE1 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_BOOT_MODE1).....	986
25.4.6	SW_PAD_CTL_PAD_TAMPER SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_TAMPER).....	987
25.4.7	SW_PAD_CTL_PAD_PMIC_ON_REQ SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_PMIC_ON_REQ).....	989
25.4.8	SW_PAD_CTL_PAD_PMIC_STBY_REQ SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_PMIC_STBY_REQ).....	991
25.4.9	SW_PAD_CTL_PAD_BOOT_MODE0 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_BOOT_MODE0).....	993
25.4.10	SW_PAD_CTL_PAD_BOOT_MODE1 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_BOOT_MODE1).....	995
25.5	IOMUXC SNVS GPR Memory Map/Register Definition.....	996
25.5.1	GPR0 General Purpose Register (IOMUXC_SNVS_GPR_GPR0).....	997
25.5.2	GPR1 General Purpose Register (IOMUXC_SNVS_GPR_GPR1).....	997
25.5.3	GPR2 General Purpose Register (IOMUXC_SNVS_GPR_GPR2).....	998
25.5.4	GPR3 General Purpose Register (IOMUXC_SNVS_GPR_GPR3).....	1000
25.6	IOMUXC GPR Memory Map/Register Definition.....	1000
25.6.1	GPR0 General Purpose Register (IOMUXC_GPR_GPR0).....	1002
25.6.2	GPR1 General Purpose Register (IOMUXC_GPR_GPR1).....	1003
25.6.3	GPR2 General Purpose Register (IOMUXC_GPR_GPR2).....	1005
25.6.4	GPR3 General Purpose Register (IOMUXC_GPR_GPR3).....	1007
25.6.5	GPR4 General Purpose Register (IOMUXC_GPR_GPR4).....	1010
25.6.6	GPR5 General Purpose Register (IOMUXC_GPR_GPR5).....	1012
25.6.7	GPR6 General Purpose Register (IOMUXC_GPR_GPR6).....	1014

Section number	Title	Page
25.6.8	GPR7 General Purpose Register (IOMUXC_GPR_GPR7).....	1014
25.6.9	GPR8 General Purpose Register (IOMUXC_GPR_GPR8).....	1015
25.6.10	GPR9 General Purpose Register (IOMUXC_GPR_GPR9).....	1016
25.6.11	GPR10 General Purpose Register (IOMUXC_GPR_GPR10).....	1017
25.6.12	GPR11 General Purpose Register (IOMUXC_GPR_GPR11).....	1019
25.6.13	GPR12 General Purpose Register (IOMUXC_GPR_GPR12).....	1020
25.6.14	GPR13 General Purpose Register (IOMUXC_GPR_GPR13).....	1022
25.7	IOMUXC Memory Map/Register Definition.....	1023
25.7.1	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_WDOG_B).....	1046
25.7.2	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_REF_CLK_24M).....	1047
25.7.3	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_REF_CLK_32K).....	1048
25.7.4	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_PWM1).....	1049
25.7.5	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL0).....	1050
25.7.6	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW0).....	1051
25.7.7	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL1).....	1052
25.7.8	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW1).....	1053
25.7.9	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL2).....	1054
25.7.10	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW2).....	1055
25.7.11	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL3).....	1056
25.7.12	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW3).....	1057
25.7.13	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL4).....	1058
25.7.14	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW4).....	1059
25.7.15	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL5).....	1060
25.7.16	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW5).....	1061
25.7.17	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL6).....	1062
25.7.18	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW6).....	1063
25.7.19	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL7).....	1064
25.7.20	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW7).....	1065
25.7.21	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA00).....	1066

Section number	Title	Page
25.7.22	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA01).....	1067
25.7.23	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA02).....	1068
25.7.24	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA03).....	1069
25.7.25	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA04).....	1070
25.7.26	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA05).....	1071
25.7.27	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA06).....	1072
25.7.28	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA07).....	1073
25.7.29	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA08).....	1074
25.7.30	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA09).....	1075
25.7.31	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA10).....	1076
25.7.32	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA11).....	1077
25.7.33	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA12).....	1078
25.7.34	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA13).....	1079
25.7.35	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA14).....	1080
25.7.36	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA15).....	1081
25.7.37	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDCLK).....	1082
25.7.38	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDLE).....	1083
25.7.39	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDOE).....	1084
25.7.40	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDSHR).....	1085
25.7.41	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDCE0).....	1086
25.7.42	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDCE1).....	1087
25.7.43	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDCE2).....	1088
25.7.44	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDCE3).....	1089
25.7.45	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_GDCLK).....	1090
25.7.46	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_GDOE).....	1091
25.7.47	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_GDRL).....	1092
25.7.48	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_GDSP).....	1093
25.7.49	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_VCOM0).....	1094
25.7.50	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_VCOM1).....	1095

Section number	Title	Page
25.7.51	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_BDR0).....	1096
25.7.52	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_BDR1).....	1097
25.7.53	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_PWR_CTRL0).....	1098
25.7.54	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_PWR_CTRL1).....	1099
25.7.55	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_PWR_CTRL2).....	1100

Chapter 26 Keypad Port (KPP)

26.1	Overview	1675
26.1.1	Features.....	1677

Section number	Title	Page
26.1.2	Modes and Operations.....	1677
26.2	Clocks.....	1677
26.3	External Signals.....	1677
26.3.1	Input Pins.....	1679
26.3.2	Output Pins.....	1679
26.3.3	Generation of Transfer Error Signal on Peripheral Bus.....	1680
26.4	Functional Description.....	1680
26.4.1	Keypad Matrix Construction.....	1680
26.4.2	Keypad Port Configuration.....	1681
26.4.3	Keypad Matrix Scanning.....	1681
26.4.4	Keypad Standby.....	1681
26.4.5	Glitch Suppression on Keypad Inputs.....	1682
26.4.6	Multiple Key Closures.....	1683
	26.4.6.1 Ghost Key Problem and Correction.....	1685
26.4.7	3-Point Contact Keys Support.....	1687
26.5	Initialization/Application Information.....	1688
26.5.1	Typical Keypad Configuration and Scanning Sequence.....	1688
26.5.2	Key Press Interrupt Scanning Sequence.....	1689
26.5.3	Additional Comments.....	1689
26.6	KPP Memory Map/Register Definition.....	1689
26.6.1	Keypad Control Register (KPP_KPCR).....	1690
26.6.2	Keypad Status Register (KPP_KPSR).....	1691
26.6.3	Keypad Data Direction Register (KPP_KDDR).....	1692
26.6.4	Keypad Data Register (KPP_KPDR).....	1693

Chapter 27

Multi Mode DDR Controller (MMDC)

27.1	Overview.....	1695
27.1.1	MMDC feature summary.....	1696
27.2	External Signals.....	1698

Section number	Title	Page
27.3	Clocks.....	1698
27.4	Functional Description.....	1699
27.4.1	Write/Read data flow.....	1699
27.4.1.1	Write data flow.....	1699
27.4.1.2	Read data flow.....	1699
27.4.2	MMDC initialization	1700
27.4.3	Configuring the MMDC registers.....	1701
27.4.4	MMDC Address Space.....	1702
27.4.4.1	Address decoding	1702
27.4.4.2	Chip select settings.....	1704
27.4.4.2.1	Creating 4 Gbyte address space with 2 Gbyte CS density.....	1705
27.4.4.2.2	Creating 2 Gbyte address spaces with 1 Gbyte CS density.....	1705
27.4.5	Power Saving and Clock Frequency Change modes.....	1706
27.4.5.1	Power saving general.....	1706
27.4.5.2	Self refresh and Frequency change entry/exit.....	1707
27.4.6	Reset	1708
27.4.6.1	Hard reset.....	1709
27.4.6.2	Warm reset.....	1709
27.4.6.3	Software reset	1709
27.4.7	Refresh Scheme.....	1710
27.4.8	Burst Length options towards DDR.....	1711
27.4.9	Exclusive accesses handling.....	1711
27.4.10	AXI Error Handling.....	1712
27.5	Performance.....	1713
27.5.1	Arbitration and reordering mechanism.....	1713
27.5.1.1	Arbitration General.....	1713
27.5.1.2	Real time channel mode.....	1714
27.5.1.3	Dynamic scoring mode (Arbitration Winning Conditions).....	1714
27.5.1.4	Guarding (aging) mechanism.....	1715

Section number	Title	Page
27.5.2	Prediction mechanism.....	1715
27.6	MMDC Debug	1716
27.6.1	Hardware debug monitor.....	1716
27.6.2	Step By Step (SBS) software monitor.....	1716

27.10.52	MMDC PHY Write Delay HW Calibration Control Register (MMDC_MPWRDLHWCTL).....	1823
27.10.53	MMDC PHY Read Delay HW Calibration Status Register 0 (MMDC_MPRDDLHWST0).....	1824
27.10.54	MMDC PHY Read Delay HW Calibration Status Register 1 (MMDC_MPRDDLHWST1).....	1825
27.10.55	MMDC PHY Write Delay HW Calibration Status Register 0 (MMDC_MPWRDLHWST0).....	1826

Section number	Title	Page
27.10.56	MMDC PHY Write Delay HW Calibration Status Register 1 (MMDC_MPWRDLHWST1).....	1827
27.10.57	MMDC PHY Write Leveling HW Error Register (MMDC_MPWLHWERR).....	1828
27.10.58	MMDC PHY Pre-defined Compare Register 1 (MMDC_MPPDCMPR1).....	1829
27.10.59	MMDC PHY Pre-defined Compare and CA delay-line Configuration Register (MMDC_MPPDCMPR2).....	1830
27.10.60	MMDC PHY SW Dummy Access Register (MMDC_MPSWDAR0).....	1833
27.10.61	MMDC PHY SW Dummy Read Data Register 0 (MMDC_MPSWDRDR0).....	1834
27.10.62	MMDC PHY SW Dummy Read Data Register 1 (MMDC_MPSWDRDR1).....	1835
27.10.63	MMDC PHY SW Dummy Read Data Register 2 (MMDC_MPSWDRDR2).....	1835
27.10.64	MMDC PHY SW Dummy Read Data Register 3 (MMDC_MPSWDRDR3).....	1835
27.10.65	MMDC PHY SW Dummy Read Data Register 4 (MMDC_MPSWDRDR4).....	1836
27.10.66	MMDC PHY SW Dummy Read Data Register 5 (MMDC_MPSWDRDR5).....	1836
27.10.67	MMDC PHY SW Dummy Read Data Register 6 (MMDC_MPSWDRDR6).....	1837
27.10.68	MMDC PHY SW Dummy Read Data Register 7 (MMDC_MPSWDRDR7).....	1837
27.10.69	MMDC PHY Measure Unit Register (MMDC_MPMUR0).....	1838
27.10.70	MMDC Write CA delay-line controller (MMDC_MPWRCADL).....	1839
27.10.71	MMDC Duty Cycle Control Register (MMDC_MPDCCR).....	1841

Chapter 28

Network Interconnect Bus System (NIC-301)

28.1	Overview	1845
28.1.1	Block diagram.....	1845
28.1.2	NIC-301 Main Features.....	1846
28.1.3	Modes and Operations.....	1847
28.2	External Signals.....	1847
28.3	Memory Map and Register Definition.....	1847
28.3.1	Memory Map.....	1847
28.3.2	Configuration programmers model.....	1847
28.3.2.1	Address control and ID registers.....	1848
28.3.2.2	AMBA master interface block (AMIB) configuration registers.....	1848

Section number	Title	Page
28.3.2.3	ASIB (AMBA slave interface block) configuration registers.....	1849
28.3.3	Register Descriptions.....	1849
28.3.4	NIC Specific Parameters.....	1850

Chapter 29 On-Chip OTP Controller (OCOTP_CTRL)

29.1	Overview.....	1851
29.1.1	Features.....	1851
29.2	Clocks.....	1851
29.3	Top-Level Symbol and Functional Overview.....	1852
29.3.1	Operation.....	1852
29.3.1.1	Shadow Register Reload.....	1853
29.3.1.2	Fuse and Shadow Register Read.....	1853
29.3.1.3	Fuse and Shadow Register Writes.....	1854
29.3.1.4	Write Postamble.....	1855
29.3.2	Fuse Shadow Memory Footprint.....	1856
29.3.3	OTP Read/Write Timing Parameters.....	1858
29.3.4	Hardware Visible Fuses.....	1858
29.3.5	Behavior During Reset.....	1858
29.3.6	Secure JTAG control.....	1858
29.4	Fuse Map.....	1859
29.5	OCOTP Memory Map/Register Definition.....	1859
29.5.1	OTP Controller Control Register (OCOTP_CTRL _n).....	1863
29.5.2	OTP Controller Timing Register (OCOTP_TIMING).....	1865
29.5.3	OTP Controller Write Data Register (OCOTP_DATA).....	1865
29.5.4	OTP Controller Read Control Register (OCOTP_READ_CTRL).....	1866
29.5.5	OTP Controller Read Fuse Data Register (OCOTP_READ_FUSE_DATA).....	1867
29.5.6	Sticky bit Register (OCOTP_SW_STICKY).....	1867
29.5.7	Software Controllable Signals Register (OCOTP_SCS _n).....	1868
29.5.8	OTP Controller CRC Test Address (OCOTP_CRC_ADDR).....	1869

Section number	Title	Page
29.5.9	OTP Controller CRC Value Register (OCOTP_CRC_VALUE).....	1870
29.5.10	OTP Controller Version Register (OCOTP_VERSION).....	1871
29.5.11	OTP Controller Timing Register 2 (OCOTP_TIMING2).....	1871
29.5.12	Value of OTP Bank0 Word0 (Lock controls) (OCOTP_LOCK).....	1872
29.5.13	Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (OCOTP_CFG0).....	1875
29.5.14	Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (OCOTP_CFG1).....	1876
29.5.15	Value of OTP Bank0 Word3 (Configuration and Manufacturing Info.) (OCOTP_CFG2).....	1876
29.5.16	Value of OTP Bank0 Word4 (Configuration and Manufacturing Info.) (OCOTP_CFG3).....	1877
29.5.17	Value of OTP Bank0 Word5 (Configuration and Manufacturing Info.) (OCOTP_CFG4).....	1877
29.5.18	Value of OTP Bank0 Word6 (Configuration and Manufacturing Info.) (OCOTP_CFG5).....	1878
29.5.19	Value of OTP Bank0 Word7 (Configuration and Manufacturing Info.) (OCOTP_CFG6).....	1878
29.5.20	Value of OTP Bank1 Word0 (Memory Related Info.) (OCOTP_MEM0).....	1879
29.5.21	Value of OTP Bank1 Word1 (Memory Related Info.) (OCOTP_MEM1).....	1879
29.5.22	Value of OTP Bank1 Word2 (Memory Related Info.) (OCOTP_MEM2).....	1880
29.5.23	Value of OTP Bank1 Word3 (Memory Related Info.) (OCOTP_MEM3).....	1880
29.5.24	Value of OTP Bank1 Word4 (Memory Related Info.) (OCOTP_MEM4).....	1881
29.5.25	Value of OTP Bank1 Word5 (Memory Related Info.) (OCOTP_ANA0).....	1881
29.5.26	Value of OTP Bank1 Word6 (General Purpose Customer Defined Info.) (OCOTP_ANA1).....	1882
29.5.27	Value of OTP Bank1 Word7 (General Purpose Customer Defined Info.) (OCOTP_ANA2).....	1882
29.5.28	Value of OTP Bank2 Word0 (OTPMK Key) (OCOTP_OTPMK0).....	1883
29.5.29	Value of OTP Bank2 Word1 (OTPMK Key) (OCOTP_OTPMK1).....	1883
29.5.30	Value of OTP Bank2 Word2 (OTPMK Key) (OCOTP_OTPMK2).....	1884
29.5.31	Value of OTP Bank2 Word3 (OTPMK Key) (OCOTP_OTPMK3).....	1884
29.5.32	Value of OTP Bank2 Word4 (OTPMK Key) (OCOTP_OTPMK4).....	1885
29.5.33	Value of OTP Bank2 Word5 (OTPMK Key) (OCOTP_OTPMK5).....	1885
29.5.34	Value of OTP Bank2 Word6 (OTPMK Key) (OCOTP_OTPMK6).....	1886
29.5.35	Value of OTP Bank2 Word7 (OTPMK Key) (OCOTP_OTPMK7).....	1886
29.5.36	Shadow Register for OTP Bank3 Word0 (SRK Hash) (OCOTP_SRK0).....	1887
29.5.37	Shadow Register for OTP Bank3 Word1 (SRK Hash) (OCOTP_SRK1).....	1887

Section number	Title	Page
29.5.38	Shadow Register for OTP Bank3 Word2 (SRK Hash) (OCOTP_SRK2).....	1888
29.5.39	Shadow Register for OTP Bank3 Word3 (SRK Hash) (OCOTP_SRK3).....	1888
29.5.40	Shadow Register for OTP Bank3 Word4 (SRK Hash) (OCOTP_SRK4).....	1889
29.5.41	Shadow Register for OTP Bank3 Word5 (SRK Hash) (OCOTP_SRK5).....	1889
29.5.42	Shadow Register for OTP Bank3 Word6 (SRK Hash) (OCOTP_SRK6).....	1890
29.5.43	Shadow Register for OTP Bank3 Word7 (SRK Hash) (OCOTP_SRK7).....	1890
29.5.44	Value of OTP Bank4 Word0 (Secure JTAG Response Field) (OCOTP_SJC_RESP0).....	1891
29.5.45	Value of OTP Bank4 Word1 (Secure JTAG Response Field) (OCOTP_SJC_RESP1).....	1891
29.5.46	Value of OTP Bank4 Word2 (MAC Address) (OCOTP_MAC0).....	1892
29.5.47	Value of OTP Bank4 Word3 (MAC Address) (OCOTP_MAC1).....	1892
29.5.48	Value of OTP Bank4 Word4 (MAC Address) (OCOTP_RESERVED) (OCOTP_MAC).....	1892
29.5.49	Value of OTP Bank4 Word5 (CRC Key) (OCOTP_CRC).....	1893
29.5.50	Value of OTP Bank4 Word6 (General Purpose Customer Defined Info) (OCOTP_GP1).....	1893
29.5.51	Value of OTP Bank4 Word7 (General Purpose Customer Defined Info) (OCOTP_GP2).....	1894
29.5.52	Value of OTP Bank5 Word0 (SW GP) (OCOTP_SW_GP0).....	1894
29.5.53	Value of OTP Bank5 Word1 (SW GP) (OCOTP_SW_GP1).....	1895
29.5.54	Value of OTP Bank5 Word2 (SW GP) (OCOTP_SW_GP2).....	1895
29.5.55	Value of OTP Bank5 Word3 (SW GP) (OCOTP_SW_GP3).....	1895
29.5.56	Value of OTP Bank5 Word4 (SW GP) (OCOTP_SW_GP4).....	1896
29.5.57	Value of OTP Bank5 Word5 (Misc Conf) (OCOTP_MISC_CONF).....	1896
29.5.58	Value of OTP Bank5 Word6 (Field Return) (OCOTP_FIELD_RETURN).....	1897
29.5.59	Value of OTP Bank5 Word7 (SRK Revoke) (OCOTP_SRK_REVOKE).....	1897
29.5.60	Value of OTP Bank6 Word0 (ROM Patch) (OCOTP_ROM_PATCH0).....	1898
29.5.61	Value of OTP Bank6 Word1 (ROM Patch) (OCOTP_ROM_PATCH1).....	1898
29.5.62	Value of OTP Bank6 Word2 (ROM Patch) (OCOTP_ROM_PATCH2).....	1898
29.5.63	Value of OTP Bank6 Word3 (ROM Patch) (OCOTP_ROM_PATCH3).....	1899
29.5.64	Value of OTP Bank6 Word4 (ROM Patch) (OCOTP_ROM_PATCH4).....	1899
29.5.65	Value of OTP Bank6 Word5 (ROM Patch) (OCOTP_ROM_PATCH5).....	1900
29.5.66	Value of OTP Bank6 Word6 (ROM Patch) (OCOTP_ROM_PATCH6).....	1900

Section number	Title	Page
29.5.67	Value of OTP Bank6 Word7 (ROM Patch) (OCOTP_ROM_PATCH7).....	1901
29.5.68	Value of OTP Bank7 Word0 (General Purpose Customer Defined Info) (OCOTP_GP3_0).....	1901
29.5.69	Value of OTP Bank7 Word1 (General Purpose Customer Defined Info) (OCOTP_GP3_1).....	1901
29.5.70	Value of OTP Bank7 Word2 (General Purpose Customer Defined Info) (OCOTP_GP3_2).....	1902
29.5.71	Value of OTP Bank7 Word3 (General Purpose Customer Defined Info) (OCOTP_GP3_3).....	1902
29.5.72	Value of OTP Bank8 Word4 (General Purpose Customer Defined Info) (OCOTP_GP3_4).....	1903
29.5.73	Value of OTP Bank7 Word5 (General Purpose Customer Defined Info) (OCOTP_GP4_0).....	1903
29.5.74	Value of OTP Bank7 Word6 (General Purpose Customer Defined Info) (OCOTP_GP4_1).....	1904
29.5.75	Value of OTP Bank7 Word7 (General Purpose Customer Defined Info) (OCOTP_GP4_2).....	1904

Chapter 30 On-Chip RAM Memory Controller (OCRAM)

30.1	Overview.....	1905
30.2	Basic Functions.....	1906
30.2.1	Read/Write Arbitration.....	1906
30.3	Advanced Features.....	1907
30.3.1	Read Data Wait State.....	1907
30.3.2	Read Address Pipeline.....	1907
30.3.3	Write Data Pipeline.....	1908
30.3.4	Write Address Pipeline.....	1908
30.4	Programmable Registers.....	1909

Chapter 31 Power Management Unit (PMU)

31.1	Overview.....	1911
31.2	Analog LDO Regulators.....	1913
31.2.1	LDO 1P1.....	1913
31.2.2	LDO 2P5.....	1913
31.2.3	Low Power Operation.....	1914
31.3	USB LDO Regulator.....	1914
31.4	SNVS Regulator.....	1915

Section number	Title	Page
31.5	Power Modes.....	1915
31.5.1	Reverse Well Biasing.....	1915
31.6	PMU Memory Map/Register Definition.....	1915
31.6.1	Regulator 1P1 Register (PMU_REG_1P1n).....	1918
31.6.2	Regulator 3P0 Register (PMU_REG_3P0n).....	1921
31.6.3	Regulator 2P5 Register (PMU_REG_2P5n).....	1923
31.6.4	Digital Regulator Core Register (PMU_REG_COREn).....	1925
31.6.5	Miscellaneous Register 0 (PMU_MISC0n).....	1927
31.6.6	Miscellaneous Register 1 (PMU_MISC1n).....	1930
31.6.7	Miscellaneous Control Register (PMU_MISC2n).....	1932
31.6.8	Low Power Control Register (PMU_LOWPWR_CTRLn).....	1937

Chapter 32

Pulse Width Modulation (PWM)

32.1	Overview.....	1941
32.2	External Signals.....	1942
32.3	Clocks.....	1943
32.4	Functional Description.....	1944
32.4.1	Operation.....	1945
32.4.1.1	FIFO.....	1945
32.4.1.2	Rollover and Compare Event.....	1946
32.4.1.3	Low Power Mode Behavior.....	1946
32.4.1.4	Debug Mode Behavior.....	1946
32.5	Enable Sequence for the PWM.....	1946
32.6	Disable Sequence for the PWM.....	1947
32.7	PWM Memory Map/Register Definition.....	1947
32.7.1	PWM Control Register (PWMx_PWMCR).....	1949
32.7.2	PWM Status Register (PWMx_PWMSR).....	1951
32.7.3	PWM Interrupt Register (PWMx_PWMIR).....	1952
32.7.4	PWM Sample Register (PWMx_PWMSAR).....	1953

Section number	Title	Page
32.7.5	PWM Period Register (PWMx_PWMPR).....	1954
32.7.6	PWM Counter Register (PWMx_PWMCNR).....	1955

Chapter 33 Pixel Pipeline (PXP)

33.1	Overview.....	1957
33.2	Clocks.....	1958
33.3	Top-level architecture.....	1958
33.3.1	Processing Details.....	1961
33.3.2	Scaling Operation.....	1962
33.3.3	Decimation Image Scaling.....	1963
33.3.4	Bilinear Image Scaling Filter	1965
33.3.5	YUV 4:2:2 Image Scaling.....	1967
33.3.6	YUV 4:2:0 Image Scaling.....	1968
33.3.7	RGB/YUV444 Image Scaling.....	1970
33.3.8	Color Space Conversion (CSC).....	1970
33.3.9	CSC1 Operation.....	1971

33.11.273	This register defines the output values (new flag) for the 5x1 LUTs in stage 2. (PXP_HW_PXP_WFE_B_STG2_5X1_OUT0).....	2330
33.11.274	This register defines the output values (new flag) for the 5x1 LUTs in stage 2. (PXP_HW_PXP_WFE_B_STG2_5X1_OUT1).....	2332
33.11.275	This register defines the output values (new flag) for the 5x1 LUTs in stage 2. (PXP_HW_PXP_WFE_B_STG2_5X1_OUT2).....	2334
33.11.276	This register defines the output values (new flag) for the 5x1 LUTs in stage 2. (PXP_HW_PXP_WFE_B_STG2_5X1_OUT3).....	2336

Section number	Title	Page
33.11.277	Each set mask bit enables one of the corresponding flag input bits. There is one mask per 5x1 LUT. (PXP_HW_PXP_WFE_B_STG2_5X1_MASKS).....	2338
33.11.278	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT0_0).....	2339
33.11.279	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT0_1).....	2341
33.11.280	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT0_2).....	2343
33.11.281	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT0_3).....	2345
33.11.282	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT0_4).....	2347
33.11.283	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT0_5).....	2349
33.11.284	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT0_6).....	2351
33.11.285	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT0_7).....	2353
33.11.286	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT1_0).....	2355
33.11.287	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT1_1).....	2357
33.11.288	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT1_2).....	2359
33.11.289	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT1_3).....	2361
33.11.290	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT1_4).....	2363
33.11.291	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT1_5).....	2365
33.11.292	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT1_6).....	2367

Section number	Title	Page
33.11.293	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT1_7).....	2369
33.11.294	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT2_0).....	2371
33.11.295	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT2_1).....	2373
33.11.296	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT2_2).....	2375
33.11.297	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT2_3).....	2377
33.11.298	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT2_4).....	2379
33.11.299	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT2_5).....	2381
33.11.300	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT2_6).....	2383
33.11.301	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT2_7).....	2385
33.11.302	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT3_0).....	2387
33.11.303	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT3_1).....	2389
33.11.304	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT3_2).....	2391
33.11.305	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT3_3).....	2393
33.11.306	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT3_4).....	2395
33.11.307	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT3_5).....	2397
33.11.308	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT3_6).....	2399

Section number	Title	Page
33.11.309	This register defines the output values (new flag) for the 8x1 LUTs in stage 3. (PXP_HW_PXP_WFE_B_STG3_F8X1_OUT3_7).....	2401
33.11.310	Each set mask bit enables one of the corresponding flag input bits. There is one mask per 8x1 LUT. (PXP_HW_PXP_WFE_B_STG3_F8X1_MASKS).....	2403
33.11.311	This register defines the control bits for the pxp alu sub-block. (PXP_HW_PXP_ALU_B_CTRLn).....	2404
33.11.312	This register defines the size of the buffer to be processed by the alu engine. (PXP_HW_PXP_ALU_B_BUF_SIZE).....	2405
33.11.313	This register defines the Entry Address for the Instruction Memory of the ALU. (PXP_HW_PXP_ALU_B_INST_ENTRY).....	2406
33.11.314	This register defines the parameter used by SW running on ALU. (PXP_HW_PXP_ALU_B_PARAM).....	2406
33.11.315	This register defines the hw configuration options for the alu core. (PXP_HW_PXP_ALU_B_CONFIG).....	2407
33.11.316	This register defines the hw configuration options for the LUT (PXP_HW_PXP_ALU_B_LUT_CONFIGn).....	2407
33.11.317	This register defines the lower 32-bit data for the LUT (PXP_HW_PXP_ALU_B_LUT_DATA0).....	2408
33.11.318	This register defines the higher 32-bit data for the LUT (PXP_HW_PXP_ALU_B_LUT_DATA1).....	2408
33.11.319	This register is used for debugging alu block (PXP_HW_PXP_ALU_B_DBG).....	2409
33.11.320	Histogram Control Register. (PXP_HW_PXP_HIST_A_CTRL).....	2410
33.11.321	Histogram Pixel Mask Register. (PXP_HW_PXP_HIST_A_MASK).....	2411
33.11.322	Histogram Pixel Buffer Size Register. (PXP_HW_PXP_HIST_A_BUF_SIZE).....	2412
33.11.323	Total Number of Pixels Used by Histogram Engine. (PXP_HW_PXP_HIST_A_TOTAL_PIXEL).....	2412
33.11.324	The X Coordinate Offset for Active Area. (PXP_HW_PXP_HIST_A_ACTIVE_AREA_X).....	2413
33.11.325	The Y Coordinate Offset for Active Area. (PXP_HW_PXP_HIST_A_ACTIVE_AREA_Y).....	2413
33.11.326	Histogram Result Based on RAW Pixel Value. (PXP_HW_PXP_HIST_A_RAW_STAT0).....	2414
33.11.327	Histogram Result Based on RAW Pixel Value. (PXP_HW_PXP_HIST_A_RAW_STAT1).....	2414
33.11.328	Histogram Control Register. (PXP_HW_PXP_HIST_B_CTRL).....	2415
33.11.329	Histogram Pixel Mask Register. (PXP_HW_PXP_HIST_B_MASK).....	2416
33.11.330	Histogram Pixel Buffer Size Register. (PXP_HW_PXP_HIST_B_BUF_SIZE).....	2417
33.11.331	Total Number of Pixels Used by Histogram Engine. (PXP_HW_PXP_HIST_B_TOTAL_PIXEL).....	2418
33.11.332	The X Coordinate Offset for Active Area. (PXP_HW_PXP_HIST_B_ACTIVE_AREA_X).....	2418

Section number	Title	Page
33.11.333	The Y Coordinate Offset for Active Area. (PXP_HW_PXP_HIST_B_ACTIVE_AREA_Y).....	2419
33.11.334	Histogram Result Based on RAW Pixel Value. (PXP_HW_PXP_HIST_B_RAW_STAT0).....	2419
33.11.335	Histogram Result Based on RAW Pixel Value. (PXP_HW_PXP_HIST_B_RAW_STAT1).....	2420
33.11.336	2-level Histogram Parameter Register. (PXP_HW_PXP_HIST2_PARAM).....	2420
33.11.337	4-level Histogram Parameter Register. (PXP_HW_PXP_HIST4_PARAM).....	2421
33.11.338	8-level Histogram Parameter 0 Register. (PXP_HW_PXP_HIST8_PARAM0).....	2421
33.11.339	8-level Histogram Parameter 1 Register. (PXP_HW_PXP_HIST8_PARAM1).....	2422
33.11.340	16-level Histogram Parameter 0 Register. (PXP_HW_PXP_HIST16_PARAM0).....	2423
33.11.341	16-level Histogram Parameter 1 Register. (PXP_HW_PXP_HIST16_PARAM1).....	2424
33.11.342	16-level Histogram Parameter 2 Register. (PXP_HW_PXP_HIST16_PARAM2).....	2424
33.11.343	16-level Histogram Parameter 3 Register. (PXP_HW_PXP_HIST16_PARAM3).....	2425
33.11.344	32-level Histogram Parameter 0 Register. (PXP_HW_PXP_HIST32_PARAM0).....	2426
33.11.345	32-level Histogram Parameter 1 Register. (PXP_HW_PXP_HIST32_PARAM1).....	2427
33.11.346	32-level Histogram Parameter 2 Register. (PXP_HW_PXP_HIST32_PARAM2).....	2427
33.11.347	32-level Histogram Parameter 3 Register. (PXP_HW_PXP_HIST32_PARAM3).....	2428
33.11.348	32-level Histogram Parameter 0 Register. (PXP_HW_PXP_HIST32_PARAM4).....	2429
33.11.349	32-level Histogram Parameter 1 Register. (PXP_HW_PXP_HIST32_PARAM5).....	2430
33.11.350	32-level Histogram Parameter 2 Register. (PXP_HW_PXP_HIST32_PARAM6).....	2430
33.11.351	32-level Histogram Parameter 3 Register. (PXP_HW_PXP_HIST32_PARAM7).....	2431
33.11.352	This register defines the pxp subblock handshake signals ready mux on top level. (PXP_HW_PXP_HANDSHAKE_READY_MUX0).....	2432
33.11.353	This register defines the pxp subblock handshake signals done mux on top level. (PXP_HW_PXP_HANDSHAKE_DONE_MUX0).....	2432

Chapter 34

Random Number Generator (RNGB)

34.1	Introduction.....	2435
34.1.1	Block diagram.....	2435
34.1.2	Features.....	2436
34.2	Modes of operation.....	2436
34.2.1	Self-test mode.....	2436

Section number	Title	Page
34.2.2	Seed-generation mode.....	2436
34.2.3	Random number generation mode.....	2437
34.2.4	Verification mode.....	2437
34.3	Memory map/register definition.....	2437
34.3.1	RNGB version ID register (RNG_VER).....	2438
34.3.2	RNGB command register (RNG_CMD).....	2439
34.3.3	RNGB control register (RNG_CR).....	2440
34.3.4	RNGB status register (RNG_SR).....	2442
34.3.5	RNGB error status register (RNG_ESR).....	2444
34.3.6	RNGB Output FIFO (RNG_OUT).....	2446
34.3.7	RNGB entropy register (RNG_ER).....	2446
34.3.8	Verification control register (RNG_VCR).....	2447
34.3.9	XKEY Data (RNG_XKEY).....	2448
34.3.10	Oscillator counter control register (RNG_OCCR).....	2449
34.3.11	Oscillator counter (RNG_OSC_CNT).....	2449
34.3.12	Oscillator counter status (RNG_OSC_CNT_STAT).....	2450
34.4	Functional description.....	2450
34.4.1	Pseudo-Random Number Generator (PRNG).....	2451
34.4.2	True Random Number Generator (TRNG).....	2451
34.4.3	Resets.....	2451
34.4.3.1	Power-on/hardware reset.....	2452
34.4.3.2	Software reset.....	2452
34.4.4	RNG interrupts.....	2452
34.5	Initialization/application information.....	2453
34.5.1	Manual seeding.....	2453
34.5.2	Automatic seeding.....	2453
34.5.3	Deterministic mode.....	2454
34.5.4	Oscillator frequency verification.....	2454

Chapter 35

Section number	Title	Page
ROM Controller with Patch (ROMC)		
35.1	Overview.....	2457
35.1.1	Features.....	2458
35.1.2	Modes of Operation.....	2458
35.1.2.1	Low Power Mode.....	2459
35.2	Clocks.....	2459
35.3	Memory Map.....	2459
35.3.1	ROM Memory Map in detail.....	2459
35.4	Functional Description.....	2460
35.4.1	ROM Controller (ROMC) Functional Description.....	2460
35.4.1.1	Functionality overview.....	2460
35.4.2	ROMC Functional Description.....	2460
35.4.2.1	ROMC Disabling.....	2461
35.4.2.2	ROMC Event Priority.....	2461
35.4.2.3	Data Fixing.....	2461
35.4.2.4	Opcode Patching.....	2462
35.4.2.4.1	Typical Software Response to Opcode Patch.....	2463
35.4.2.5	External Boot Feature.....	2464
35.4.2.6	Alternate Masters and ROMC.....	2465
35.5	ROMCP Memory Map/Register Definition.....	2465
35.5.1	ROMC Data Registers (ROMC_ROMPATCHnD).....	2466
35.5.2	ROMC Control Register (ROMC_ROMPATCHCNTL).....	2467
35.5.3	ROMC Enable Register High (ROMC_ROMPATCHENH).....	2468
35.5.4	ROMC Enable Register Low (ROMC_ROMPATCHENL).....	2468
35.5.5	ROMC Address Registers (ROMC_ROMPATCHnA).....	2469
35.5.6	ROMC Status Register (ROMC_ROMPATCHSR).....	2470

Chapter 36

Smart Direct Memory Access Controller (SDMA)

36.1	Overview.....	2473
------	---------------	------

Section number	Title	Page
36.1.1	Block Diagram.....	2473
36.1.2	Features.....	2475
36.2	External Signals.....	2477
36.3	Clocks.....	2477
36.4	Functional Description.....	2477
36.4.1	SDMA Core.....	2478
36.4.1.1	SDMA Core Structure.....	2479
36.4.1.2	Program Control Unit (PCU).....	2482
36.4.1.2.1	Instruction Types.....	2482
36.4.1.2.2	PCU States.....	2483
36.4.1.3	SDMA Core Memory.....	2486
36.4.2	Scheduler.....	2486
36.4.2.1	Primary Functions.....	2486
36.4.2.2	Channels and DMA Requests.....	2487
36.4.2.2.1	Channels.....	2487
36.4.2.2.2	DMA Requests.....	2487
36.4.2.2.3	Mapping from DMA Requests to Channels and Priorities.....	2487
36.4.2.3	Scheduler Functional Description.....	2487
36.4.2.3.1	Scheduler Overview.....	2487
36.4.2.3.2	DMA Requests Scanning.....	2488
36.4.2.3.3	Mapping DMA Requests to Pending Channels.....	2489
36.4.2.3.4	Channel Overflow.....	2492
36.4.2.3.5	Runnable Channels Evaluation.....	2492
36.4.2.3.6	Next Channel Decision Tree.....	2494
36.4.2.3.7	Scheduler State Diagram.....	2496
36.4.2.3.8	Scheduler Pipeline Timing Diagram.....	2498
36.4.2.3.9	Channel-DMA Request Mapping.....	2498
36.4.2.3.10	Examples: How to Start a Channel.....	2498
36.4.2.4	Context Switching.....	2499

Section number	Title	Page
36.4.2.4.1	Context Switch Modes.....	2500
36.4.2.4.2	Context Switch Procedure.....	2500
36.4.2.4.3	Context Map in Memory.....	2502
36.4.3	Functional Units.....	2502
36.4.3.1	Burst DMA Unit.....	2502
36.4.3.1.1	Burst DMA Structure.....	2503
36.4.3.1.2	Burst DMA Registers.....	2504
36.4.3.1.3	Burst DMA Data Transfers.....	2505
36.4.3.1.3.1	Data Retrieval from the ARM platform Memory.....	2505
36.4.3.1.3.2	Storing Data Into the ARM platform Memory.....	2505
36.4.3.1.3.3	Transferring Data Between Two ARM platform Memory Locations-Burst DMA Unit.....	2506
36.4.3.2	Peripheral DMA Unit.....	2506
36.4.3.2.1	Peripheral DMA Structure.....	2507
36.4.3.2.2	Peripheral DMA Registers.....	2508
36.4.3.2.3	Peripheral DMA Data Transfers.....	2509
36.4.3.2.3.1	Data Retrieval from the ARM platform Memory or Peripheral.....	2509
36.4.3.2.3.2	Storing Data into the ARM platform Memory or Peripheral.	2509
36.4.3.2.3.3	Transferring Data Between Two ARM platform Memory Locations-Peripheral DMA Unit.....	2510
36.4.4	SDMA Security Support.....	2510
36.4.4.1	Locked Mode.....	2510
36.4.5	OnCE and PCU Debug States.....	2511
36.4.6	SDMA Clocks and Low Power Modes.....	2513
36.4.6.1	Clock Gating and Low Power Modes.....	2514
36.4.6.1.1	Coarse Clock Gating.....	2514
36.4.6.1.2	Refined Clock Gating.....	2515
36.4.6.1.3	Low Power Modes and User Control.....	2515
36.4.6.1.3.1	SLEEP Mode.....	2516

Section number	Title	Page
	36.4.6.1.3.2 RUN Mode.....	2516
	36.4.6.1.3.3 DEBUG Mode.....	2517
	36.4.6.1.4 Stop Mode Response.....	2517
	36.4.6.2 Reset.....	2517

38.2.2.2	Time counter alarm.....	2749
38.2.2.3	Periodic interrupt.....	2749
38.3	SNVS_LP (low-power domain).....	2749
38.3.1	Behavior during system power down.....	2750
38.3.2	Monotonic Counter (MC).....	2750
38.4	SNVS reset and system powerup.....	2751
38.4.1	PMIC interface.....	2751
38.5	SNVS interrupts and alarms.....	2752
38.6	Programming guidelines.....	2753
38.6.1	RTC control bits setting.....	2753
38.6.2	RTC value read.....	2754
38.6.3	General initialization guidelines.....	2754
38.7	SNVS memory map/register definition.....	2755
38.7.1	SNVS_HP Lock register (SNVS_HPLR).....	2757
38.7.2	SNVS_HP Command register (SNVS_HPCOMR).....	2759
38.7.3	SNVS_HP Control register (SNVS_HPCR).....	2761
38.7.4	SNVS_HP Status register (SNVS_HPSR).....	2764
38.7.5	SNVS_HP Real-Time Counter MSB Register (SNVS_HPRTCMR).....	2766
38.7.6	SNVS_HP Real-Time Counter LSB Register (SNVS_HPRTCLR).....	2766
38.7.7	SNVS_HP Time Alarm MSB Register (SNVS_HPTAMR).....	2767
38.7.8	SNVS_HP Time Alarm LSB Register (SNVS_HPTALR).....	2767
38.7.9	SNVS_LP Lock Register (SNVS_LPLR).....	2768
38.7.10	SNVS_LP Control Register (SNVS_LPCR).....	2770
38.7.11	SNVS_LP Status Register (SNVS_LPSR).....	2772
38.7.12	SNVS_LP Secure Monotonic Counter MSB Register (SNVS_LPSMCMR).....	2774
38.7.13	SNVS_LP Secure Monotonic Counter LSB Register (SNVS_LPSMCLR).....	2775
38.7.14	SNVS_LP General-Purpose Register (SNVS_LPGPR).....	2775
38.7.15	SNVS_HP Version ID Register 1 (SNVS_HPVIDR1).....	2776

Section number	Title	Page
38.7.16	SNVS_HP Version ID Register 2 (SNVS_HPVIDR2).....	2776

Chapter 39

Shared Peripheral Bus Arbiter (SPBA)

39.1	Overview.....	2779
39.1.1	Features.....	2780
39.1.2	Modes of operation.....	2781
39.2	Clocks.....	2781
39.3	Functional description.....	2782
39.3.1	Masters arbitration.....	2782
39.4	Resource ownership control.....	2785
39.4.1	Access control	2785
39.4.1.1	Peripheral access.....	2785
39.4.1.2	Peripheral Right Register access.....	2786
39.4.2	Owner election.....	2787
39.4.3	Ending ownership.....	2787
39.4.3.1	Software Controlled Ownership Ending.....	2787
39.4.4	The Un-owned State.....	2788
39.5	SPBA Memory Map/Register Definition.....	2788
39.5.1	Peripheral Rights Register (SPBA_PRR _n).....	2790

Chapter 40

Sony/Philips Digital Interface (SPDIF)

40.1	Overview	2793
40.2	External Signals.....	2795
40.3	Clocks.....	2795
40.4	Functional Description.....	2795
40.4.1	SPDIF Receiver.....	2797
40.4.1.1	Audio Data Reception.....	2797
40.4.1.1.1	Application Note.....	2799
40.4.1.2	Channel Status Reception.....	2800

Section number	Title	Page
40.4.1.2.1	Channel Status Interrupt.....	2800
40.4.1.3	User Bit Reception.....	2800
40.4.1.4	Validity Flag Reception.....	2802
40.4.1.5	SPDIF Receiver Interrupt Exception Definition.....	2803
40.4.1.6	Standards Compliance.....	2803
40.4.1.7	SPDIF PLOCK Detection and Rxcclk Output.....	2804
40.4.1.8	Measuring Frequency of SPDIF_RxCclk.....	2804
40.4.2	SPDIF Transmitter.....	2805
40.4.2.1	Audio Data Transmission.....	2805
40.4.2.2	Channel Status Transmission.....	2806
40.4.2.3	Validity Flag Transmission.....	2806
40.5	SPDIF Memory Map/Register Definition.....	2806
40.5.1	SPDIF Configuration Register (SPDIF_SCR).....	2808
40.5.2	CDText Control Register (SPDIF_SRCD).....	2810
40.5.3	PhaseConfig Register (SPDIF_SRPC).....	2811
40.5.4	InterruptEn Register (SPDIF_SIE).....	2812
40.5.5	InterruptStat Register (SPDIF_SIS).....	2814
40.5.6	InterruptClear Register (SPDIF_SIC).....	2816
40.5.7	SPDIFRxLeft Register (SPDIF_SRL).....	2817

Chapter 41 System Reset Controller (SRC)

41.1	SRC Overview.....	2825
41.1.1	Features.....	2825
41.2	External Signals.....	2825
41.3	Clocks.....	2826
41.4	Top-level resets, power-up sequence and external supply integration.....	2827
41.4.1	Reset and Power-up Flow.....	2827
41.4.2	Finite-State Machine (FSM).....	2830
41.4.3	Power mode transitions.....	2831
41.5	Power-On Reset and power sequencing.....	2832
41.5.1	External POR using SRC_POR_B.....	2832
41.5.2	Internal POR.....	2833
41.6	Functional Description.....	2833
41.6.1	Reset Control.....	2833
41.6.1.1	Reset inputs and outputs.....	2833
41.6.1.2	Reset Handling.....	2835
41.6.1.2.1	Reset Qualification.....	2835
41.6.1.2.2	Reset Sequence and De-Assertion.....	2836
41.6.1.2.3	POR (SRC_POR_B).....	2836
41.6.1.2.4	COLD RESET.....	2837
41.6.1.2.5	WARM RESET.....	2838
41.6.2	Parallel Reset Requests.....	2839
41.6.3	Boot Mode Control.....	2840
41.6.3.1	BOOT_MODE Pin Latching.....	2840
41.7	SRC Memory Map/Register Definition.....	2841
41.7.1	SRC Control Register (SRC_SCR).....	2842
41.7.2	SRC Boot Mode Register 1 (SRC_SBMR1).....	2845

Section number	Title	Page
41.7.3	SRC Reset Status Register (SRC_SRSR).....	2845
41.7.4	SRC Interrupt Status Register (SRC_SISR).....	2848
41.7.5	SRC Boot Mode Register 2 (SRC_SBMR2).....	2850
41.7.6	SRC General Purpose Register 1 (SRC_GPR1).....	2851
41.7.7	SRC General Purpose Register 2 (SRC_GPR2).....	2852
41.7.8	SRC General Purpose Register 3 (SRC_GPR3).....	2852
41.7.9	SRC General Purpose Register 4 (SRC_GPR4).....	2853
41.7.10	SRC General Purpose Register 5 (SRC_GPR5).....	2853
41.7.11	SRC General Purpose Register 6 (SRC_GPR6).....	2854
41.7.12	SRC General Purpose Register 7 (SRC_GPR7).....	2854
41.7.13	SRC General Purpose Register 8 (SRC_GPR8).....	2855
41.7.14	SRC General Purpose Register 9 (SRC_GPR9).....	2855
41.7.15	SRC General Purpose Register 10 (SRC_GPR10).....	2856

Chapter 42

Synchronous Serial Interface (SSI)

42.1	Overview.....	2857
42.1.1	Features.....	2858
42.1.2	Modes of Operation.....	2859
42.2	External Signal Description.....	2859
42.2.1	Signals Overview.....	2859
42.3	Clocks.....	2863
42.4	SSI Transmit FIFO 0 & 1 Registers.....	2863
42.5	SSI Transmit Shift Register (TXSR).....	2864
42.6	SSI Receive FIFO 0 and 1 Registers.....	2866
42.7	SSI Receive Shift Register (RXSR).....	2867
42.8	Functional Description.....	2869
42.8.1	Operating Modes.....	2869
42.8.1.1	Normal Mode.....	2871
42.8.1.1.1	Normal Mode Transmit.....	2871

Section number	Title	Page
42.8.1.1.2	Normal Mode Receive.....	2872
42.8.1.2	Network Mode.....	2874
42.8.1.2.1	Network Mode Transmit.....	2875
42.8.1.2.2	Network Mode Receive.....	2876
42.8.1.3	Gated Clock Mode.....	2878
42.8.1.4	I2S Mode.....	2881
42.8.1.5	AC97 Mode.....	2883
42.8.1.5.1	AC97 Fixed Mode (SSI.SACNT[1]=0).....	2885
42.8.1.5.2	AC97 Variable Mode (SSI.SACNT[1]=1).....	2885
42.8.2	External Frame and Clock Operation.....	2886
42.8.2.1	Data Alignment Formats Supported.....	2886
42.8.3	SSI Architecture.....	2887
42.8.4	SSI Clocking.....	2888
42.8.4.1	SSI Clock and Frame Sync Generation.....	2889
42.8.4.2	DIV2, PSR and PM Bit Description.....	2890
42.8.5	Receive Interrupt Enable Bit Description.....	2892
42.8.6	Transmit Interrupt Enable Bit Description.....	2893
42.8.7	Internal Frame and Clock Shutdown.....	2894
42.8.8	Peripheral Bus Interface.....	2896
42.8.8.1	Transfer Lengths Supported.....	2896
42.8.8.2	Transfer Bus Errors.....	2896
42.8.8.3	Clock Rate.....	2897
42.8.9	Reset.....	2897
42.9	SSI Memory Map/Register Definition.....	2897
42.9.1	SSI Transmit Data Register n (SSIx_STXn).....	2900
42.9.2	SSI Receive Data Register n (SSIx_SRXn).....	2900
42.9.3	SSI Control Register (SSIx_SCR).....	2901
42.9.4	SSI Interrupt Status Register (SSIx_SISR).....	2903
42.9.5	SSI Interrupt Enable Register (SSIx_SIER).....	2909

Section number	Title	Page
42.9.6	SSI Transmit Configuration Register (SSLx_STCR).....	2913
42.9.7	SSI Receive Configuration Register (SSLx_SRCR).....	2915
42.9.8	SSI Transmit Clock Control Register (SSLx_STCCR).....	2917
42.9.9	SSI Receive Clock Control Register (SSLx_SRCCR).....	2919
42.9.10	SSI FIFO Control/Status Register (SSLx_SFCSR).....	2920
42.9.11	SSI AC97 Control Register (SSLx_SACNT).....	2924
42.9.12	SSI AC97 Command Address Register (SSLx_SACADD).....	2925
42.9.13	SSI AC97 Command Data Register (SSLx_SACDAT).....	2925
42.9.14	SSI AC97 Tag Register (SSLx_SATAG).....	2926
42.9.15	SSI Transmit Time Slot Mask Register (SSLx_STMSK).....	2926
42.9.16	SSI Receive Time Slot Mask Register (SSLx_SRMSK).....	2927
42.9.17	SSI AC97 Channel Status Register (SSLx_SACCST).....	2927
42.9.18	SSI AC97 Channel Enable Register (SSLx_SACCEN).....	2928
42.9.19	SSI AC97 Channel Disable Register (SSLx_SACCDIS).....	2928

Chapter 43 Temperature Monitor (TEMPMON)

43.1	Overview.....	2929
43.2	Software Usage Guidelines.....	2930
43.3	TEMPMON Memory Map/Register Definition.....	2932
43.3.1	Tempsensor Control Register 0 (TEMPMON_TEMPSENSE0n).....	2933
43.3.2	Tempsensor Control Register 1 (TEMPMON_TEMPSENSE1n).....	2935

Chapter 44 TrustZone Address Space Controller (TZASC)

44.1	Overview.....	2937
44.2	Clocks.....	2938
44.3	Chip Specific Configuration	2938
44.4	Address Mapping in various memory mapping modes.....	2939

Chapter 45 Universal Asynchronous Receiver/Transmitter (UART)

45.1	Overview.....	2941
------	---------------	------

Section number	Title	Page
45.1.1	Features.....	2942
45.1.2	Modes of operation.....	2943
45.2	External Signals.....	2943
45.2.1	Detailed Signal Descriptions.....	2948
45.2.1.1	Interrupt Signals.....	2948
45.2.1.1.1	interrupt_uart - UART Interrupt.....	2948
45.2.1.2	DMA Request Signals.....	2948
45.2.1.2.1	dma_req_rx - Receiver DMA Request.....	2948
45.2.1.2.2	dma_req_tx - Transmitter DMA Request.....	2948
45.2.1.3	Special Signals.....	2948
45.2.1.3.1	stop_req - Stop Mode.....	2948
45.2.1.3.2	doze_req - Doze Mode.....	2949
45.2.1.3.3	debug_req - Debug Mode.....	2949
45.3	Clocks.....	2949
45.4	Functional Description.....	2949
45.4.1	Interrupts and DMA Requests.....	2949
45.4.2	Clocks.....	2951
45.4.2.1	Clock requirements.....	2951
45.4.2.2	Maximum Baud Rate.....	2951
45.4.2.3	Clocking in Low-Power Modes.....	2952
45.4.3	General UART Definitions.....	2952
45.4.3.1	RTS_B - UART Request To Send.....	2953
45.4.3.2	RTS Edge Triggered Interrupt.....	2954
45.4.3.3	DTR_B - Data Terminal Ready	2954
45.4.3.4	DSR_B - Data Set Ready.....	2955
45.4.3.5	DTR_B/DSR_B Edge Triggered Interrupt.....	2955
45.4.3.6	DCD_B - Data Carrier Detect.....	2956
45.4.3.7	RI_B - Ring Indicator.....	2956
45.4.3.8	CTS_B - Clear To Send.....	2956

Section number	Title	Page
45.4.3.9	Programmable CTS_B Deassertion.....	2956
45.4.3.10	TX_DATA - UART Transmit.....	2957
45.4.3.11	RX_DATA - UART Receive.....	2957
45.4.4	Transmitter.....	2959
45.4.4.1	Transmitter FIFO Empty Interrupt Suppression.....	2959
45.4.4.2	Transmitting a Break Condition.....	2961
45.4.5	Receiver.....	2961
45.4.5.1	Idle Line Detect.....	2962
45.4.5.2	Aging Character Detect.....	2963
45.4.5.3	Receiver Wake.....	2964
45.4.5.4	Receiving a BREAK Condition.....	2965
45.4.5.5	Vote Logic.....	2965
45.4.5.6	Baud Rate Automatic Detection Logic.....	2967
45.4.5.6.1	Baud Rate Automatic Detection Protocol.....	2968
45.4.5.6.2	New Baud Rate Determination.....	2968
45.4.5.6.2.1	New Autobaud Counter Stopped bit and Interrupt.....	2969
45.4.6	Escape Sequence Detection.....	2969
45.5	Binary Rate Multiplier (BRM).....	2971
45.6	Infrared Interface.....	2973
45.6.1	Generalities-Infrared.....	2973
45.6.2	Inverted Transmission and Reception bits (INVT & INVR).....	2974
45.6.3	InfraRed Special Case (IRSC) Bit.....	2974
45.6.4	IrDA interrupt.....	2975
45.6.5	Conclusion about IrDA.....	2976
45.6.6	Programming IrDA Interface.....	2977
45.6.6.1	High Speed.....	2977
45.6.6.2	Low Speed.....	2977
45.7	9-bit RS-485 Mode.....	2978
45.7.1	Generalities.....	2978

Section number	Title	Page
45.7.2	Transmit 9-bit RS-485 frames.....	2979
45.7.3	Receive 9-bit RS-485 frames.....	2979
45.7.3.1	RS-485 Slave Address Normal Detect Mode.....	2979
45.7.3.2	RS-485 Slave Address Automatic Detect Mode.....	2980
45.8	Low Power Modes.....	2980
45.8.1	UART Operation in System Doze Mode.....	2981
45.8.2	UART Operation in System Stop Mode.....	2981
45.8.3	Power Saving Method in UART.....	2982
45.9	UART Operation in System Debug State.....	2982
45.10	Reset.....	2983
45.10.1	Hardware reset.....	2983
45.10.2	Software reset.....	2983
45.11	Transfer Error.....	2983
45.12	Functional Timing.....	2984
45.12.1	IrDA Mode.....	2984
45.13	Initialization.....	2984
45.13.1	Programming the UART in RS-232 mode.....	2984
45.13.2	Programming the UART in 9-bit RS-485 mode.....	2986
45.14	References.....	2987
45.15	UART Memory Map/Register Definition.....	2988
45.15.1	UART Receiver Register (UARTx_URXD).....	2993
45.15.2	UART Transmitter Register (UARTx_UTXD).....	2995
45.15.3	UART Control Register 1 (UARTx_UCR1).....	2996
45.15.4	UART Control Register 2 (UARTx_UCR2).....	2998
45.15.5	UART Control Register 3 (UARTx_UCR3).....	3001
45.15.6	UART Control Register 4 (UARTx_UCR4).....	3003
45.15.7	UART FIFO Control Register (UARTx_UFCR).....	3005
45.15.8	UART Status Register 1 (UARTx_USR1).....	3007
45.15.9	UART Status Register 2 (UARTx_USR2).....	3010

Section number	Title	Page
45.15.10	UART Escape Character Register (UARTx_UESC).....	3012
45.15.11	UART Escape Timer Register (UARTx_UTIM).....	3013
45.15.12	UART BRM Incremental Register (UARTx_UBIR).....	3013
45.15.13	UART BRM Modulator Register (UARTx_UBMR).....	3014
45.15.14	UART Baud Rate Count Register (UARTx_UBRC).....	3014
45.15.15	UART One Millisecond Register (UARTx_ONEMS).....	3015
45.15.16	UART Test Register (UARTx_UTS).....	3016
45.15.17	UART RS-485 Mode Control Register (UARTx_UMCR).....	3017

Chapter 46 Universal Serial Bus Controller (USB)

46.1	Overview.....	3019
46.1.1	Features.....	3020
46.1.2	Modes of Operation.....	3021
46.1.2.1	Normal Mode.....	3022
46.1.2.2	Low-Power Mode.....	3022
46.2	External Signals.....	3022
46.3	Functional Description.....	3023
46.3.1	USB 2.0 Controller Core 0.....	3023
46.3.1.1	Host Mode.....	3024
46.3.1.2	Peripheral (Device) Mode.....	3024
46.3.1.3	Pins Used for OTG 1 Controller.....	3024
46.3.2	USB 2.0 Controller Core 1.....	3025
46.3.2.1	Pins Used for OTG 2 Controller.....	3025
46.3.3	USB Power Control.....	3025
46.3.3.1	Entering Low Power Suspend Mode.....	3026
46.3.3.2	Wake-Up Events.....	3026
46.3.3.2.1	Host Mode Events.....	3026
46.3.4	Interrupts.....	3027
46.3.4.1	USB Core Interrupts.....	3027

Section number	Title	Page
46.3.4.2	USB Wake-Up Interrupts.....	3027
46.4	USB Operation Model.....	3028
46.4.1	Register Interface.....	3028
46.4.1.1	Configuration, Control and Status Register Set.....	3029
46.4.1.2	Identification Registers.....	3031
46.4.1.3	OTG Operations.....	3031
46.4.1.3.1	Register Bits.....	3031
46.4.2	Host Data Structures.....	3032
46.4.2.1	Periodic Frame List.....	3033
46.4.2.2	Asynchronous List Queue Head Pointer.....	3035
46.4.2.3	Isochronous (High-Speed) Transfer Descriptor (iTDD).....	3036
46.4.2.3.1	Next Link Pointer.....	3037
46.4.2.3.2	iTDD Transaction Status and Control List.....	3038
46.4.2.3.3	iTDD Buffer Page Pointer List (Plus).....	3039
46.4.2.4	Split Transaction Isochronous Transfer Descriptor (siTDD).....	3041
46.4.2.4.1	Next Link Pointer.....	3041
46.4.2.4.2	siTDD Endpoint Capabilities/Characteristics.....	3042
46.4.2.4.3	siTDD Transfer State.....	3043
46.4.2.4.4	siTDD Buffer Pointer List (plus).....	3044
46.4.2.4.5	siTDD Back Link Pointer.....	3045
46.4.2.5	Queue element transfer descriptor (qTDD).....	3045
46.4.2.5.1	Next qTDD Pointer.....	3046
46.4.2.5.2	Alternate Next qTDD Pointer.....	3047
46.4.2.5.3	qTDD Token.....	3047
46.4.2.5.4	qTDD Buffer Page Pointer List.....	3050
46.4.2.6	Queue Head.....	3051
46.4.2.6.1	Queue Head Horizontal Link Pointer.....	3051
46.4.2.6.2	Queue Head Endpoint Capabilities/Characteristics.....	3052
46.4.2.6.3	Transfer Overlay-Queue Head.....	3054

Section number	Title	Page
46.4.2.7	Periodic Frame Span Traversal Node (FSTN).....	3055
46.4.2.7.1	FSTN Normal Path Pointer	3056
46.4.2.7.2	FSTN Back Path Link Pointer	3056
46.4.3	Host Operational Model	3057
46.4.3.1	Host Controller Initialization	3057
46.4.3.2	Port Routing and Control.....	3059
46.4.3.2.1	Port Routing Control through EHCI Configured (CF) Bit	3061
46.4.3.2.2	Port Routing Control through PortOwner and Disconnect Event	3062
46.4.3.2.3	Example Port Routing State Machine	3064
46.4.3.2.3.1	EHCI HC Owner	3064
46.4.3.2.3.2	Companion HC Owner	3065
46.4.3.2.4	Port Power	3065
46.4.3.2.5	Port Reporting Over-Current	3066
46.4.3.3	Suspend/Resume-Host Operational Model	3067
46.4.3.3.1	Port Suspend/Resume	3067
46.4.3.4	Schedule Traversal Rules.....	3070
46.4.3.4.1	Example - Preserving Micro-Frame Integrity	3072
46.4.3.4.1.1	Transaction Fit - A Best-Fit Approximation Algorithm	3072
46.4.3.5	Periodic Schedule Frame Boundaries vs Bus Frame Boundaries	3074
46.4.3.6	Periodic Schedule	3077
46.4.3.7	Managing Isochronous Transfers Using iTDs	3079
46.4.3.7.1	Host Controller Operational Model for iTDs	3079
46.4.3.7.2	Software Operational Model for iTDs	3081
46.4.3.7.2.1	Periodic scheduling threshold.....	3083
46.4.3.8	Asynchronous Schedule	3084
46.4.3.8.1	Adding Queue Heads to Asynchronous Schedule.....	3085
46.4.3.8.2	Removing Queue Heads from Asynchronous Schedule	3086
46.4.3.8.3	Empty Asynchronous Schedule Detection	3088
46.4.3.8.4	Restarting Asynchronous Schedule Before EOF	3089

Section number	Title	Page
46.4.3.8.4.1	Example Method for Restarting Asynchronous Schedule Traversal	3090
46.4.3.8.4.2	Async Sched Not Active	3091
46.4.3.8.4.3	Async Sched Active	3091
46.4.3.8.4.4	Async Sched Sleeping	3092
46.4.3.8.4.5	Example Derivation for AsyncSchedSleepTime.....	3092
46.4.3.8.5	Asynchronous schedule traversal: Start Event.....	3092
46.4.3.8.6	Reclamation Status Bit (USBSTS Register).....	3093
46.4.3.9	Operational Model for Nak Counter.....	3093
46.4.3.9.1	Nak Count Reload Control	3095
46.4.3.9.1.1	Wait for List Head	3096
46.4.3.9.1.2	Do Reload	3096
46.4.3.9.1.3	Wait for Start Event	3096
46.4.3.10	Managing Control/Bulk/Interrupt Transfers through Queue Heads.....	3097
46.4.3.10.1	Fetch Queue Head	3099
46.4.3.10.2	Advance Queue	3099
46.4.3.10.3	Execute Transaction	3100
46.4.3.10.3.1	Interrupt Transfer Pre-condition Criteria	3101
46.4.3.10.3.2	Asynchronous Transfer Pre-operations and Pre-condition Criteria	3101
46.4.3.10.3.3	Transfer Type Independent Pre-operations.....	3101
46.4.3.10.3.4	Halting a Queue Head	3104
46.4.3.10.3.5	Asynchronous Schedule Park Mode	3105
46.4.3.10.4	Write Back qTD	3107
46.4.3.10.5	Follow Queue Head Horizontal Pointer	3107
46.4.3.10.6	Buffer Pointer List Use for Data Streaming with qTDs	3108
46.4.3.10.7	Adding Interrupt Queue Heads to the Periodic Schedule	3110

	48.4.3.4 Command control.....	3350
	48.4.3.5 Data control.....	3351
48.4.4	Clock & Reset Manager.....	3351
48.4.5	Clock Generator.....	3352
48.4.6	SDIO Card Interrupt.....	3352
	48.4.6.1 Interrupts in 1-bit Mode.....	3352
	48.4.6.2 Interrupt in 4-bit Mode.....	3352
	48.4.6.3 Card Interrupt Handling.....	3353
48.4.7	Card Insertion and Removal Detection.....	3354
48.4.8	Power Management and Wake Up Events.....	3355
	48.4.8.1 Setting Wake Up Events.....	3356
48.4.9	MMC fast boot.....	3356
	48.4.9.1 Boot operation.....	3356
	48.4.9.2 Alternative boot operation.....	3357
48.5	Initialization/Application of uSDHC.....	3358
48.5.1	Command Send & Response Receive Basic Operation.....	3358
48.5.2	Card Identification Mode.....	3359
	48.5.2.1 Card Detect.....	3359
	48.5.2.2 Reset.....	3360
	48.5.2.3 Voltage Validation.....	3361
	48.5.2.4 Card Registry.....	3363
48.5.3	Card Access.....	3364
	48.5.3.1 Block Write.....	3364
	48.5.3.1.1 Normal Write.....	3364

Section number	Title	Page
	48.5.3.1.2 DDR Write.....	3366
	48.5.3.1.3 Write with Pause.....	3366
48.5.3.2	Block Read.....	3368
	48.5.3.2.1 Normal Read.....	3368
	48.5.3.2.2 DDR Read.....	3369
	48.5.3.2.3 Read with Pause.....	3369
	48.5.3.2.4 DLL (Delay Line) in Read Path.....	3370
48.5.3.3	Suspend Resume.....	3372
	48.5.3.3.1 Suspend.....	3372
	48.5.3.3.2 Resume.....	3373
48.5.3.4	ADMA Usage.....	3373
48.5.3.5	Transfer Error.....	3374
	48.5.3.5.1 CRC Error.....	3374
	48.5.3.5.2 Internal DMA Error.....	3374
	48.5.3.5.3 Transfer ADMA Error.....	3375
	48.5.3.5.4 Auto CMD12 Error.....	3375
48.5.3.6	Card Interrupt.....	3376
48.5.4	Switch Function.....	3376
	48.5.4.1 Query, Enable and Disable SDIO High Speed Mode.....	3377
	48.5.4.2 Query, Enable and Disable SD High Speed Mode/SDR50/SDR104/DDR50.....	3377
	48.5.4.3 Query, Enable and Disable MMC High Speed Mode.....	3378
	48.5.4.4 Set MMC Bus Width.....	3378
48.5.5	ADMA Operation.....	3378
	48.5.5.1 ADMA1 Operation.....	3379
	48.5.5.2 ADMA2 Operation.....	3379
48.5.6	Fast Boot Operation.....	3380
	48.5.6.1 Normal fast boot flow	3380
	48.5.6.2 Alternative fast boot flow.....	3381
	48.5.6.3 Fast boot application case (in DMA mode).....	3381

Section number	Title	Page
48.6	Commands for MMC/SD/SDIO.....	3383
48.7	Software Restrictions.....	3388
48.7.1	Initialization Active.....	3388

Chapter 1

Introduction

1.1 About This Document

The i.MX 6SLL application processors are NXP's latest additions to a growing family of real-time processing products offering high-performance processing optimized for lowest power consumption.

The i.MX 6SLL processors feature NXP's advanced implementation of the ARM[®]Cortex[®]-A9 core.

The processors can be interfaced with LPDDR3 and LPDDR2 DRAM memory devices.

These products are suitable for applications such as:

- High-end Mobile Internet Devices and high-end PDAs
- Netbooks
- Nettops
- High-end portable media players with HD video capability
- Portable navigation devices
- Gaming Consoles

1.1.1 Audience

This manual is intended for the board-level product designers and product software developers. This manual assumes that the reader has a background in computer engineering and/or software engineering and understands the concepts of the digital system design, microprocessor architecture, Input/Output (I/O) devices, industry standard communication, and device interface protocols.

1.1.2 Organization

This document covers the chip at a system level and provides an architectural overview. It also covers the system memory map, system-level interrupt events, external pins and pin multiplexing, external memory, system debug, system boot, multimedia subsystem, power management, and system security.

1.1.3 Suggested Reading

This section lists the additional resources that provide background for the information in this manual, as well as general information about the architecture.

1.1.3.1 General Information

The following documentation provides useful background information about the ARM Cortex processor.

For information about the ARM Cortex processor see:

- <http://infocenter.arm.com>

1.1.3.2 Related Documentation

NXP documentation is available from the sources listed on the back cover of this manual; the document order numbers are included in parentheses for ease in ordering.

For a current list of documentation, refer to <http://www.nxp.com>.

1.1.4 Conventions

This document uses the following notational conventions:

cleared / set

When a bit has a value of zero, it is said to be cleared; when it has a value of one, it is said to be set.

mnemonics

Instruction mnemonics are shown in lowercase bold.

italics

Italics indicate variable command parameters, for example, **bcctrx**.

The book titles in the text are set in italics.

15

An integer in decimal.

0x

the prefix to denote a hexadecimal number.

0b

The prefix to denote a binary number. Binary values of 0 and 1 are written without a prefix.

n'H4000CA00

The n-bit hexadecimal number.

BLK_REG_NAME

The register names are all uppercase. The block mnemonic is prepended with an underscore delimiter (_).

BLK_REG[FIELD]

The fields within registers appear in brackets. For example, ESR[RLS] refers to the Receive Last Slot field of the ESAI Status Register.

BLK_REG[*n*]

The bit number *n* within the BLK.REG register.

BLK_REG[*l:r*]

The register bit ranges. The ranges are indicated by the left-most bit number *l* and the right-most bit number *r*, separated by a colon (:). For example, ESR[15:0] refers to the lower half word in the ESAI Status Register.

x, U

In some contexts, such as signal encodings, an unitalicized x indicates a "don't care" or "uninitialized". The binary value can be 1 or 0.

x

An italicized *x* indicates an alphanumeric variable.

n, m

Italicized *n* or *m* represent integer variables.

!

Binary logic operator NOT.

&&

Binary logic operator AND.

||

Binary logic operator OR.

^ or <O+>

Binary logic operator XOR. For example, A <O+> B.

|

Bit-wise OR. For example, 0b0001 | 0b1000 yields the value of 0b1001.

&

Bit-wise AND. For example, 0b0001 and 0b1000 yields the value of 0b0000.

{A,B}

Concatenation, where the n -bit value A is prepended to the m -bit value B to form an $(n+m)$ -bit value. For example, $\{0, \text{REG}m[14:0]\}$ yeilds a 16-bit value with 0 in the most significant bit.

- or grey fill

Indicates a reserved bit field in a register. Although these bits can be written to with ones or zeros, they always read zeros.

>>

Shift right logical one position.

<<

Shift left logical one position.

<=

Assignment.

==

Compare equal.

!=

Compare not equal.

>

Greater than.

<

Less than.

1.1.5 Register Access

1.1.5.1 Register Diagram Field Access Type Legend

This figure provides the interpretation of the notation used in the register diagrams for a number of common field access types:

Figure 1-1. Register Field Conventions

NOTE

For reserved register fields, the software should mask off the data in the field after a read (the software can't rely on the contents of data read from a reserved field) and always write all zeros.

1.1.5.2 Register Macro Usage

A common operation is to update one field without disturbing the contents of the remaining fields in the register. Normally, this requires a read-modify-write (RMW) operation, where the CPU reads the register, modifies the target field, then writes the results back to the register. This is an expensive operation in terms of CPU cycles, because of the initial register read.

To address this issue, some hardware registers are implemented as a group, including registers that can be used to either set, clear, or toggle (SCT) individual bits of the primary register. When writing to an SCT register, all the bits set to 1 perform the associated operation on the primary register, while the bits set to 0 are not affected. The SCT registers always read back 0, and should be considered write-only. The SCT registers are not implemented if the primary register is read-only.

With this architecture, it is possible to update one or more fields using only register writes. First, all bits of the target fields are cleared by a write to the associated clear register, then the desired value of the target fields is written to the set register. This sequence of two writes is referred to as a clear-set (CS) operation.

A CS operation does have one potential drawback. Whenever a field is modified, the hardware sees a value of 0 before the final value is written. For most fields, passing through the 0 state is not a problem. Nonetheless, this behavior is something to consider when using a CS operation.

Also, a CS operation is not required for fields that are one-bit wide. While the CS operation works in this case, it is more efficient to simply set or clear the target bit (that is, one write instead of two). A simple set or clear operation is also atomic, while a CS operation is not.

Note that not all macros for set, clear, or toggle (SCT) are atomic. For registers that do not provide hardware support for this functionality, these macros are implemented as a sequence of read-modify-write operations. When an atomic operation is required, the developer should pay attention to this detail, because unexpected behavior might result if an interrupt occurs in the middle of the critical section comprising the update sequence.

A set of SCT registers is offered for registers in many modules on this device, as described in this manual. In a module memory map table, the suffix `_SET`, `_CLR`, or `_TOG` is added to the base name of the register. For example, the `CCM_ANALOG_PLL_ARM` register has three other registers called `CCM_ANALOG_PLL_ARM_SET`, `CCM_ANALOG_PLL_ARM_CLR`, and `CCM_ANALOG_PLL_ARM_TOG`.

In the sub-section that describes one of these sets of registers, a short-hand convention is used to denote that a register has the SCT register set. There is an italicized *n* appended to the end of the short register name. Using the above example, the name used for this register is CCM_ANALOG_PLL_ARM*n*. When you see this designation, there is a SCT register set associated with the register, and you can verify this by checking it in the memory map table. The address offset for each of these registers is given in the form of the following example:

Address: 20C_8000h base + 0h offset + (4d × i), where i=0d to 3d

In this example, the address for each of the base registers and their three SCT registers can be calculated as:

Register	Address
CCM_ANALOG_PLL_ARM	20C_8000h
CCM_ANALOG_PLL_ARM_SET	20C_8004h
CCM_ANALOG_PLL_ARM_CLR	20c_8008h
CCM_ANALOG_PLL_ARM_TOG	20C_800Ch

1.1.6 Signal Conventions

_b, _B

When appended to a signal name, this indicates that a signal is active-low.

NEG_ACTIVE

Overbar also denotes a negative active signal.

UPPERCASE

Package pin names, Block I/O signals.

lowercase

Lowercase is used to indicate internal signals.

1.1.7 Acronyms and Abbreviations

The table below contains acronyms and abbreviations used in this document.

Acronyms and Abbreviated Terms

Term	Meaning
ADC	Analog-to-Digital Converter
AHB	Advanced High-performance Bus
AIPS	ARM IP Bus
ALU	Arithmetic Logic Unit

Table continues on the next page...

Term	Meaning
AMBA	Advanced Microcontroller Bus Architecture
APB	Advanced Peripheral Bus
ASRC	Asynchronous Sample Rate Converter
AXI	Advanced eXtensible Interface
BIST	Built-In Self Test
CA/CM	ARM Cortex-A/Cortex-M
CAN	Controller Area Network
CCM	Clock Controller Module
CPU	Central Processing Unit
CSI	CMOS Sensor Interface
CSU	Central Security Unit
CTI	Cross Trigger Interface
DAP	Debug Access Port
DDR	Double data rate
DMA	Direct memory access
DPLL	Digital phase-locked loop
DRAM	Dynamic random access memory
ECC	Error correcting codes
ECSPI	Enhanced Configurable SPI
EIM	External Interface Module
ENET	Ethernet
EPD	Electrophoretic Display
EPDC	Electrophoretic Display Controller
EPIT	Enhanced Periodic Interrupt Timer
EPROM	Erasable Programmable Read-Only Memory
ETM	Embedded Trace Macrocell
FIFO	First-In-First-Out
GIC	General Interrupt Controller
GPC	General Power Controller
GPIO	General-Purpose I/O
GPR	General-Purpose Register
GPS	Global Positioning System
GPT	General-Purpose Timer
GPU	Graphics Processing Unit
HAB	High-Assurance Boot
I2C or I ² C	Inter-Integrated Circuit
IC	Integrated Circuit
IEEE	Institute of Electrical and Electronics Engineers
IOMUX	Input-Output Multiplexer
IP	Intellectual Property
IrDA	Infrared Data Association

Table continues on the next page...

About This Document

Term	Meaning
JTAG	Joint Test Action Group (a serial bus protocol usually used for test purposes)
LCD	Liquid Crystal Display
LCDIF	Liquid Crystal Display Interface
LDO	Low-Dropout
LIFO	Last-In-First-Out
LRU	Least-Recently Used
LSB	Least-Significant Byte
LUT	Look-Up Table
LVDS	Low Voltage Differential Signaling
MMC	Multimedia Card
MMDC	Multi Mode DDR Controller
MSB	Most-Significant Byte
MT/s	Mega Transfers per second
OCRAM	On-Chip Random-Access Memory
OCOTP	On-Chip One-Time Programmable Controller
PCMCIA	Personal Computer Memory Card International Association
PGC	Power Gating Controller
PIC	Programmable Interrupt Controller
PMU	Power Management Unit
POR	Power-On Reset
PWM	Pulse Width Modulation
PXP	Pixel Pipeline
QoS	Quality of Service
R2D	Radians to Degrees
RISC	Reduced Instruction Set Computing
ROM	Read-Only Memory
ROMCP	ROM Controller with Patch
RTOS	Real-Time Operating System
Rx	Receive
SAI	Synchronous Audio Interface
SCU	Snoop Control Unit
SD	Secure Digital
SDIO	Secure Digital Input/Output
SDLC	Synchronous Data Link Control
SDMA	Smart DMA
SIM	Subscriber Identification Module
SoC	System-on-Chip
SPBA	Shared Peripheral Bus Arbiter
SPDIF	Sony Phillips Digital Interface
SPI	Serial Peripheral Interface
SRAM	Static Random-Access Memory

Table continues on the next page...

Term	Meaning
SRC	System Reset Controller
TFT	Thin-Film Transistor
TPIU	Trace Port Interface
Tx	Transmit
TZASC	TrustZone Address Space Controller
UART	Universal Asynchronous Receiver/Transmitter
USB	Universal Serial Bus
USDHC	Ultra Secured Digital Host Controller
WDOG	Watchdog
WLAN	Wireless Local Area Network
WXGA	Wide Extended Graphics Array

1.2 Introduction

This chapter introduces the architecture of the i.MX 6SLL Multimedia Applications Processors. The i.MX 6SLL processors represent NXP's latest achievement in integrated multimedia applications processors.

It is part of a growing i.MX family of multimedia-focused products, offering high-performance processing optimized for the lowest power consumption.

1.3 Target Applications

The i.MX 6SLL applications processor is designed specifically for the eReader market. This device integrates the unique display controller for the EPD panel and pixel processing engines to make it an ideal solution for EPD-based eReaders. This device also has an integrated LCD controller that enables it to support eReaders with LCD panels.

The architecture's flexibility enables it to be used in a wide variety of general embedded applications. The i.MX 6SLL processor provides all interfaces necessary to connect peripherals such as WLAN, Bluetooth™, GPS, camera sensors, and multiple displays.

1.4 Features

The i.MX 6SLL processor is based on ARM Cortex-A9 MPCore™ Platform, which has the following features:

Features

- Single ARM Cortex-A9 MPCore (with TrustZone) with:
 - 32 KB L1 Instruction Cache
 - 32 KB L1 Data Cache
 - Private Timer and Watchdog
 - Cortex-A9 NEON MPE (Media Processing Engine) Co-processor

The ARM Cortex-A9 MPCore complex includes:

- General Interrupt Controller (GIC) with 128 interrupt support
- Global Timer
- Snoop Control Unit (SCU)
- 256 KB unified I/D L2 cache:
- Two Master AXI (64-bit) bus interfaces output of L2 cache
- NEON MPE coprocessor
 - SIMD Media Processing Architecture
 - NEON register file with 32x64-bit general-purpose registers
 - NEON Integer execute pipeline (ALU, Shift, MAC)
 - NEON dual, single-precision floating point execute pipeline (FADD, FMUL)
 - NEON load/store and permute pipeline
 - Supports single and double-precision add, subtract, multiply, divide, multiply and accumulate, and square root operations as described in the ARM VFPv3 architecture.
 - Provides conversions between 16-bit, 32-bit, and 64-bit floating-point formats and ARM integer word formats

Target frequency of the core (including Neon and L1 cache) is 800 MHz non-overdrive over the specified temperature range:

- 1 GHz overdrive over the specified temperature range
- 800 MHz non-overdrive over the specified temperature range

The i.MX 6SLL processor supports latest, high volume, cost effective handheld DRAM, and SD memory card standards.

The memory system consists of the following components:

- Level 1 Cache—32 KB Instruction, 32 KB Data cache
- Level 2 Cache—Unified instruction and data (256 KB)
- On-Chip Memory:
 - Boot ROM, including High Assurance Boot (HAB, 96 KB)
 - Internal multimedia / shared, fast access RAM (OCRAM, 128 KB)
- External memory interfaces:
 - 32-bit LP-DDR2
 - 32-bit LP-DDR3

The i.MX 6SLL processor enables the following interfaces to external devices (some of them are muxed and not available simultaneously):

Displays:

- EPDC supporting color and monochrome E-INK EPD panels up to 1650x2332 resolution and 5-bit grayscale
- LCDIF supporting one parallel 24-bit LCD display with up to WXGA (1366x768) resolution at 60 Hz
- Both LCD and EPD displays can be active simultaneously.

Camera sensors:

- Parallel Camera port (up to 16 bit and up to 66 MHz peak)

Expansion cards: Three MMC/SD/SDIO card ports all supporting:

- 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR-104 mode (104 MB/s max)
- 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to HS400 mode

USB:

- Two High Speed (HS) USB 2.0 OTG (Up to 480 Mbps), with integrated HS USB PHY

Miscellaneous IPs and interfaces:

- Three I2S/SSI/AC97, up to 1.4 Mbps each
- Five UARTs operating up to 4.0 Mbps each, providing RS232 interface and supporting 9-bit RS485 multidrop mode, which support 4-wire mode
- Four eCSPI (Enhanced CSPI), three of them can support up to 52 Mbps, one can be of low speed
- Three I2C, supporting 400 kbps
- Four Pulse Width Modulators (PWM)
- System JTAG Controller (SJC)
- GPIO with interrupt capabilities
- 8x8 Key Pad Port (KPP)
- Sony Philips Digital Interface (SPDIF), Rx and Tx
- Two Watchdog timers (WDOG)
- Audio MUX (AUDMUX)

The i.MX 6SLL processor integrates advanced power management unit and controllers:

- Provide PMU, including multiple LDO supplies, for on-chip resources
- Use Temperature Sensor for monitoring the die temperature
- Support DVFS techniques for low power modes
- Use SW State Retention and Power Gating for ARM and MPE
- Support various levels of system power modes
- Use flexible clock gating control scheme

The i.MX 6SLL processor uses dedicated HW accelerators to meet the targeted multimedia performance. The use of HW accelerators is a key factor in obtaining high performance at low power consumption numbers, while having the CPU core relatively free for performing other tasks.

The i.MX 6SLL processor incorporates the following hardware accelerators:

- PXP—PiXel Processing Pipeline. Off loading key pixel processing operations are required to support the EPD display applications.

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.)
- SJC—System JTAG Controller. Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features.
- DCP—Data Co-Processor for cryptographic function, with 128-bit AES for Bulk Encryption, ECB and CCB modes, supports SHA-1, SHA-256 for Message Authentication/Integrity.
- RNGB—True Random Number Generation.
- SNVS—Secure Non-Volatile Storage, including Secure Real Time Clock.
- CSU—Central Security Unit. Enhancement for the IC Identification Module (IIM). Will be configured during boot and by eFUSES and will determine the security level operation mode as well as the TZ policy.
- HAB—High Assurance Boot (Secure Boot) v4.2.6.

NOTE

The actual feature set depends on the part number. Functions, such as KPP may not be enabled for specific part numbers.

1.5 Architectural Overview

This section contains details about the chip architecture.

1.5.1 Simplified Block Diagram

A high-level block diagram is shown in the following figure. This diagram provides a view of the chip's major sub-systems (processor domains, shared peripherals domain, and memories) and logical connectivity.

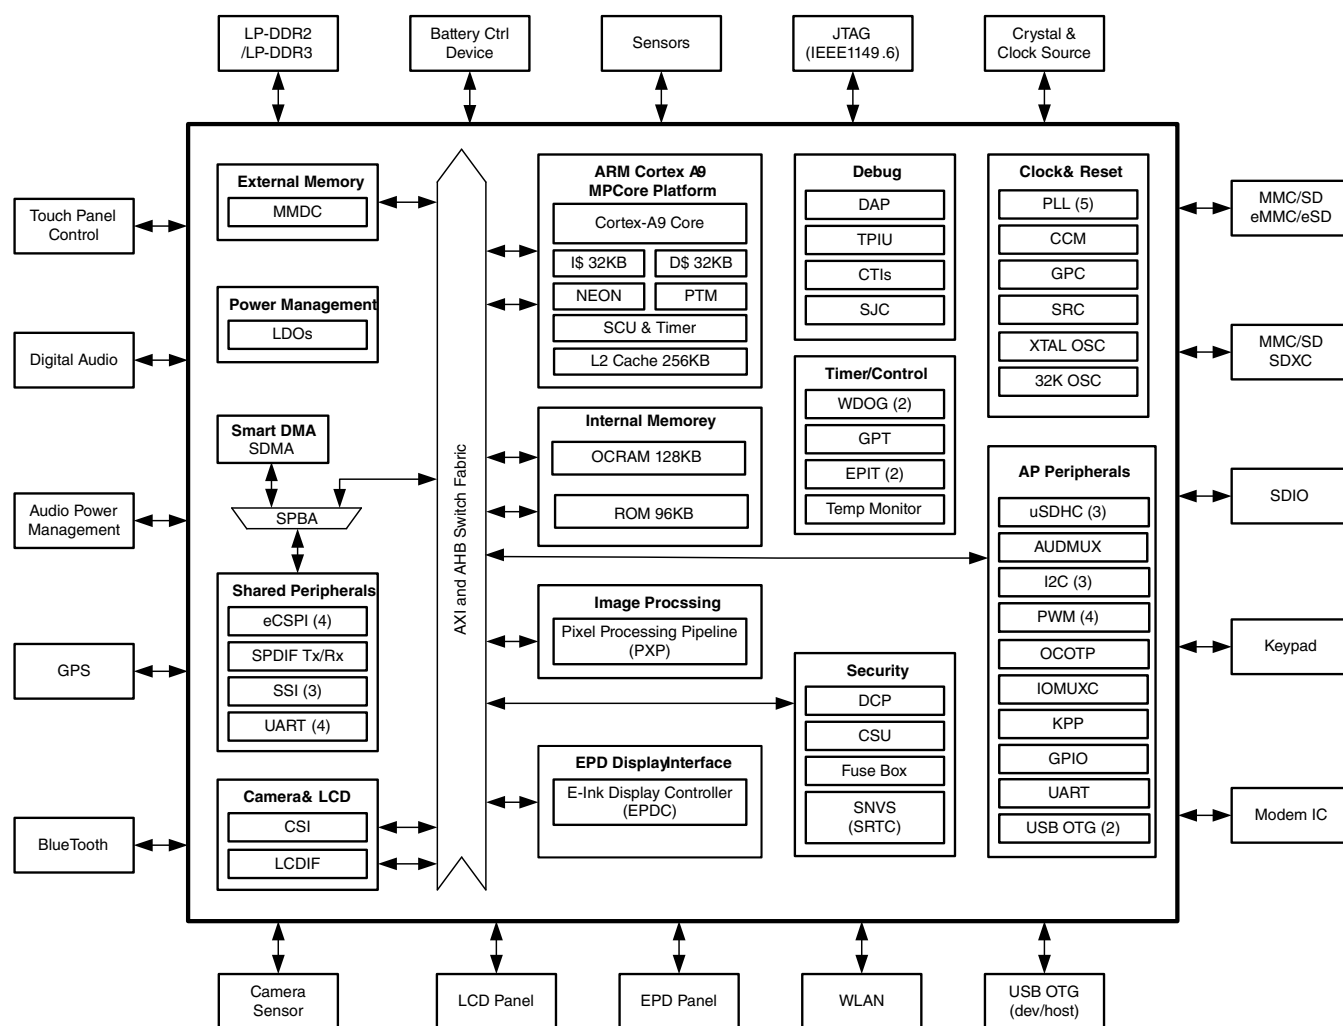

Figure 1-2. Simplified block diagram

1.5.2 Architectural Partitioning

The architecture supports the processing-intensive tasks in the following ways:

- ARM Cortex A9 MPCore™ platform is responsible for:
 - Operating system
 - User applications (including control over hardware accelerators and non-accelerated functions)
 - TrustZone applications
 - The 256 KB L2 cache memory inside the ARM platform can be configured into the OCRAM mode and used as a normal OCRAM
- Smart DMA enables the data transfer between the non-mastering peripherals and the external or internal memories.
- System control is supported via:

- Clock Control Module (CCM)
- Seven PLLs
- XTALOSC—a 24-MHz crystal oscillator source support
- OSC32KHz—a 32.768-Hz crystal oscillator source support
- System Reset Controller (SRC)
- General Power Controller (GPC)
- Temperature Sensor for monitoring and alarming of high-temperature situations.
- Multimedia is supported by:
 - Audio
 - The audio codecs are provided by the software which runs on the ARM core, supporting (but not limited to) the MP3, WMA, AAC, HE-AAC, and Pro10 formats.
 - Three SSIs interfaced to the Audio Mux
 - SPDIF Tx/Rx
 - Video
 - The video codecs are provided by the software which runs on the ARM core, supporting (but not limited to) the MPEG4 and H.264 formats.
- Security is supported by:
 - High Assurance Boot (HAB4) System
 - ARM TrustZone (TZ) Trusted Execution environment
 - DDR Memory secure region protection by TrustZone Address Space Controller
 - On-Chip RAM (OCRAM) single-region TrustZone protection
 - Peripheral access policy control, using Central Security Unit (CSU)
 - One-Time Programmable (OTP) electrical fuse array (Total of 2048-bit e-fuses) via the on-chip electrical fuse controller (OCOTP_CTRL)
 - DCP and SNVS security architecture, providing:
 - Secure Real Time Counters (SRTC)
 - Security State Controller
 - Random Number Generator (RNGB)
 - Security Violation/Tamper Detection and Reporting
 - System JTAG controller (SJC)
 - TrustZone Watchdog (TZ WDOG)
- Connectivity peripherals, timers and external memory interfaces:
 - Embedded DMAs
 - Configurable 1.8 V/3.3 V I/O voltage for seamless integration
 - Two USB 2.0 ports, including 2x HS-USB OTG PHYs
 - LP-DDR2/LP-DDR3 (32-bit)

- Timers: 2xEPIT, GPT, and two watchdog timers (one of which is used for TZ), in addition to the timers and watchdog timers integrated within the ARM Cortex A9 MPCore™ platform.
- Miscellaneous connectivity support—MMC/SD, I²C, SPI, UART, PWM, and Keypad interface

1.5.3 Endianness Support

The chip supports only the Little Endian mode.

1.5.4 Memory Interfaces

The chip DDR controller supports these memory interfaces:

- LP-DDR2, 32-bit, 400-MHz clock
- LP-DDR3, 32-bit, 400-MHz clock.

Chapter 2

Memory Maps

2.1 Memory system overview

This section introduces the memory architecture of the chip.

2.2 ARM Platform Memory Map

The chip memory map has been provided in the following tables.

Table 2-1. System memory map

Start address	End address	Size	Description
8000_0000	FFFF_FFFF	2048 MB	MMDC—DDR Controller.
1000_0000	7FFF_FFFF	1792 MB	Reserved
0800_0000	0FFF_FFFF	128 MB	Reserved
02C0_0000	07FF_FFFF	84 MB	Reserved
0280_0000	02BF_FFFF	4 MB	Reserved

NOTE

Accessing the reserved memory regions can result in an unpredictable behavior.

Chapter 3

Interrupts and DMA Events

3.1 Overview

This section describes the assignments of interrupts from the ARM domain in [Cortex A9 interrupts](#) and from the DMA events in [SDMA event mapping](#).

3.2 Cortex A9 interrupts

The Global Interrupt Controller (GIC) collects up to 128 interrupt requests from all chip sources and provides an interface to the Cortex A9 CPU. The first 32 interrupts are private to the CPUs' interface. These interrupts are not included in the table below. All interrupts besides those private to the CPU are hooked up to the GPC.

Each interrupt can be configured as a normal or a secure interrupt. Software force registers and software priority masking are also supported. This table describes the ARM Cortex A9 interrupt sources:

Table 3-1. ARM Cortex A9 domain interrupt summary

IRQ	Interrupt Source	Interrupt Description
32	IOMUXC	General-Purpose Register 1 from IOMUXC. Used to notify the core on the exception condition while booting.
33	DAP	Debug Access Port interrupt request
34	SDMA	SDMA interrupt request from all channels
35	Reserved	Reserved
36	SNVS	ON-OFF button press shorter than five seconds (pulse event)
37	RNGB	Random Number Generator interrupt request
38	Reserved	Reserved
39	CSI	Error interrupt request
40	Reserved	Reserved

Table continues on the next page...

Table 3-1. ARM Cortex A9 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
41	QOS	QoSC interrupt request
42	Reserved	Reserved
43	Reserved	Reserved
44	Reserved	Reserved
45	Reserved	Reserved
46	Reserved	Reserved
47	Reserved	Reserved
48	Reserved	Reserved
49	Reserved	Reserved
50	Reserved	Reserved
51	SNVS	SRTC consolidated interrupt
52	SNVS	SRTC security interrupt
53	CSU	CSU interrupt request 1. Indicates to the processor that one or more alarm inputs were asserted.
54	uSDHC1	uSDHC1 (Enhanced SDHC) interrupt request
55	uSDHC2	uSDHC2 (Enhanced SDHC) interrupt request
56	uSDHC3	uSDHC3 (Enhanced SDHC) interrupt request
57	Reserved	Reserved
58	UART1	UART1 interrupt request

159	PMU	Brownout event on either the core or SoC regulators.

3.3 SDMA event mapping

This table shows the DMA request signals for the peripherals in the chip:

Table 3-2. SDMA event mapping

Event Number	DMA Source	Description
0	Reserved	Reserved
1	Reserved	Reserved
2	IOMUX	Muxed with external DMA pad #1
3	eCSPI1 / I2C3	eCSPI1 Rx request; Muxed with I2C3 controlled by IOMUXC register GPR0[1]
4	eCSPI1 / I2C2	eCSPI1 Tx request; Muxed with I2C2 controlled by IOMUXC register GPR0[2]
5	eCSPI2 / I2C1	eCSPI2 Rx request; Muxed with I2C1 controlled by IOMUXC register GPR0[3]
6	eCSPI2	eCSPI2 Tx request
7	eCSPI3	eCSPI3 Rx request
8	eCSPI3	eCSPI3 Tx request
9	eCSPI4 / EPIT2	eCSPI4 Rx request; Muxed with EPIT2 DMA request controlled by IOMUXC register GPR0[5]
10	eCSPI4 / I2C1	eCSPI4 Tx request; Muxed with I2C1 controlled by IOMUXC register GPR0[4]
11	Reserved	Reserved
12	Reserved	Reserved
13	GPT	GPT counter event
14	SPDIF / IOMUX	SPDIFRX DMA request; Muxed with external DMA pad #2 controlled by IOMUXC register GPR0[7]

Table continues on the next page...

Table 3-2. SDMA event mapping (continued)

Event Number	DMA Source	Description
15	SPDIF	SPDIF TX DMA request
16	EPIT1	EPIT1 request
17	EPDC	EPDC DMA request
18	PXP	PXP DMA request
19	LCDIF	LCDIF DMA request
20	PXP	PXP DMA request
21	Reserved	Reserved
22	CSI	CSI DMA request
23	I2C3	I2C3 DMA request
24	Reserved	Reserved
25	UART1	UART1 Rx FIFO
26	UART1	UART1 Tx FIFO
27	UART2	UART2 Rx FIFO
28	UART2	UART2 Tx FIFO
29	UART3	UART3 Rx FIFO
30	UART3	UART3 Tx FIFO
31	UART4	UART4 Rx FIFO
32	UART4	UART4 Tx FIFO
33	UART5	UART5 Rx FIFO
34	UART5	UART5 Tx FIFO
35	SSI1	SSI1 receive 1 DMA request
36	SSI1	SSI1 transmit 1 DMA request
37	SSI1	SSI1 receive 0 DMA request
38	SSI1	SSI1 transmit 0 DMA request
39	SSI2	SSI2 receive 1 DMA request
40	SSI2	SSI2 transmit 1 DMA request
41	SSI2	SSI2 receive 0 DMA request
42	SSI2	SSI2 transmit 0 DMA request
43	SSI3	SSI3 receive 1 DMA request
44	SSI3	SSI3 transmit 1 DMA request
45	SSI3	SSI3 receive 0 DMA request
46	SSI3	SSI3 transmit 0 DMA request
47	Reserved	Reserved

As shown in the table, some of the events are the output of a mux of two signals or triggers. The selection of this mux is controlled by the general-purpose registers in IOMUXC.

Chapter 4

External Signals and Pin Multiplexing

4.1 Overview

The chip contains a limited number of pins, most of which have multiple signal options. These signal-to-pin and pin-to-signal options are selected by the input-output multiplexer called IOMUX. The IOMUX is also used to configure other pin characteristics, such as voltage level, drive strength, and hysteresis.

[Pin Assignments](#) lists the pad names of the chip, the various signals that can be assigned to each of the pads, and the default settings for each pad. The muxing options table lists the external signals grouped by the module instance, the muxing options for each signal, and the registers used to route the signal to the chosen pad.

4.1.1 Pin Assignments

Table 4-1. Pin Assignments

Pad Name	Mode	Signal	Pad Settings	Pad/Group Registers
AUD_MCLK	ALT0	AUDIO_CLK_OUT	IPD - ENABLED	SW_PAD_CTL_PAD_AUD_MCLK

Chapter 5

Fusemap

5.1 Boot Fusemap

This section describes the various modes and the selection of the required boot devices.

A separate map is given for each and every boot device. The device select is specified by the BOOT_CFG1[6:4] fuses listed in [Table 5-1](#).

Table 5-1. Boot device select

Boot Device	BOOT_CFG1[6]	BOOT_CFG1[5]	BOOT_CFG1[4]
Serial ROM (Table 5-2)	0	1	1
SD/eSD (Table 5-3)	1	0	X
MMC/eMMC (Table 5-4)	1	1	X

NOTE

The fuses marked as “Reserved” are reserved for NXP internal (and future) use only. Customers must not attempt to burn these, because the IC behavior may be unpredictable. The reserved fuses can be read as either '0' or '1'.

Table 5-2. Serial-ROM boot fusemap

Addr	7	6	5	4	3	2	1	0
0x450[7:0] (BOOT_CFG1)	Use L2 cache as OCRAM 0 - L2 cache enabled mode 1 - L2 cache is disabled and the L2 cache	0	1	1	Reserved	Reserved	Reserved	Reserved

Table 5-6. Fusemap descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Settings	Locked by
0x450[7:0]	BOOT_CFG1	8	BOOT configuration register #1, Usage varies, depending on the selected boot device.	X001XXXX - Reserved-NVM X011XXXX - Serial ROM (I2C/SPI) boot X10XXXX - SD/eSD X11XXXX - MMC/eMMC boot Others - Reserved See Table 5-1 for details.	BOOT_CFG_LOCK
0x450[15:8]	BOOT_CFG2	8	BOOT configuration register #2, Usage varies, depending on the selected boot device.	Refer to the respective boot fusemap tables for details.	BOOT_CFG_LOCK
0x450[23:16]	BOOT_CFG3	8	BOOT configuration register #3	Refer to the respective boot fusemap tables for details.	BOOT_CFG_LOCK
0x450[31:24]	BOOT_CFG4	8	BOOT configuration register #4	Refer to the respective boot fusemap tables for details.	BOOT_CFG_LOCK
0x460[1]	SEC_CONFIG[1]	1	Security Configuration (with SEC_CONFIG[0])	00 - FAB (Open) 01 - Open - enables any code to be flashed and executed, even if it has no valid signature. 1x - Closed (Security On)	BOOT_CFG_LOCK
0x460[3]	DIR_BT_DIS	1	Direct External Memory Boot Disable	0 - Direct boot from external memory is allowed 1 - Direct boot from external memory is not allowed	BOOT_CFG_LOCK
0x460[4]	BT_FUSE_SEL	1	Determines, whether using fuses for boot configuration, or GPIO /Serial loader.	If boot_mode="00" (Development) 0 - Boot mode configuration is taken from GPIOs 1 - Boot mode configuration is taken from fuses If boot_mode="10" (Production) 0 - Boot using Serial Loader (USB) 1 - Boot mode configuration is taken from fuses	BOOT_CFG_LOCK
0x460[5]	FORCE_COLD_BOOT(SBMR)	1	Force cold boot when the A9 core comes out of reset. Reflected in the SBMR register of SRC.	Fuse Function: 0 - Default behavior equivalent to the rest of the i.MX6 family, allowing a fast recovery from low-power modes. That is, the ROM is allowed to jump to the	BOOT_CFG_LOCK

Table continues on the next page...

Table 5-6. Fusemap descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Settings	Locked by
				address previously programmed in the SRC-persistent register. 1 - Fast recovery path in the ROM is not allowed and a cold boot is always performed. Customers who want a higher level of security should burn this fuse.	
0x460[15:8]	DDR_CONFIG[7:0]	8	TBD (DDR config options)		BOOT_CFG_LOCK
0x460[16]	FORCE_INTERNAL_BOOT	1	When blown, the external BT_MODE[1:0] pins are ignored and the BootROM takes the Boot Mode as "Internal Boot".	0 - Boot Mode from BT_MODE pins 1 - BT_MODE pins be ignored, Boot Mode forced to "Internal Boot"	BOOT_CFG_LOCK
0x460[17]	SDP_DISABLE	1	Disable or Enable the serial download support	0 - Serial download supported 1 - No serial download support	BOOT_CFG_LOCK
0x460[18]	SDP_READ_DISABLE	1	Disable/Enable the serial download READ_REGISTER command	0 - SDP READ_REGISTER command is enabled 1 - SDP READ_REGISTER command is disabled	BOOT_CFG_LOCK
0x460[19]	SD3_RST_POLARITY_SELECT	1	Select the reset polarity for SD3	0 - Reset active low 1 - Reset active high	BOOT_CFG_LOCK
0x460[20]	SJC_DISABLE	1	Disable/Enable the Secure JTAG Controller module. This fuse is used to create the highest JTAG security level, where JTAG is completely blocked.	0 - Secure JTAG Controller is enabled 1 - Secure JTAG Controller is disabled	BOOT_CFG_LOCK
0x460[21]	WDOG_ENABLE	1	Watchdog Enable	Used to specify whether to enable the watchdog at boot or not. 0 - Watchdog is disabled 1 - Watchdog is enabled	BOOT_CFG_LOCK
0x460[23:22]	JTAG_SMODE[1:0]	2	JTAG Security Mode. Controls the security mode of the JTAG debug interface	00 - JTAG enable mode 01 - Secure JTAG mode 11 - No debug mode	BOOT_CFG_LOCK
0x460[24]	DLL_ENABLE	2	Enable/Disable the DLL for SD/eMMC boot	0 - Disable DLL for SD/eMMC 1 - Enable DLL for SD/eMMC	BOOT_CFG_LOCK

Table continues on the next page...

Table 5-6. Fusemap descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Settings	Locked by
0x460[26]	KTE	1	Kill Trace Enable. Enables tracing capability on ETM, and other modules.	0 - Bus tracing is allowed 1 - Bus tracing is allowed for the security state as if the Secure JTAG allows it (for example, JTAG_ENABLE or NO_DEBUG).	BOOT_CFG_LOCK
0x460[27]	JTAG_HEO	1	JTAG HAB Enable Override. Disables the HAB JTAG enabling. The HAB usually enables the JTAG debugging using the HAB_JDE-bit in the OCOTP SCS register. The JTAG_HEO-bit can override this behavior.	0 - HAB may enable the JTAG debug access 1 - HAB JTAG enable is overridden (HAB may not enable JTAG debug access)	BOOT_CFG_LOCK
0x460[28]	TZASC_ENABLE	1	TZASC enable fuse	0 - TZASC module is left in the disable and bypass state. 1 - TZASC module and the associated clocks and muxing are enabled by the Boot ROM code.	BOOT_CFG_LOCK
0x460[29]	PWR_STABLE_CYCLE_SELECTION	1	Select power stable cycle	0 - 5 ms 1 - 2.5 ms	BOOT_CFG_LOCK
0x470[0]	Override SD Pad Settings	1	Overrides the ROM default value for the SD PAD control register. When set, the ROM overrides the SD pad control register with a value programmed into the PAD SETTING fuse bits.		BOOT_CFG_LOCK
0x470[1]	BT_MMU_DISABLE	1	The fuse bit is used for the ROM to disable the MMU.		BOOT_CFG_LOCK
0x470[2]	L1 I-Cache DISABLE	1	The fuse bit is used for the ROM to disable the L1 I-Cache.		BOOT_CFG_LOCK
0x470[3]	Disable SDMMC Manufacture mode	1	The fuse bit is used to disable the ROM feature "SD/MMC Manufacturing Mode".	0 - Enable 1 - Disable	BOOT_CFG_LOCK
0x470[4]	SD3 VOLTAGE SELECTION	1	The fuse bit to change the voltage selection for the SD3 pads. When set to ROM, it selects 1.8 V for SD3. Otherwise, it is 3.3 V.	0 - 3.3 V 1 - 1.8 V	BOOT_CFG_LOCK

Table continues on the next page...

Table 5-6. Fusemap descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Settings	Locked by
0x470[5]	SD1 VOLTAGE SELECTION	1	The fuse bit to change the voltage selection for the SD1 pads. When set to ROM, it selects 1.8 V for SD3. Otherwise, it is 3.3 V.	0 - 3.3 V 1 - 1.8 V	BOOT_CFG_LOCK
0x470[6]	SD1_RST_POLARITY_SELECT	1	Select the reset polarity for SD1	0 - Reset active low 1 - Reset active high	BOOT_CFG_LOCK
0x470[7]	DLL Override	1	Select the DLL mode for SD/eMMC	0 - DLL Slave Mode for SD/eMMC 1 - DLL Override Mode for SD/eMMC	BOOT_CFG_LOCK
0x470[8]	USDHC IOMUX SRE Enable	1	The fuse bit is used for the ROM to enable the SRE bit for the SD pads.	0 - Disable 1 - Enable	BOOT_CFG_LOCK
0x470[9]	USDHC_IOMUX_SION_BIT_ENABLE	1	The fuse bit is used for the ROM to enable the SION bit for the MUX control register.	0 - Disable 1 - Enable	BOOT_CFG_LOCK
0x470[10]	Boot Failure Indication Pin Select[4]	1	Indicates a boot failure	00000 - gpio1.IO00 00001 - gpio1.IO01 ... 11111 - gpio1.Io31 NOTE: Pins to which the gpio1.IOxx is muxed by default.	BOOT_CFG_LOCK
0x470[11]	ENABLE_EMMC_22K_PULLUP	1	The fuse bit is used for the ROM to enable the 22 K pullup for the SD pads.	0 - 47 K pullup 1 - 22 K pullup	BOOT_CFG_LOCK
0x470[12]	USDHC_PAD_PULL_DOWN	1	The fuse bit is used for the ROM to enable the pull down bit for the SD pads.	0 - no action 1 - pull down	BOOT_CFG_LOCK
0x470[13]	SDMMC_HYS_EN	1	When this fuse is blown, the [HYS] bit of IOMUXC_SW_PAD_CTL_PAD_SDx_CLK x is the SD port from which the ROM boots. IOMUXC_SW_PAD_CTL_PAD_SDx_CMD, IOMUXC_PAD_CTL_PAD_SDx_DAT0-n 9n will be 0, 3, or 7, depends on the bus width selected) will be set.		BOOT_CFG_LOCK
0x470[14]	eMMC 5.0 - RESET TO PRE-IDLE STATE	1	Once this fuse be blown, the CMD0 with argument 0xf0f0f0 will be sent to put the eMMC card into PRE-		BOOT_CFG_LOCK

Table continues on the next page...

Table 5-6. Fusemap descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Settings	Locked by
			IDLE state, so that eMMC card's fast boot can work properly. This is useful for the warm boot, such as boot due to the WDOG reset.		
0x470[15]	SD2_RST_POLARITY_SELECT	1	Select reset polarity for SD2	0 - Reset active low 1 - Reset active high	BOOT_CFG_LOCK
0x460[19:16]	Boot Failure Indication Pin Select[3:0]	4	Miscellaneous power management configuration bits	00000 - gpio1.IO00 00001 - gpio1.IO01 ... 11111 - gpio1.Io31 NOTE: Pins to which the gpio1.IOxx is muxed by default.	BOOT_CFG_LOCK
0x470[20]	BT_LPB_POLARITY	1	Define the GPIO3 polarity to determine the LPB boot mode.	0 - Active High 1 - Active Low	BOOT_CFG_LOCK
0x470[22:21]	LPB_BOOT	2	Define the LowPower Boot options	(Core / DDR- Bus) 00 - LPB Disable 01 - 1 GPIO (def freq) 01 - Div by 2 11 - Div by 4	BOOT_CFG_LOCK
0x470[30:24]	MMC_DLL_DLY[6:0]	7	eMMC 4.4/4/41 delay line default value (set by boot rom), used in conjunction with "DLL Override" = 1 (BOOT_CFG3[3])	Connected to the LVDS module	BOOT_CFG_LOCK
0x470[31]	DOUBLE_GPT_DELAY_ENABLE	1	Enable double GPT delay time	0 - Disabled 1 - Enabled	BOOT_CFG_LOCK
0x4F0[15:0]	USB_VID[31:0]	16	USB VID		ANALOG_LOCK
0x4F0[31:16]	USB_PID[31:0]	16	USB VID		ANALOG_LOCK
0x580[31:0]	SRK_HASH[255:0]	256	SRK key, no hardware visible lines. No hardware visible signals are available.		SRK_LOCK
0x600[23:0]	SJC_RESP[55:0]	56	Response reference value for the secure JTAG controller		SJC_RESP_LOCK (locks also for read and explicit sense)
0x660[31:0]	GP1[31:0]	32	General-Purpose fuse register #1		GP1_LOCK
0x670[31:0]	GP2[31:0]	32	General-Purpose fuse register #2		GP2_LOCK

Table continues on the next page...

Table 5-6. Fusemap descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Settings	Locked by
0x680[31:0]	SW_GP[159:0]	160	Software general-purpose key		SW_GP_LOCK
0x6D0[5:0]	PAD_SETTINGS	6	Used with conjunction of MMC/SD/NAND "Override Pad Settings" fuse value, as follows: 0 - Use IO default settings for boot device IO pads 1 - Use "Override" value, as set by this register	IO pads settings of the selected boot interface are overridden with these fuses, as follows: [0] - Slew Rate [3:1] - Drive Strength [5:4] - Speed Settings Refer to the IO PAD section for the "Settings" field value	MISC_CONF_LOCK
0x6D0[6]	USB_VBUS_EVENT_HANDLER_EN	1	The ROM handles the USB VBUS attach/detach event	0 - The ROM does not handle the USB VBUS attach/detach event 1 - ROM handles the USB VBUS attach/detach event	MISC_CONF_LOCK
0x6D0[7]	Enable Boot Failure Indication Pin	1	Enable Boot Failure Indication Pin	0 - disabled 1 - enabled	MISC_CONF_LOCK
0x6D0[11:8]	READ_RETRY_SEQUENCE_ID	1	Choose read retry sequence	0000 - Do not use the read retry (RR) sequence embedded in the ROM 0001 - Micron 20 nm RR sequence 0010 - Toshiba A19 nm RR sequence 0011 - Toshiba 19 nm RR sequence 0100 - SanDisk 19 nm RR sequence 0101 - SanDisk 1 ynm RR sequence Others - Reserved	MISC_CONF_LOCK

Fusemap Descriptions Table

Chapter 6

External Memory Controllers

6.1 Overview

This chip has these external memory interfaces and controllers:

- Multi-Mode DDR Controller (MMDC)

6.2 Multi-mode DDR controller (MMDC) overview and feature summary

The MMDC module is a DDR controller that supports several types of DDR memories.

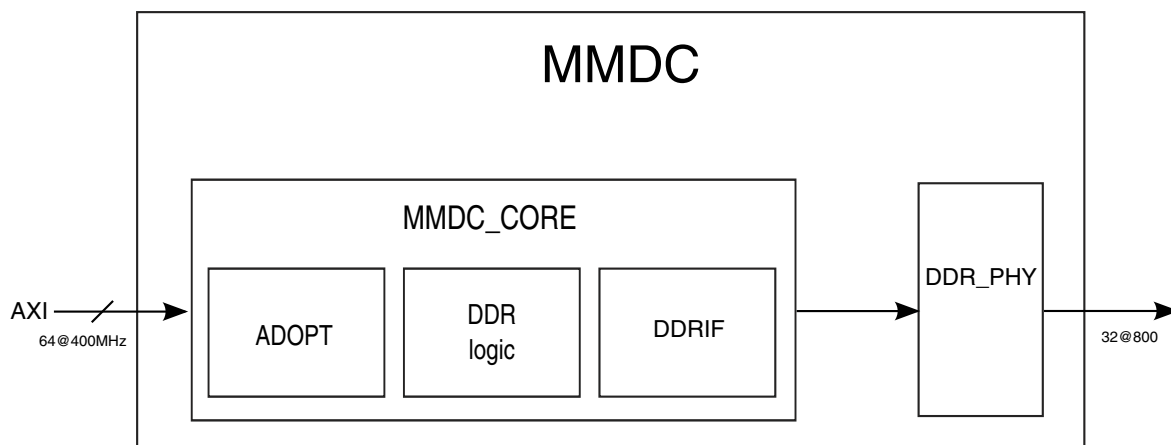

Figure 6-1. MMDC block diagram

Table 6-1. MMDC feature summary

Feature	Description
Supported standards	<ul style="list-style-type: none"> • LPDDR3 x32 • LPDDR2 1ch x32
DDR interface	<ul style="list-style-type: none"> • x16, x32 data bus width • Density of 256 MB-4 GB <ul style="list-style-type: none"> • Column size of 8-12 bits • Row size of 11-16 bits • Up to 2 GB address space and configurable address space per CS. • Supports burst length of 8 (aligned) for LPDDR3 and burst lengths of 4 for LPDDR2
DDR performance	<ul style="list-style-type: none"> • LPDDR3 and LPDDR2 running at 400 MHz (800 MT/s) • Supports Real-Time priority by means of QoS the sideband priority signals from the chip to enable different priority levels in the re-ordering mechanism • Page hit/page miss optimizations • Consecutive read/write access optimizations • Supports deep read and write requests queues to enable bank prediction • Drives back the critical word in a read transaction as soon as it is received by the DDR device (doesn't wait until the whole data phase has been completed) • Can track open memory pages • Supports bank interleaving • Special optimization for non-aligned wrap accesses in burst length 8
AXI interface	<ul style="list-style-type: none"> • AXI bus compliant with glueless interface to PL301 AXI network interconnect • Supports bus transfers of 8, 16, and 32 bits (single accesses and bursts) running at 400 MHz
DDR calibration and delay-lines	<ul style="list-style-type: none"> • All calibrations can be done automatically by hardware or manually by software. • ZQ calibration for an external DDR device (in LPDDR2 and LPDDR3 through the MRW command). <ul style="list-style-type: none"> • Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh). • Can be handled manually at ZQ INIT.
DDR general	<ul style="list-style-type: none"> • Configurable timing parameters • Configurable refresh scheme • Supports dynamic voltage, frequency change, and low-power mode entry through hardware negotiation with the system (req/ack handshake) • Supports automatic self-refresh and power down entry and exit • Supports MRW and MRR commands for LPDDR2 and LPDDR3 • Software control for moving to derated timing parameters and derated refresh rate according to the temperature variation. • Supports various debug and profiling modes

Chapter 7

System Debug

7.1 Overview

This section describes the hardware and software debug and application development features and resources of the chip. It describes the following:

- Core/platform-specific resources
- Resources associated with complex IP blocks
- Chip-wide resources
- Interface to the external debug and development tools

The debug and trace architecture is designed around the following:

- ARM CoreSight architecture, adapted to i.MX 6SLL SoC (for 1x core debug), including a cross-trigger subsystem for cross-domain triggering of debug resources
- JTAG port used to interact with core under the debug by means of SJC, the system JTAG controller port
- DAP, the debug access port that supports the interface to the ARM RealView Debugging tools and other third-party tools
- TPIU, a trace port interface unit that efficiently accesses the program trace information from the system
- Various chip-wide resources, such as debug features built into the IP blocks and critical signal visibility available through alternate pin functions or observability muxes

7.2 Chip and ARM Platform Debug Architecture

The ARM Debug architecture is based on the CoreSight architecture by ARM. The CoreSight architecture provides a system-wide solution to real-time debug and trace.

The CoreSight architecture is embodied in a set of CoreSight components and compliant processors that form the CoreSight systems. Its architecture maintains the traditional requirements of debug and trace:

- To access the debug functionality without software interaction
- To connect to a running system without performing a reset

Full access to the processor debug capability is available by the ARM debug register map through the Advanced Peripheral Bus (APB) slave port. The core includes a Processor Debug Unit which stops program execution, examines and alters the processor and coprocessor state, examines and alters the memory and input/output peripheral state, and restarts the processor core.

7.2.1 Debug Features

- CoreSight Program Trace Macrocell (PTM): trace generator for the ARM Cortex-A9 core
- Support for a TrustZone-related 3-level debug scheme:
 - Debug in Non-Secure privileged and user, and Secure user
 - Debug in Non-Secure only
- EmbeddedICE-RT logic
 - Support for both the monitor-mode and halt-mode debugging:
 - Core run/halt control, debug status/control
 - Breakpoint/watchpoint control
 - Core-mapped and memory-mapped resource examination/modification
- Data communication channel between the ARM core and the host debugger via JTAG and the Debug Access Port (DAP) module
- PMU (Performance Metrics Unit) used for system profiling and debug
- CP15 register for debugging the MMU, I and D L1 cache, and TLB
- PL310 L2 cache provides an event monitoring signal routed to pins for visibility to help in system debug

The chip includes ARM CoreSight components for multicore debug and trace solutions.

See the following figure for the ARM debug architecture scheme.

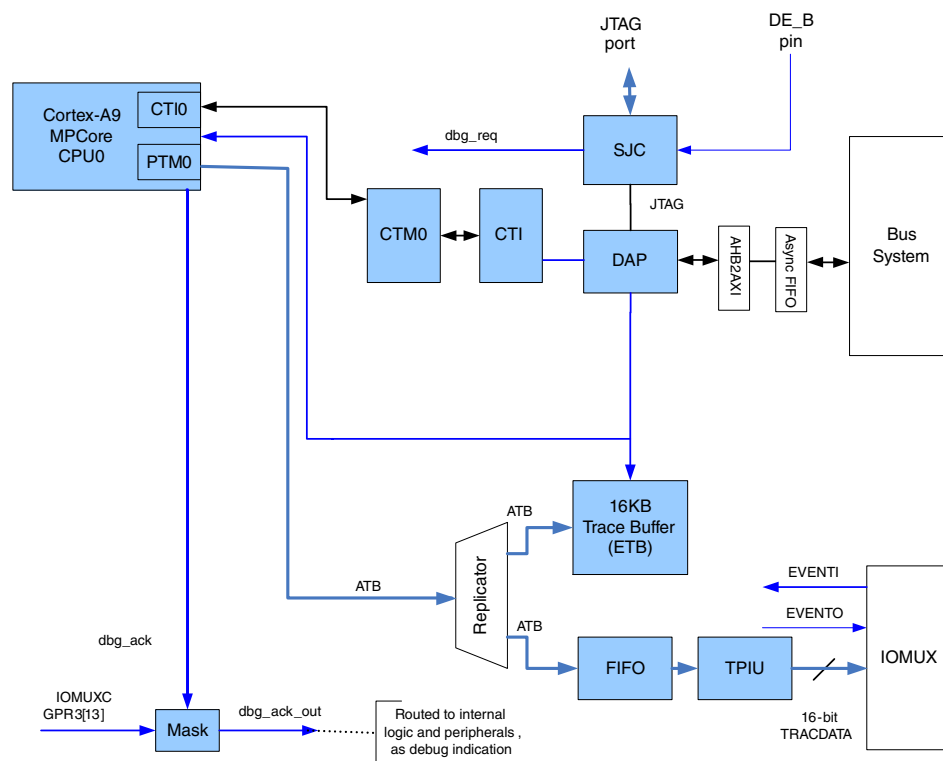

Figure 7-1. i.MX 6SLL Cortex-A9 platform debug architecture

7.2.2 Debug system components

The CoreSight components include:

- **Embedded Trace Buffer (ETB)**: RAM array to be used for on-chip capture of trace data output from the PTM
- **ATB Replicator** to connect the trace data to TPIU (Trace Port Interface) and ETB (Embedded Trace Buffer)
- **Cross Triggering logic** for event routing, including CTIs and CTMs

Other related IPs and functionality:

- ROMPATCH module to support modification of program/data information in the MCU ROM
- Debug Visibility which selects critical signals routed to the I/O pads as alternate outputs for external visibility

7.2.2.1 AMBA Trace Bus (ATB)

ATB transfers trace data through the chip CoreSight infrastructure. The trace sources are ATB masters and the sinks are ATB slaves. The ARM (via PTM) cores are the data generators. Link components such as the Trace Funnel and Replicator provide both the master and slave interfaces.

The ATB protocol supports:

- Stalling of trace sources to enable the CoreSight components to funnel and combine the sources into a single trace stream
- Association of the trace data with the generating source using trace source IDs. The CoreSight system can trace up to 111 different items at any time
- Capture and transfer of multiple byte bus widths, currently to 32 bits
- A flushing mechanism to force the historic trace to drain from any sources, links, or sinks up to the point that the request is initiated

7.2.2.2 ATB replicator

The ATB replicator enables two trace sinks to be wired together and to operate from the same incoming trace stream.

There are no programmable registers. This component is invisible to the user on a particular trace path, from source to sink.

- Incoming ATB Interface—the ATB replicator accepts the trace data from the trace source, either directly or through a trace funnel.
- Outgoing ATB Interfaces—the ATB replicator sends identical trace data on the outgoing master port interfaces.

7.2.2.3 Embedded Cross Triggering

The ECT is a modular component from ARM Limited that supports the interaction and synchronization of multiple triggering events within a chip. The main function of the ECT (CTI and CTM) is to pass debug events from one core to another. For example, the ECT can communicate the debug state information from one core to another, so that the program execution can be stopped on both processors at the same time (if required).

The ECT consists of these types of modules:

- Cross Trigger Interfaces (CTI)
- Cross Trigger Matrix (CTM)

The cross trigger interfaces provide the interface between the component or subsystem and the cross trigger matrix. The system requires a CTI for each subsystem that supports cross triggering. The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events. When the CTI receives a channel event, it maps it onto a trigger output. This enables the subsystems to cross trigger with each other. The reception and transmission of triggers is performed through the trigger interface.

The Cross Trigger Matrix (CTM) combines the trigger requests generated from the CTIs and broadcasts them to all CTIs as channel triggers. The CTM controls the distribution of channel events. It provides the Channel Interfaces (CIs) to connect to either the CTIs or CTMs. This enables multiple CTIs to be linked together. The ECT is composed of three/five CTIs (Cross Trigger Interface) and two CTMs (Cross Trigger Matrix). The ECT is key in the multi-core and multi-IP debug strategy. The outcome is a software-controlled debug signal matrix that receives signals from various sources (cores and peripherals) and propagates/ routes them to the different debug resources of the SoC. These debug resources include the time-stamping capability, profiling capabilities, real-time trace (trace enabled or disabled), triggers, SOC level multiplexing, and debug interrupts.

NOTE

Because the ECT should only be used during the debug sessions, it is disabled by default.

The chip's cross-triggering architecture consists of 2xCTMs and 2 CTIs cover the basic groups of functionality:

- CTI 0 - for ARM core

7.2.2.3.1 Cross-Trigger Matrix (CTM)

The CTM (Cross-Trigger Matrix) is provided by ARM. A brief description is provided below. See the ARM documentation for more details.

The CTM is a relatively simple block with no configuration options. There are two CTM instances in i.MX 6SLL in the ARM platform.

One of them is used to route 1x Core's CTI's, while the second one is used for the additional CoreSight CTIs. Each CTI has four channel lines, to which the CTI events are mapped. The exact mapping is configured in the CTI logic.

7.2.2.3.2 Cross-Trigger Interface (CTI)

The Cross-Trigger Interface (CTI) component is provided by ARM. A brief description of the CTI is provided below.

There are 2 CTIs in the chip's ARM platform. One is of which, dedicated to the single core, while the 2nd is used for various other signals routing.

Each of these CTIs has 8 trigger inputs and 8 trigger outputs that connect to logic in the domain to be debugged or profiled. Each CTI also includes a 4 channel interface to the CTM (4 inputs and 4 outputs).

For more information, see [ARM platform chapter](#).

7.2.2.4 Debug Access Port (DAP)

The DAP enables debug access to the chip modules through APB-AP (the APB access port) and APB-Mux (the APB multiplexer).

AHB-AP provides system access. Debug tools can use JTAG to connect to the chip.

DAP has the following features:

- AMBA 3 Peripheral Bus Multiplexor access through AMBA 3 APB Access Port, providing debug peripheral access through the APB interface.
- External JTAG access using the JTAG Debug Port (JTAG-DP).
- Internal chip module access using:
 - AHB Access Port (AHB-AP)
 - APB Access Port (APB-AP)
 - JTAG Access Port (JTAG-AP)

APB-Mux enables system access to CoreSight components connected to the Debug APB.

The ROM table provides a list of memory locations of CoreSight components connected to the Debug APB. This is visible from both tools and system access and one configures it during system implementation.

External read/write access to the internal interface is provided by JTAG-DP. JTAG-DP provides a standard interface for debug access to the chip through DAP. It interfaces to the DAP internal bus.

Internal access to on-chip buses and other interfaces are provided by the access ports (APs). The available APs are:

- AHB-AP which provides an AHB-Lite master for access to a system AHB bus.
- APB-AP which provides an AMBA 3 APB master for access to the Debug APB that configures all CoreSight components.
- JTAG-AP which provides JTAG access to on-chip components and operates as a JTAG master port to drive JTAG chains throughout the chip.

7.2.3 Chip-Specific SJC Features

7.2.3.1 JTAG Disable Mode

In addition to three different JTAG security modes that are implemented internally in the System JTAG Controller (SJC), there is an option to disable the SJC functionality by e-fuse configuration.

This creates additional JTAG mode "JTAG Disabled" with highest level of JTAG protection. In this mode all JTAG features are disabled. Specifically, the following debug features are disabled in addition to the features that were already disabled in "No Debug" JTAG mode:

- Non-Secure JTAG control registers (PLL configuration, Deterministic Reset, PLL bypass)
- Non-Secure JTAG status registers (Core status)
- Chip Identification Code (IDCODE)

7.2.3.2 JTAG ID

Table 7-1. i.MX JTAG ID

Device	Silicon revision	JTAG ID
i.MX 6SLL	Rev 1.0	088C_201Dh

7.2.4 System JTAG Controller - SJC

The SJC module is the bridge between external development and test instrumentation and the internal JTAG-accessible debug and test resources.

It implements and manages the daisy-chained topology consisting of its own TAP and those of the SDMA, and the ARM Debug Access Port (DAP).

NOTE

Single Wire Debug (SWD) protocol is not supported.

7.2.5 System JTAG controller main features

- IEEE P1149.1, 1149.6 (standard JTAG) interface to off-chip test and development equipment
 - Includes an SJC-only mode for true IEEE P1149.1 compliance, used primarily for board-level implementation of boundary scan.
 - Supports IEEE P1149.6 extensions to the JTAG standard for AC testing of selected I/O signals.
- Debug-related control and status; putting selected cores into reset and/or debug mode and monitoring individual core status signals by means of JTAG
- System status, such as the state of the PLLs (locked or not locked)
- Three levels of security, ranging from no security to no JTAG accessibility to the chip

7.2.6 SJC TAP Port

The SJC supports the following standard JTAG pins:

- TRSTB
- TDI
- TDO
- TCK
- TMS

7.2.7 SJC main blocks

- Interface to the outside world via the standard JTAG pins
- Interface to the external Debug_Event pin
- A master TAP controller which implements the standard JTAG state machine

- Implementation of the mandatory and optional IEEE P1149.1 (JTAG) instructions
 - Mandatory: "EXTEST", "SAMPLE/PRELOAD", and "BYPASS"
 - Optional: "ID_CODE" (SOC JTAG ID register), "HIGHZ"
- Supports the SDMA's DR-path-only JTAG architecture by implementing the controller portion of its TAP (including "BYPASS" as the default state) within the SJC
- The ExtraDebug registers, which implement a variety of control and status features
 - Three 32-bit insecure general purpose status registers
 - Two 32-bit secure status registers - one predefined, one general purpose.
 - Control and status registers for debug, core, charge pump, and PLL.
- Four levels of fuse-defined security, ranging from no security to no access.

Both predefined and user-defined control and status functions are supported by the SJC.

7.3 Smart DMA (SDMA) core

SDMA is a dedicated, programmable DMA engine. It is an integration of a 32-bit RISC core and DMA-specific hardware. It includes ports for the AP domain and a peripheral domain, along with a burst-capable port for direct external memory access.

NOTE

The SDMA and its integration in the chip is unchanged from previous i.MX chips.

The main SDMA debug features are:

- OnCE - On Chip Emulator, provides the following capabilities:
 - SDMA core control - run/halt/single-step
 - SDMA core register/memory-map access
 - Event detection, watchpoints, and hardware breakpoints
 - Real time buffer and PC trace buffer capability
- Trace buffer
 - Contains information to identify the 32 last changes of flow detected during a program execution
- Context dump
 - Includes information about all the channel dump activity
 - Current contents of SDMA RAM
- ROMPATCH

7.3.1 SDMA On Chip Emulation Module (OnCE) Feature Summary

The SDMA debug features are primarily defined by the OnCE portion of its design.

They are summarized as follows:

- **Memory And Register Access** - dedicated logic enables user-access to SDMA memory and register locations. These accesses are supported only when the processor is in debug mode.
- **Event Detection Unit** - watches signals from the data memory bus (DMBus) which is used by the RISC core to access its RAM, ROM, and memory-mapped registers
- **Watchpoints** - one output signal is available to watch event matching conditions at the chip level. Match conditions are defined by programming memory-mapped registers.
- **Hardware Breakpoint** - a counter is decremented after an event detection. A debug request is sent to the SDMA core only when the counter reaches the value of zero. It is possible to program the initial value of the counter or to disable the use of the counter if a debug request must be generated after each event detection.
- **Real Time Buffer** - The Real Time Buffer Register (RTB) is a single 32-bit memory-mapped register which can be accessed as a regular memory location during program execution. It is used to store and retrieve run time information without putting the SDMA in debug mode. Each write to this register causes an event. This register is, in fact, located in the OnCE. Executing through JTAG, a buffer command exports the content of this register through the JTAG port.
- **Core Control (Core Status / Single Stepping)** - Commands are provided to monitor and control processor activity. The commands can halt the core, rerun the core from another address location, and get processor status.
- **Trace Buffer** - a 32x32 buffer which records the last 32 changes of flow during program execution. The buffer stores data in a modulo fashion (i.e. the 33rd instruction change replaces the 1st). Captured trace information is retrieved via reads to the Trace Buffer Register.

7.3.1.1 Other SDMA Debug Functionality

- **Core Trace** - basic core trace capability is available through debug visibility functionality only. PTM trace capability does not exist.
- **ROM Patch** - can be accomplished by manipulating the CHN0ADDR register through JTAG or via the MCU's ability to write to SDMA OnCE registers. This must be done right after reset and before the SDMA core is enabled to begin processing events.
- **Additional debug control/status interaction with the SJC module**

- SJC-controlled Debug Request
- SJC-readable Debug Acknowledge (in debug mode)
- Debug clock control - allows SJC to force clocks on for debug purposes
- Debug core state (SDMA RISC Core State) - 4 bits accessible from the SJC via JTAG

7.3.1.2 SDMA ROM Patching

After reset, the SDMA is in its IDLE_AFTER_RESET mode. A debug request also puts the SDMA in its DEBUG_IN_IDLE_AFTER_RESET mode. The new address boot must be stored in CHN0ADDR register (e.g., through the SDMA OnCE via debugger).

The user must then issue the `exec_core <instruction> SDMA OnCE` instruction to return to the IDLE_AFTER_RESET mode. The very first instructions of the boot code fetches the contents of this register (which is also mapped in the SDMA memory space) and jumps to the given address.

7.4 Miscellaneous

The Miscellaneous function described in this section provide useful general capabilities.

7.4.1 Clock/Reset/Power

CDBGPWRUPREQ and CDBGPWRUPACK are the handshake signals between the DAP and the clock control module to ensure debug power and clocks are turned on. If the debug components are always powered on, the handshake becomes a mechanism to turn debug clocks on. Similarly, there is a register bit in the CCM which allows internal software to turn debug clocks on as well because the CDBGPWRUPREQ is in the TCLK domain and is inaccessible to software.

The Cortex-A9 and VSP cores can receive resets from the following sources:

- Debug Reset (CDBGGRSTREQ bit within the SWJ-DP CTRL/STAT register of the DAP) in the TCLK domain. This allows the debug tools to reset the debug logic.
- System POR reset

7.5 Supported tools

DS-5 ARM Debugger is supported.

Supported tools

The debugger is connected to the chip from the host by the DS-5 ICE protocol converter. Other third party tools can be used via the standard JTAG interface, but may need to be adapted for individual IC. It is important to check with tool vendors for specific tool requirements, especially for on-chip IC.

Chapter 8

System Boot

8.1 Overview

The boot process begins at the Power-On Reset (POR) where the hardware reset logic forces the ARM core to begin the execution starting from the on-chip boot ROM.

The boot ROM code uses the state of the internal register `BOOT_MODE[1:0]` as well as the state of various eFUSEs and/or GPIO settings to determine the boot flow behavior of the device.

The main features of the ROM include:

- Support for booting from various boot devices
- Device Configuration Data (DCD) and plugin
- Digital signature High-Assurance Boot (HAB)
- Wake-up from the low-power modes

The boot ROM supports these boot devices:

- SD/MMC
- Serial (SPI) NOR flash

The boot ROM uses the state of the `BOOT_MODE` and eFUSEs to determine the boot device. For development purposes, the eFUSEs used to determine the boot device may be overridden using the GPIO pin inputs.

The boot ROM code also allows to download the programs to be run on the device. The example is a provisioning program that can make further use of the serial connection to provide a boot device with a new image. Typically, the provisioning program is downloaded to the internal RAM and allows to program the boot devices, such as the SD/MMC flash. The ROM serial downloader uses a high-speed USB in a non-stream mode connection.

The Device Configuration Data (DCD) feature allows the boot ROM code to obtain the SOC configuration data from an external program image residing on the boot device. As an example, the DCD can be used to program the DDR controller for optimal settings, improving the boot performance. The DCD is restricted to the memory areas and peripheral addresses that are considered essential for the boot purposes (see [Write data command](#)).

A key feature of the boot ROM is the ability to perform a secure boot, also known as a High-Assurance Boot (HAB). This is supported by the HAB security library which is a subcomponent of the ROM code. The HAB uses a combination of hardware and software together with the Public Key Infrastructure (PKI) protocol to protect the system from executing unauthorized programs. Before the HAB allows the user image to execute, the image must be signed. The signing process is done during the image build process by the private key holder and the signatures are then included as a part of the final program image. If configured to do so, the ROM verifies the signatures using the public keys included in the program image. A secure boot with HAB can be performed on all boot devices supported on the chip in addition to the serial downloader. The HAB library in the boot ROM also provides the API functions, allowing the additional boot chain components (bootloaders) to extend the secure boot chain. The out-of-fab setting for the SEC_CONFIG is the open configuration, in which the ROM/HAB performs the image authentication, but all authentication errors are ignored and the image is still allowed to execute.

8.2 Boot modes

During reset, the chip checks the power gating controller status register.

During boot, the core's behavior is defined by the boot mode pin settings, as described in [Boot mode pin settings](#). When waking up from the low-power boot mode, the core skips the clock settings. The boot ROM checks that the PERSISTENT_ENTRY0 (see [Persistent bits](#)) is a pointer to a valid address space (OCRAM, DDR, or EIM). If the PERSISTENT_ENTRY0 is a pointer to a valid range, it starts the execution using the entry point from the PERSISTENT_ENTRY0 register. If the PERSISTENT_ENTRY0 is a pointer to an invalid range, the core performs the system reset.

8.2.1 Boot mode pin settings

The device has four boot modes (one is reserved for NXP use). The boot mode is selected based on the binary value stored in the internal BOOT_MODE register.

The BOOT_MODE is initialized by sampling the BOOT_MODE0 and BOOT_MODE1 inputs on the rising edge of the POR_B. After these inputs are sampled, their subsequent state does not affect the contents of the BOOT_MODE internal register. The state of the internal BOOT_MODE register may be read from the BMOD[1:0] field of the SRC Boot Mode Register (SRC_SBMR2). The available boot modes are: Boot From Fuses, serial boot via USB, and Internal Boot. See this table for settings:

Table 8-1. Boot MODE pin settings

BOOT_MODE[1:0]	Boot Type
00	Boot From Fuses
01	Serial Downloader
10	Internal Boot
11	Reserved

8.2.2 High-level boot sequence

The figure found here show the high-level boot ROM code flow.

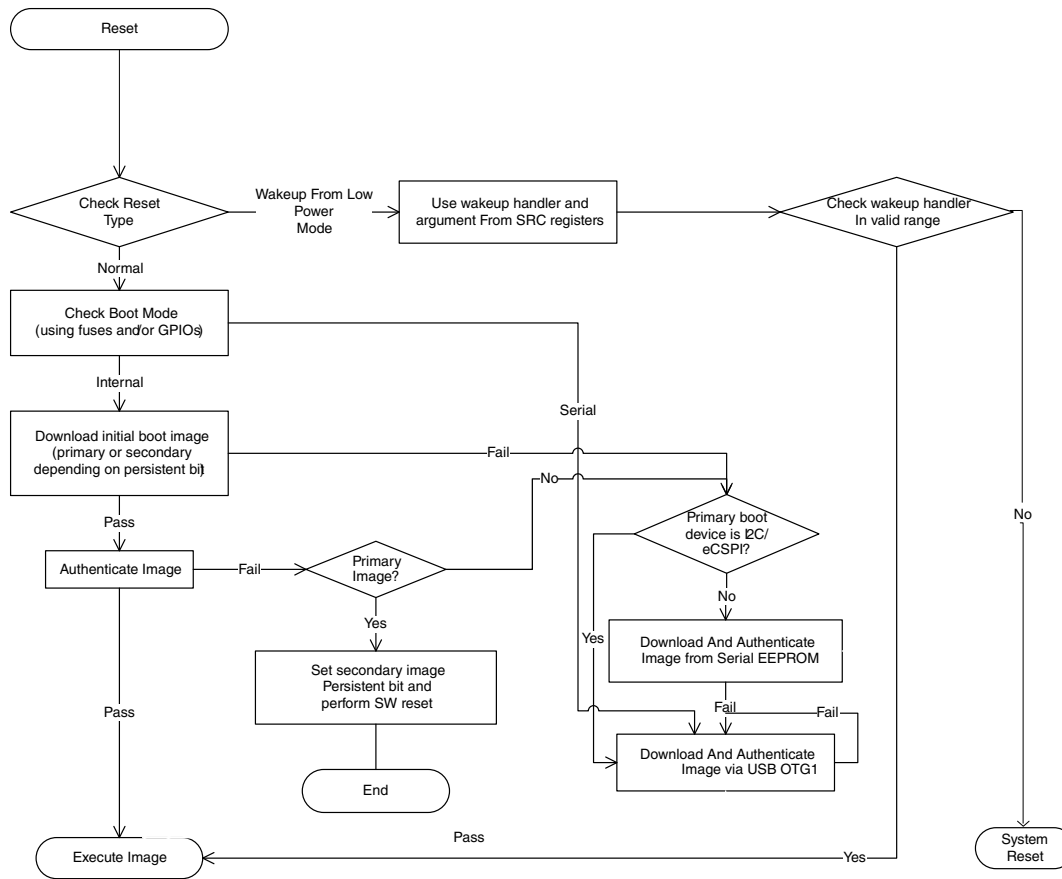

Figure 8-1. Boot flow

8.2.3 Boot From Fuses mode (BOOT_MODE[1:0] = 00b)

A value of 00b in the BOOT_MODE[1:0] register selects the Boot From Fuses mode.

This mode is similar to the Internal Boot mode described in [Internal Boot mode \(BOOT_MODE\[1:0\] = 0b10\)](#) with one difference. In this mode, the GPIO boot override pins are ignored. The boot ROM code uses the boot eFUSE settings only. This mode also supports a secure boot using HAB.

If set to Boot From Fuses, the boot flow is controlled by the BT_FUSE_SEL eFUSE value. If BT_FUSE_SEL = 0, indicating that the boot device (for example, flash, SD/MMC) was not programmed yet, the boot flow jumps directly to the Serial Downloader. If BT_FUSE_SEL = 1, the normal boot flow is followed, where the ROM attempts to boot from the selected boot device.

The first time a board is used, the default eFUSES may be configured incorrectly for the hardware on the platform. In such case, the Boot ROM code may try to boot from a device that does not exist. This may cause an electrical/logic violation on some pads. Using the Boot From Fuses mode addresses this problem.

Setting the BT_FUSE_SEL=0 forces the ROM code to jump directly to the Serial Downloader. This allows a bootloader to be downloaded which can then provision the boot device with a program image and blow the BT_FUSE_SEL and the other boot configuration eFUSES. After the reset, the boot ROM code determines that the BT_FUSE_SEL is blown (BT_FUSE_SEL = 1) and the ROM code performs an internal boot according to the new eFUSE settings. This allows the user to set BOOT_MODE[1:0]=00b on a production device and burn the fuses on the same device (by forcing the entry to the Serial Downloader), without changing the value of the BOOT_MODE[1:0] or the pullups/pulldowns on the BOOT_MODE pins.

8.2.4 Serial Downloader

The Serial Downloader provides a means to download a program image to the chip over the USB serial connection.

In this mode, the ROM programs the WDOG1 for a 90-second time-out if the WDOG_ENABLE eFuse is 1 and continuously polls for the USB connection. If no activity is found on the USB OTG1 and the watchdog timer expires, the ARM core is reset.

NOTE

After the downloaded image is loaded, it is responsible for managing the watchdog resets properly.

This figure shows the USB boot flow:

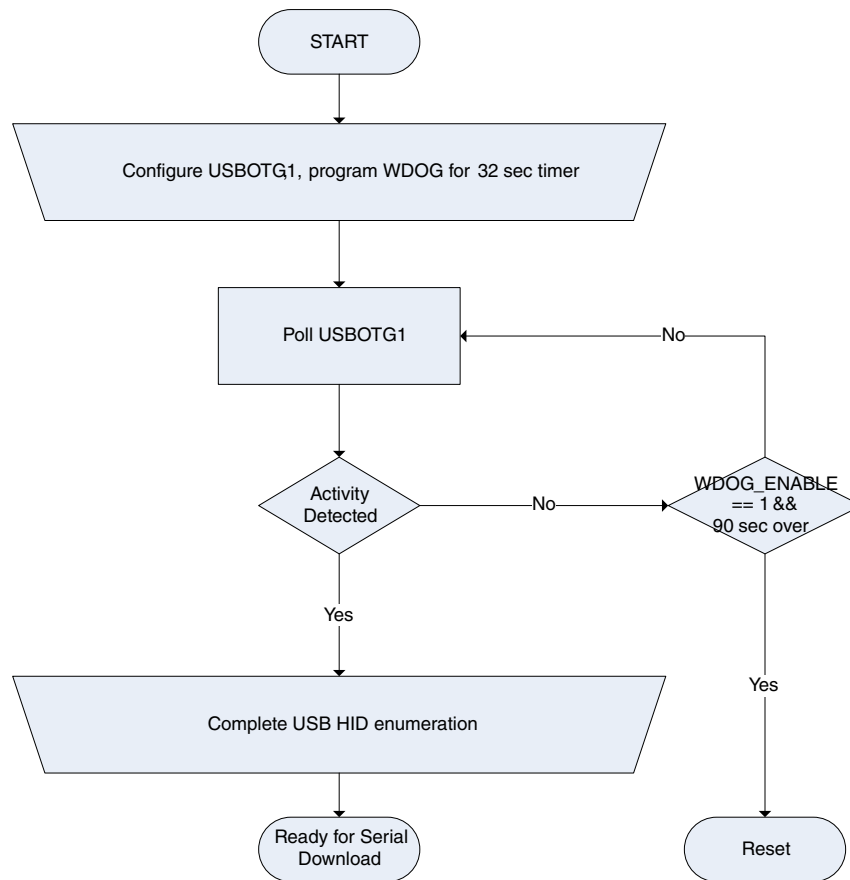

Figure 8-2. Serial Downloader boot flow

8.2.5 Internal Boot mode (BOOT_MODE[1:0] = 0b10)

A value of 0b10 in the BOOT_MODE[1:0] register selects the Internal Boot mode. In this mode, the processor continues to execute the boot code from the internal boot ROM.

The boot code performs the hardware initialization, loads the program image from the chosen boot device, performs the image validation using the HAB library (see [Boot security settings](#)), and then jumps to an address derived from the program image. If an error occurs during the internal boot, the boot code jumps to the Serial Downloader (see [Serial Downloader](#)). A secure boot using the HAB is possible in all the three boot modes.

When set to the Internal Boot, the boot flow may be controlled by a combination of eFUSE settings with an option of overriding the fuse settings using the General Purpose I/O (GPIO) pins. The GPIO Boot Select FUSE (BT_FUSE_SEL) determines whether the ROM uses the GPIO pins for a selected number of configuration parameters or eFUSES in this mode.

- If BT_FUSE_SEL = 1, all boot options are controlled by the eFUSEs described in [Table 8-2](#).
- If BT_FUSE_SEL = 0, the specific boot configuration parameters may be set using the GPIO pins rather than eFUSEs. The fuses that can be overridden when in this mode are indicated in the GPIO column of [Table 8-2](#). [Table 8-3](#) provides the details of the GPIO pins.

The use of the GPIO overrides is intended for development since these pads are used for other purposes in the deployed products. NXP recommends controlling the boot configuration by the eFUSEs in the deployed products and reserving the use of the GPIO mode for the development and testing purposes only.

8.2.6 Boot security settings

The internal boot modes use one of three security configurations.

- **Closed:** This level is intended for use with shipping-secure products. All HAB functions are executed and the security hardware is initialized (the Security Controller or SNVS enters the Secure state), the DCD is processed if present, and the program image is authenticated by the HAB before its execution. All detected errors are logged, and the boot flow is aborted with the control being passed to the serial downloader. At this level, the execution does not leave the internal ROM unless the target executable image is authenticated.
- **Open:** This level is intended for use in non-secure products or during the development phases of a secure product. All HAB functions are executed as for a closed device. The security hardware is initialized (except for the SNVS which is left in the Non-Secure state), the DCD is processed if present, and the program image is authenticated by the HAB before its execution. All detected errors are logged, but have no influence on the boot flow which continues as if the errors did not occur. This configuration is useful for a secure product development because the program image runs even if the authentication data is missing or incorrect, and the error log can be examined to determine the cause of the authentication failure.
- **Field Return:** This level is intended for the parts returned from the shipped products.

NOTE

If the DIR_BT_DIS eFuse is not blown, the authentication may be bypassed. In this case the system is not secure.

8.3 Device configuration

This section describes the external inputs that control the behavior of the Boot ROM code.

This includes the boot device selection (SPI, EIM, NOR, SD, MMC, and so on), boot device configuration (SD bus width, speed, and so on), and other. In general, the source for this configuration comes from the eFUSES embedded inside the chip. However, certain configuration parameters can be sourced from the GPIO pins, allowing further flexibility during the development process.

8.3.1 Boot eFUSE descriptions

This table is a comprehensive list of the configuration parameters that the ROM uses.

Table 8-2. Boot eFUSE descriptions

Fuse	Configuration	Definition	GPIO ¹	Shipped value	Settings ²
DIR_BT_DIS	OEM	Disables the NXP reserved modes. Must be set for the secure boot. .	NA	0	0—The reserved NXP modes are enabled. 1—The reserved NXP modes are disabled.
BT_FUSE_SEL	OEM	In the Internal Boot mode BOOT_MODE[1:0] = 10, the BT_FUSE_SEL fuse determines whether the boot settings indicated by a Yes in the GPIO column are controlled by the GPIO pins or the eFUSE settings in the On-Chip OTP Controller (OCOTP). In the Boot From Fuse mode BOOT_MODE[1:0] = 00, the BT_FUSE_SEL fuse indicates whether the bit configuration eFuses are programmed.	NA	0	If BOOT_MODE[1:0] = 0b10: <ul style="list-style-type: none"> 0—The bits of the SBMR are overridden by the GPIO pins. 1—The specific bits of the SBMR are controlled by the eFUSE settings. If BOOT_MODE[1:0] = 0b00 <ul style="list-style-type: none"> 0—The BOOT configuration eFuses are not programmed yet. The boot flow jumps to the serial downloader. 1—The BOOT configuration eFuses are programmed. The regular boot flow is performed.
SEC_CONFIG[1:0]	SEC_C ONFIG[0] - NXP SEC_C ONFIG[1] - OEM	Security Configuration, as defined in Boot security settings	NA	01	00—Reserved 01—Open (allows any program image, even if the authentication fails) 1x—Closed (The program image executes only if authenticated)
FIELD_RETURN	OEM	Enables the NXP reserved modes.			0—The NXP reserved modes are enabled/disabled based on the DIR_BT_DIS value.

Table continues on the next page...

**Table 8-2. Boot eFUSE descriptions
(continued)**

Fuse	Config uration n	Definition	GPIO ¹	Shipped value	Settings ²
					1—The NXP reserved modes are enabled.
SRK_HASH[255:0]	OEM	256-bit hash value of the super root key (SRK_HASH)	NA	0	Settings vary—used by HAB
UNIQUE_ID[63:0]	NXP	Device Unique ID, 64-bit UID	NA	Unique ID	Settings vary—used by HAB
BT_MMU_DISABLE	OEM	The MMU/L1 D Cache/PL310 disable bit used by the boot ROM for fast HAB processing.	No	0	0—MMU/L1 D Cache/PL310 is enabled by the ROM during the boot. 1—MMU/L1 D Cache/PL310 is disabled by the ROM during the boot.
L1 I-Cache DISABLE	OEM	L1 I Cache disable bit used by the boot during the entire execution.	No	0	0—L1 I Cache is enabled by the ROM during the boot. 1—L1 I Cache is disabled by the ROM during the boot.
BT_FREQ (BOOT_CFG2[2])	OEM	Boot frequency selection	Yes	0	0—ARM—792 MHz, DDR—396 MHz, AXI—264 MHz 1—ARM—528 MHz, DDR—307 MHz, AXI—176 MHz
BOOT_CFG1[7:0]	OEM	Boot configuration 1	Yes	0	Specific to the selected boot mode
BOOT_CFG2[7:0]	OEM	Boot configuration 2	Yes	0	Specific to the selected boot mode
BOOT_CFG4[6:0]	OEM	Boot configuration 4		0	Specific to the selected boot mode
BOOT_CFG4[7]	OEM	Infinite Loop Enable at the start of the boot ROM. Used for debugging purposes. Ignored if the DIR_BT_DIS is 1 and FIELD_RETURN is 0.	Yes	0	0—Disabled 1—Enabled
LPB_BOOT	OEM	USB Low-Power Boot	No	0	00—LPB Disable 01—1 GPIO (default frequencies) 10—Divide by 2 11—Divide by 4
BT_LPB_POLARITY	OEM	USB Low-Power Boot GPIO polarity	No	0	0—Low on the GPIO pad indicates the low-power condition. 1—High on the GPIO pad indicates the low-power condition.
WDOG_ENABLE	OEM	Watchdog reset counter enable	No	0	0—The watchdog reset counter is disabled during the serial downloader. 1—The watchdog reset counter is enabled during the serial downloader.
MMC_DLL_DLY[6:0]	OEM	uSDHC Delay Line settings	No	0	uSDHC Delay Line settings
SRK_REVOKE[2:0]	OEM	SRK revocation mask	No	0	SRK revocation mask

Table continues on the next page...

**Table 8-2. Boot eFUSE descriptions
(continued)**

Fuse	Configuration	Definition	GPIO ¹	Shipped value	Settings ²
DISABLE_SDMMC_MFG	OEM	Disable the SDMMC manufacture mode	No	0	0—enable the SD/MMC MFG mode 1—disable the SD/MMC MFG mode
PAD_SETTINGS	OEM	Override values for the SD/MMC and NAND boot modes	No	0	Override these IO PAD settings: <ul style="list-style-type: none"> PAD_SETTINGS[0]—Slew Rate PAD_SETTINGS[3:1]—Drive Strength PAD_SETTINGS[5:4]—Speed Settings
USE_L2_CACHE_AS_OCRAM (BOOT_CFG1[7])	OEM	L2 cache memory to be configured as OCRAM	Yes	0	0—L2 cache is used as the cache. 1—L2 cache is used as the OCRAM. ³
OVERRIDE_HYS_SDMMC_PADS	OEM	Overrides the HYS bit for the SD pads	No	0	Override the IO PAD setting HYS to 1 for the SD pads.
eMMC_4.4_RESET_TO_PRE-IDLE_STATE	OEM	ROM resets the boot device in the pre-idle state using the eMMC 4.4 feature, CMD0 with the argument value 0xf0f0f0.	No	0	Applicable for booting from the eMMC 4.4 spec or greater version devices. The fuse must not be blown for the eMMC 4.3 or lesser spec version devices.

1. This setting can be overridden by the GPIO settings when the BT_FUSE_SEL fuse is intact. See [GPIO Boot Overrides](#) for the corresponding GPIO pin.
2. 0 = intact fuse and 1= blown fuse
3. L2 cache is locked after the boot to prevent the leaking of cache contents.

8.3.2 GPIO boot overrides

This table provides a list of the GPIO boot overrides:

Table 8-3. GPIO override contact assignments

Package pin	Direction on reset	eFuse
BOOT_MODE1	Input	Boot mode selection
BOOT_MODE0	Input	
LCD_DAT0	Input	BOOT_CFG1[0]
LCD_DAT1	Input	BOOT_CFG1[1]
LCD_DAT2	Input	BOOT_CFG1[2]
LCD_DAT3	Input	BOOT_CFG1[3]
LCD_DAT4	Input	BOOT_CFG1[4]

Table continues on the next page...

Table 8-3. GPIO override contact assignments (continued)

Package pin	Direction on reset	eFuse
LCD_DAT5	Input	BOOT_CFG1[5]
LCD_DAT6	Input	BOOT_CFG1[6]
LCD_DAT7	Input	BOOT_CFG1[7]
LCD_DAT8	Input	BOOT_CFG2[0]
LCD_DAT9	Input	BOOT_CFG2[1]
LCD_DAT10	Input	BOOT_CFG2[2]
LCD_DAT11	Input	BOOT_CFG2[3]
LCD_DAT12	Input	BOOT_CFG2[4]
LCD_DAT13	Input	BOOT_CFG2[5]
LCD_DAT14	Input	BOOT_CFG2[6]
LCD_DAT15	Input	BOOT_CFG2[7]
LCD_DAT16	Input	BOOT_CFG4[0]
LCD_DAT17	Input	BOOT_CFG4[1]
LCD_DAT18	Input	BOOT_CFG4[2]
LCD_DAT19	Input	BOOT_CFG4[3]
LCD_DAT20	Input	BOOT_CFG4[4]
LCD_DAT21	Input	BOOT_CFG4[5]
LCD_DAT22	Input	BOOT_CFG4[6]
LCD_DAT23	Input	BOOT_CFG4[7]

The input pins provided are sampled at boot, and can be used to override the corresponding eFUSE values, depending on the setting of the BT_FUSE_SEL fuse.

8.3.3 Device Configuration Data (DCD)

The DCD is the configuration information contained in the program image (external to the ROM) that the ROM interprets to configure various on-chip peripherals. See [Device Configuration Data \(DCD\)](#) for more details on DCD.

8.4 Device initialization

This section describes the details of the ROM and provides the initialization details.

This includes details on:

- The ROM memory map
- The RAM memory map
- On-chip blocks that the ROM must use or change the POR register default values

- Clock initialization
- Enabling the MMU/L2 cache
- Exception handling and interrupt handling

8.4.1 Internal ROM/RAM memory map

These figures show the iROM memory map:

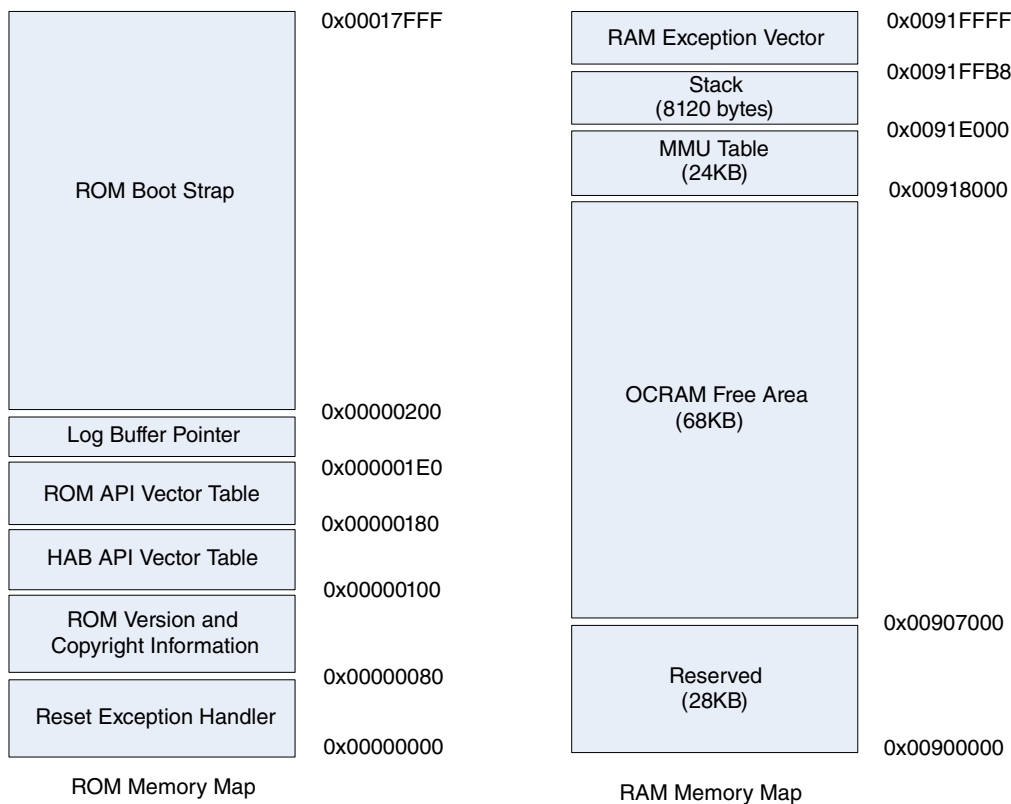

Figure 8-3. Internal ROM and RAM memory map for i.MX 6SLL

NOTE

The entire OCRAM region can be used freely after the boot.

8.4.2 Boot block activation

The boot ROM affects a number of different hardware blocks which are activated and play a vital role in the boot flow.

The ROM configures and uses the following blocks (listed in an alphabetical order) during the boot process. Note that the blocks actually used depend on the boot mode and the boot device selection:

- CCM—Clock Control Module
- ECSPI—Enhanced Configurable Serial Peripheral Interface
- OCOTP_CTRL—On-Chip OTP Controller; the OCOTP contains the eFUSES
- IOMUXC—I/O Multiplexer Control which allows the GPIO use to override the eFUSE boot settings;
- IOMUXC GPR—I/O Multiplexer Control General-Purpose Registers
- DCP—Data Co-Processor module for hash acceleration
- SNVS—Secure Non-Volatile Storage
- SRC—System Reset Controller
- USB—used for the serial download of a boot device provisioning program
- USDHC—Ultra-Secure Digital Host Controller
- WDOG-1—Watchdog timer

8.4.3 Clocks at boot time

The table below show the various clocks and their sources used by the ROM.

Table 8-4. Normal frequency clocks configuration

Clock	Source	Frequency (MHz) BT_FREQ=0	Frequency (MHz) BT_FREQ=1
ARM PLL / PLL1	-	792	792
System PLL / PLL2	-	528	528
USB1 PLL / PLL3	-	480	480
ARM core clock	ARM PLL	792	198
AXI	System PLL PFD2 (PFD396)	198	-
AHB	System PLL PFD2 (PFD396)	132	-
IPG	System PLL PFD2 (PFD396)	66	-
AXI	System PLL PFD0 (PFD307)	-	153
AHB	System PLL PFD0 (PFD307)	-	102
IPG	System PLL PFD0 (PFD307)	-	51

After the reset, each ARM core has access to all peripherals. The ROM code disables the clocks listed in the following table, except for the boot devices listed in the second column.

Table 8-5. List of disabled clocks

Clock name	Enabled for boot device
CCGR0_APBHDMA	
CCGR1_ECSP11	ECSP11
CCGR1_ECSP12	ECSP12

CCGR6_USDHC2	USDHC2
CCGR6_USDHC3	USDHC3

8.4.4 Enabling MMU and caches

The boot ROM includes a feature that enables the Memory Management Unit (MMU) and the caches to improve the boot speed.

The L1 instruction cache is enabled at the start of the image download. The L1 data cache, L2 cache, and MMU are enabled during the image authentication. When the HAB authentication completes, the ROM disables the L1 data cache, L2 cache, and MMU.

The L1 Instruction cache, L1 data cache, L2 cache, and MMU is controlled by eFuse. By default, these features are enabled.

Enabling the MMU when booting non-securely with SEC_CONFIG=Open and setting the CSF pointer in the Image Vector Table to NULL has no impact on the boot performance. With this configuration, it is recommended to blow the BT_MMU_DISABLE fuse.

8.4.5 Exception handling

The exception vectors located at the start of the ROM are used to map all the ARM exceptions (except the reset exception) to a duplicate exception vector table in the internal RAM.

During the boot phase of CPU0, the RAM vectors point to the serial downloader in the ROM.

After the boot, the program image can overwrite the vectors as required. The code shown below is used to map the ROM exception vector table to the duplicate exception vector table in the RAM.

Mapping ROM Exception Vector Table

```
;; Define linker area for ROM exception vector table
AREA IROM_VECTORS, CODE, READONLY
LDR    PC, Reset_Addr
LDR    PC, Undefined_Addr
LDR    PC, SWI_Addr
LDR    PC, Prefetch_Addr
LDR    PC, Abort_Addr
NOP                                ; Reserved vector
LDR    PC, IRQ_Addr
LDR    PC, FIQ_Addr

;; Define exception vector table
Reset_Addr    DCD    start_address
Undefined_Addr DCD    iRAM_Undefined_Handler
SWI_Addr      DCD    iRAM_SWI_Handler
Prefetch_Addr DCD    iRAM_Prefetch_Handler
Abort_Addr    DCD    iRAM_Abort_Handler
              DCD    0 ; Reserved vector
IRQ_Addr      DCD    iRAM_IRQ_Handler
FIQ_Addr      DCD    iRAM_FIQ_Handler

start_address DCD start ;reset handler vector
```

8.4.6 Interrupt handling during boot

No special interrupt-handling routines are required during the boot process. The interrupts are disabled during the boot ROM execution and may be enabled in a later boot stage.

8.4.7 Persistent bits

Some modes of the boot ROM require the registers that keep their values after a warm reset. The SRC General-Purpose registers are used for this purpose.

See this table for persistent bits list and description:

Table 8-6. Persistent bits

Bit name	Bit location	Description
PERSIST_SECONDARY_BOOT	SRC_GPR10[30]	This bit identifies which image must be used—primary and secondary. Used only for the boot modes that support redundant boot.
PERSISTENT_ENTRY0[31:0]	SRC_GPR1[31:0]	Holds the entry function for the CPU0 to wake up from the low-power mode.
PERSISTENT_ARG0[31:0]	SRC_GPR2[31:0]	Holds the argument of entry function for the CPU0 to wake up from the low-power mode.

8.5 Boot devices (internal boot)

The chip supports these boot flash devices:

- SD/MMC/eSD/SDXC/eMMC4.4 via USDHC interface, supporting high capacity cards.
- Serial NOR boot via SPI (serial flash).

The selection of the external boot device type is controlled by the BOOT_CFG1[7:4] eFUSES. See this table for more details:

Table 8-7. Boot device selection

BOOT_CFG1[6:4]	Boot device
000	Reserved
001	Reserved
011	Serial ROM (SPI)
10x	SD/eSD/SDXC
11x	MMC/eMMC

8.5.1 Expansion device

The ROM supports booting from the MMC/eMMC and SD/eSD compliant devices.

8.5.1.1 Expansion device eFUSE configuration

The SD/MMC/eSD/eMMC/SDXC boot can be performed using either the USDHC ports, based on the setting of the BOOT_CFG2[4:3] (Port Select) fuse or it is associated to the GPIO input value at the boot.

All USDHC ports support the eMMC4.3 and eMMC4.4 fast boot. See this table for details:

Table 8-8. USDHC boot eFUSE descriptions

Fuse	Config	Definition	GPIO ¹	Shipped value	Settings
BOOT_CFG1[7:6]	OEM	Boot device selection	Yes	00	01 - Boot from the USDHC interfaces
BOOT_CFG1[5]	OEM	SD/MMC selection	Yes	0	0 - SD/eSD/SDXC 1 - MMC/eMMC
BOOT_CFG1[4]	OEM	Fast boot support	Yes	0	0 - Normal boot 1 - Fast boot
BOOT_CFG1[3:2]	OEM	SD/MMC speed mode	Yes	00	MMC 0x - High-speed mode 1x - Normal-speed mode x0 - eMMC fast boot acknowledge enable x1 - eMMC fast boot acknowledge disable SD 0x - High/normal 10 - SDR50 11 - SDR104

BOOT_CFG2[2]	OEM	Boot frequencies	Yes	0	Boot frequencies (ARM / DDR) 0 - 792/400 MHz 1 - 528/307 MHz
BOOT_CFG2[1]	OEM	SD2 voltage selection	Yes	0	SD2 voltage selection 0 - 3.3 V 1 - 1.8 V
BOOT_CFG2[0]	OEM	Reserved	Yes	0	Reserved
MMC_DLL_DLY[6:0]	OEM	MMC DLL value/UHSI calibration start value	No	0000000	MMC DLL value/UHSI calibration start value

1. The setting can be overridden by the GPIO settings when the BT_FUSE_SEL fuse is intact. See [GPIO boot overrides](#) for the corresponding GPIO pin.

The boot code supports these standards:

- MMCv4.4 or less
- eMMCv4.4 or less
- SDv2.0 or less
- eSDv2.10 rev-0.9, with or without FAST_BOOT
- SDXCV3.0

The MMC/SD/eSD/SDXC/eMMC can be connected to any of the USDHC blocks and can be booted by copying 4 KB of data from the MMC/SD/eSD/eMMC device to the internal RAM. After checking the Image Vector Table header value (0xD1) from program image, the ROM code performs a DCD check. After a successful DCD extraction, the ROM code extracts from the Boot Data Structure the destination pointer and length of image to be copied to the RAM device from where the code execution occurs.

The maximum image size to load into the SD/MMC boot is 32 MB. This is due to a limited number of uSDHC ADMA Buffer Descriptors allocated by the ROM.

NOTE

The initial 4 KB of the program image must contain the IVT, DCD, and the Boot Data structures.

Table 8-9. SD/MMC frequencies

	SD	MMC	MMC (DDR mode)
Identification (KHz)	347.22		
Normal-speed mode (MHz)	25	20	25
High-speed mode (MHz)	50	40	50
UHSI SDR50 (MHz)	100		
UHSI SDR104 (MHz)	200		

NOTE

The boot ROM code reads the application image length and the application destination pointer from the image.

8.5.1.2 MMC and eMMC boot

This table provides the MMC and eMMC boot details.

Table 8-10. MMC and eMMC boot details

Normal boot mode	During the initialization (normal boot mode), the MMC frequency is set to 347.22 KHz. When the MMC card enters the identification portion of the initialization, the voltage validation is performed, and the ROM boot code checks the high-voltage settings and the card capacity. The ROM boot code supports both the high-capacity and low-capacity MMC/eMMC cards. After the initialization phase is complete, the ROM boot code switches to a higher frequency (20 MHz in the normal boot mode or 40 MHz in the high-speed mode). The eMMC is also interfaced via the USDHC and follows the same flow as the MMC.
------------------	--

Table continues on the next page...

Table 8-10. MMC and eMMC boot details (continued)

	<p>The boot partition can be selected for an MMC4.x card after the card initialization is complete. The ROM code reads the BOOT_PARTITION_ENABLE field in the Ext_CSD[179] to get the boot partition to be set. If there is no boot partition mentioned in the BOOT_PARTITION_ENABLE field or the user partition was mentioned, the ROM boots from the user partition.</p>
eMMC4.3 or eMMC4.4 device supporting special boot mode	<p>If using an eMMC4.3 or eMMC4.4 device that supports the special boot mode, it can be initiated by pulling the CMD line low. If the BOOT ACK is enabled, the eMMC4.3/eMMC4.4 device sends the BOOT ACK via the DATA lines and the ROM can read the BOOT ACK [S010E] to identify the eMMC4.3/eMMC4.4 device. The eMMC4.3/eMMC4.4 device with the "boot mode" feature can only be supported via the ESDHCV3-3 and with or without the BOOT ACK. If the BOOT ACK is enabled, the ROM waits 50 ms to get the BOOT ACK and if the BOOT ACK is received by the ROM. If BOOT ACK is disabled ROM waits 1 second for data. If the BOOT ACK or data was received, the eMMC4.3/eMMC4.4 is booted in the "boot mode", otherwise the eMMC4.3/eMMC4.4 boots as a normal MMC card from the selected boot partition. This boot mode can be selected by the BOOT_CFG1[4] (fast boot) fuse. The BOOT ACK is selected by the BOOT_CFG2[1].</p>
eMMC4.4 device	<p>If using the eMMC4.4 device, the Double Data Rate (DDR) mode can be used. This mode can be selected by the BOOT_CFG2[7:5] (bus width) fuse.</p>

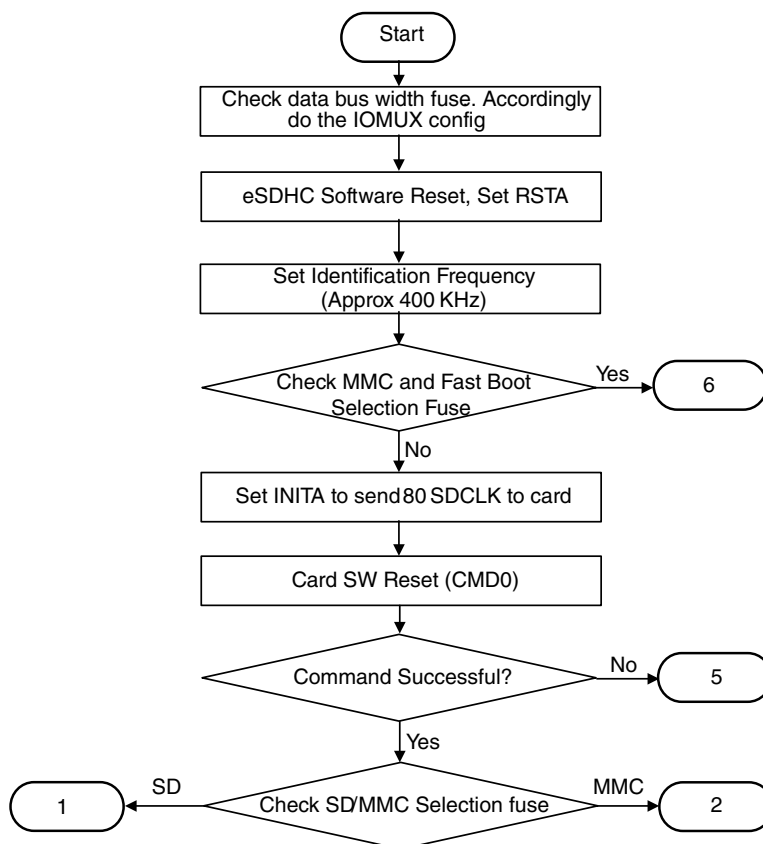

Figure 8-4. Expansion device boot flow (1 of 6)

i.MX 6SLL Applications Processor Reference Manual, Rev. 0, 06/2017

8.5.1.3 SD, eSD, and SDXC

After the normal boot mode initialization begins, the SD/eSD/SDXC frequency is set to 347.22 kHz. During the identification phase, the SD/eSD/SDXC card voltage validation is performed. During the voltage validation, the boot code first checks with the high-voltage settings; if that fails, it checks with the low-voltage settings.

The capacity of the card is also checked. The boot code supports the high-capacity and low-capacity SD/eSD/SDXC cards after the voltage validation card initialization is done.

During the card initialization, the ROM boot code attempts to set the boot partition for all SD, eSD, and SDXC devices. If this fails, the boot code assumes that the card is a normal SD or SDXC card. If it does not fail, the boot code assumes it is an eSD card. After the initialization phase is over, the boot code switches to a higher frequency (25 MHz in the normal-speed mode or 50 MHz in the high-speed mode). The ROM also supports the FAST_BOOT mode booting from the eSD card. This mode can be selected by the BOOT_CFG1[4] (Fast Boot) fuse described in [Table 8-8](#).

For the UHSI cards, the clock speed fuses can be set to SDR50 or SDR104 on USDHC1, USDHC2, and USDHC3 ports. This enables the voltage switch process to set the signaling voltage to 1.8 V during the voltage validation. The bus width is fixed at a 4-bit width and a sampling point tuning process is needed to calibrate the number of the delay cells. If the SD Loopback Clock eFuse is set, the feedback clock comes directly from the loopback SD clock, instead of the card clock (by default). The SD clock speed can be selected by the BOOT_CFG1[3:2], and the SD Loopback Clock is selected by the BOOT_CFG1[0].

The UHSI calibration start value (MMC_DLL_DLY[6:0]) and the step value (BOOT_CFG2[7:5]) can be set to optimize the sample point tuning process.

If the SD Power Cycle Enable eFuse is 1, the ROM sets the SD_RST pad low, waits for 5 ms, and then sets the SD_RST pad high. If the SD_RST pad is connected to the SD power supply enable logic on board, it enables the power cycle of the SD card. This may be crucial in case the SD logic is in the 1.8 V states and must be reset to the 3.3 V states.

The SDR50 and SDR104 boots are not supported on the USDHC1 and USDHC2 ports because there are no reset signals for those ports when connected in the IOMUX.

8.5.1.4 IOMUX configuration for SD/MMC

Table 8-11. SD/MMC IOMUX pin configuration

Signal	USDHC-1	USDHC-2	USDHC-3
CLK	SD1_CLK.alt0	SD2_CLK.alt0	SD3_CLK.alt0
CMD	SD1_CMD.alt0	SD2_CMD.alt0	SD3_CMD.alt0

CD	KEY_ROW7.alt6	-	-

1. Active-low

8.5.1.5 Redundant boot support for expansion device

The ROM supports the redundant boot for an expansion device. The primary or secondary image is selected, depending on the PERSIST_SECONDARY_BOOT setting. (see [Table 8-6](#)).

If the PERSIST_SECONDARY_BOOT is 0, the boot ROM uses address 0x0 for the primary image.

If the PERSIST_SECONDARY_BOOT is 1, the boot ROM reads the secondary image table from address 0x200 on the boot media and uses the address specified in the table.

Table 8-12. Secondary image table format

Reserved (chipNum)
Reserved (driveType)
tag
firstSectorNumber
Reserved (sectorCount)

Where:

Boot devices (internal boot)

- The tag is used as an indication of the valid secondary image table. It must be 0x00112233.
- The firstSectorNumber is the first 512-byte sector number of the secondary image.

For the secondary image support, the primary image must reserve the space for the secondary image table. See this figure for the typical structures layout on an expansion device.

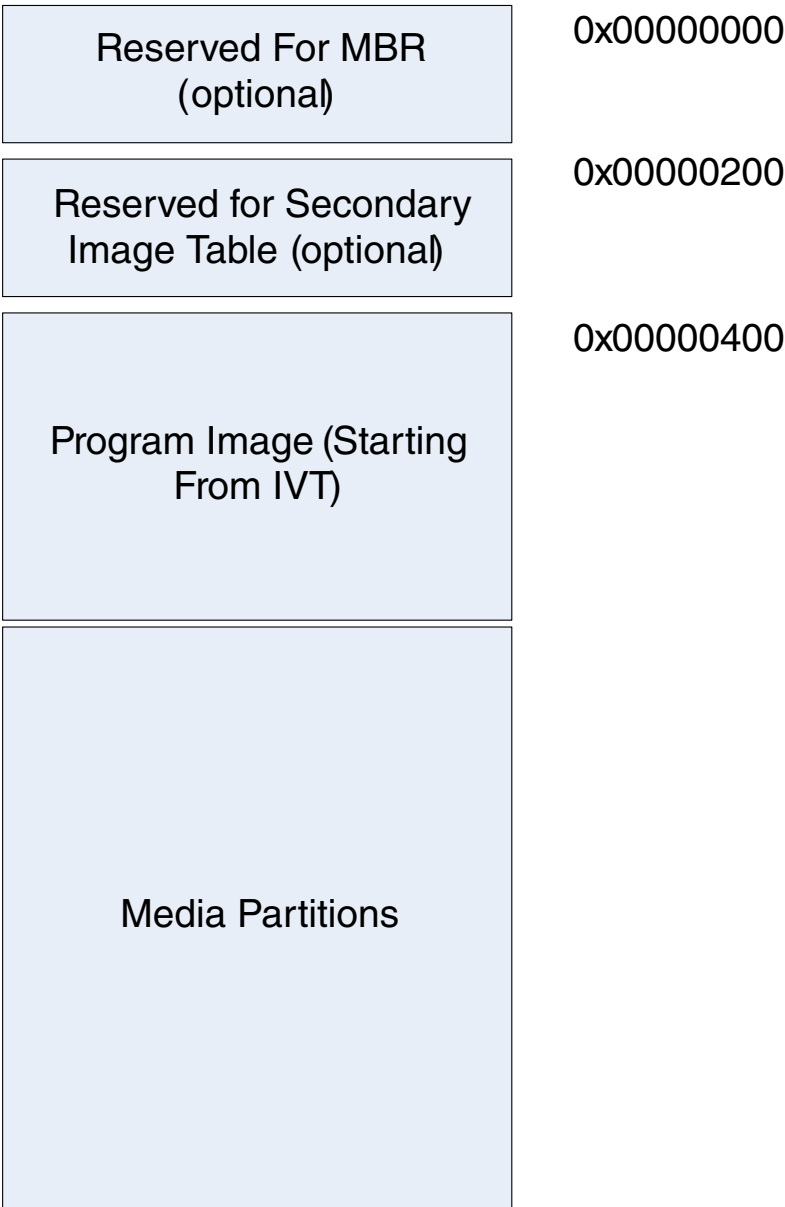

Figure 8-11. Expansion device structures layout

For the Closed mode, if there are failures during primary image authentication, the boot ROM turns on the PERSIST_SECONDARY_BOOT bit (see [Table 8-6](#)) and performs the software reset. (After the software reset, the secondary image is used.)

8.5.2 Serial ROM through SPI

The chip supports booting from serial memory devices, such as EEPROM and serial flash, using the SPI.

These ports are available for serial boot: eCSPI (eCSPI1, eCSPI2, eCSPI3, eCSPI4) interfaces.

8.5.2.1 Serial ROM eFUSE configuration

The boot ROM code determines the type of device using the following parameters, either provided by the eFUSE settings or sampled on the I/O pins, during boot.

See this table for details:

Table 8-13. Serial ROM boot eFUSE descriptions

Fuse	Config	Definition	GPIO ¹	Shipped value	Settings
BOOT_CFG1[7:4]	OEM	Boot device selection	Yes	0000	0011 - Boot from the serial ROM
BOOT_CFG4[6]	OEM	EEPROM recovery enable	Yes	0	0 - Disabled EEPROM recovery 1 - Enabled EEPROM recovery
BOOT_CFG4[5:4]	OEM	CS select (SPI only)	Yes	00	00 - ECSPiX_SS0 01 - ECSPiX_SS1 10 - ECSPiX_SS2 11 - ECSPiX_SS3
BOOT_CFG4[3]	OEM	SPI addressing (SPI only)	Yes	0	0 - 2 B (16-bit) 1 - 3 B (24-bit)
BOOT_CFG4[2:0]	OEM	Port select	Yes	00	000 - ECSPi-1 001 - ECSPi-2 010 - ECSPi-3 011 - ECSPi-4 101 - I2C1 110 - I2C2 111 - I2C3

1. The setting can be overridden by the GPIO settings when the BT_FUSE_SEL fuse is intact. See [GPIO Boot Overrides](#) for the corresponding GPIO pin.

The ECPSI-1/ECPSI-2/ECPSI-3/ECPSI-4 block can be used as a boot device using the ECSPI interface for the serial ROM boot. The SPI interface is configured to operate at 15 MHz for 3-byte addressing devices and at 3.75 MHz for 2-byte addressing devices.

The I2C-1/I2C-2/I2C-3 block can be used as a boot device using the I²C interface for the serial ROM boot. The I²C interface is configured to operate at 343.75 kbit/s.

The boot ROM copies 4 KB of data from the serial ROM device to the internal RAM. After checking the Image Vector Table header value (0xD1) from the program image, the ROM code performs a DCD check. After a successful DCD extraction, the ROM code extracts the destination pointer and length of image from the Boot Data Structure to be copied to the RAM device from where the code execution occurs.

NOTE

The Initial 4 KB of program image must contain the IVT, DCD, and the Boot Data Structures.

8.5.2.2 ECSPI boot

The Enhanced Configurable SPI (ECSPI) interface is configured in the master mode and the EEPROM device is connected to the ECSPI interface as a slave.

The boot ROM code copies 4 KB of data from the EEPROM device to the internal RAM. If the DCD verification is successful, the ROM code copies the initial 4 KB of data, as well as the rest of the image extracted from the application image, directly to the application destination. The ECSPI can read data from the EEPROM using 2- or 3-byte addressing. Its burst length is 32 B.

NOTE

The Serial ROM Chip Select Number is determined by the BOOT_CFG4[5:4] (Chip Select) fuse.

When using the SPI as a boot device, the chip supports booting from both the serial EEPROM and serial flash devices. The boot code determines which device is being used by reading the appropriate eFUSE/I/O values at the boot (see [Table 8-13](#) for details).

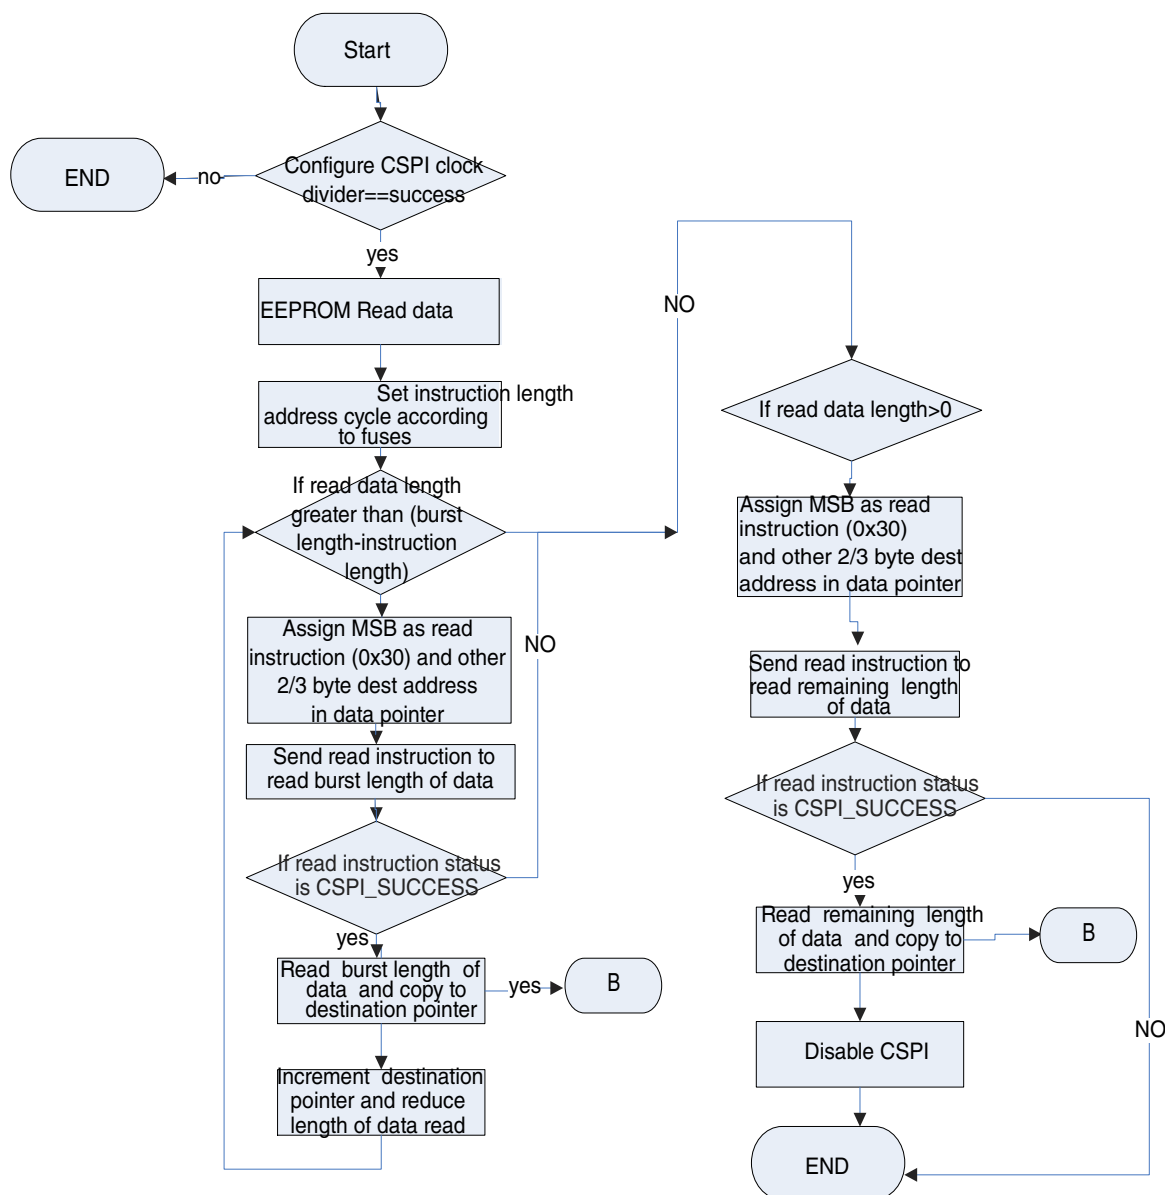

Figure 8-12. CSPI flow chart

8.5.2.2.1 ECSPI IOMUX pin configuration

The contacts assigned to the signals used by the CSPI blocks are shown in this table:

Table 8-14. ECSPI IOMUX pin configuration

Signal	ECSPI-1	ECSPI-2	ECSPI-3	ECSPI4	ECSPI-5
MISO	ECSP11_MISO.alt0	ECSP12_MISO.alt0	EPDC_D9.alt1	EPDC_D1.alt1	N/A
MOSI	ECSP11_MOSI.alt0	ECSP12_MOSI.alt0	EPDC_D8.alt1	EPDC_D0.alt1	N/A

Table continues on the next page...

**Table 8-14. ECSPI IOMUX pin configuration
(continued)**

RDY	N/A ¹	N/A	N/A	N/A	N/A
SCLK	ECSP11_SCLK.alt0	ECSP12_SCLK.alt0	EPDC_D11.alt1	EPDC_D3.alt1	N/A
SS0	ECSP11_SS0.alt0	ECSP12_SS0.alt0	EPDC_D10.alt1	EPDC_D2.alt1	N/A
SS1	I2C1_SCL.alt6	EPDC_SDCE0.alt1	EPDC_D12.alt6	EPDC_D4.alt1	N/A
SS2	I2C1_SDA.alt6	EPDC_GDCLK.alt1	EPDC_D13.alt6	EPDC_D5.alt1	N/A
SS3	ECSP12_SS0.alt1	EPDC_GDOE.alt1	EPDC_D14.alt6	EPDC_D6.alt1	N/A

1. The N/A in the ROM code indicates that the pins are not available or not used.

8.6 Program image

This section describes the data structures that are required to be included in the user's program image. The program image consists of:

- Image vector table—a list of pointers located at a fixed address that the ROM examines to determine where the other components of the program image are located.
- Boot data—a table that indicates the program image location, program image size in bytes, and the plugin flag.
- Device configuration data—IC configuration data.
- User code and data.

8.6.1 Image Vector Table and Boot Data

The Image Vector Table (IVT) is the data structure that the ROM reads from the boot device supplying the program image containing the required data components to perform a successful boot.

The IVT includes the program image entry point, a pointer to Device Configuration Data (DCD) and other pointers used by the ROM during the boot process. The ROM locates the IVT at a fixed address that is determined by the boot device connected to the Chip. The IVT offset from the base address and initial load region size for each boot device

type is defined in the table below. The location of the IVT is the only fixed requirement by the ROM. The remainder of the image memory map is flexible and is determined by the contents of the IVT.

Table 8-15. Image Vector Table Offset and Initial Load Region Size

Boot Device Type	Image Vector Table Offset	Initial Load Region Size
NOR	4 Kbyte = 0x1000 bytes	Entire Image Size
OneNAND	256 bytes = 0x100 bytes	1 Kbyte
SD/MMC/eSD/eMMC/SDXC	1 Kbyte = 0x400 bytes	4 Kbyte
I2C/SPI EEPROM	1 Kbyte = 0x400 bytes	4 Kbyte

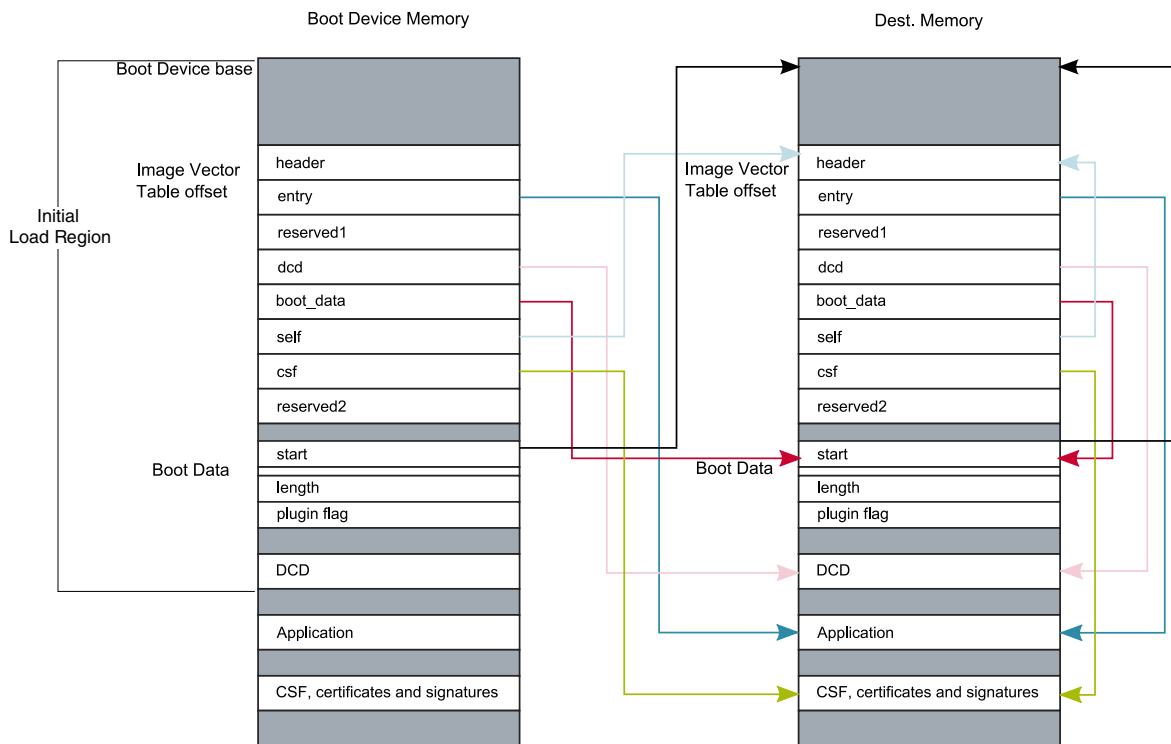

Figure 8-13. Image Vector Table

8.6.1.1 Image vector table structure

The IVT has the following format where each entry is a 32-bit word:

Table 8-16. IVT format

header

Table continues on the next page...

Table 8-16. IVT format (continued)

entry:	Absolute address of the first instruction to execute from the image
reserved1:	Reserved and should be zero
dcd:	Absolute address of the image DCD. The DCD is optional so this field may be set to NULL if no DCD is required. See Device Configuration Data (DCD) for further details on the DCD.
boot data:	Absolute address of the boot data
self:	Absolute address of the IVT. Used internally by the ROM.
csf:	Absolute address of the Command Sequence File (CSF) used by the HAB library. See High-Assurance Boot (HAB) for details on the secure boot using HAB. This field must be set to NULL when not performing a secure boot
reserved2:	Reserved and should be zero

Figure 8-14 shows the IVT header format:

Tag	Length	Version
-----	--------	---------

Figure 8-14. IVT header format

where:

Tag: A single byte field set to 0xD1
Length: a two byte field in big endian format containing the overall length of the IVT, in bytes, including the header. (the length is fixed and must have a value of 32 bytes)
Version: A single byte field set to 0x40 or 0x41

8.6.1.2 Boot data structure

The boot data must follow the format defined in the table found here, each entry is a 32-bit word.

Table 8-17. Boot data format

start	Absolute address of the image
length	Size of the program image
plugin	Plugin flag (see Plugin image)

8.6.2 Device Configuration Data (DCD)

Upon reset, the chip uses the default register values for all peripherals in the system. However, these settings typically are not ideal for achieving the optimal system performance and there are even some peripherals that must be configured before they can be used.

The DCD is a configuration information contained in the program image (external to the ROM) that the ROM interprets to configure various peripherals on the chip.

For example, the EIM default settings allow the core to interface to a NOR flash device immediately after the reset. This allows the chip to interface with any NOR flash device, but has the disadvantage of slow performance. Additionally, some components (such as DDR) require some sequence of register programming as a part of the configuration before it is ready to be used. The DCD feature can be used to program the EIM registers and the MMDC registers to the optimal settings.

The ROM determines the location of the DCD table based on the information located in the Image Vector Table (IVT). See [Image Vector Table and Boot Data](#) for more details. The DCD table shown below is a big-endian byte array of the allowable DCD commands. The maximum size of the DCD is limited to 1768 B.

Header
[CMD]
[CMD]
...

Figure 8-15. DCD data format

The DCD header is 4 B with the following format:

Tag	Length	Version
-----	--------	---------

Figure 8-16. DCD header format

where:

Program image

Tag: A single-byte field set to 0xD2
Length: a two-byte field in the big-endian format containing the overall length of the DCD (in bytes) including the header
Version: A single-byte field set to 0x41

8.6.2.1 Write data command

The write data command is used to write a list of given 1-, 2- or 4-byte values (or bitmasks) to a corresponding list of target addresses.

The format of the write data command (in a big-endian byte array) is shown in this table:

Table 8-18. Write data command format

Tag	Length	Parameter
	Address	
	Value/Mask	
	[Address]	
	[Value/Mask]	
	...	
	[Address]	
	[Value/Mask]	

where:

Tag: a single-byte field set to 0xCC
Length: a two-byte field in a big-endian format, containing the length of the Write Data Command (in bytes) including the header
Address: the target address to which the data must be written
Value/Mask: the data value (or bitmask) to be written to the preceding address

The parameter field is a single byte divided into the bitfields, as follows:

Table 8-19. Write data command parameter field

7	6	5	4	3	2	1	0
flags					bytes		

where

bytes: the width of the target locations in bytes (either 1, 2, or 4)
flags: control flags for the command behavior
Data Mask = bit 3: if set, only specific bits may be overwritten at the target address (otherwise all bits may be overwritten)
Data Set = bit 4: if set, the bits at the target address are overwritten with this flag (otherwise it is ignored)

One or more target address and value/bitmask pairs can be specified. The same bytes' and flags' parameters apply to all locations in the command.

When successful, this command writes to each target address in accordance with the flags as follows:

Table 8-20. Interpretation of write data command flags

"Mask"	"Set"	Action	Interpretation
0	0	*address = val_msk	Write value
0	1	*address = val_msk	Write value
1	0	*address &= ~val_msk	Clear bitmask
1	1	*address = val_msk	Set bitmask

NOTE

If any of the target addresses does not have the same alignment as the data width indicated in the parameter field, none of the values are written.

If any of the values are larger or any of the bitmasks are wider than permitted by the data width indicated in the parameter field, none of the values are written.

If any of the target addresses do not lie within the allowed region, none of the values are written. The list of allowable blocks and target addresses for the chip are provided below.

Table 8-21. Valid DCD address ranges

Address range	Start address	Last address
IOMUX Control (IOMUXC) registers	0x020E0000	0x020E3FFF
CCM register set	0x020C4000	0x020C7FFF
ANADIG registers	0x020C8000	0x020C8FFF
MMDC register set	0x021B0000	0x021B7FFF
OCRAM free space	0x00907000	0x00917FF0
EIM memory	0x08000000	0x0FFEFFFF
EIM registers	0x021B8000	0x021BBFFF
DDR	0x10000000	0xFFFFFFF

8.6.2.2 Check data command

The check data command is used to test for a given 1-, 2-, or 4-byte bitmasks from a source address.

The check data command is a big-endian byte array with the format shown in this table:

Table 8-22. Check data command format

Tag	Length	Parameter
	Address	
	Mask	
	[Count]	

where:

Tag: a single-byte field set to 0xCF

Length: a two-byte field in the big-endian format containing the length of the check data command (in bytes) including the header

Address: the source address to test

Mask: the bit mask to test

Count: an optional poll count; If the count is not specified, this command polls indefinitely

until the exit condition is met. If count = 0, this command behaves as for the NOP.

The parameter field is a single byte divided into bitfields, as follows:

Table 8-23. Check data command parameter field

7	6	5	4	3	2	1	0
flags					bytes		

where

bytes: the width of target locations in bytes (either 1, 2, or 4)

flags: control flags for the command behavior

Data Mask = bit 3: if set, only the specific bits may be overwritten at a target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, the bits at the target address are overwritten with this flag (otherwise it is ignored)

This command polls the source address until either the exit condition is satisfied, or the poll count is reached. The exit condition is determined by the flags as follows:

Table 8-24. Interpretation of check data command flags

"Mask"	"Set"	Action	Interpretation
0	0	(*address & mask) == 0	All bits clear
0	1	(*address & mask) == mask	All bits set
1	0	(*address & mask) != mask	Any bit clear
1	1	(*address & mask) != 0	Any bit set

NOTE

If the source address does not have the same alignment as the data width indicated in the parameter field, the value is not read.

If the bitmask is wider than permitted by the data width indicated in the parameter field, the value is not read.

8.6.2.3 NOP command

This command has no effect.

The format of the NOP command is a big-endian four-byte array, as shown in this table:

Table 8-25. NOP command format

Tag	Length	Undefined
-----	--------	-----------

where:

Tag: a single-byte field set to 0xC0

Length: a two-byte field in big endian containing the length of the NOP command in bytes (fixed to a value of 4)

Undefined: this byte is ignored and can be set to any value.

8.6.2.4 Unlock command

The unlock command is used to prevent specific engine features from being locked when exiting the ROM.

The format of the unlock command (in a big-endian byte array) is shown in this table:

Table 8-26. Unlock command format

Tag	Length	Eng
	Value	
	Value	
	...	
	Value	

where:

Tag: a single-byte field set to 0xB2

Eng: the engine to be left unlocked; the supported engines are SNVS and OCOTP.

Values: [optional] the unlock values required by the engine. The valid values are:

for SNVS: 0x01 (HAB_SNVS_UNLOCK_LP_SWR) - leave the LP software reset unlocked (leave the LP_SWR bit cleared in the SNVS_HP command register)

0x02 (HAB_SNVS_UNLOCK_ZMK_WRITE) - leave the zeroizable master key write unlocked (leave the ZMK_WSL bit cleared in the SNVS_HP lock register).

for OCOTP:

0x01 (HAB_OCOTP_UNLOCK_FIELD_RETURN) - leave the field return activation unlocked in the OCOTP_SW_STICKY register

0x02 (HAB_OCOTP_UNLOCK_SRK_REVOKE) - leave the SRK revocation

Plugin image

unlocked in the OCOTP_SW_STICKY register
0x04 (HAB_OCOTP_UNLOCK_SCS) - leave the lock bit cleared in
the OCOTP_SCS register
0x08 HAB_OCOTP_UNLOCK_JTAG) - leave the HAB_JDE bit cleared in
the OCOTP_SCS register to unlock the JTAG

NOTE

This command may not be used in the DCD structure if the SEC_CONFIG is configured as closed.

8.7 Plugin image

The ROM supports a limited number of boot devices. When using other devices as a boot source (for example, Ethernet, CDRom, or USB), the supported boot device must be used (typically serial ROM) as a firmware to provide the missing boot drivers. Additionally, the plugin can be customized to support boot drivers, which is more flexible when performing the device initialization, such as condition judging, delay assertion, or to apply custom settings to the boot device and memory system.

In addition to the standard images, the chip also supports plugin images. The plugin images return the execution to the ROM whereas the standard image does not.

The boot ROM detects the image type using the plugin flag of the boot data structure (see [Boot data structure](#)). If the plugin flag is 1, then the ROM uses the image as a plugin function. The function must initialize the boot device and copy the program image to the final location. At the end, the plugin function must return with the program image parameters. (See [High-level boot sequence](#) for details about the boot flow).

The boot ROM authenticates the plugin image before running the plugin function and then authenticates the program image.

The plugin function must follow the API described below:

```
typedef BOOLEAN (*plugin_download_f)(void **start, size_t *bytes, UINT32  
*ivt_offset);
```

ARGUMENTS PASSED:

- start - the image load address on exit.
- bytes - the image size on exit.
- ivt_offset - the offset (in bytes) of the IVT from the image start address on exit.

RETURN VALUE:

- 1 - success
- 0 - failure

8.8 Serial Downloader

The Serial Downloader provides a means to download a program image to the chip over the USB serial connection.

In this mode, the ROM programs the WDOG1 for a 90-second time-out if the WDOG_ENABLE eFuse is 1 and continuously polls for the USB connection. If no activity is found on the USB OTG1 and the watchdog timer expires, the ARM core is reset.

NOTE

After the downloaded image is loaded, it is responsible for managing the watchdog resets properly.

This figure shows the USB boot flow:

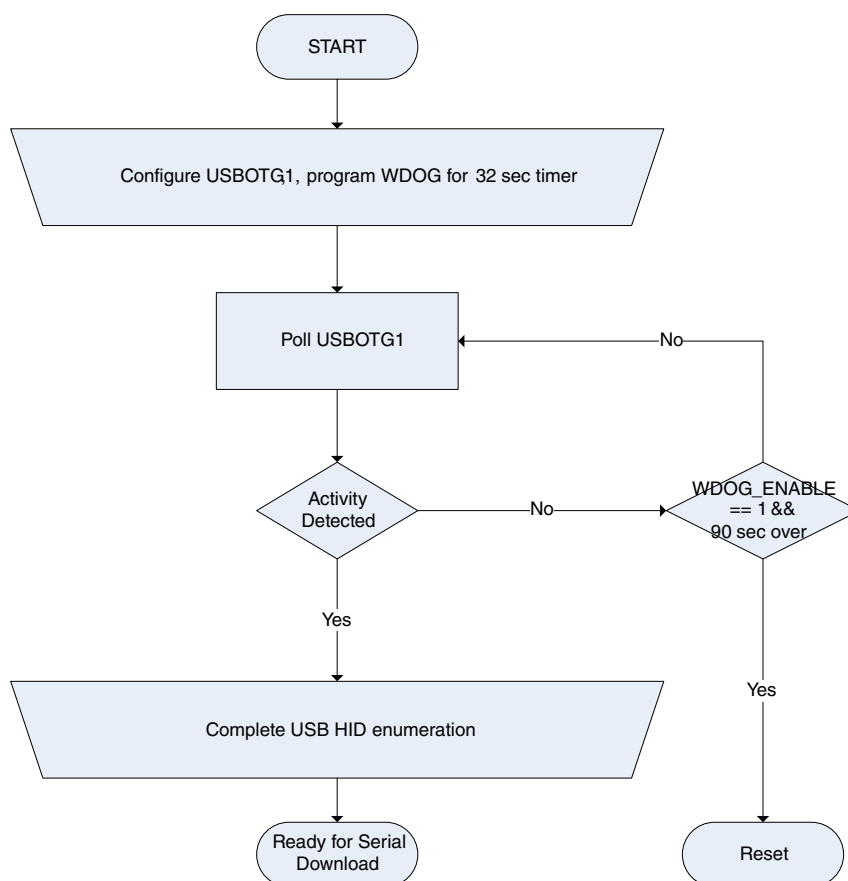

Figure 8-17. Serial Downloader boot flow

8.8.1 USB

The USB support is composed of the USBOH3 (USB OTG1 core controller, compliant with the USB 2.0 specification) and the USBPHY (HS USB transceiver).

The ROM supports the USB OTG port for boot purposes. The other USB ports on the chip are not supported for boot purposes.

The USB Driver is implemented as a USB HID class. A collection of four HID reports are used to implement the SDP protocol for data transfers, as described in [Table 8-27](#).

Table 8-27. USB HID reports

Report ID (first byte)	Transfer endpoint	Direction	Length	Description
1	control OUT	Host to device	17 B	SDP command from the host to the device.
2	control OUT	Host to device	Up to 1025 B	Data associated with the report 1 SDP command.
3	interrupt	Device to host	5 B	HAB security configuration. The device sends 0x12343412 in the closed mode and 0x56787856 in the open mode.
4	interrupt	Device to host	Up to 65 B	Data in response to the SDP command in report 1.

8.8.1.1 USB configuration details

The USB OTG function device driver supports a high speed (HS for UTMI) non-stream mode with a maximal packet size of 512 B and a low-level USB OTG function.

The VID/PID and strings for the USB device driver are listed in the following table.

Table 8-28. VID/PID and strings for USB device driver

Descriptor	Value
VID	0x15A2 (NXP vendor ID)
PID ¹	
String Descriptor1 (manufacturer)	NXP Semiconductors
String Descriptor2 (product)	S Blank

Table continues on the next page...

Table 8-28. VID/PID and strings for USB device driver (continued)

Descriptor	Value
	SE Blank
	NS Blank
String Descriptor4	NXP Flash
String Descriptor5	NXP Flash

1. Allocation based on the BPN (Before Part Number)

8.8.1.2 IOMUX configuration for USB

The interface signals of the UTMI PHY are not configured in the IOMUX. The UTMI PHY interface uses the dedicated contacts on the IC. See the chip data sheet for details.

8.8.2 Serial Download Protocol (SDP)

The 16-byte SDP command from the host to device is sent using the HID report 1.

This table describes the 16-byte SDP command data structure:

Table 8-29. 16-byte SDP command data structure

BYTE offset	Size	Name	Description
0	2	COMMAND TYPE	These commands are supported for the ROM: <ul style="list-style-type: none"> • 0x0101 READ_REGISTER • 0x0202 WRITE_REGISTER • 0x0404 WRITE_FILE • 0x0505 ERROR_STATUS • 0x0A0A DCD_WRITE • 0x0B0B JUMP_ADDRESS
2	4	ADDRESS	Only relevant for these commands: READ_REGISTER, WRITE_REGISTER, WRITE_FILE, DCD_WRITE, and JUMP_ADDRESS. For the READ_REGISTER and WRITE_REGISTER commands, this field is the address to a register. For the WRITE_FILE and JUMP_ADDRESS commands, this field is an address to the internal or external memory address.
6	1	FORMAT	Format of access, 0x8 for an 8-bit access, 0x10 for a 16-bit access, and 0x20 for a 32-bit access. Only relevant for the READ_REGISTER and WRITE_REGISTER commands.

Table continues on the next page...

Table 8-29. 16-byte SDP command data structure (continued)

BYTE offset	Size	Name	Description
7	4	DATA COUNT	Size of the data to read or write. Only relevant for the WRITE_FILE, READ_REGISTER, WRITE_REGISTER, and DCD_WRITE commands. For the WRITE_FILE and DCD_WRITE commands, the DATA COUNT is in the byte units.
11	4	DATA	The value to write. Only relevant for the WRITE_REGISTER command.
15	1	RESERVED	Reserved

8.8.2.1 SDP commands

The SDP commands are described in the following sections.

8.8.2.1.1 READ_REGISTER

The transaction for the READ_REGISTER command consists of these reports: Report1 for the command, Report3 for the security configuration, and Report4 for the response or the register value.

The register to read is specified in the ADDRESS field of the SDP command. The first device sends Report3 with the security configuration followed by the Report4 with the bytes read at a given address. If the count is greater than 64, multiple reports with the report id 4 are sent until the entire data requested by the host is sent. The STATUS is either 0x12343412 for the closed parts and 0x56787856 for the open or field return parts.

Report1, Command, Host to Device:

1	Valid values for the READ_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT
---	---

ID 16-byte SDP command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host: first response report

4	Register value
---	----------------

ID 4 bytes of data containing the register value. If the number of bytes requested is less than 4, the remaining bytes must be ignored by the host.

Multiple reports of the report id 4 are sent until the entire requested data is sent.

Report4, Response, Device to Host: last response report

4	Register value
---	----------------

ID 64 bytes of data containing the register value. If the number of bytes requested is less than 64, the remaining bytes must be ignored by the host.

8.8.2.1.2 WRITE_REGISTER

The transaction for the WRITE_REGISTER command consists of these reports: Report1 for the command, Report3 for the security configuration and Report4 for the write status.

The host sends Report1 with the WRITE_REGISTER command. The register to write is specified in the ADDRESS field of the SDP command of Report1, with the FORMAT field set to the data type (number of bits to write, either 8, 16, or 32) and the value to write in the DATA field of the SDP command. The device writes the DATA to the register address and returns the WRITE_COMPLETE code using Report4 and the security configuration using Report3 to complete the transaction.

Report1, Command, Host to Device:

1	Valid values for WRITE_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT and DATA
---	---

ID 16-byte SDP command

Report3, Response, Device to Host:

3	4 bytes indicating the security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes data with the first 4 bytes to indicate that the write is completed with code 0x128A8A12. On failure, the device reports the HAB error status.

8.8.2.1.3 WRITE_FILE

The transaction for the WRITE_FILE command consists of these reports: Report1 for the command phase, Report2 for the data phase, Report3 for the HAB mode, and Report4 to indicate that the data are received in full.

The size of each Report2 is limited to 1024 bytes (limitation of the USB HID protocol). Hence, multiple Report2 packets are sent by the host in the data phase until the entire data is transferred to the device. When the entire data (DATA_COUNT bytes) is received, the device sends Report3 with the HAB mode and Report4 with 0x88888888, indicating that the file download completed.

Report1, Host to Device:

1	Valid values for WRITE_FILE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16-byte SDP command

=====Optional Begin=====

Host sends the ERROR_STATUS command to query if the HAB rejected the address

===== Optional End=====

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report3, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	COMPLETE (0x88888888) status
---	------------------------------

ID 64 bytes data with the first four bytes to indicate that the file download completed with code 0x88888888. On failure, the device reports the HAB error status.

8.8.2.1.4 ERROR_STATUS

The transaction for the SDP command ERROR_STATUS consists of three reports.

Report1 is used by the host to send the command; the device sends global error status in four bytes of Report4 after returning the security configuration in Report3. When the device receives the ERROR_STATUS command, it returns the global error status that is updated for each command. This command is useful to find out whether the last command resulted in a device error or succeeded.

Report1, Command, Host to Device:

1	ERROR_STATUS COMMAND
---	----------------------

ID 16-byte SDP Command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host:

4	Four bytes Error status
---	-------------------------

ID first 4 bytes status in 64 bytes Report4

8.8.2.1.5 DCD_WRITE

The SDP command DCD_WRITE is used by the host to send multiple register writes in one shot. This command is provided to speed up the process of programming the register writes (such as to configure an external RAM device).

The command goes with Report1 from the host with COMMAND TYPE set to DCD_WRITE, ADDRESS which is used as a temporary location of the DCD data, and DATA_COUNT to the number of bytes sent in the data out phase. In the data phase, the

host sends the data for a number of registers using Report2. The device completes the transaction with Report3 indicating the security configuration and Report4 with the WRITE_COMPLETE code 0x12828212.

Report1, Command, Host to Device:

1	DCD_WRITE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16-byte SDP Command

Report2, Data, Host to Device:

2	DCD binary data
---	-----------------

ID Max 1024 bytes per report

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes report with the first four bytes to indicate that the write completed with the code 0x128A8A12. On failure, the device reports the HAB error status.

See [Device Configuration Data \(DCD\)](#) for the DCD format description.

8.8.2.1.6 JUMP_ADDRESS

The SDP command JUMP_ADDRESS is the last command that the host can send to the device. After this command, the device jumps to the address specified in the ADDRESS field of the SDP command and starts to execute.

This command usually follows after the WRITE_FILE command. The command is sent by the host in the command-phase of the transaction using Report1. There is no data phase for this command, but the device sends the status Report3 to complete the transaction. If the authentication fails, it also sends Report4 with the HAB error status.

Report1, Command, Host to Device:

1	JUMP_ADDRESS COMMAND, ADDRESS
---	-------------------------------

ID 16-byte SDP Command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

This report is sent by the device only in case of an error jumping to the given address, or if the device reports error in Report4, Response, Device to Host:

4	Four bytes HAB error status
---	-----------------------------

ID 4 bytes status, 64 bytes report length

8.9 Recovery devices

The chip supports recovery devices. If the primary boot device fails, the boot ROM tries to boot from the recovery device using one of the I²C or ECSPI ports.

To enable the recovery device, the BOOT_CFG4[6] fuse must be set. Additionally, the serial EEPROM fuses must be set as described in [Serial ROM through SPI](#).

8.10 USB low-power boot

The ROM supports the USB low-power boot. This feature enables a device with a dead or weak battery to power up and boot if the device is connected to a USB upstream port, no matter if the upstream port is a USB charger or a USB host/hub.

If a USB dedicated charger or a host/hub charger are connected, as soon as the device is connected to the upstream port, a stable current (max.1.5 A) can be supplied by the charger. If a USB host/hub is connected, a maximal current of 100 mA is supplied to the device and the device is able to power up to boot the image with less than 100 mA.

If the LPB_BOOT fuses are blown, the chip checks if there is a low-power condition via the GPIO_3 pad. If there is a low-power boot condition, the USB charger detection is activated. If there is no USB charger, the ROM initializes the USB as a device and applies division factors on the ARM, DDR, AXI, and AHB root clocks based on the

LPB_BOOT fuses value (see the table below). The polarity of the low-power boot condition on the GPIO_3 pad is set by the BT_LPBOOT_POLARITY fuse (see the following figure).

Table 8-30. USB low-power boot frequencies

LPB_BOOT	Boot Frequencies=0	Boot Frequencies=1

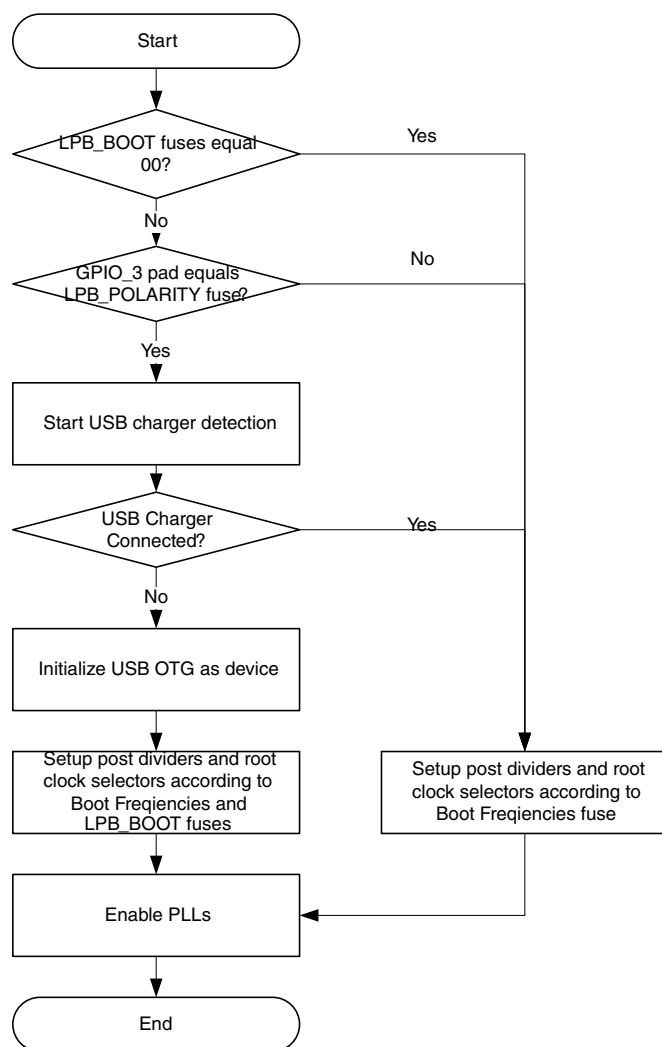

Figure 8-18. USB low-power boot flow

8.11 SD/MMC manufacture mode

When the internal boot and recover boot (if enabled) failed, , the boot goes to the SD/MMC manufacture mode before the serial download mode. In the manufacture mode, one bit bus width is used despite of the fuse setting.

In the manufacture mode, the SD or MMC card is scanned on the uSDHC1 only. If a card is detected and a valid boot image is found in the card, the boot image is loaded and executed. Pad of SD1_CD is used to detect whether a card is inserted or not.

By default, the SD/MMC manufacture mode is enabled. Blow the fuse of the DISABLE_SDMMC_MFG to disable it.

NOTE

A secondary boot is not supported in the SD/MMC manufacture mode.

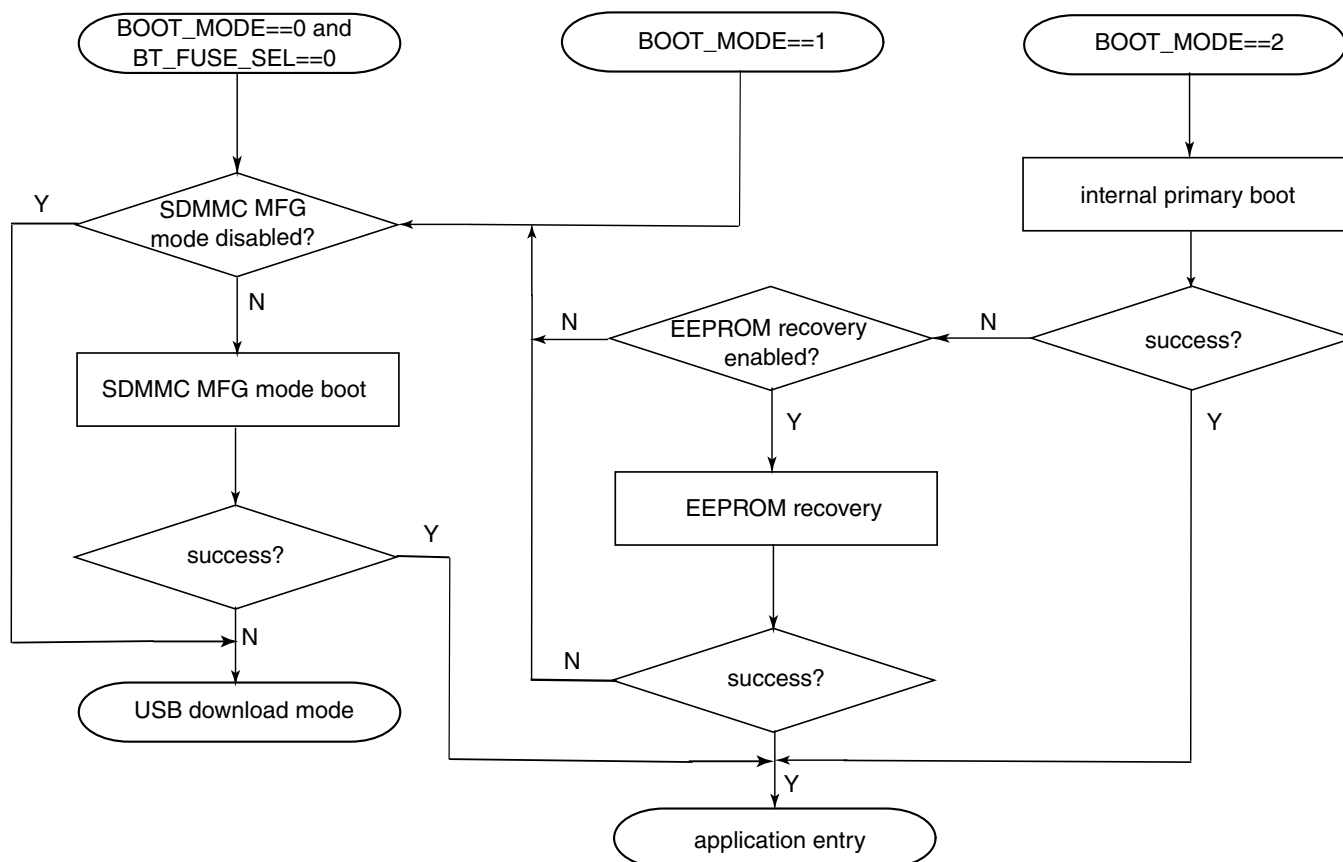

Figure 8-19. SD/MMC manufacture boot flow

8.12 High-Assurance Boot (HAB)

The High Assurance Boot (HAB) component of the ROM protects against the potential threat of attackers modifying the areas of code or data in the programmable memory to make it behave in an incorrect manner. The HAB also prevents the attempts to gain access to features which must not be available.

The integration of the HAB feature with the ROM code ensures that the chip does not enter an operational state if the existing hardware security blocks detected a condition that may be a security threat or if the areas of memory deemed to be important were modified. The HAB uses the RSA digital signatures to enforce these policies.

Figure 8-20. Secure boot components

The figure above illustrates the components used during a secure boot using HAB. The HAB interfaces with the SNVS to make sure that the system security state is as expected. The HAB also uses the DCP hardware block to accelerate the SHA-256 message digest operations performed during the signature verifications. The HAB also includes a software implementation of SHA-256 for cases where a hardware accelerator can't be used. The RSA key sizes supported are 1024, 2048, and 3072 bits. The RSA signature verification operations are performed by a software implementation contained in the HAB library. The main features supported by the HAB are:

- X.509 public key certificate support
- CMS signature format support

NOTE

NXP provides the reference Code Signing Tool (CST) for key generation, certificate generation, and code signing for use with the HAB library. The CST can be found by searching for "IMX_CST_TOOL" at <http://www.nxp.com>.

NOTE

For further details on using the secure boot feature using HAB, contact your local NXP representative.

8.12.1 HAB API vector table addresses

For devices that perform a secure boot, the HAB library may be called by the boot stages that execute after the ROM code.

The RVT table contains the pointers to the HAB API functions and is located at 0x00000094.

NOTE

For additional information on the secure boot including the HAB API, contact your local NXP representative.

Chapter 9

Multimedia

9.1 Display and graphics subsystem

The chip display and graphics subsystem consists of the dedicated modules found here.

- EPDC (electrophoretic display controller): display controller for E-INK EPD panel
- LCD Interface (LCDIF): 24-bit parallel RGB LCD interface
- PXP pixel pipeline: pixel/image processing engine for EPD and LCD display
- Camera Sensor Interface (CSI): up to 16-bit parallel interface for image sensor

The following figure shows the high-level integration scheme of the chip display and graphics system.

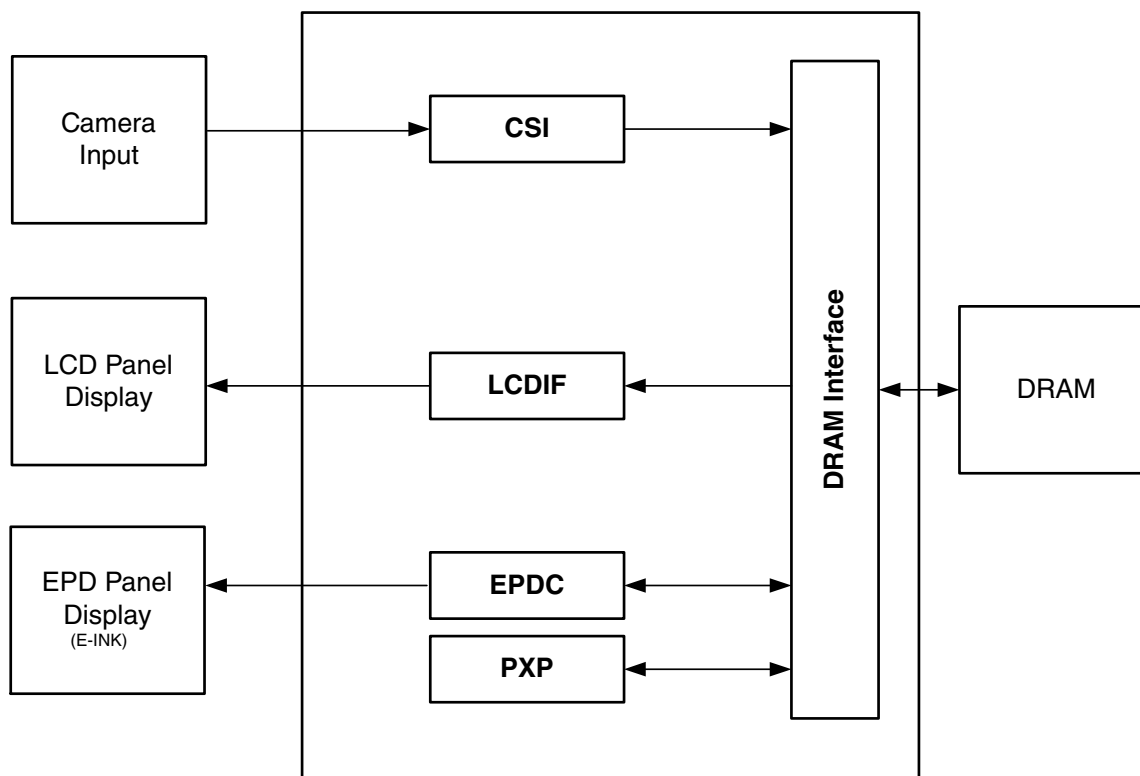

Figure 9-1. Chip display and graphics subsystem

9.1.1 Electrophoretic Display Controller

The EPDC is a feature-rich, low power, and high-performance direct-drive active matrix EPD controller. It is specifically designed to drive E•INK™ EPD panels supporting a wide variety of TFT backplanes. The goal of the EPDC is to provide an efficient SoC integration of this functionality for e-paper applications, allowing a significant BOM cost saving over an external solution whilst reaching much higher levels of performance and lower power. The EPDC module is defined in the context of an optimized HW/SW partitioning and works in conjunction with the ePXP IP module to form a complete display processing solution.

The key features of the EPDC are as follows:

- Supports direct-driver for E-Ink EPD panels, with up to 2048x1536 resolution at 106 Hz refresh rate (or 4096x4096 resolution at 20 Hz refresh rate)
- Supports up to 64 LUT for concurrent update
- Supports automatic waveform selection based on both input image and current panel content
- Supports collision detection
- Supports both PVI panels and LGD GIP panels.

9.1.2 PiXel Processing Pipeline (PXP)

The pixel processing pipeline is used to perform image processing on image/video buffers before sending to an LCD display or EPD display. It supports basic image operations including resizing, overlay, rotation, as well as CSC and CFA operation used for EPD display.

The main features of PXP include:

- Multiple input/output format support, including YUV/RGB/Grayscale
- Supports both RGB/YUV scaling
- Supports overlay with Alpha blending
- RGB656/RGB444 to RGBW4444 conversion with LUT for color EPD panel

9.1.3 LCD Interface (LCDIF)

The LCDIF is a general purpose display controller that is used to drive a wide range of display devices. These displays can vary in size and capability. Many of these displays have had an asynchronous parallel MPU interface for command and data transfer to an integrated frame buffer. There are other popular displays that support moving pictures and require the RGB interface mode (called DOTCLK interface in this document) or the VSYNC mode for high-speed data transfers. In addition to these displays, it is also common to provide support for digital video encoders that accept ITU-R BT.656 format 4:2:2 YCbCr digital component video and convert it to analog TV signals. The LCDIF block supports these different interfaces by providing fully programmable functionality.

The block has several major features:

- Bus master interface to source frame buffer data for display refresh and a DMA interface to manage input data transfers from the LCD requiring minimal CPU overhead.
- 8/16/18/24/32 bit LCD data bus support available depending on I/O mux options.
- Programmable timing and parameters for MPU, VSYNC and DOTCLK LCD interfaces to support a wide variety of displays.
- ITU-R BT.656 mode (called Digital Video Interface or DVI mode here) including progressive-to-interlace feature and RGB to YCbCr 4:2:2 color space conversion to support 525/60 and 625/50 operation.

9.1.4 CMOS Sensor Interface (CSI)

The CSI enables the chip to connect directly to external CMOS image sensors. CMOS image sensors are separated into two classes, dumb and smart. Dumb sensors are those that support only traditional sensor timing (Vertical SYNC and Horizontal SYNC) and output only Bayer and statistics data, while smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The capabilities of the CSI include:

- Configurable interface logic to support most commonly available CMOS sensors.
- Support for CCIR656 video interface as well as traditional sensor interface.
- 8-bit data port for YCC, YUV, or RGB data input.
- 8-bit/10-bit/16-bit data port for Bayer data input.
- Full control of 8-bit/pixel, 10-bit/pixel or 16-bit/pixel data format to 32-bit receive FIFO packing.
- 128 × 32 FIFO to store received image pixel data. Receive FIFO overrun protection mechanism.
- Embedded DMA controllers to transfer data from receive FIFO or statistic FIFO through AHB bus.
- Support for 2D DMA transfer from the receive FIFO to the frame buffers in the external memory.
- Support for double buffering two frames in the external memory.
- Single interrupt source to interrupt controller from maskable interrupt sources:
 - Start of Frame
 - End of Frame
 - Change of Field
 - FIFO full
 - FIFO overrun
 - DMA transfer done
 - CCIR error
 - AHB bus response error
- Configurable master clock frequency output to sensor.
- Statistic data generation for Auto Exposure (AE) and Auto White Balance (AWB) control of the camera (only for Bayer data and 8-bit/pixel format).

9.2 Audio subsystem

The audio subsystem consists of the following modules: SSI-1, SSI-2, SSI-3, AUDMUX, and SPDIF. In addition, the IOMUX must be appropriately configured to get signals in and out of the chip.

[Audio Subsystem Module Overview](#) provides an overview of each of the audio subsystem component modules, followed by a module-specific section.

9.2.1 Audio Subsystem Module Overview

The following figure shows a high level block diagram of the audio subsystem.

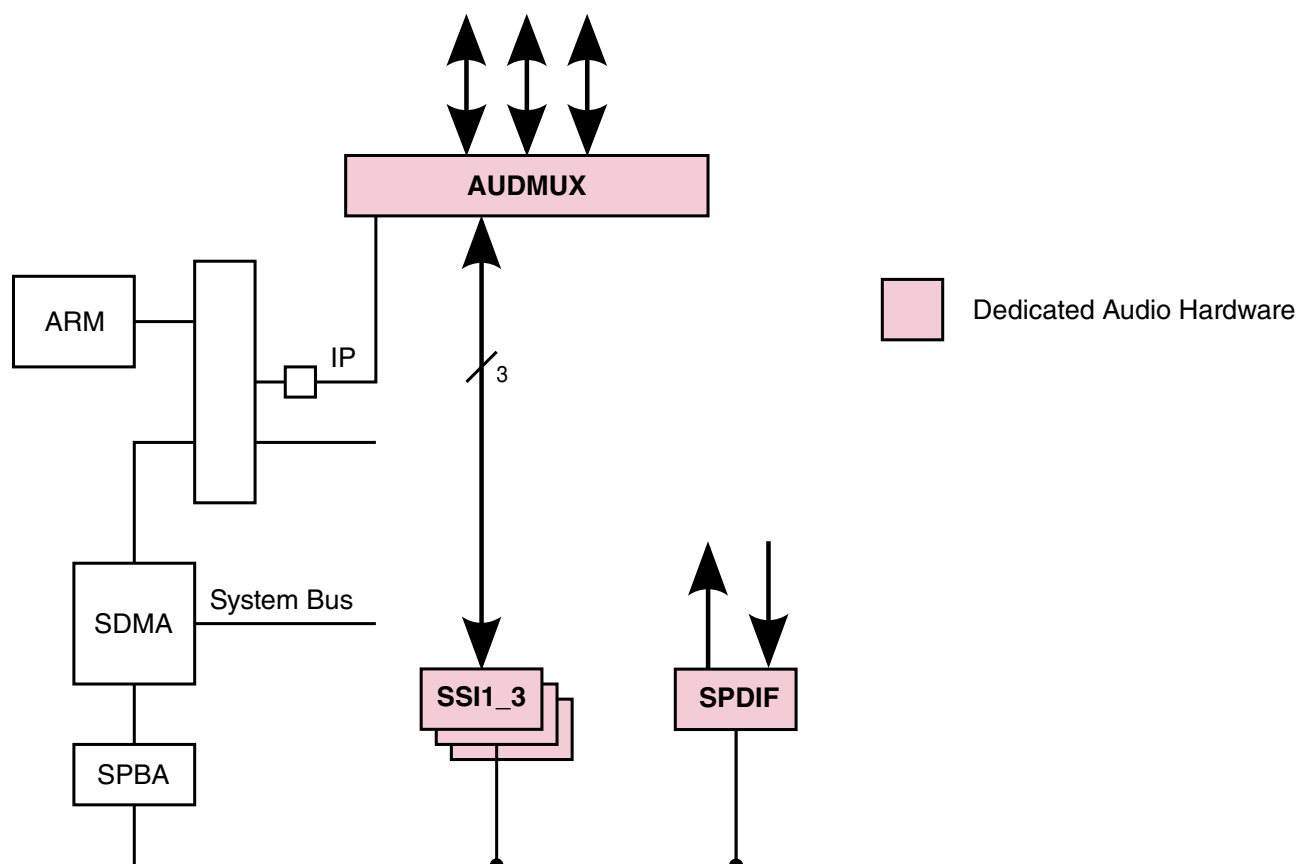

Figure 9-2. Audio subsystem block diagram

SSI1–3 are synchronous serial interfaces used to transfer audio data. SSI1–3 are on the shared peripheral bus. Instead of connecting to the IOMUX directly, their serial lines connect to the digital audio mux (AUDMUX).

AUDMUX handles data and clock signal routings to a particular SSI unit (SSI1, SS2, or SSI3) because SSI has no direct contact to the pin. AUDMUX routes audio data (and even splices together multiple time-multiplexed audio streams) but does not decode or process audio data itself. The ARM controls AUDMUX, but AUDMUX can route data even when the ARM is in a low-power mode.

The SPDIF (Sony/Philips digital interface) audio module is a stereo transceiver that allows the processor to receive and transmit digital audio over it. The SPDIF receiver section includes a frequency measurement block that allows the precise measurement of an incoming sampling frequency. A recovered clock is provided by the SPDIF receiver section and may be used to drive both internal and external components in the system. SPDIF is connected to the shared peripheral bus.

9.2.2 Synchronous Serial Interface (SSI)

The Synchronous Serial Interface (SSI) is a full-duplex serial port that allows communication with external devices using a variety of serial protocols. The SSI supports a wide variety of protocols (SSI normal, SSI network, I2S, and AC-97), bit depths (up to 24 bits per word), and clock/frame sync options.

The SSI has two pairs of 15x32 FIFOs and hardware support for an external DMA controller in order to minimize its impact on system performance. The second pair of FIFOs provides hardware interleaving of a second audio stream which reduces CPU overhead in use cases where two timeslots are being used simultaneously.

The three SSIs may support three audio streams (possibly at different sample rates) simultaneously. SSI1, SSI2 and SSI3 are located on the Shared Peripheral Bus. Since the SDMA can directly access SSI1...SSI3 (being on the Shared Peripheral Bus), they can be used for high-bandwidth data transfers in order to optimize bus bandwidth consumption.

9.2.3 Sony/Philips Digital Interface (SPDIF)

The SPDIF module is a stereo that allows the processor transmit digital audio over it using the IEC60958 standard, consumer format. The chip provides one SPDIF transmitter with one output.

The SPDIF allows the handling of both SPDIF channel status (CS) and User (U) data.

For the SPDIF transmitter, the audio data is provided by the processor via the SPDIFTxLeft and SPDIFTxRight registers, and the data is stored in two 16-word-deep FIFOs, one for the right channel, the other for the left channel. The FIFOs support programmable watermark levels so that FIFO Empty service request can be triggered when the combined number of empty data words locations in both FIFOs is 8, 16, 24 or 32 words. It is recommended to program the watermark level to trigger a FIFO Empty service request when 16 word locations are empty. For optimal performance when servicing the FIFO Empty service request, the FIFOs should be written alternately, starting with the left channel FIFO. The Channel Status bits are also provided via the

corresponding registers. The SPDIF transmitter generates an SPDIF output bitstream in the biphas mark format (IEC 60958), which consists of audio data, channel status and user bits.

The data handled by the SPDIF module is 24-bit wide. The 24-bit SPDIF data is aligned in the 24 least significant bits of the 32-bit shared peripheral bus data word. The 8 most significant bits of the 32-bit word are ignored by the SPDIF Transmitter when data is being stored in the Transmit FIFOs from the peripheral bus. The 8 most significant bits of the 32-bit word are zeroed by the SPDIF Receiver module when the data is being read from the Receiver FIFOs to the peripheral bus.

Note that 16-bit data is left-aligned in the 24-bit word format of the SPDIF. When 16-bit data is to be transmitted, the 32-bit word to be written to the SPDIF Transmit FIFOs should be created as follows: the 16-bit data should be located in the middle two bytes of the 32-bit data word and the 8 bits of the LSB must be set to zero, while the 8 bits of the MSB will be ignored.

The SPDIF Transmit clock is generated by the SPDIF internal clock generator module and the clock sources are from outside of the SPDIF block. The clock sources should provide a clock that is at least $64 \times F_s$, where F_s is the sampling frequency. The external clock source should provide at least $128 \times F_s$. Clocks of higher frequency may be provided as long as the multiplication factor is a power of 2 (for example, $128x$, $256x$ or $512x$). Also, clock frequency precision of 100ppm or better should be provided.

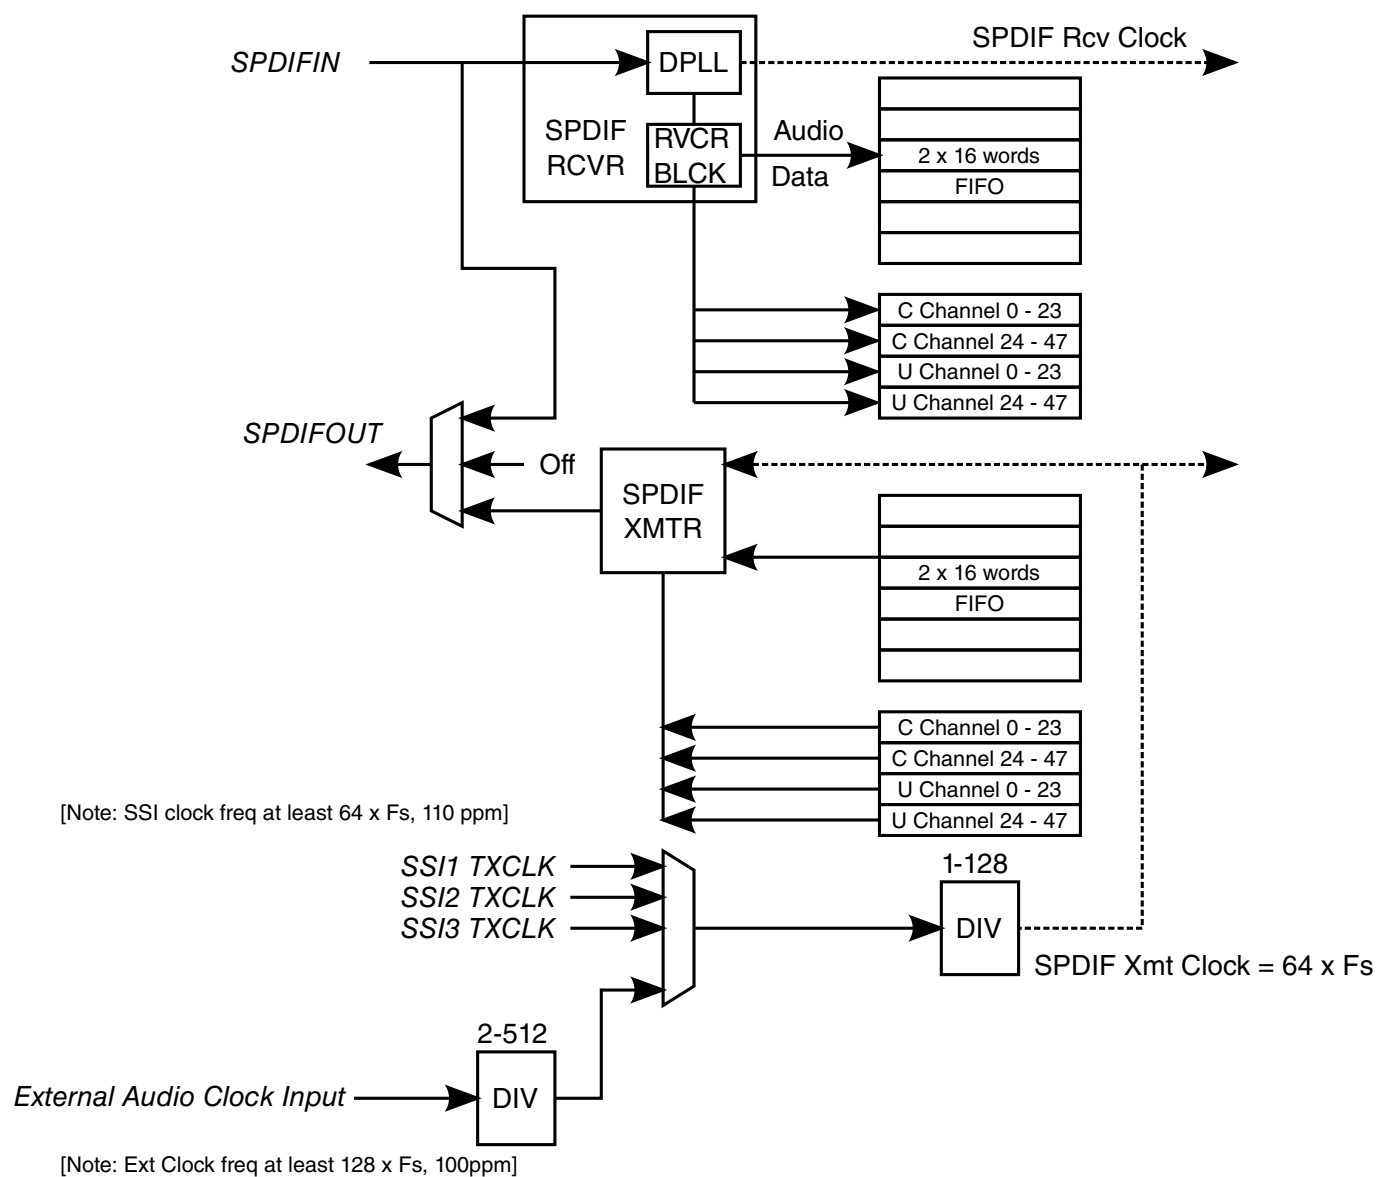

Figure 9-3. SPDIF Transceiver Clock Diagram

Chapter 10

Clock and Power Management

10.1 Introduction

This chapter describes the Clock and Power Management architecture of the SoC.

The chip targets applications where low power consumption, long battery life, always-on and instant-on capabilities are paramount, and where there is no need for active cooling. To achieve these capabilities, the primary focus of the chip's design is reducing current consumption as much as possible, while simultaneously enabling the maximum level of peak performance and a balanced level of sustained performance for target applications. To achieve this, the chip architecture uses a wide range of power-management techniques and their combinations for maximum system design flexibility.

This chapter contains information about:

- Structural components of the power and clock management systems of the chip
- Power, clock and thermal management techniques supported by the chip

All given numerical values are typical or examples. For accurate values one should refer to the datasheet.

10.2 Device Power Management Architecture Components

To provide a clean and versatile architecture supporting a wide range of power-management techniques, clocks, and power rails are managed resources.

For each rail, two levels of management are defined: the first level is centralized or SoC-level resource management, and the second is a local or "module level" resource management.

The high level architectural view of the clock, power and thermal management system of the chip is presented in the figure below.

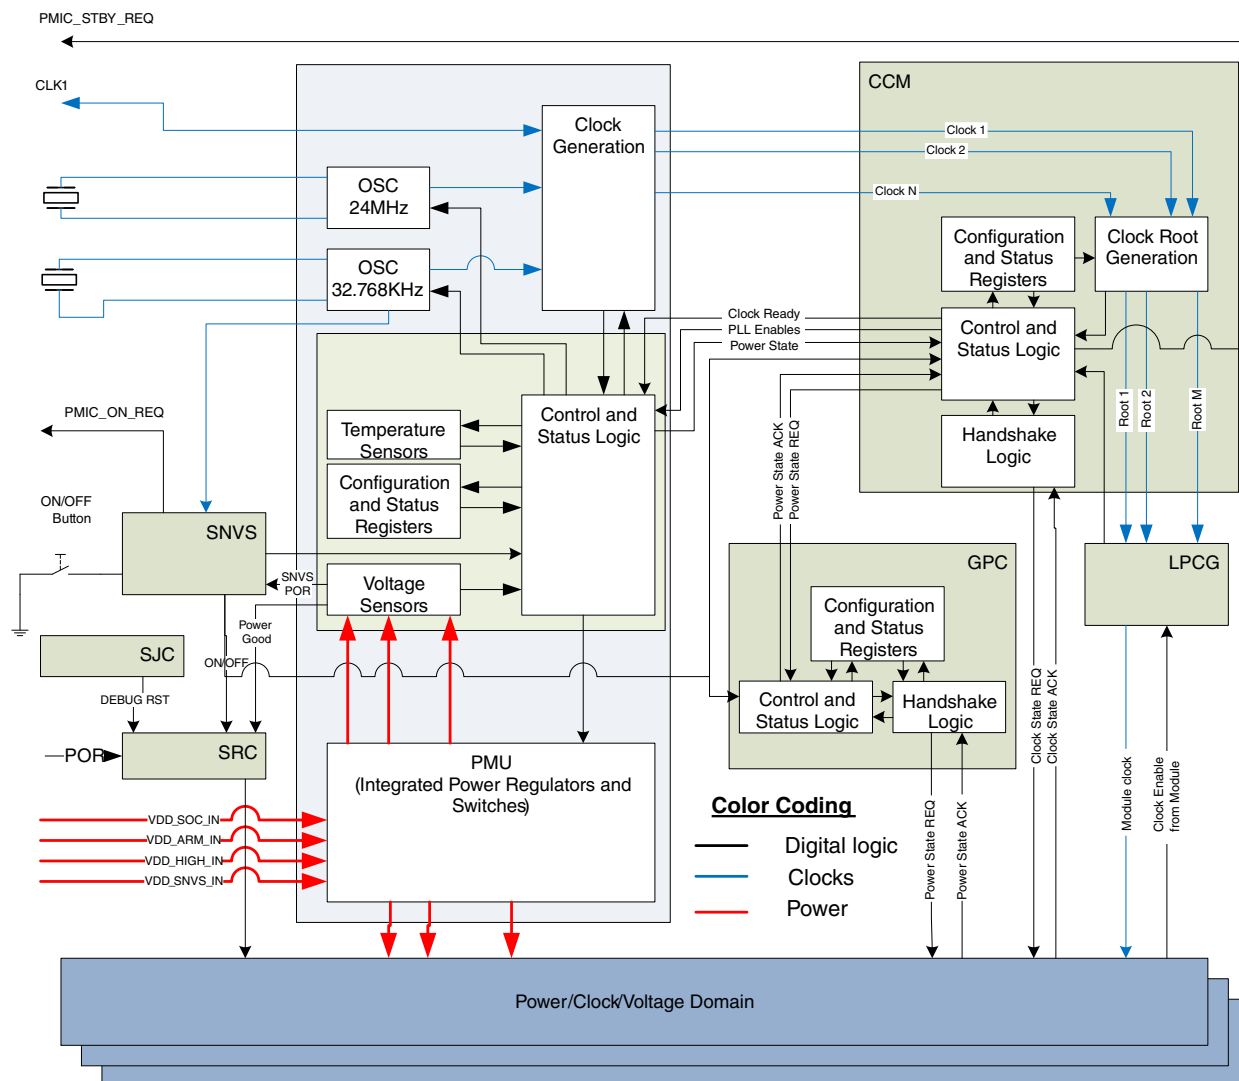

Figure 10-1. Power and clock management framework

10.2.1 Centralized components of clock generation and management

Centralized components of the clock generation and management sub-system are implemented in the following blocks:

- **CCM (Clock Control Module):** The CCM module provides control for primary (source level) and secondary (root level) clock generation, division, distribution, synchronization, and coarse-level gating. See [Clock Controller Module \(CCM\)](#) for

information on the CCM architecture, functional description and programming model.

- LPCG (Low Power Clock Gating): This module distributes the clocks to all blocks in the SoC and handles block level software-controllable and automated clock gating. See [Clock Controller Module \(CCM\)](#) for information on the LPCG architecture and functional description.

10.2.2 Centralized components of power generation, distribution and management

Centralized components of the power generation, distribution and management subsystem are implemented in the following blocks:

- Power Management Unit (PMU). See [Power Management Unit \(PMU\)](#) for information on the PMU architecture, functional description and programming model.
- General Power Controller (GPC). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

10.2.3 Reset generation and distribution system

Power and clock management are accompanied with an appropriate reset generation and distribution system, centralized functions of which are implemented by the [System Reset Controller \(SRC\)](#). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

10.2.4 Power and clock management framework

Together, the modules listed above provide enhanced power-management features with centralized control for the clock, reset, and power-management signals on the SoC.

The centralized management framework defines the managed components of the power-management architecture. These components are called the clock, power, and voltage domains.

NOTE

A domain is a group of modules or functional blocks that share a common resource entity (for example, common clock root, common power source, or a common power switch). The software component managing shared resources should take

into account the joint constraints of all the modules belonging to that resource domain.

10.3 Clock Management

10.3.1 Centralized components of clock management system

The clock generation and management system is built around the CCM and LPCG blocks.

A high level block diagram of the clock management system in the SoC environment is shown in the following figure.

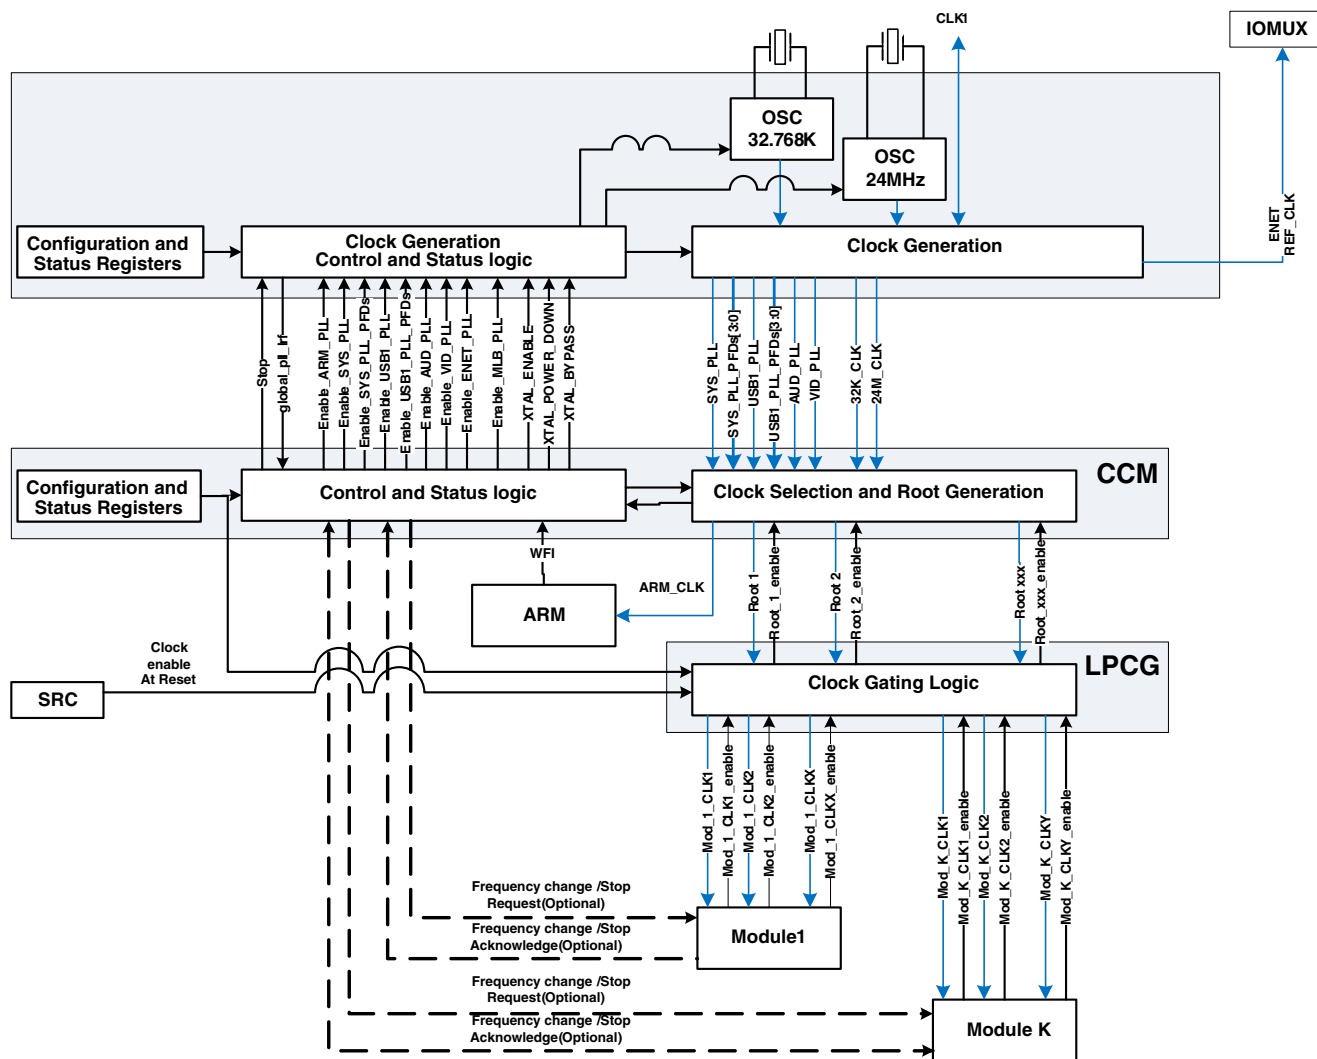

Figure 10-2. Clock Management System

A high level block diagram of the clock generation is shown in the figure below.

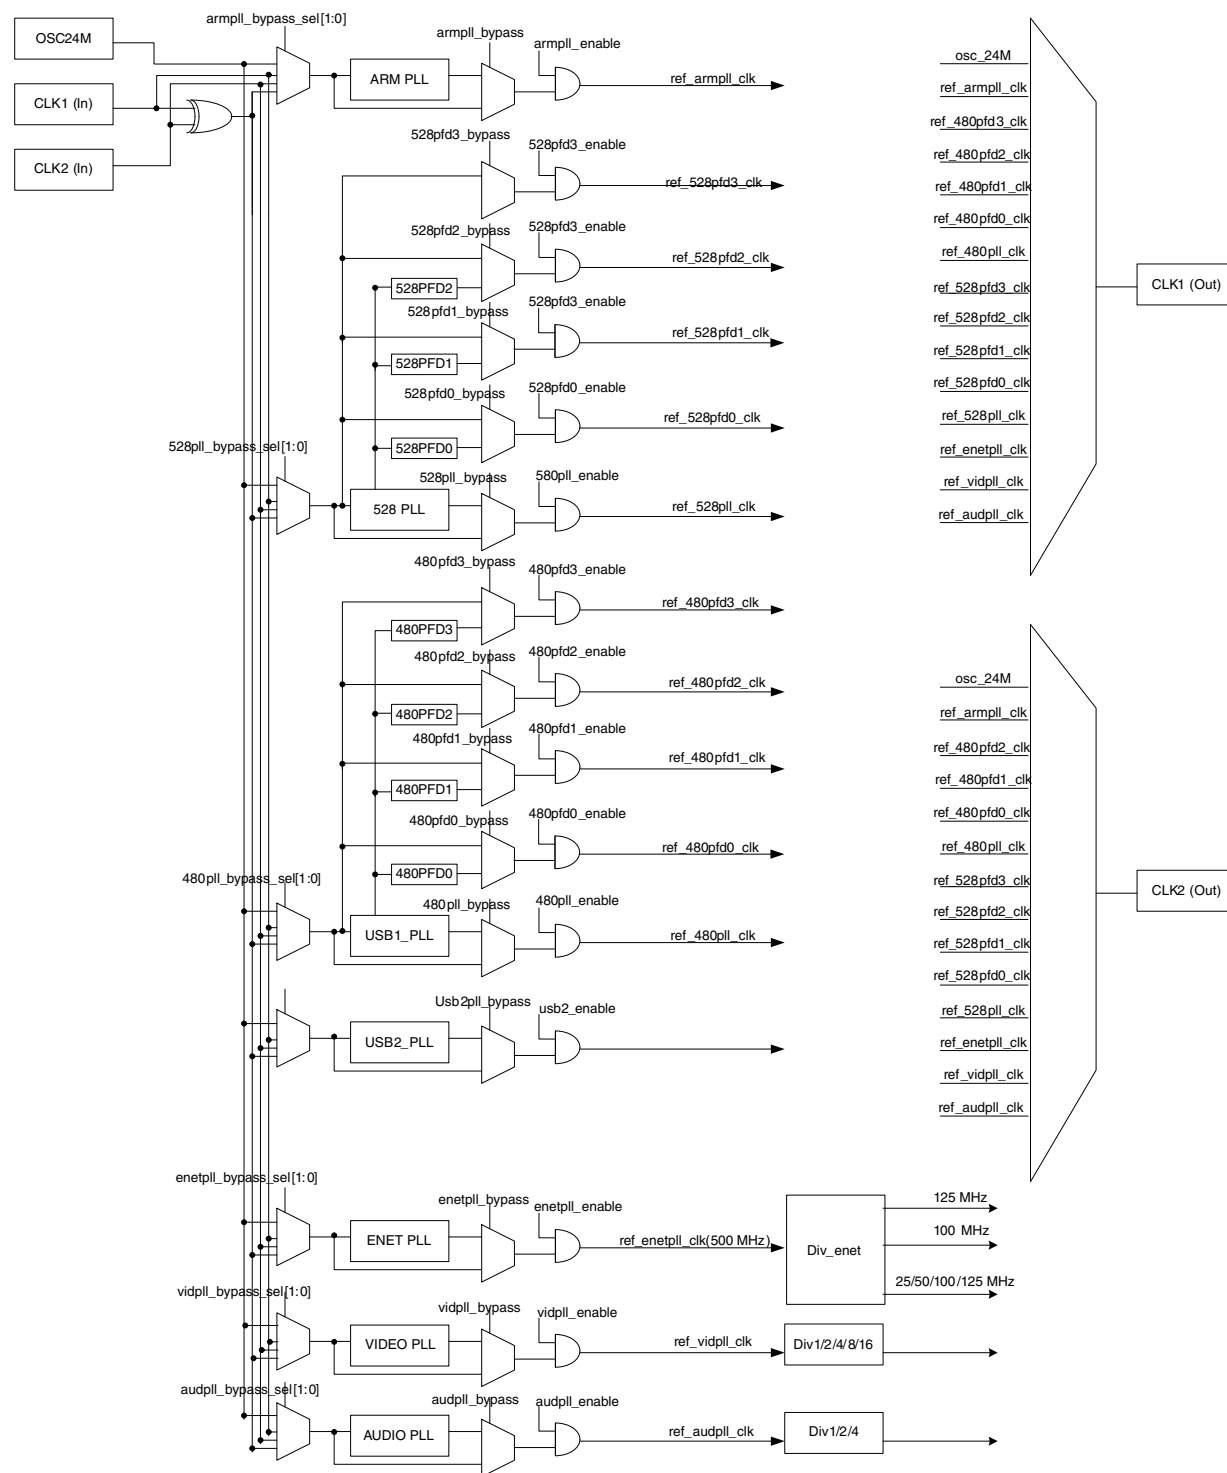

Figure 10-3. Primary Clock Generation

10.3.2 Clock generation

The clock generation section includes the components detailed in the following sections.

10.3.2.1 Crystal Oscillator (XTALOSC)

The Crystal Oscillator block is comprised of both the high frequency oscillator (typical frequency is 24 MHz) and the low frequency real time clock oscillator (typical frequency of 32.768 KHz). Each of these oscillators is implemented as a biased amplifier that, when combined with a suitable external quartz crystal and external load capacitors, implements an oscillator. See [Crystal Oscillator \(XTALOSC\)](#) for details of the XTALOSC block.

There is also a lower-power RC oscillator available on-chip that can be used as an alternative to the crystal oscillator. Because it has accuracy limitations it is intended to be used mainly in conjunction with the low-power modes. For more information please contact a NXP FAE for pertinent application notes.

10.3.2.2 Low Voltage Differential Signaling (LVDS) I/O ports

There is one LVDS I/O port used for clock generation. The low jitter differential I/O port is provided to input and output clocks. It can take input clocks from outside of the SoC and provide them to the PLLs or to the other modules, or it can take the outputs of the PLLs and provide them outside of the SoC as a functional or reference clock.

10.3.2.3 PLLs

Seven PLLs are included in the clock generation section. Two of these PLLs are each equipped with four Phase Fractional Dividers (PFDs) in order to generate additional frequencies.

NOTE

Each PFD works independently by interpolating the VCO of the PLL to which it is connected. It effectively takes the PLL VCO frequency and produces $18/N \times F_{vco}$ at its output where N ranges from 12 to 35. PFD is a completely digital design with no analog components or feedback loops. The frequency switch time is much faster than a PLL because keeping the base PLL locked and changing the integer N only changes the logical combination of the interpolated outputs of the VCO. Note that the PFD not only enables faster frequency changes than a PLL, but also allows the configuration to be safely changed "on-the-fly" without going through the output clock disabling/enabling process.

The seven PLLs are listed below:

- PLL1 (also referred to as ARM_PLL) - This is the PLL clocking the ARM core complex. It is a programmable integer frequency multiplier capable of output frequency of up to 1.3 GHz. Note that this frequency is higher than the maximum chip supported frequency 1.0 GHz.
- PLL2 (also referred to as System_PLL or 528_PLL) - PLL2 runs at a fixed multiplier of 22, producing 528 MHz output frequency with 24 MHz reference from XTALOSC. Besides the main output, this PLL drives three PFDs (PLL2_PFD0...PLL2_PFD2). The main PLL output and its PFD outputs are used as inputs for many clock roots. These do not require exact/constant frequency and can be changed as a part of dynamic frequency scaling procedure. Typically, this PLL or its PFDs are a clock source for internal system buses, internal processing logic, DDR interface, NAND/NOR interface modules, etc.
- PLL3 (also referred to as USB1_PLL) - PLL3 is used in conjunction with the first instance of USB PHY (USBPHY1, also known as OTG PHY). This PLL drives four PFDs (PLL3_PFD0...PLL3_PFD3) and runs at a fixed multiplier of 20. This results in a VCO frequency of 480 MHz with a 24 MHz oscillator. The main PLL output and its PFD outputs are used as inputs for many clock roots that require constant frequency, such as UART and other serial interfaces, audio interfaces, etc.
- PLL4 (also referred to as an Audio PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision audio clock with standardized audio frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for serial audio interfaces and as a reference clock for external audio codecs. It is equipped with a divider on its output and can generate divided by 1, 2 or 4 from the PLL VCO frequency.
- PLL5 (also referred to as a Video PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision video clock with standardized video frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for display and video interfaces. It is equipped with dividers on its output and can generate clock divided by 1, 2, 4, 8 or 16 from the PLL VCO frequency.
- PLL6 (also referred to as ENET_PLL) - This PLL implements a fixed $20 + (5/6)$ multiplier. With a 24 MHz input, it has a VCO frequency of 500 MHz. This PLL is used to generate:
 - 50 or 25 MHz for the external ethernet interface.
 - 125 MHz for reduced gigabit ethernet interface.
 - 100 MHz for general purposes.
- PLL7 (also referred to as USB2_PLL) - This PLL provides clock exclusively to USB2 PHY (USBPHY2, also known as PHY). It runs at a fixed multiplier of 20, resulting in a VCO frequency of 480 MHz with a 24 MHz oscillator.

10.3.2.3.1 General PLL Control and Status Functions

Each PLLs configuration and control functions are accessible individually through its PFDs and global configuration and status registers.

Reference input clock for any of the PLLs could be selected individually by the `BYPASS_CLK_SRC` field of the PLL control register. See [CCM Analog Memory Map/ Register Definition](#) for more information.

Each of the PLLs could be individually configured to "Bypass", "Output disabled" and "Power Down" modes.

When configured in "Bypass" PLL pass directly its input reference clocks to the PLL output. Bypassing the PLL is done by setting the `BYPASS` bit in the control register. For the PLL equipped with PFDs the input reference clock is also bypassed to all PFDs outputs.

When configured in output disabled mode (`ENABLE=0`), the PLL's output is completely gated and there is neither a bypass clock nor PLL generated clock that propagates to PLL output. Each PLL output has an individual "Output Enable" control bit. The PFDs are gated by the `ENABLE` bit of their associated PLL. Each PFD does have an associated clock gate bit that can be used to turn it off individually.

When configured in "Power Down mode" most of the PLL circuitry is switched off. Neither main PLL output nor PFD outputs are available in this mode.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related `PFDx_CLKGATE` bit in `CCM_ANALOG_PFD_480n` or `CCM_ANALOG_PFD_528n`, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, Configuration of Phase Fractional Dividers (EB790) at www.nxp.com for procedure details.

Individual PLL status is reflected in "PLL Lock" bits of the PLL control registers. PLL enable logic which monitors the register value change is implemented to gate off the PLL outputs during the "lock in" period.

Outputs are generated to be sent out by monitoring the individual PLL lock flags and filtering out any random initial edges.

Individual PLL Lock ready flags are first "ORED" with "enables" and then "ANDED" together to generate the global PLL lock ready flag that reflects status of all PLLs enabled in certain moment.

[CCM Memory Map/Register Definition](#) and [CCM Analog Memory Map/Register Definition](#) contains detailed descriptions of the memory mapped registers and control functions of the clock generation sub-module.

10.3.2.4 CCM

CCM includes:

- Clock root generation logic - This sub-block provides the registers that control most of the secondary clock source programming, including both the primary clock source selection and the clock dividers. The clock roots are each individual clocks to the core, system buses (AXI, AHB, IPG) and all other SoC peripherals, among those are serial clocks, baud clocks, and special functional clocks. Most of clock roots are specific per module.
- CCM, in coordination with GPC, PMU and SRC, manages the [Power modes](#), namely RUN, WAIT and STOP modes. The gating of the peripheral clocks is programmable in RUN and WAIT modes.

CCM manages the frequency scaling procedure for:

- ARM core clock - "on the fly" without clock interruption, by either shifting between PLL sources [PLL clock change](#) or by changing the divider ratio.
- changing of the DDR memory controller clock. See [MMDC handshake](#) and [Self refresh and Frequency change entry/exit](#) for more details.
- Peripheral root clock - by using programmable divider. The division factor can change on the fly without loss of clocks.

NOTE

On-the-fly frequency changing for synchronous interfaces like serial audio interfaces, video and display interfaces, or general purpose serial interfaces (e.g. UART, CAN) may cause synchronization loss and should not be done.

10.3.2.5 Low Power Clock Gating unit (LPCG)

The LPCG block receives the root clocks from CCM and splits them to clock branches for each block. The clock branches are individually gated clocks.

The enables for those gates can come from three sources:

- Clock enable signal from CCM - This signal is generated depending on the power mode the system is in. For each power mode, it is defined in the software using the configuration of the CGR bits in CCM.
- Clock enable signal from the block - This signal is generated by the block based on its internal logic. Not every enable signal from the block is used. Each clock enable signal from the block can be overridden based on the programmable bit in CCM.
- Clock enable signal from the reset controller (SRC) - This signal will enable the clock during the reset procedure.

10.3.3 Peripheral components of clock management system

The figure found here shows the clock interface of a functional module in the system.

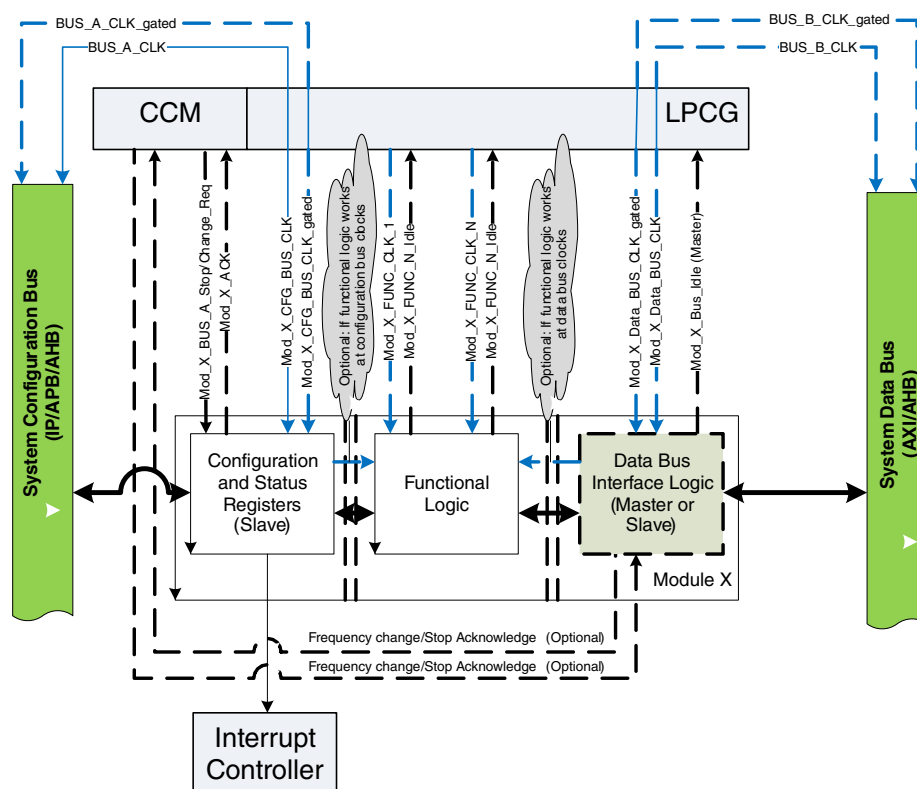

Figure 10-4. Clock interface of the functional module in the system

10.3.3.1 Interface and functional clock

Each block within the SoC has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to modules, the clocks are divided into two categories: bus interface clocks and functional clocks.

The bus interface clocks have the following characteristics:

- They ensure proper communication between any block/subsystem and the system buses.
- In most cases, they supply the system interface and configuration registers of the block.
- A typical block has one system bus clock, but blocks with multiple interface clocks may also exist (that is, when a block is connected to multiple buses).
- The bus interface clocks are always fed by the outputs of the CCM/LPCG.
- Clock management for this type of clock is always implemented at the system level because it requires coordinated clock management between the block and system buses.

Functional clocks have the following characteristics:

- They supply the functional part of a block or a subsystem.
- Typically, these clocks are completely asynchronous and independent from the bus interface clock of the same block.
- A block can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A block needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the block activity.
- The functional clocks are fed either by a CCM/LPCG block functional clock output, or by some other clock source, such as a clock output of another block or an external signal coming from IOMUX.

10.3.3.2 Block level clock management

Each block in the system may also have specific clock requirements. Certain module clocks must be active when operating in some specific modes, or may be gated in some others. Generally, the activation and gating of the module clocks are managed by LPCG. Hence, the LPCG block must be programmed properly and, in case of hardware controllable clock gating, peripheral module should provide signals indicating when to activate and when to gate the module clocks.

The LPCG block differentiates the clock-management behavior for device modules based on whether the block can initiate transactions on the device interconnect (called master module), or if it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based clock-management protocols are used:

- Master protocol - Clock-management protocol between the CCM/LPCG and blocks that can be bus master
- Slave protocol - Clock-management protocol between the CCM/LPCG and slave modules

10.3.3.2.1 Master clock protocol

This protocol is used to indicate that a master module is ready to initiate a transaction on the device interconnect and requests specific (both functional and interface) clocks. The CCM/LPCG block ensures that the required clocks are active when the master module requests that the CCM/LPCG enable them. The module is said to be functional after the required clocks are activated.

Similarly, when the master module no longer requires the clocks, it informs the LPCG/CCM block and the LPCG/CCM can then gate the clocks to the module and all the clock precedents that are not used by other blocks. The master module is then said to be in clock-gated or partially clock gated mode.

Examples of module supporting master clock protocol is USDHC. Please see details in chapters describing these modules and in the CCM enable override register (CCM_CMEOR).

10.3.3.2.2 Slave clock protocol

This hardware protocol allows CCM to control the state of a slave module. CCM informs the slave module, through assertion of a stop/change request, when its clocks (both interface and functional) can be changed or gated. The slave acknowledges the request and CCM is then allowed to gate or change the clocks to the block.

Similarly, a clock-gated slave module may need to be woken up because of some event or a service request from a master module. In this situation, CCM enables the clocks to the module and then de-asserts the stop request to signal the module to wake up.

Examples of modules supporting slave clock protocol are EPIT and GPT. Please see details in chapters describing these modules and in the CCM Module Enable Override Register (CCM_CMEOR). See [CCM Memory Map/Register Definition](#) for more details.

The protocol in both "master" and "slave" cases is completely hardware-controlled, but software should configure the clock management behavior for the module in two places: in the CCM registers associated with the block and in the block configuration registers.

10.3.3.3 Clock Domain(s)

A clock domain is a group of blocks fed by clock signals controlled by the same clock controls in CCM. By gating the clocks in a clock domain, the clocks to all the blocks belonging to that clock domain can be gated/activated, either by software control or by hardware control associated with block activity. Thus, a clock domain allows efficient control of the dynamic power consumption of the domain.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated group of clock gating cells within the LPCG block. This allows the CCM/LPCG to individually activate and gate each clock domain of the system.

Examples of clock domains are: Main AXI bus clock domain, main AHB bus clock domain, etc.

10.3.3.4 Domain level clock management

The domain clock manager can automatically (based on hardware conditions) and manage the bus interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

10.3.3.5 Domain dependencies

A domain dependency is a hierarchical relationship between two clock domains. Clock domain "X" is said to depend on a clock domain "Y" when a block in clock domain "Y" provides services (or even just a clock) to a block in clock domain "X". As a result, clock domain "Y" must be active whenever clock domain "X" is active.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two blocks (for example, the clock domain of the device interconnect).

10.4 Power management

10.4.1 Centralized Components of Power Management System

The power generation and management system is built around the PMU and GPC blocks.

A high level block diagram of the power management system in the SoC environment is shown in the figure below.

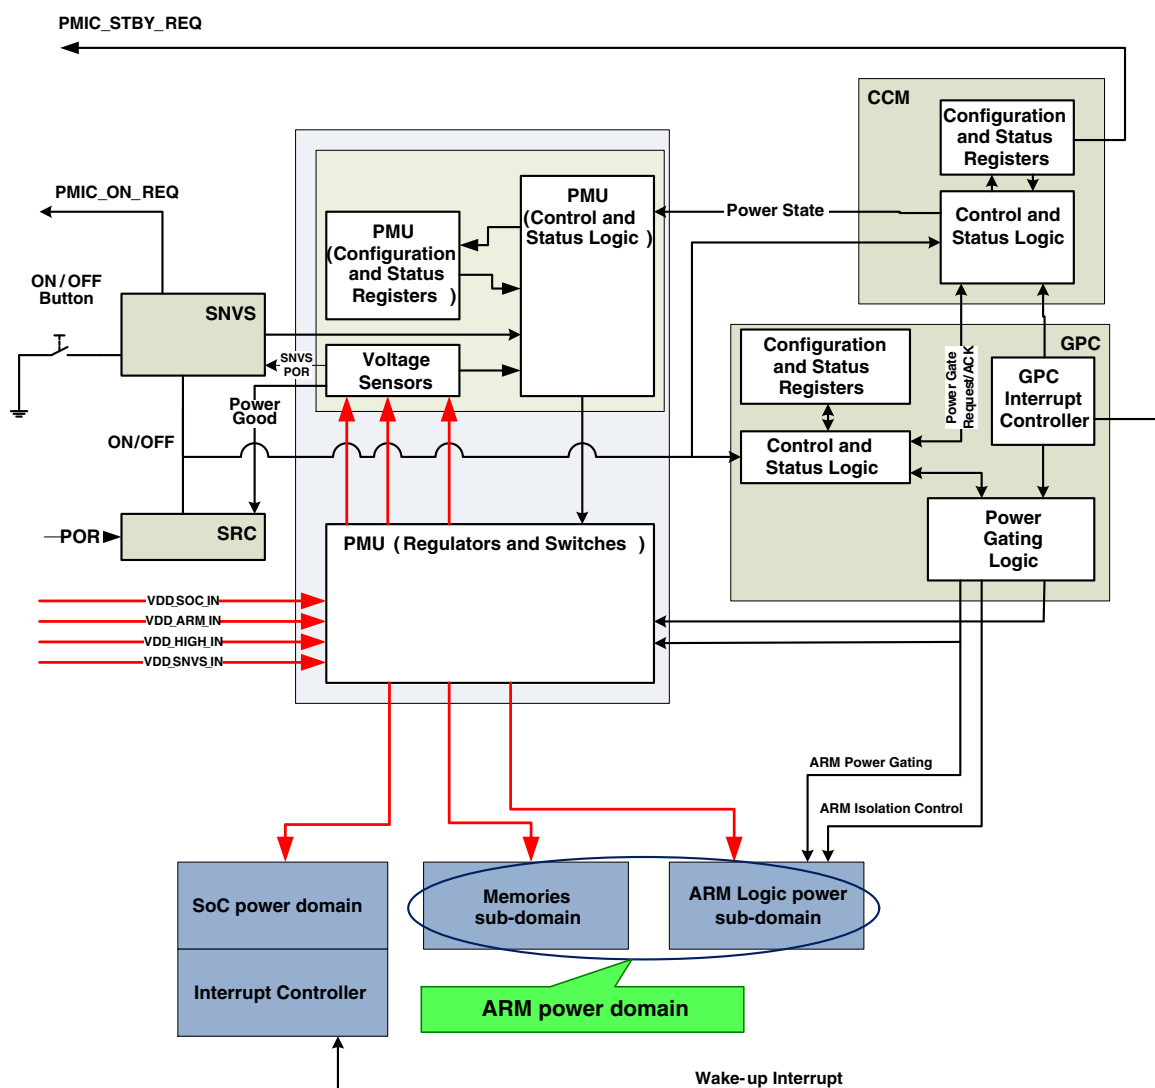

Figure 10-5. Power Management System

10.4.1.1 Integrated PMU

The first component of the power management system, referred to as the integrated PMU, is designed to simplify the external power interface.

It consists of a set of secondary power supplies that enable SoC operations from just two or three primary supplies. The high level block diagram of the power tree, utilizing the integrated PMU, is shown below.

The integrated PMU includes the following components:

- Three Digital LDO regulators
- Two Analog LDO regulators
- USB LDO
- SNVS regulator
- Reverse well biasing

See [Power Management Unit \(PMU\)](#) for further details on integrated PMU functional description and programmability.

10.4.1.1.1 Digital LDO Regulators

The integrated PMU includes three digital LDO regulators: LDO_ARM, LDO_PU, and LDO_SOC. These regulators provide power to the ARM_Core power domain, the combined VPU and GPU power domain, and the rest of the SoC logic (except always-ON SNVS domain).

NOTE

The name "digital" only refers to the type of load. It is not related to the LDO design or feature set.

The digital LDO regulators can operate in the following modes:

- **Internal Bypass** - The regulation pass device (FET) is switched fully on, passing the external input voltage to the load unaltered. The analog part of the regulator is powered down in this state, removing any loss other than the IR drop through the power grid and the FET. Be aware that a period of time (see datasheet) is required to switch from the internal digital bypass mode to the analog regulation mode. Typically it takes less than 100us. Please refer to [PMU](#) for further details on bypass and power gate configuration.
- **External Bypass** - The input and output of the regulator are shorted externally to the SoC. If operating in this configuration, enable the internal bypass early in the startup sequence before attempting high frequency/high power operation. Be aware that internal power gating is not available in this mode.
- **Power Gate** - The regulation FET is switched fully off, limiting the current draw from the supply. The analog part of the regulator is powered down, limiting the power consumption. The output voltage will fall to a level where the residual leakage

of the power FET balances with the leakage of the load. Power gating is applicable to ARM and PU power domains.

- Analog regulation mode - The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25mV steps.

These modes allow the regulators to implement voltage scaling and power gating, and allow bypass when an external high power efficient regulator is used as a direct source for some of the SoC loads.

These digital regulators also feature brownout detection, which is helpful to sense when supplies are starting to collapse. Note that the core will be interrupted on a brownout. Please see details in [Miscellaneous Control Register \(PMU_MISC2n\)](#).

For further details of LDO programming and configuration please refer to [Digital Regulator Core Register \(PMU_REG_COREn\)](#).

The power management system is built under assumption that in typical applications the single (and simple) shared power supply will be used for ARM core domain and SoC domain. The combined load gains some efficiency, especially in low power modes and saves BoM significantly.

The DVFS in a typical cost/complexity optimized application is considered by mean of internal LDO. In "full speed" modes LDO bypass is considered in both domains. The dynamic voltage scaling to low load workpoints for ARM domain is implemented by programming associated LDO.

In highly power-optimized systems, it is possible to use multiple external DCDC buck converters and bypass internal LDO for high power domains. The obvious trade-off is in the increased complexity of the external power supply components and the associated increase in the BoM and board design complexity.

10.4.1.1.2 Analog LDO regulators

There are two analog LDO regulators used for general system purposes:

- LDO_1P1 - The LDO_1P1 (VDD_HIGH_IN, NVCC_PLL) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 1.1V output voltage. This regulator supplies digital portions of USB PHYs, PLLs, and the internal 24 MHz oscillator.

10.4.1.1.3 USB LDO

The USB_LDO linearly regulates down the USB VBUS input voltages (typically 5V) to produce a nominal 3.0V output voltage. This regulator has a built in power-mux that allows the user to run the regulator from either one of the VBUS supplies when both are present. If only one of the VBUS voltages is present, the regulator automatically selects that supply. Current limit is also included to help the system keep the in-rush current within limits as required in USB 2.0 specification. This regulator supplies only low speed and full speed transceivers of USB PHYs.

10.4.1.1.4 SNVS regulator

The SNVS regulator takes the SNVS_IN supply and generates the SNVS_CAP supply, which in turn powers the real time clock and low power section of the SNVS blocks. If VDDHIGH_IN is present, then the SNVS_IN supply is internally shorted to the VDDHIGH_IN supply to allow coin cell recharging if necessary.

10.4.1.1.5 Reverse well biasing

The reverse well biasing module on the SoC consists of a self-clocked/self-regulating charge-pump circuit, used to generate a negative bias voltage for the floating PWELL, and a low-power regulator. The low-power regulator is used to generate a positive bias voltage for the NWELL of the digital logic cells on the SOC power domain. Static leakage reduction can be achieved during SoC low-power modes through the use of these reverse well bias voltages. Please refer to the CCM_CLPCR register in [CCM Memory Map/Register Definition](#) and PMU_MISC0 in [PMU Memory Map/Register Definition](#) for details about well bias control and [Static](#) " for functional description of the reverse well biasing.

10.4.1.2 GPC - General Power Controller

The GPC block includes the sub-blocks listed here.

- Power Gating Controller (PGC) - This sub-block of GPC has the following functions:
 - Provides the user with the ability to switch off power to a target subsystem.
 - Generates power-up and power-down control sequences. This includes interaction with CCM/LPCG and SRC, and control for clock and reset generation for power domains affected by power gating.
 - Provides programmable registers that adjust the timing of the power control signals.

- Controls the CPU power domain and the combined GPU/VPU power domain.
- Wake-up interrupt controller - This controller initiates the system wake-up from low power modes when only low frequency real time clock remains active, and thus the Generic Interrupt Controller (GIC) can not handle synchronous interrupt signals.

Additional features are as follows:

- Supports up to 128 interrupts
- Provides an option to mask/unmask each interrupt
- Detects interrupts and generates the wake up signal

See [General Power Controller \(GPC\)](#) for further details on GPC, its sub-blocks, and information on its functional description and programmability.

10.4.1.3 SRC - System reset Controller

The reset controller is responsible for the generation of all reset signals and boot configuration decoding.

It determines the source and the type of reset, such as POR, WARM, and COLD, and performs the necessary reset signal qualifications. SRC is capable of generating reset sequences in the following conditions:

- in interaction with external PMIC, based on external POR_B signal and "power ready" signals generated by the integrated PMU
- or in interaction with the integrated PMU only, based on its "power ready" signal.

Based on the type of reset, the reset logic generates the reset sequence for either the entire SoC or for the blocks that are power-gated.

See [System Reset Controller \(SRC\)](#) for further details on SRC functional description and programmability.

10.4.1.4 Power domain(s)

A power domain is a group of blocks or sub-blocks fed by power sources controlled by the same power controls in GPC.

Some power domains can be split into a logic sub-domain and a memory sub-domain. The memory sub-domain in such case may contain two entities:

- Memory array(s) - Powered by a dedicated voltage rail enabling memory retention while core is OFF.
- Memory interface logic - Powered by the same voltage source as the logic sub-domain of the power domain.

Signals crossing power domain boundaries or sub-domain boundaries are passed through proper isolation and/or level-shifting cells to ensure robust operations of the SoC when some of domains are power gated or working at a reduced voltage.

The following figure shows the power domain interface within the system.

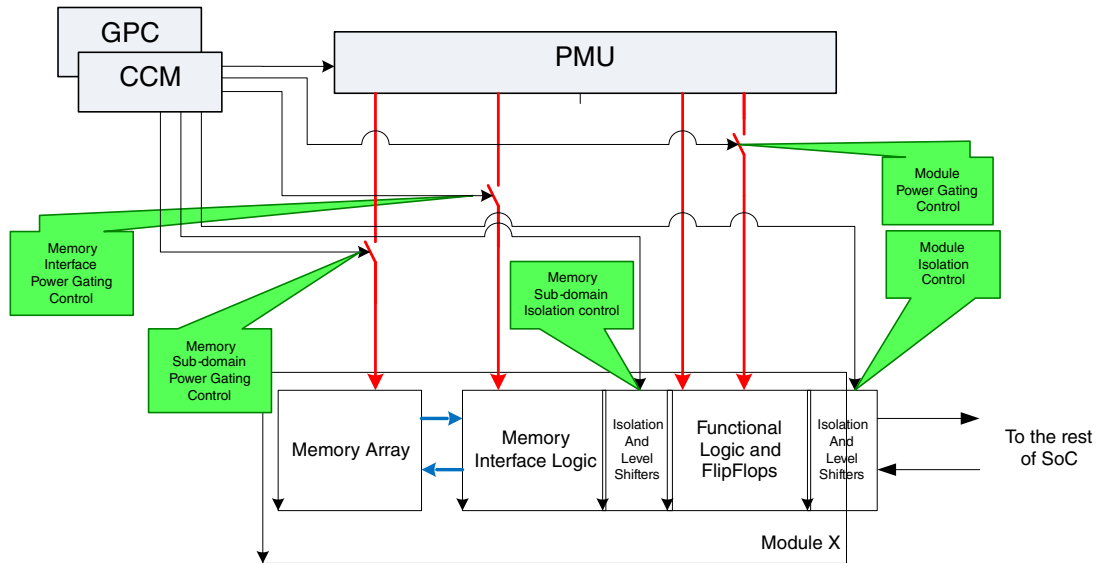

Figure 10-6. Power domain interface

10.4.1.4.1 Power distribution

The power distribution tree is comprised of multiple power domains. The main power domains are:

- **ARM** - The ARM domain contains the ARM Core platform (except for memory arrays and interface logic). This domain can be supplied from an external controllable regulator, preferably high efficiency DCDC converter.
- **ARM Memory array** - Memory arrays are connected to a separate and dedicated power domain (separated from the Main logic and ARM domain). In normal operation mode (functional mode), the memory arrays domain voltage level should be kept equal to (same as) the rest of the core logic domains (Main, ARM). Please refer to the Datasheet for further information about voltage level difference between domains allowed in different power modes.
- **SOC_PD domain** -- The SOC_PD domain contains MMDC, CSI, LCDIF, PXP, SDMA, uSDHC, and USB. It is supplied by external regulator.
- **SNVS/RTC low power domain** - The SRTC domain contains only counter, comparator and compared data of the on-chip RTC. This domain should be supplied from an external single cell LiION battery and/or an external pre-regulated power supply.

- Analog domain - The analog domain contains the PLLs, LDOs and USB PHY. The domain supplies should be constant to allow continuous clock during any dynamic voltage scaling techniques. The digital supply should be provided from an internal regulator, and can be combined with the memory array supply. The analog supply should be provided from internal low noise regulator.
- Main SoC logic - The main SoC logic domain contains the rest of the logic of the SoC.

From a DVFS and Power Gating standpoint, the following digital logic domains are affected:

- Cortex-A9 Core Platform - DVFS and power gating.
- ARM Cortex-A9 memories - Power gating only.
- SOC_PD - Power gating only.

See table below for details of the i.MX 6SLL system power domains layout and dependencies.

10.4.1.4.2 Domain Memory and domain logic state retention in case of Power Gating

The following is the list of relevant memories and logic domains with the description of their state-retention support:

- Cortex-A9 Core Platform is sub-divided into three sub-domains listed below:
- Cortex-A9 Core Platform logic: The software state retention for all logic is implemented in this domain. That means that the content of relevant registers should be stored in some memory retaining its state (L2 cache for example) while the logic domain is power-gated. Details on how to implement the software retention can be found in the Cortex-A9 Core Platform TRM.
- Cortex-A9 Core L1 memories - No retention. The L1 cache should be flushed prior to power gating in order to allow powering up of the CPU at the same state as before power gating.
- Cortex-A9 Core L2 memories - hardware state-retention since its supplies are driven by the SoC supplies.
- SoC - hardware state-retention in Standby mode. Reverse Well Biasing is applicable for this domain.
- SNVS_LP - hardware state-retention even when SoC supplies are removed.

10.4.1.4.3 Power Gating Domain Management

The following bullets provide the sequence required for power-gating the relevant power-domains:

10.4.1.4.3.1 ARM Core Platform

1. Copy through software all the Core configuration registers to a powered-on memory
2. Configure the GPC/PGC CPU registers in [PGC Memory Map/Register Definition](#) as follows to power-down the core on the next "WFI" instruction:
 - Configure the GPC/PGC PGC_CPU_PDNSCR Register ISO and ISO2SW bits. These bits determine the delay between the power-down request to enabling the platform isolation and the platform isolation to the actual power-off switch to the supplies accordingly.
 - Configure the GPC/PGC PGC_CPU_PUPSCR Register SW and SW2ISO bits. These bits determine the delay between the power-up request to the actual power-up of the supplies and the last to the platform isolation disabling.
 - Configure the GPC PGC PGC_CPU_CTRL PCR bit to allow the power down of the platform
 - ARM Core Platform should execute a "WFI" instruction.

Figure 10-7. ARM Core Platform isolation and power on switch flow

10.4.1.4.3.2 SoC

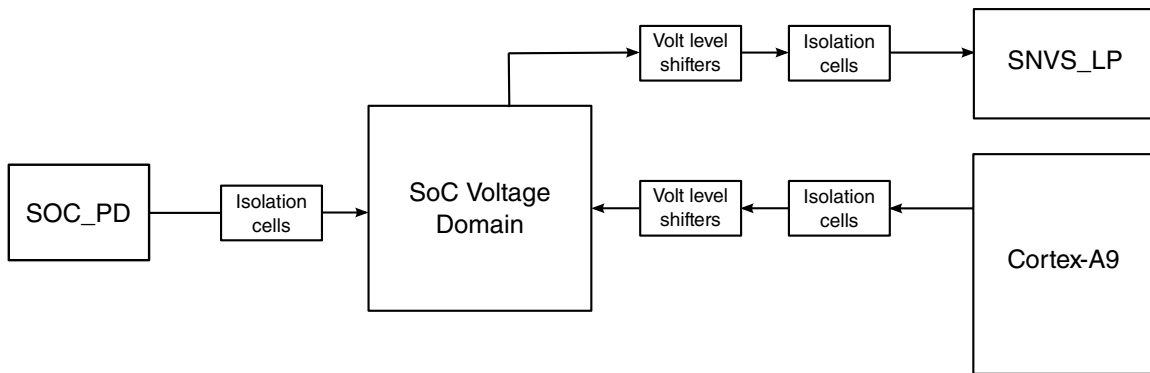

For additional power reduction it is possible to do the following:

- Power-down the internal oscillator by configuring the following bits CCM_CCR[COSC_EN] ([CCM Memory Map/Register Definition](#)). This can be done only in case there is no dependency on 24 MHz XTAL for wake-up.
- Enable reverse well biasing by configuring the CCM_CLPCR[WB_PER_AT_LPM] bit ([CCM Memory Map/Register Definition](#)).
- It is possible to turn off and turn on the PMIC supplies to the SoC even when the SoC supplies are off. Since SNVS_LP is powered through an "always on" supply, configuring the SNVS_LP DP_EN to "1" allows changing the PMIC_ON_REQ pad (SoC on/off supply indication to the PMIC) through the ONOFF pad.

10.4.1.4.4 Power Gating domain dependencies

There are 3 power domains that need to be isolated in different power-down cases:

- Cortex-A9 Core Platform - Isolation needs to be enabled before power-down. This is taken care of automatically once CCM and PGC are configured and the Cortex-A9 Core Platform executes the "WFI" instruction.
- SOC_PD - Isolation needs to be enabled before power-down. This should be taken care through software configuration of the PGC.
- SNVS_LP - Different from the 2 cases above, the SNVS_LP isolation isolates the signals coming from the SoC to the SNVS_LP. This is required for saving the contents of the SNVS_LP (such as the real-time clock). The isolation is activated in 2 ways:
 - Automatically through the power-fail detector in the PMU
 - Through software configuration

Note: The arrows refer to the signal directions for the voltage level shifters and isolation cells

Figure 10-8. Isolation cells and Voltage level shifters placing

10.4.1.5 Voltage domains

The list found here states the different voltage domains and their scalability in regarding to power-saving in dynamic and static scenarios.

- ARM - Cortex-A9 Core Platform including L1 cache - Scalable voltage in both dynamic and static scenarios
- SoC and SOC_PD Domains - Scalable voltage only in static scenarios
- ANALOG components including PLLs - Fixed voltage
- I/O - Fixed voltage
- SNVS_LP - Fixed voltage

10.4.1.6 Voltage domain management

10.4.1.6.1 Dynamic

10.4.1.6.1.1 Voltage Scaling

A simplistic way to reduce power consumption in dynamic scenarios is to scale down the ARM and SoC voltage according to the allowed voltage points and corresponding frequencies specified in datasheet.

10.4.1.6.2 Static

10.4.1.6.2.1 Standby Leakage reduction (SLR)

Standby leakage reduction is a power-management technique utilizing:

- Reduced supply voltage for relevant domains
- Reverse well-biasing in STOP, WAIT, or Deep Sleep Mode (DSM) modes

With SLR, the device switches into low-power active system modes automatically or in response to user requests during system Stop, Wait, or DSM modes (that is, in situations when no application is started and no system activity is presented).

When applying SLR, the system remains in the lowest static power mode while retaining logic and memory states. This technique trades static power consumption for wake-up latency while maintaining fast system response time suitable for most applications.

See CCM Control Register (CCM_CCR), CCM Low Power Control Register (CCM_CLPCR) and PMU Miscellaneous Register 0 (PMU_MISC0) for further details on SLR programmability options.

The following describes the flow for applying standby voltage and reverse well bias to the SoC:

- Configure the external PMIC standby voltage, refer to chip datasheet.
- Configure CCM_CCR[RBC_EN] bits to bypass and disable PMU regulators in the next ARM "WFI" execution.
- Configure CCM_CCR[REG_BYP_COUNT] bits to allow proper voltage restoration by the external PMIC when exiting standby.

- ARM Core Platform executes the "WFI" instruction that completes the software sequence putting the SoC into low power mode
- After that, the reverse well bias will be applied automatically (if enabled) with appropriate delay. Please refer to CCM_CLPCR and CCM_CCR Registers in CCM for further information on reverse bias enabling and counters configuration.

10.4.1.6.3 Voltage domain dependencies

When applying voltage changes for power saving the following voltage domain limitation should be taken into account:

- In dynamic scenario's the ARM supply should not be higher than the SoC supply by more the 50mV.

The above limitation is also mentioned in datasheet.

10.4.1.6.4 IO voltage

10.4.1.7 System domains layout

The following table describes the different power modes.

NOTE

Wakeup time is the hardware perspective, and doesn't reflect the time it takes software to resume drivers and perform system operations.

Table 10-1. Aimerd power modes

Mode	Description (Status of main power domains)	Wake-up capability	Wakeup time	Applicable use case
RUN	Power supplies are on, all clocks are on.	N/A	N/A	All
WAIT	Power supplies are on. ARM executes WFI command, Option to gate off clocks for specific modules based on programmable bits.	Based on interrupt from any module	Immediate (ARM exit WFI)	IDLE process of operating system.
STOP	Power supplies are on. ARM executes WFI command. GPU is in power gating	Based on interrupt from modules that can track operation with low frequency clock- like Keypad press, GPIO, Timer, etc.	~50us	Suspend state of operating system - system is on but is waiting for operation.

Table continues on the next page...

Table 10-1. Aimed power modes (continued)

Mode	Description (Status of main power domains)	Wake-up capability	Wakeup time	Applicable use case
	PLLs are off, hence all system clocks are off.			
Standby	<ul style="list-style-type: none"> - PLLs disabled - Low voltage could be applied to ARM and SoC power inputs - Chip regulator bypass if reduce supply voltage, - Well Bias could be activated - CPU regulator disabled for power gating - PU regulator is disabled in software - xtal enabled 	Same as above	~220 us	Low power standby mode with limited reaction on external events
Deep Sleep	Same as above but with OSC24M disabled	Interrupts from modules those could generate asynchronous interrupts (Keypad, GPIO, SNVS)	~1400us	
SRTC	Only SNVS domain and OSC32K keep alive	<p>SRTC security alert / SRTC timer expire.</p> <p>Based on each one of those, SRTC module will generate request to PMIC to perform POR sequence and walk-up the system. The system will go through boot process.</p> <p>PMIC can also receive press on "ON" button to walk-up the system. This should be connected directly to PMIC.</p>	<p>~1700us to WARM boot</p> <p>COLD boot, depends on boot procedure and boot device</p>	

There is a single hardware signal coming into PMU which sets the PMU in either of two "STOP" states. The STOP state is implemented is controlled by the PMU_MISC0[STOP_MODE_CONFIG] bit (See [PMU Memory Map/Register Definition](#)). It is recommended that the blocks be configured for safe powerdown/up through the registers before asserting the stop_mode signal. Blocks not described in the section below are unaffected by stop_mode.

If the stop_mode_config is set to zero, thus in the STOP mode all blocks powered down in minimum power configuration.

If the stop_mode_config is set to one, thus in the STOP mode some of the blocks remain powered and in different states as defined in the table below.

Table 10-2. STOP mode configuration

Block	STOP_MODE_CONFIG=0	STOP_MODE_CONFIG=1
reg1p1	off	on
reg2p5	off	on
reg3p0	off/on depending on vbus. Uses crude local reference if vbus is present	off/on depending on vbus . Uses analog central bandgap if VBUS is present.
bandgap	off	functional
temp_sensor	off	off
well_bias	hardware controlled	hardware controlled
All PLLs	off	off
OSC24M	off	Controlled by CCM configuration

10.4.2 Power management techniques

The device supports the power-management techniques with the features found here.

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows flexible configurations of domains on/off states to form use cases targeting various applications
- Clock tree with selective clock-gating conditions and almost independent clock roots
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Software-controllable and hardware-controllable clock gating for functional modules and buses
- Memory retention and state retention capability (Software State Retention for ARM core) for preserving memory contents and device state in low-power modes
- Support for low-power device modes input/output (I/O) pad configuration for minimum power
- Variety of operating modes to optimize device performance and wake-up times
- Thermal monitoring and thermal aware performance management

Many of the low power features are fully or partially software controllable and can be configured for the specific requirements of a target system.

Combining these techniques, the system designer may meet tight requirements of low-power standby and operational modes while maintaining high performance for time-critical tasks.

10.4.2.1 Power saving techniques

The table below lists power saving techniques supported by the SoC in their connection to different components of power consumption.

Table 10-3. Power saving design/architecture and power saving techniques

Techniques	Active SoC Power	Standby SoC Power	System Power
Temperature Monitoring, and active frequency throttling	√		
ARM Core Platform SRPG (Software)		√	
ARM Core Platform Power Gating		√	
Clock gating (automatic dynamic and forced)	√		
Integrated PMU (IR drop, efficiency, accuracy)	√		√
Display Backlight optimization (SW)			√
Architecture: L2 cache, Video / Audio / Graphics acceleration	√		
Architecture: USB integration			√
Low Power DDR: LPDDR2, LPDDR3			√

10.4.2.2 Thermal-aware power management

The temperature sensor block (TEMPMON) implements a temperature sensor/conversion function. The block features an alarm function that can raise an interrupt signal if the temperature is above a specified threshold.

Software may implement temperature aware DVFS for the ARM domain as well as temperature aware frequency scaling for other system components to ensure that both the frequency and voltage is lowered when the die temperature is above the specified limit.

Software may also implement temperature aware task scheduling to ensure that non-critical tasks are suspended when the die temperature is above the specified limit.

See [Temperature Monitor \(TEMPMON\)](#) for further details on temperature monitor functions and programmability options.

10.4.2.3 Peripheral Power management

10.4.2.3.1 Main memory power management

Main system memory, LPDDR2 and LPDDR3 are some of the most power-hungry system components, but the SoC provides several options to manage DDR power.

Automated power saving modes are supported by the MMDC hardware. This feature allows the DDR memory to automatically enter self-refresh mode when there are no DDR accesses for a configurable time. The default setting is 1024 clock cycles which can be optimized based on the customer use case and application.

See [Power Saving and Clock Frequency Change modes](#) for further details on MMDC power saving features and programmability options.

Software may support DDR frequency scaling. Automated frequency changing procedure is supported by MMDC and CCM modules.

NOTE

DDR frequency changes cost extra time and power. Slowing requestors while keeping DDR at full speed may increase total system power. Software may also implement Cooperative Dynamic Frequency Scaling in order to keep the system balanced, (that is, keep the system in balance when DDR throughput is equal or slightly higher than total amount of requests generated by all requestors).

Reducing the DDR frequency while in DLL-ON mode may be not efficient because:

- Reduction in DDR frequency will cause bus duty cycle to increase and thus reduces chance of automatic MMDC power saving (place memory into SR).
- Total amount of read/write operation does not change (power is per-operation).
- The termination is active longer, though, lowering frequency below 396 MHz may enable lowering drive strengths and termination.

The DRAM Interface power dissipation depends on many variables, however, proper termination and drive strength is key for power and thermal performance. Memory and controllers provide a host of programmable options for the drive strength of the output buffers and for the on-die termination impedance.

The ideal settings for drive strength and ODT also depend on the clock frequency to ensure that inter-symbol interference (ISI) effects are not introduced.

DDR PHY power is proportional to the amount and type of bus activity.

In cases where the DDR is placed into self-refresh, software can configure DDR I/O to be floated or lowered to the minimum drive allowed by JEDEC.

Modifying the DDR drive strength must be done by code that is executing from a memory region other than DDR (for example, IRAM). No access to DDR (including page table walks, cache misses, alternate bus master accesses, etc.) is allowed while the DDR I/O pads are being re-configured.

10.4.2.3.2 Video-Graphics system power management

10.4.2.3.3 IO power reduction

Software configures IO to low power modes:

- PHYs - make sure that all unused PHYs are placed to lowest power state. Please refer relevant chapter for further information about different PHYs
- Digital IOs - Make sure all unnecessary PU/PD are disabled and IO are switched to either minimal drive strength or to input mode (when applicable)
- Set DDR type IO to CMOS mode if possible
- Disable all unused LVDS pads (ANALOG, LDB)

10.4.3 Examples of External Power Supply Interface

This section presents the example of external power supply interfacing to the chip.

The scenario based on integrated PMU system is presented in the following figure. This scenario minimizes BoM and board design complexity.

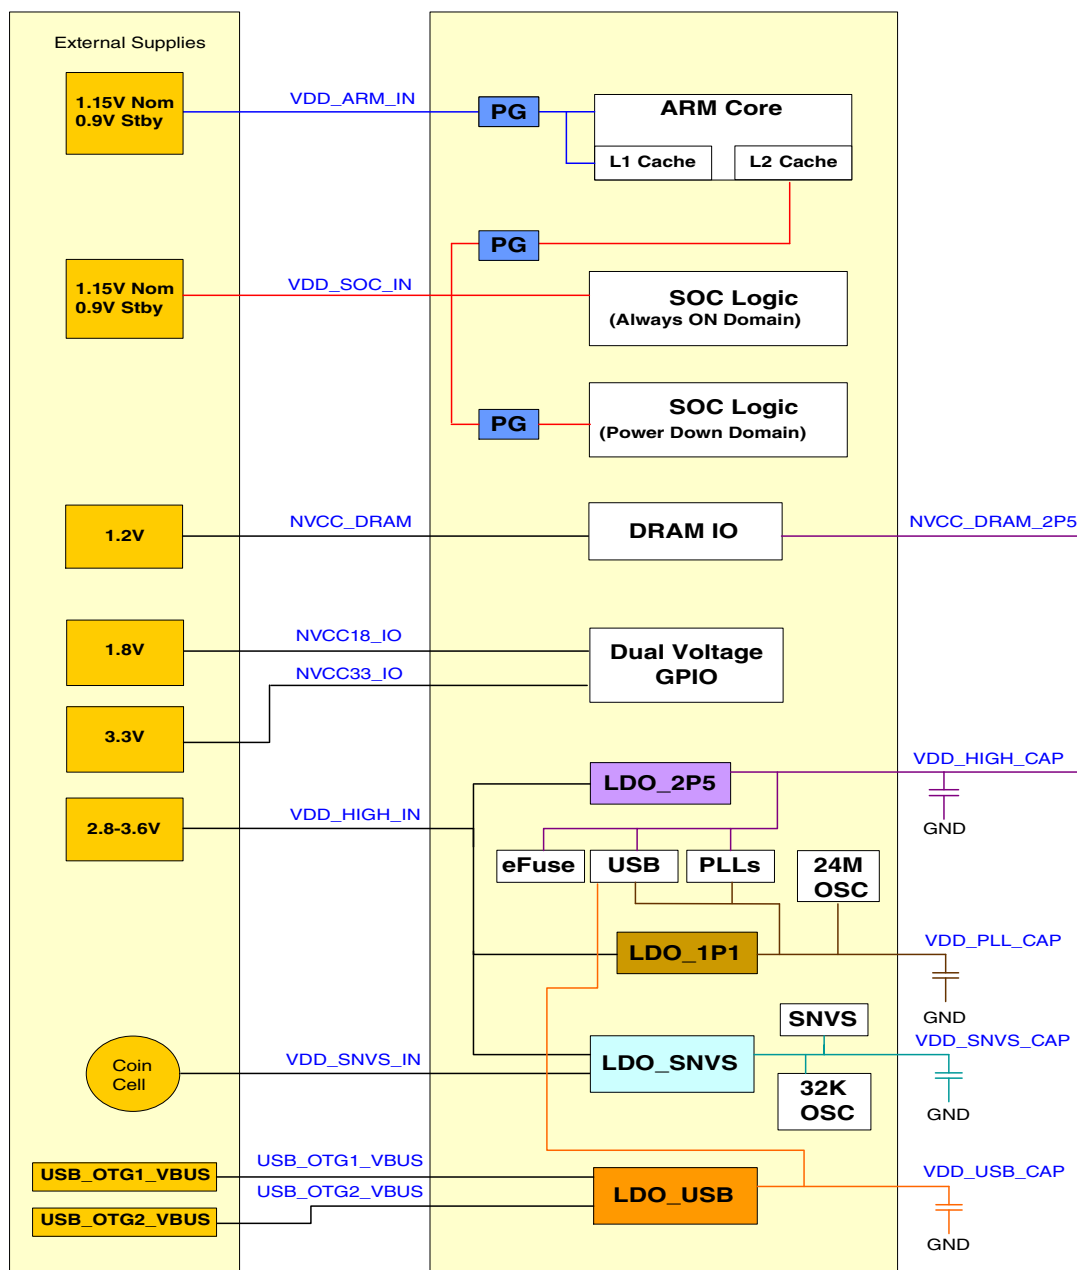

Figure 10-9. Supplying i.MX 6SLL power using integrated PMU

The scenario based on external programmable regulators is presented below: This scenario could be used in highly power optimized systems.

10.5 ONOFF (Button)

The chip supports the use of a button input signal to request main SoC power state changes (i.e. On or Off) from the PMU.

The button is used to power On and Off the SoC using an always-on (e.g., coincell battery-backed) power domain.

- When the chip main power supply is Off, a button press greater in duration than 750 ms asserts an output signal to request power from a power IC to power up the SoC.
- When the chip main power supply is On, a button press between 750 ms and 5 seconds will send an interrupt to the core to request that software bring down the SoC safely. Software may respond to the interrupt by saving the processor state and then setting a control bit that requests to the power IC the removal of the main power supply.
- Button presses greater than 5 seconds, when the SoC is powered, results in a direct hardware power down request signal to the power IC without providing a software interrupt first. This long button press initiates a hardware-enforced mode which is applicable when software is unable to power Off the device.

The button is connected to input ONOFF and the power IC is connected the chip output PMIC_ON_REQ. The chip must have TEST_MODE deasserted. An always-On supply (e.g. coincell) is needed in the system for this feature.

Chapter 11

System Security

11.1 Overview

Security is a common requirement for platforms built using the chip, although the specific needs vary greatly depending on the platform and market. The type and cost of assets to be protected on a portable consumer device are very different from those to be protected on automotive or industrial platforms, and the same applies to the kind of attacks and level of resources threatening those assets. The platform designer must select an appropriate set of counter measures to meet the relevant platform security needs.

The following figure shows a simplified diagram of the security subsystem.

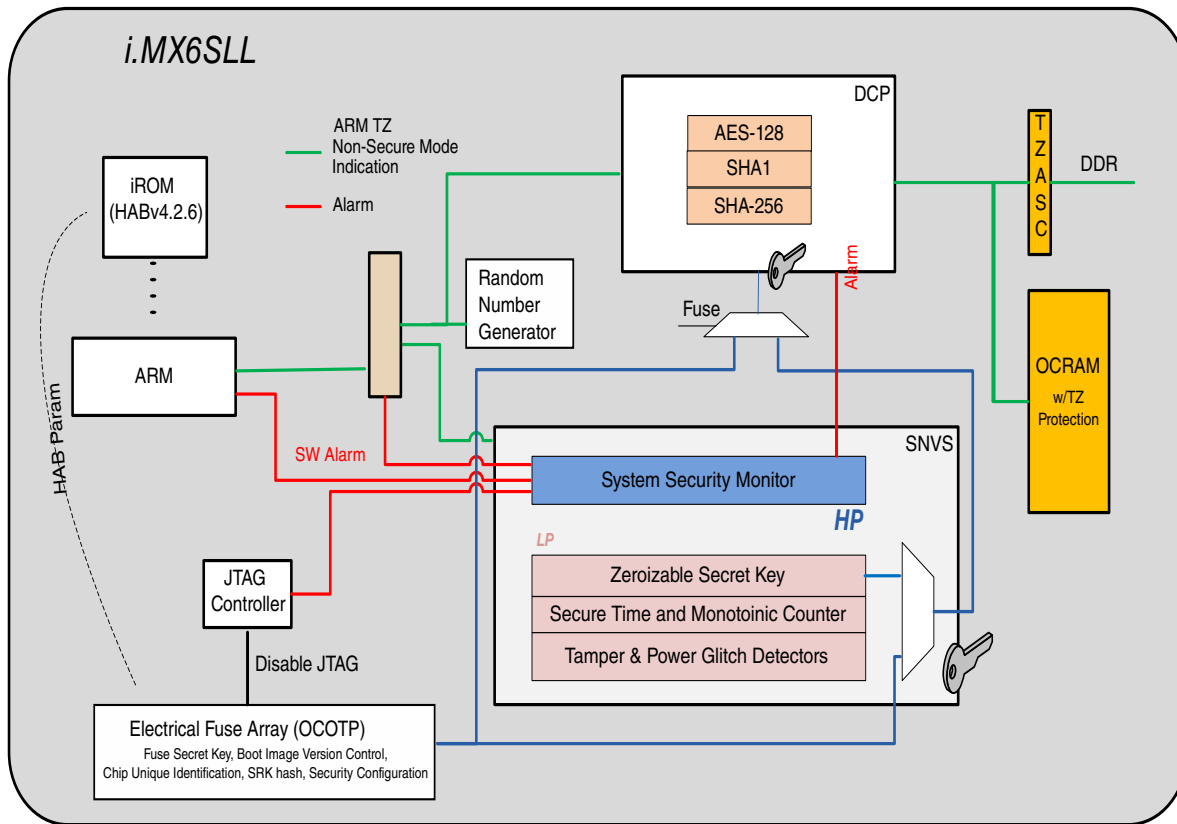

Figure 11-1. Security subsystem (simplified)

For the platform designer to meet the requirements for each market, the chip incorporates a range of security features which can be used individually or in concert to underpin the platform security architecture. Most of the chip security features provide protection against particular kinds of attack and can be configured at various levels according to the required degree of protection. These features are designed to work together and can be integrated with appropriate software to create defensive layers. In addition to protection features, the chip includes a general purpose accelerator to enhance the performance of selected industry standard cryptographic algorithms.

The following is an introduction to the chip security components.

- High Assurance Boot (HAB) feature in the System Boot up to RSA-4096 signature verification
- Data co-processor (DCP) with SHA-1/SHA-256 hashing algorithms, and AES encryption algorithm with device unique secret key for secure off-chip storage.
- Random number generator (RNGB)
- Secure Non Volatile Storage (SNVS)
- TrustZone (TZ) Architecture in the ARM Cortex A9 Platform, TrustZone aware Interrupt Controller (GIC) and TrustZone Watchdog Timer (WDOG-2)

- TrustZone Address Space Controller (TZC-380) - providing security address region control functions on DDR memory space.
- On-chip RAM (OCRAM) with TrustZone protection using OCRAM controller.
- On chip OTP (OCOTP) with on-chip electrical fuses
- Central Security Unit (CSU)
- Secure JTAG Controller (SJC)
- Locked mode in the Smart Direct Memory Access (SDMA) controller
- 1 tamper pin support
- Hardware Cryptographic Accelerators
 - Symmetric: AES-128, AES-192, AES-256, DES, 3DES, and ARC4
 - Hash Message Digest and HMAC: SHA-1, SHA-224, SHA-256, and MD-5
- DPA protection for 3DES engine
- True and Pseudo Random Number Generator

Detailed descriptions of the components are provided in the *Multimedia Applications Processor Security Reference Manual*.

11.2 Central Security Unit (CSU)

11.2.1 CSU Overview

The CSU manages the system security policy for peripheral access on the SoC. The CSU allows trusted code to set individual security access privileges on each of the peripherals, using one of eight security access privilege levels. Also, according to programmed policy, the CSU may assign bus master security privileges during bus transactions.

11.2.2 CSU Features

The Central Security Unit (CSU) sets access control policies between bus masters and bus slaves, allowing peripherals to be separated into distinct security domains. This protects against unauthorized access to data e.g. when software programs a DMA bus master to access addresses that the software itself is prohibited from accessing directly. Configuring DMA bus master privileges in the CSU consistent with software privileges defends against such attempted accesses.

CSU has the following security related features:

- Peripheral access policy - Appropriate bus master privileges and identity are required to access each peripheral.
- Masters privilege policy - CSU overrides bus master privilege signals, i.e. user/supervisor secure/non-secure, according to access control policy.

11.2.3 CSU Functional Description

The CSU enables secure software to set bus privilege security policy within the platform.

Security policies may be set, and optionally locked in the CSU registers. These privilege values may originate in the command sequence file (CSF) which is processed by the High Assurance Boot (HAB) itself or by an HAB authenticated image which executes after the initial boot ROM phase.

11.2.3.1 CSU Peripheral Access Policy

According to its programmed policy, the CSU determines the bus master privileges and the masters that are allowed to access each of the slave peripherals.

There are four security modes of operation (i.e. bus privileges) in the system distinguished by security (TrustZone/non-TrustZone) and privilege (Supervisor/User) setting of the module. Below is the list of these security modes from the highest security level to the lowest:

- TrustZone (Secure) Privilege (Supervisor) Mode - Highest Security Level
- TrustZone (Secure) non-Privilege (User) Mode - Medium Security Level
- non-TrustZone (Regular) Privilege (Supervisor) Mode - Medium Security Level
- non-TrustZone (Regular) non-Privilege (User) Mode - Lowest Security Level

This functionality is implemented as follows:

The Configure Slave Level (CSL) Register value for a specified peripheral resource defines the output signal -- `csu_sec_level` for that peripheral. The value of this signal determines by what master privileges a peripheral is accessible. The relationship between the value of the `csu_sec_level` signal and security operation mode is shown in the table below. The CSL registers reside in the CSU module. Details, describing CSL register fields and how they are programmed to control access privileges for specific peripherals, can be found in the Security Reference Manual.

Table 11-1. Permission Access Table

CSU_SEC_LEVEL[2:0]	Non-Secure User Mode	Non-Secure Spvr Mode	Secure (TZ) User Mode	Secure (TZ) Spvr Mode	CSL register value
(0) 000	RD+WR	RD+WR	RD+WR	RD+WR	8'b1111_1111
(1) 001	None	RD+WR	RD+WR	RD+WR	8'b1011_1011
(2) 010	RD	RD	RD+WR	RD+WR	8'b0011_1111
(3) 011	None	RD	RD+WR	RD+WR	8'b0011_1011
(4) 100	None	None	RD+WR	RD+WR	8'b0011_0011
(5) 101	None	None	None	RD+WR	8'b0010_0010
(6) 110	None	None	RD	RD	8'b0000_0011
(7) 111	None	None	None	None	Any other value

11.3 Secure Non-Volatile Storage (SNVS)

11.3.1 SNVS Overview

SNVS is a hardware device that includes a security state machine and security violation detection circuits that, together with High Assurance Boot software, determine whether the chip is currently in a secure state.

When the security state machine indicates a secure state, the SNVS allows DCP use of special cryptographic keys to decrypt long-term secrets such as public/private keypairs, Digital Rights Management keys and proprietary software. When the SNVS detects a potential security violation, such as a tamper alert, the SNVS sends an interrupt to alert the Operating System of the event and denies the use of the special cryptographic keys mentioned above. The SNVS also includes a general purpose real-time counter.

The SNVS includes the following features:

- Security State Machine driven by High Assurance Boot software and tamper detection circuits
- Master Key Control that protects the integrity and secrecy of the Master Key (OTPMK) stored in fuses
- Tamper detection circuits that detect JTAG events, power glitches, Master Key ECC check failure, and software-reported and hardware-reported security violations
- 256-bit Zeroizable Master Key that can be automatically erased in the event of a security breach
- Tamper-protected Secure Realtime Counter that continues running when the chip is powered off

- Non-volatile Monotonic Counter used to protect against “roll-back” attacks
- Non-volatile General Purpose Register can be used to store a 32-bit value across power cycles
- Non-Secure Real Time Counter with programmable alarm and periodic interrupt

11.3.2 Tamper Detection

Tamper Detection is a special mechanism provided through a chip pin to signal when the device encounters unauthorized opening or tampering.

When not in use, the Tamper Detection signal is pulled-down internally. In case of use, it should be connected to a Tamper Detection contact in a target system (Normally closed, pulled-up to the VDD_SNVS_IN).

An always-ON power supply (coin-cell battery) should be present in the system. If the tamper detection feature is enabled by software then opening of the tamper contact:

- Switches system power ON with a Tamper Detection alarm interrupt asserted (for software reaction)
- Activate security related hardware (e.g. automatic and immediate erasure of the Zeroizable Master Key and deny access and erase secure memory contents)

11.4 Data Co-Processor (DCP)

For security purposes, the Data Co-Processor (DCP) provides hardware acceleration for the cryptographic algorithms. The features of DCP are:

- Encryption Algorithms: AES-128 (ECB and CBC modes)
- Hashing Algorithms: SHA-1 and SHA-256
- Key selection from the SNVS, DCP internal key storage, or general memory
- Internal Memory for storing up to four AES-128 keys—when a key is written to a key slot it can be read only by the DCP AES-128 engine
- IP slave interface
- DMA

11.5 High-Assurance Boot (HAB)

The HAB, which is the high-assurance boot feature in the system boot ROM, detects and prevents the execution of unauthorized software (malware) during the boot sequence.

When the unauthorized software is permitted to gain control of the boot sequence, it can be used for a variety of goals, such as exposing stored secrets; circumventing access controls to sensitive data, services, or networks, or for repurposing the platform. The unauthorized software can enter the platform during upgrades or reprovisioning, or when booting from the USB connections or removable devices.

The HAB protects against unauthorized software by:

- Using digital signatures to recognize the authentic software. This enables you to boot the device to a known initial state and run the software signed by the device manufacturer.

11.6 System JTAG Controller (SJC)

The JTAG port provides debug access to hardware blocks, including the ARM processor and the system bus. This enables program control and manipulation as well as visibility to the chip peripherals and memory.

The JTAG port must be accessible during initial platform development, manufacturing tests, and general troubleshooting. Given its capabilities, JTAG manipulation is a known attack vector for accessing sensitive data and gaining control over software execution. The System JTAG Controller (SJC) protects against the whole range of attacks based on unauthorized JTAG manipulation. It also provides a JTAG port that conforms to the IEEE 1149.1 and IEEE 1149.6 (AC) standards for BSR (boundary-scan) testing.

The SJC provides these security levels:

- The JTAG Disabled-JTAG use is permanently blocked.
- The No-Debug-All security sensitive JTAG features are permanently blocked.
- The Secure JTAG-JTAG use is restricted (as in the No-Debug level) unless a secret-key challenge/response protocol is successfully executed.
- The JTAG Enabled-JTAG use is unrestricted.

The security levels are selected via the e-fuse configuration.

Chapter 12

ARM Cortex A9 MPCore Platform (ARM)

12.1 Overview

The Cortex-A9 Core Platform consists of an ARM[®]Cortex[®]-A9 MPCore processor, which includes a NEON co-processor, a private timer and watch-dog, and 32 KB + 32 KB L1 data and instruction caches per core.

The Cortex-A9 Core Platform consists of a unified 256 KB L2 cache, SCU (Snoop Control Unit), and Generic Interrupt Controller (GIC). In addition, the Cortex-A9 Core Platform includes various components composing the ARM CoreSight debug/Trace system, including PTM and a 2 x CTI, 2xCTM, and 16KB ETB.

The Cortex-A9 processor utilizes two AXI-64 master ports connected from the SCU to the Level 2 Cache. The L2 cache also utilizes 2x AXI-64 to access the L3 memory or other SoC peripherals in a symmetric way.

The core supports debug through real-time trace via PTM, and static debug via JTAG.

The core platform supports static debug through the debug logic to SOC. This includes the capability of real time trace via ARM's CoreSight PTM, ETB and TPIU modules. The CTI and CTM modules allow cross-triggering of internal and external trigger sources.

12.2 External Signals

The following table describes the external signals of ARM:

Table 12-1. ARM External Signals

Signal	Description	Pad	Mode	Direction
ARM_EVENTI	Input event signal	EPDC_PWRSTAT	ALT4	I
ARM_EVENTO	Output event signal	EPDC_PWRWAKEUP	ALT4	O

Table continues on the next page...

Table 12-1. ARM External Signals (continued)

Signal	Description	Pad	Mode	Direction
ARM_TRACE00	Trace signal	LCD_DATA00	ALT6	O
ARM_TRACE01	Trace signal	LCD_DATA01	ALT6	O
ARM_TRACE02	Trace signal	LCD_DATA02	ALT6	O
ARM_TRACE03	Trace signal	LCD_DATA03	ALT6	O
ARM_TRACE04	Trace signal	LCD_DATA04	ALT6	O
ARM_TRACE05	Trace signal	LCD_DATA05	ALT6	O
ARM_TRACE06	Trace signal	LCD_DATA06	ALT6	O
ARM_TRACE07	Trace signal	LCD_DATA07	ALT6	O
ARM_TRACE08	Trace signal	LCD_DATA08	ALT6	O
ARM_TRACE09	Trace signal	LCD_DATA09	ALT6	O
ARM_TRACE10	Trace signal	LCD_DATA10	ALT6	O
ARM_TRACE11	Trace signal	LCD_DATA11	ALT6	O
ARM_TRACE12	Trace signal	LCD_DATA12	ALT6	O
ARM_TRACE13	Trace signal	LCD_DATA13	ALT6	O
ARM_TRACE14	Trace signal	LCD_DATA14	ALT6	O
ARM_TRACE15	Trace signal	LCD_DATA15	ALT6	O
ARM_TRACE_CLK	Clock signal	LCD_HSYNC	ALT6	O
ARM_TRACE_CTL	Control signal	LCD_VSYNC	ALT6	O

12.3 Platform configuration

The [Bus](#), [Cortex A9 Core](#), and [L2 Cache](#) configuration options are contained in the following subsections.

Table 12-2. Cortex-A9 revision

Core	MP004-BU-50000-r4p1-00rel1
Neon	AT397-BU-50001- r4p1-00rel0
PL310	PL310-BU-00000-r3p2-00rel0

12.3.1 Platform and SCU configuration

Table 12-3. Cortex-A9 configuration

Option	Selected Value	Comments
MP_MODE	Yes	Multi-Processor mode
POWER_DOMAIN_WRAPPER	No	Wrappers to support power off of individual cores.
PTM_INTERFACE_PRESENT	Yes	Use PTM as part of Trace/Debug logic.
PARITY	Yes	Using RAM arrays which support parity.
CORE_NUM	1	Number of cores
INT_NUM	128	Number of interrupts (SPIs) in GIC
ACP_PRESENT	No	Accelerator Coherency Port (ACP)
MASTER_NUM	2	Number of 64-bit AXI output master ports.

12.3.2 Core configuration

Table 12-4. Cortex-A9 Core configuration

Option	Selected Value	Comments
DCACHESIZE	32	L1 Data cache size
ICACHESIZE	32	L1 Instruction cache size
TLBSIZE	128	
JAZELLE_PRESENT	Yes	Providing ARM's Jazelle technology hardware extensions.
FPU_PRESENT	No	The FPU functions are provided by NEON, thus additional FPU cannot be used.
NEON_PRESENT	Yes	Use MPE, NEON Co-Processor and FPU
PRELOAD_ENGINE_PRESENT	No	May only be beneficial in Video processing.

12.3.3 PL310 L2 Cache configuration

Table 12-5. PL310 L2 Cache configuration

Option	Selected Value	Comments
Cache way size	64 KB	(For total of 256 KB L2 size)
Number of cache ways	16	Performance enhancement versus 8 ways
RAM latencies	4	
Data RAM banking	Yes	Significantly improves cache throughput
Slave port 1 present	Yes	
Master port 1 present	Yes	

Table continues on the next page...

Table 12-5. PL310 L2 Cache configuration (continued)

Option	Selected Value	Comments
Parity logic	Yes	For military / surveillance applications, and side ease the process of identify memory related issues.
Lockdown by master	Yes	Increase L2 optimization
Lockdown by line	Yes	Increase L2 optimization
AXI ID width	5	
Address filtering	No	Help in timing closure, not required for symmetric AXI bus connectivity scheme.
Speculative read	Yes	Performance boost, when used with CortexA9.
Size of L2 cache	256 KB	Size is implied by Cache-Size times cache-ways (i.e. 256 KB)

12.3.4 Endian Modes

The Cortex-A9 Core Platform supports little endian mode only. Big Endian is not supported even though both modes are supported by the Cortex-A9 processor.

12.3.5 Memory Parity error support

The i.MX 6SLL ARM Cortex A9 MPCore™ platform supports Parity Fail signals for several of the RAM arrays.

Parity fail indication is provided by "PARITYFAILn[7:0]" and "PARITYFAILSCU[N:0]" buses for system notification. On parity error event, these signals will be ORed together to provide a single event (interrupt) to the core, in case of any parity fail event.

12.4 Performance and Power

This section will discuss the operational conditions and performance goals for the Cortex-A9 Core Platform.

12.4.1 Low-Power design

The Cortex-A9 Core Platform low-power design is based on these characteristics:

- Symmetric processing and ARM design by using the same clock frequency on core
- Low leakage of LP process

As a result, the proposed power modes and power management scheme is as follows:

- The same voltage level must be used for the logic part of the whole platform.

12.4.1.1 SRPG (State Retention Power Gating)

ARM core SRPG is implemented by software save & restore of essential configuration registers prior to the complete power-down of the entire ARM platform.

Save & restore utilizes "Dormant mode" for the primary core (L1 cache flushed, L2 preserved), and power down mode of all other cores, as follows:

Power Down flow¹

- Power down request
- Save core's essential registers and platform registers to L2/DDR memory by Dormant mode routines.
- Perform L1 cache clean operation
- Enter WFI state
- Power Gating of core and platform logic

Power Up flow¹

- Power up request to GPC external controller (interrupt)
- Supply power
- Reset
- Restore registers of platform and core from memory by Dormant mode routines.

12.4.1.2 Dynamic Voltage and Frequency Scaling (DVFS)

The Cortex-A9 Core Platform has been designed, in conjunction with external control logic and software, to support dynamic scaling of voltage and frequency.

12.4.2 Clocks, frequency goals

12.4.2.1 ARM Clock

For ARM clock please see the product data sheet.

1. Dormant mode implementation information, provided by ARM, is preliminary.

12.4.2.2 Bus Clocks

The AXI master ports are designed to run at half the frequency of the Cortex A9 core clock.

The on-platform debug components clock is asynchronous to the ARM core clock.

12.4.2.3 Debug Clocks

The ARM platform contains several debug components.

Their clock frequencies are as follows:

- Trace buffer (ETB) clock - 133 MHz
- Trace port (TPIU) clock - 133 MHz
- AHB clock - 133 MHz

12.5 Core Platform Sub-Blocks details

12.5.1 ARM Cortex A9 MPCore™ Processor

The information presented in this section focuses on design aspects of the ARM Cortex A9 MPCore™ in the AP subsystem.

The ARM Cortex A9 is a high-performance, low-power, synthesisable processor with an L1 cache subsystem that provides full virtual memory capabilities. The Cortex A9 processor implements the ARMv7-A architecture and runs 32-bit ARM instructions, 16-bit and 32-bit Thumb2 instructions, and 8-bit Java™ byte-codes in Jazelle state.

The ARM Cortex A9 MPCore™ processor in the chip consists of:

- Cortex A9 processor in a cluster and a Snoop Control Unit (SCU) that can be used to ensure coherency within the cluster.
- A set of private memory-mapped peripherals, including a global timer and a watchdog and private timer for each Cortex-A9 processor present in the cluster.
- An integrated Interrupt Controller is an implementation of the Generic Interrupt Controller architecture. The integrated Interrupt Controller registers sit beside the timers and watchdog control registers in the private memory region of the Cortex-A9 MPCore.

Individual Cortex-A9 processors in the Cortex-A9 MPCore cluster are symmetrically implemented with hardware configurations as specified in [Platform configuration](#).

12.5.2 Media Processing Engine (MPE - NEON)

The Media Processing Engine (MPE) implements ARM NEON technology, a media and signal processing architecture that adds instructions targeted at audio, video, 3-D graphics, image, and speech processing.

Advanced SIMD instructions are available in both ARM and Thumb states. The MPE also implements a VFPv3-D32 Floating-Point Unit.

The ARM Cortex A9 MPCore™ Platform includes MPE per core.

12.5.3 Generic Interrupt Controller (GIC)

The Cortex-A9 MPCore contains an integrated interrupt controller that shares the same programmer's model as the PL390 (GIC), although there are implementation-specific differences.

12.5.3.1 Interrupt Controller Features

- 128 interrupt sources
- The Cortex-A9 multiprocessor contains the following types of interrupts:
 - Up to 16 Software Generated Interrupts (SGIs)
 - Private Peripheral Interrupt (PPI) - an interrupt generated by a peripheral that is specific to a single Cortex-A9 processor (there are 5 PPIs for each Cortex-A9 processor interface)
 - Shared Peripheral Interrupt (SPI) - an interrupt generated by a peripheral which the Interrupt Controller can route to any or all Cortex-A9 processor interfaces. The Interrupt Controller supports a maximum of 224 SPIs .
 - Lockable Shared Peripheral Interrupts (LSPI) - there are 31 LSPIs, interrupts 32-62. The user can configure and then lock these interrupts against further change using CFGSDISABLE. The LSPIs are present only if the SPIs are present.

For more information, see ARM MPCORE Technical Reference Manual.

12.5.3.2 About the Interrupt Controller

The Interrupt Controller is a single functional unit that is located in a Cortex-A9 multiprocessor design.

The Interrupt Controller is memory-mapped. The Cortex-A9 processors access it by using a private interface through the SCU.

12.5.3.3 Interrupt Controller Clock frequency

The interrupt controller's clock period is 2x multiple of the main clock period.

The watchdogs and timers use the same clock as the interrupt controller.

12.5.3.4 TrustZone support

The Interrupt Controller permits all implemented interrupts to be individually defined as Secure or Non-secure.

The user can program Secure interrupts to use either the IRQ or FIQ interrupt mechanism of a Cortex-A9 processor through the FIQen bit in the ICPICR Register.

Non-secure interrupts are always signalled using the IRQ mechanism of a Cortex-A9 processor.

12.5.4 Instruction and data caches (L1)

The Cortex-A9 processor is configured with a 32 Kbyte Instruction Cache and a 32 Kbyte Data Cache.

12.5.4.1 L1 features

- Four-way set associative cache
- Virtually indexed and physically addressed
- Capable of providing two words per cycle for all requesting sources
- Eight 32-bit words per cache line
- 128 indexes per tag RAM

12.5.5 L2 Cache and controller (PL310)

The platform includes unified (data / instruction) L2 cache unit, based on the cache controller IP by ARM.

The Cortex-A9 processor utilizes 2x AXI-64 master ports connected from the SCU to the Level 2 Cache. The L2 cache also utilizes 2x AXI-64 to access the L3 memory or other SoC peripherals in a symmetric way.

See [Table 12-5](#) for more information.

12.6 Debug and Trace Sub-blocks (CoreSight components)

This section gives a brief overview of the modules that are implemented within the Cortex-A9 Core Platform.

The Cortex-A9 Core Platform debug blocks are part of the overall CoreSight debug system which include the 16KB ETB, 2 x CTM's, 2 x CTI's, ATB replicator, DAP, TPIU and APB address decode.

The CoreSight™ compatible Program Flow Trace Macrocell (PTM) provides control for ARM software tracing and debug. The Cross Trigger Interface (CTI) is included in the Cortex-A9 platform to provide a common programming model for use by the debug tools, control the trigger sources, and interface to the Cross Trigger Matrix (CTM). The debug is controlled via an ARM Debug Access Port (DAP).

For details of the full CoreSight debug subsystem, see the [System Debug](#) chapter.

12.6.1 Debug Access Port (DAP)

The Debug Access Port (DAP) is an implementation of an ARM Debug Interface version 5.1 (ADIV5.1) comprised of a number of components supplied in a single configuration.

All the supplied components fit into the various architectural components for Debug Ports (DPs), which are used to access the DAP from an external debugger and Access Ports (APs), to access on-chip system resources.

The debug port and access ports together are referred to as the DAP. The DAP provides real-time access for the debugger without halting the processor to:

- AMBA system memory and peripheral registers
- All debug configuration registers

The DAP also provides debugger access to JTAG scan chains of system components, (to non-CoreSight compliant processors, for example).

12.6.2 Program Trace Macrocell (PTM)

The PTM unit is a nonintrusive trace macrocell that filters and compresses instruction trace for use in system debugging and system profiling.

The PTM unit has an external interface outside of the processor called the *Advanced Trace Bus* (ATB) interface. The PTM is an evolution of the ETM, designed for the Cortex A9 cores, handling program trace only.

The Cortex A9 PTM provides real time instruction trace for the Cortex A9. It's designed to be used with the CoreSight Design Kit.

Real time tracing is controlled by specifying a set of filtering and triggering resources which include address and data comparators, counters and sequencers.

Two main schemes can be used for connecting PTMs:

1. Single PTM - shared by core and resources.
2. Nx PTMs, where N is numbers of cores in the system.

12.6.2.1 Program Flow Trace (PFT)

The CoreSight Program Flow Trace Macrocell (PTM) is based on the Program Flow Trace (PFT) architecture. The PTM generates information that trace tools use to reconstruct the execution of all or part of a program.

The PFT architecture assumes the trace tools can access a copy of the code being traced. For this reason, the PTM generates trace only at certain points in program execution, called waypoints. This reduces the amount of trace data generated by the PTM compared to the ETM protocol. Waypoints are changes in the program flow or events, such as an exception. The trace tools use waypoints to follow the flow of program execution.

For full reconstruction of the program flow, the PTM traces:

- Indirect branches, with target address and condition code
- Direct branches with only the condition code
- Instruction barrier instructions
- Exceptions, with indication of where the exception occurred
- Changes in processor instruction set state
- Changes in processor security state

- Context-ID changes
- Entry to and return from Debug state when Halting Debug-mode is enabled

You can also configure the PTM to trace:

- Cycle count between traced waypoints
- Global system timestamps
- Target addresses for taken direct branches

PTM components include the following main components:

- Processor Interface to monitor the behavior of the processor.
- Trace Generation to create a real-time trace stream.
- Filtering and Triggering Resources used to affect when trace is generated and to control the capturing of trace by the trace tools.
- Main FIFO (72 bytes) flattens out any bursts in the trace stream, and signals an overflow in the trace when it becomes full, halting trace generation until the FIFO empties.
- ATB interface for PTM output.
- APB interface to access the PTM registers.

12.6.3 Cross Trigger Interface (CTI)

This block controls the Trigger Interface (TI). The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events.

When the CTI receives a channel event, it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the TI. Each CTI has 3/5 trigger inputs.

See [System Debug](#) for more information on the CTI.

12.6.4 Embedded Trace Buffer (ETB)

The ETB provides on-chip storage of trace data using 32-bit, 16KB RAM.

The ETB accepts trace data from the Cortex-A9 via an ATB port (passing through a replicator in between). Providing an on-chip buffer alleviates the pin count, bandwidth, and pad design requirements associated with sending trace data to a debugger directly through package pins in near real-time.

Features:

- compiled memory for the trace buffer and can be used as general purpose memory
- AMBA Peripheral Bus programming interface for configuration and memory access

12.6.4.1 AMBA Trace Bus (ATB) Replicator

The ATB Replicator enables two trace sinks (ETB and an off platform port generally connected to a Trace Port Interface Unit-TPIU) to be wired together and receive ATB trace data from the same trace source (PTM).

There are no programmable registers. It takes incoming trace data from a single source (PTM) and replicates it as multiple masters.

Chapter 13

AHB to IP Bridge (AIPSTZ)

13.1 Overview

This section provides an overview of the AHB to IP Bridge (AIPSTZ). This particular peripheral is designed as the bridge between AHB bus and peripherals with the lower bandwidth IP Slave (IPS) buses.

13.1.1 Features

The following list summarizes the key features of the bridge:

- The bridge supports the IPS slave bus signals. This interface is only meant for slave peripherals.
- The bridge supports 8-, 16-, and 32-bit IPS peripherals. (Accesses larger than the size of a peripheral are not supported, except to 32-bit memory.)
- The bridge supports a pair of IPS accesses for 64-bit and certain misaligned AHB transfers to 32-bit memory in 64-bit platforms.
- The bridge directly supports up to 32 16-Kbyte external IPS peripherals, and 2 global external IPS peripheral spaces. The bridge occupies 1 MBytes of total address space.
- The bridge provides configurable per-block and per-master access protections. More details on the protection features and configuration can be found in the Security Reference Manual
- Peripheral read transactions require a minimum of 2 hclk clocks, and unbuffered write transactions require a minimum of 3 hclk clocks.
- The bridge uses one single asynchronous reset and one global clock.

13.2 Clocks

The following table describes the clock sources for AIPSTZ. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 13-1. AIPSTZ Clocks

Clock name	Clock Root	Description
hclk	ahb_clk_root	Module clock

13.3 Functional Description

The AIPS bridge serves as a protocol translator between the AHB system bus and the IP bus.

Support is provided for generating a pair of 32-bit IP bus accesses when targeted by a 64-bit system bus access, or a misaligned access which crosses a 32-bit boundary. No other bus-sizing access support is provided.

The AHB to IP bridge is the interface between the AHB and on-chip IPS peripherals, which are sub-blocks containing readable/writable control and status registers.

The AHB master reads and writes these registers through the AIPSTZ. The bridge generates block enables, the block address, transfer attributes, byte enables and write data as inputs to the IPS peripherals. The bridge captures read data from the IPS interface and drives it on the AHB.

Each bridge that connects to the IPS (or peripherals) are referred as AIPS. The chip has three separate AIPS modules, and peripherals are grouped and assigned under each AIPS block. The list of peripherals are indicated as n-1, n-2, and n-3 for AIPS-1, AIPS-2, and AIPS-3 respectively.

AIPS occupies a 1-Mbyte portion of the address space. The register maps of the IPS peripherals are located on 16-Kbyte boundaries. Each IPS peripheral is allocated one 16-Kbyte block of the memory map, and is activated by one of the block enables from the bridge. Up to thirty-two 16-Kbyte external IPS peripherals may be implemented, occupying contiguous blocks of 16-Kbytes. Two global external IPS block enables are available for the remaining address space to allow for customization and expansion of addressed peripheral devices. In addition, a single "non-global" block enable is also asserted whenever any of the thirty-two non-global block enables is asserted.

The bridge is responsible for indicating to IPS peripherals if an access is in supervisor or user mode. It may block user mode accesses to certain IPS peripherals or it may allow the individual IPS peripherals to determine if user mode accesses are allowed. In addition, peripherals may be designated as write-protected.

The bridge supports the notion of "trusted" masters for security purposes. Masters may be individually designated as trusted for reads, trusted for writes, or trusted for both reads and writes, as well as being forced to look as though all accesses from a master are in user-mode privilege level. Refer to [AIPSTZ Memory Map/Register Definition](#) for more information.

All peripheral devices are expected to only require aligned accesses equal to or smaller in size than the peripheral size. An exception to this rule is supported for 32-bit peripherals to allow memory to be placed on the IPS.

13.4 Access Protections

The AIPSTZ bridge provides programmable access protections for both masters and peripherals. It allows the privilege level of a master to be overridden, forcing it to user-mode privilege, and allows masters to be designated as trusted or untrusted.

Peripherals may require supervisor privilege level for access, may restrict access to a trusted master only, and may be write-protected. IP bus peripherals are subject to access control policies set in both CSU registers and AIPSTZ registers. An access is blocked if it is denied by either policy.

13.5 Access Support

Aligned 64-bit accesses, aligned and misaligned word and half word accesses, as well as byte accesses are supported for 32-bit peripherals. Misaligned accesses are supported to allow memory to be placed on the IPS.

Peripheral registers must not be misaligned, although no explicit checking is performed by the AIPS bridge. The bridge will perform two IPS transfers for 64-bit accesses, word accesses with byte offsets of 1, 2, or 3, and for half word accesses with a byte offset of 3. All other accesses will be performed with a single IPS transfer.

Only aligned half word and byte accesses are supported for 16-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

Only byte accesses are supported for 8-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

13.6 Initialization Information

The AIPS bridge should be programmed before use.

The following registers should be initialized: The Master Privilege Registers (AIPSTZ_MPRs), the Peripheral Access Control registers (AIPSTZ_PACRs), and the Off-platform Peripheral Access Control registers (AIPSTZ_OPACRs) described in [AIPSTZ Memory Map/Register Definition](#).

13.6.1 Security Block

The AIPSTZ contains a security block that is connected to each off-platform peripheral. This block filters accesses based on write/read, non-secure, and supervisor signals.

Each peripheral can be individually configured to allow or deny each of the following transactions as described in the table below:

Table 13-2. Peripheral Access Configuration options

Config Bit	Write	Non-Secure	Supervisor	Meaning
0	0	0	0	Secure User Read
1	0	0	1	Secure Supervisor Read
2	0	1	0	Non-Secure User Read
3	0	1	1	Non-Secure Supervisor Read
4	1	0	0	Secure User Write
5	1	0	1	Secure Supervisor Write
6	1	1	0	Non-Secure User Write
7	1	1	1	Non-Secure Supervisor Write

Each peripheral has a security configuration (sec_config_X) input for determining whether to allow or deny a given access type. These are 8-bit vectors, with each bit corresponding to one of the transactions above as listed in the Config Bit column of [Table 13-2](#). If the bit is asserted (1'b1), the transaction is allowed. If the bit is negated (1'b0), the transaction is not allowed.

For example, if peripheral 0 is configured as follows:

sec_config_0 [7:0] = 8'b0011_0011

This peripheral can only be accessed by secure transactions. Bits 0, 1, 4, and 5 are asserted and these bits refer to the four types of secure transactions. If an insecure transaction is attempted to this peripheral, it will result in an error.

Eight bits per peripheral across an entire system can result in a large number of configuration bits that must be assigned and controlled, most likely in a series of registers in another block. To reduce the number of register bits required predefined sets of security profiles can be defined and encapsulated in an external security translation block. The table below describes one set of security profiles that has been proposed for use with the AIPSTZ.

Table 13-3. Security Levels

CSU_SEC_LEVEL	Non-Secure User	Non-Secure Supervisor	Secure User	Secure Supervisor
0	RD+WR	RD+WR	RD+WR	RD+WR
1	NOT ALLOWED	RD+WR	RD+WR	RD+WR
2	Read Only	Read Only	RD+WR	RD+WR
3	NOT ALLOWED	Read Only	RD+WR	RD+WR
4	NOT ALLOWED	NOT ALLOWED	RD+WR	RD+WR
5	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	RD+WR
6	NOT ALLOWED	NOT ALLOWED	Read Only	Read Only
7	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED

Information regarding CSU is provided in the Security Reference Manual. Contact your NXP representative for information about obtaining this document.

A 3-bit input, 8-bit output translation block can be used such that only three register bits are required to set the security profile and the translation block will drive the correct 8-bit configuration vector. Each peripheral connected to the AIPSTZ would require this translation block. The top level AIPSTZ has this three bit input line `csu_sec_level[2:0]' corresponding to each peripheral X.

13.7 AIPSTZ Memory Map/Register Definition

The memory map for the AIPS SW-visible registers is shown in the table below.

The MPROT and OPACR fields are 4 bits in width. Some bits may be reserved depending on device.

AIPSTZ memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
207_C000	Master Priviledge Registers (AIPSTZ1_MPR)	32	R/W	7700_0000h	13.7.1/400
207_C040	Off-Platform Peripheral Access Control Registers (AIPSTZ1_OPACR)	32	R/W	4444_4444h	13.7.2/402
207_C044	Off-Platform Peripheral Access Control Registers (AIPSTZ1_OPACR1)	32	R/W	4444_4444h	13.7.3/405
207_C048	Off-Platform Peripheral Access Control Registers (AIPSTZ1_OPACR2)	32	R/W	4444_4444h	13.7.4/408
207_C04C	Off-Platform Peripheral Access Control Registers (AIPSTZ1_OPACR3)	32	R/W	4444_4444h	13.7.5/411
207_C050	Off-Platform Peripheral Access Control Registers (AIPSTZ1_OPACR4)	32	R/W	4444_4444h	13.7.6/414
217_C000	Master Priviledge Registers (AIPSTZ2_MPR)	32	R/W	7700_0000h	13.7.1/400
217_C040	Off-Platform Peripheral Access Control Registers (AIPSTZ2_OPACR)	32	R/W	4444_4444h	13.7.2/402
217_C044	Off-Platform Peripheral Access Control Registers (AIPSTZ2_OPACR1)	32	R/W	4444_4444h	13.7.3/405
217_C048	Off-Platform Peripheral Access Control Registers (AIPSTZ2_OPACR2)	32	R/W	4444_4444h	13.7.4/408
217_C04C	Off-Platform Peripheral Access Control Registers (AIPSTZ2_OPACR3)	32	R/W	4444_4444h	13.7.5/411
217_C050	Off-Platform Peripheral Access Control Registers (AIPSTZ2_OPACR4)	32	R/W	4444_4444h	13.7.6/414

13.7.1 Master Priviledge Registers (AIPSTZx_MPR)

Each AIPSTZ_MPR specifies 16 4-bit fields defining the access privilege level associated with a bus master in the platform, as well as specifying whether write accesses from this master are bufferable shown in [Table 13-4](#)

The registers provide one field per bus master, where field 15 corresponds to master 15, field 14 to master 14,... field 0 to master 0 (typically the processor core). The master index allocation is shown in [Table 13-5](#).

Table 13-4. MPROT Field

Bit	Field	Description
3	MBW	Master Buffer Writes - This bit determines whether the AIPSTZ is enabled to buffer writes from this master.
2	MTR	Master Trusted for Reads - This bit determines whether the master is trusted for read accesses.
1	MTW	Master Trusted for Writes - This bit determines whether the master is trusted for write accesses.

Table continues on the next page...

Table 13-4. MPROT Field (continued)

Bit	Field	Description
0	MPL	Master Privilege Level - This bit determines how the privilege level of the master is determined.

NOTE

The reset value is set to 0000_0000_7700_0000, which makes master 0 and master 1 (ARM CORE) the trusted masters. Trusted software can change the settings after reset.

Table 13-5. Master Index Allocation

Master Index	Master Name	Comments
Master 0	All masters excluding ARM core and SDMA	Share the same number allocation.
Master 1	ARM CORE	
Master 2	Reserved	
Master 3	SDMA	
Master 4-15	Reserved	

Address: Base address + 0h offset

The hprot[1] access attribute is used directly to determine ips_supervisor_access.</p> <p>xx0x MTW — This master is not trusted for write accesses.</p>

Table continues on the next page...

AIPSTZx_MPR field descriptions (continued)

Field	Description
xx1x	MTW — This master is trusted for write accesses.
x0xx	MTR — This master is not trusted for read accesses.
x1xx	MTR — This master is trusted for read accesses.
0xxx	MBW — Write accesses from this master are not bufferable
1xxx	MBW — Write accesses from this master are allowed to be buffered
23–20 -	This field is reserved. Reserved
19–16 MPROT3	Master 3 Privilege, Buffer, Read, Write Control. xxx0 MPL — Accesses from this master are forced to user-mode (ips_supervisor_access is forced to zero) regardless of the hprot[1] access attribute. xxx1 MPL — Accesses from this master are not forced to user-mode. The hprot[1] access attribute is used directly to determine ips_supervisor_access. xx0x MTW — This master is not trusted for write accesses. xx1x MTW — This master is trusted for write accesses. x0xx MTR — This master is not trusted for read accesses. x1xx MTR — This master is trusted for read accesses. 0xxx MBW — Write accesses from this master are not bufferable 1xxx MBW — Write accesses from this master are allowed to be buffered
-	This field is reserved. Reserved

13.7.2 Off-Platform Peripheral Access Control Registers (AIPSTZx_OPACR)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ_OPACR has the following format shown in [Table 13-6](#)

Table 13-6. OPAC Field

Bit	Field	Description
3	BW	Buffer Writes - This bit determines whether write accesses to this peripheral are allowed to be buffered. ¹
2	SP	Supervisor Protect - This bit determines whether the peripheral requires supervisor privilege level for access.
1	WP	Write Protect - This bit determines whether the peripheral allows write accesses.
0	TP	Trusted Protect - This bit determines whether the peripheral allows accesses from an untrusted master.

1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.

Field	Description
	0xxx BW — Write accesses to this peripheral are not bufferable by the AIPSTZ. 1xxx BW — Write accesses to this peripheral are allowed to be buffered by the AIPSTZ.
7–4 OPAC14	Off-platform Peripheral Access Control 14 xxx0 TP — Accesses from an untrusted master are allowed. xxx1 TP — Accesses from an untrusted master are not allowed. If an access is attempted by an untrusted master, the access is terminated with an error response and no peripheral access is initiated on the IPS bus. xx0x WP — This peripheral allows write accesses. xx1x WP — This peripheral is write protected. If a write access is attempted, the access is terminated with an error response and no peripheral access is initiated on the IPS bus. x0xx SP — This peripheral does not require supervisor privilege level for accesses. x1xx SP — This peripheral requires supervisor privilege level for accesses. The master privilege level must indicate supervisor via the hprot[1] access attribute, and the MPROTx[MPL] control bit for the master must be set. If not, the access is terminated with an error response and no peripheral access is initiated on the IPS bus. 0xxx BW — Write accesses to this peripheral are not bufferable by the AIPSTZ. 1xxx BW — Write accesses to this peripheral are allowed to be buffered by the AIPSTZ.
OPAC15	Off-platform Peripheral Access Control 15 xxx0 TP — Accesses from an untrusted master are allowed. xxx1 TP — Accesses from an untrusted master are not allowed. If an access is attempted by an untrusted master, the access is terminated with an error response and no peripheral access is initiated on the IPS bus. xx0x WP — This peripheral allows write accesses. xx1x WP — This peripheral is write protected. If a write access is attempted, the access is terminated with an error response and no peripheral access is initiated on the IPS bus. x0xx SP — This peripheral does not require supervisor privilege level for accesses. x1xx SP — This peripheral requires supervisor privilege level for accesses. The master privilege level must indicate supervisor via the hprot[1] access attribute, and the MPROTx[MPL] control bit for the master must be set. If not, the access is terminated with an error response and no peripheral access is initiated on the IPS bus. 0xxx BW — Write accesses to this peripheral are not bufferable by the AIPSTZ. 1xxx BW — Write accesses to this peripheral are allowed to be buffered by the AIPSTZ.

13.7.4 Off-Platform Peripheral Access Control Registers (AIPSTZx_OPACR2)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ_OPACR has the following format shown in [Table 13-6](#)

Address: Base address + 48h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Chapter 14

Digital Audio Multiplexer (AUDMUX)

14.1 Overview

The Digital Audio Multiplexer (AUDMUX) provides a programmable interconnect device for voice, audio, and synchronous data routing between Synchronous Serial Interface Controller (SSI) and audio/voice codec's (also known as coder-decoders) peripheral serial interfaces.

This section includes a top level diagram that shows the functional organization of the block, including all off-chip signals.

AUDMUX allows the users to reconfigure the audio system signal routing through programming, as opposed to altering the PCB design. The full description of the block is in [Functional Description](#).

[Figure 14-1](#) shows the block diagram.

Figure 14-1. AUDMUX Block Diagram

AUDMUX supports single source to single destination connectivity or single source to multiple destination connectivity.

AUDMUX includes two types of interfaces: Internal ports and External ports. Internal ports are hard wired to Synchronous Serial Interface Controller (SSI). The connection between each SSI and AUDMUX's Internal ports cannot be modified, however, routing of the signals connected to each of the internal port can be routed within AUDMUX. External ports are connected to IOMUX module where the ports connect to off-chip audio devices and serial interfaces of other processors. The connectivity of the External port and IOMUX cannot be configured, but the output or input of the signal can be routed easily by setting the appropriate AUDMUX registers.

14.1.1 Features

Key features of the block include:

- Three internal ports
- Four external ports
- Full 6-wire SSI interfaces for asynchronous receive and transmit
- Configurable 4-wire (synchronous) or 6-wire (asynchronous) peripheral interfaces
- Independent Tx/Rx Frame sync and clock direction selection for host or peripheral
- Each host interface's capability to connect to any other host or peripheral interface in a point-to-point or point-to-multipoint (network mode)

14.1.2 Modes and Operations

The AUDMUX supports the modes described in [Operating Modes](#).

14.2 External Signals

The following table describes the external signals of AUDMUX:

Table 14-1. AUDMUX External Signals

Signal	Description	Pad	Mode	Direction
AUD3_RXC (RXC)	Receive clock signal	AUD_RXC	ALT0	IO
AUD3_RXD (RXD)	Data receive signal	AUD_RXD	ALT0	IO
AUD3_RXFS (RXFS)	Receive Frame sync signal	AUD_RXFS	ALT0	IO
AUD3_TXC (TXC)	Transmit clock signal	AUD_TXC	ALT0	IO

Table continues on the next page...

Table 14-1. AUDMUX External Signals (continued)

Signal	Description	Pad	Mode	Direction

14.3 Clocks

This section provides information about AUDMUX clocking including clock inputs and the clock diagram.

The following table describes the clock source for AUDMUX. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 14-2. AUDMUX Clocks

Clock name	Clock Root	Description
ipg_clk_s	ipg_clk_root	Peripheral access clock

14.3.1 Clock Inputs

The IP Bus read/write clock-peripheral clock (ipg_clk_s) is an input to the AUDMUX. It is used for all AUDMUX register accesses. It is driven only when there is an AUDMUX access on the IP Bus.

14.3.2 Clock Diagram

The figure below shows the clocking used in the AUDMUX.

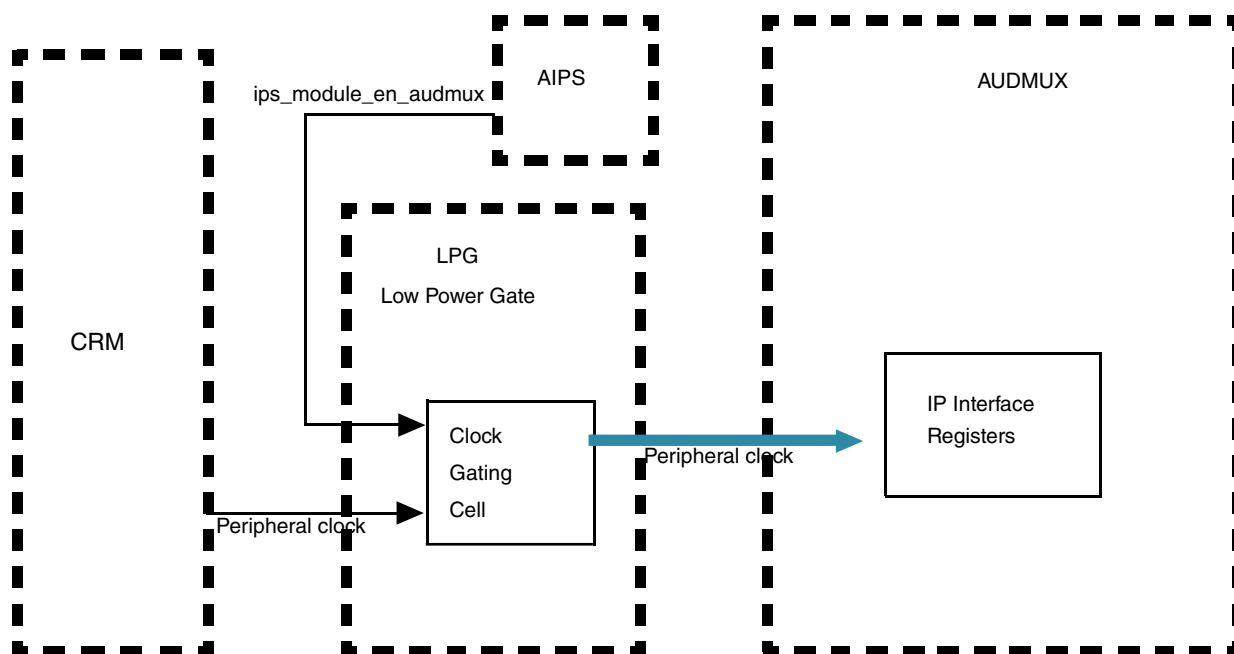

Figure 14-2. AUDMUX Clocking Scheme

14.3.3 Clocking Restrictions

- Since the AUDMUX requires only peripheral clock, it places no restrictions on the bus frequency.
- All registers in the AUDMUX are control registers so their values will not change frequently. These values will be programmed when changing between use cases (not during operation in a particular mode).

14.4 Default Register Configuration

There are two configuration registers for each port. Each pair of configuration registers is identical for each port; however, the default values following a reset differ as shown in the Memory Map.

[Default Port Configuration](#), describes the default configuration of the ports.

14.4.1 Default Port Configuration

After a reset, each port defaults to normal mode ($PDCRn[MODE] = 0$) with synchronous timing mode ($PTCRn[SYN] = 1$) enabled.

The default port-to-port connections are as follows:

- Port 1 to Port 6
 - Port 6 provides the clock and frame sync.
- Port 2 to Port 5
 - Port 5 provides the clock and frame sync.
- Port 3 to Port 4
 - Port 4 provides the clock and frame sync.
- Port 7 to Port 7 (in data loopback mode)
 - Clock and frame syncs are inputs.

14.5 Functional Description

This section provides a complete functional description of the AUDMUX.

14.5.1 Operating Modes

This section describes all functional operation modes of the AUDMUX.

Figure 14-1 shows the AUDMUX block diagram.

All of the ports are essentially identical; there is no functional difference among Ports 1 through 7. The main difference is whether a port is hard wired to synchronous serial interface (SSI) or hard wired to the chip's pads. Each of the connection is hard wired to specific AUDMUX port. AUDMUX provides flexibility in routing the signal within the module, but all Internal and External port connections are fixed to specific configuration.

All ports can be configured as four- or six-wire interfaces. When configured as a six-wire interface, Receive Frame Sync (RXFS) and Receive Clock (RXC) signals of SSI interface enable the serial interface to be used in asynchronous mode with separate receive and transmit clocks.

AUDMUX supports both Normal mode (not to be confused with SSI's Normal Mode), External Network mode and Internal Network mode. The definition of each mode will be given in the next section.

All ports have a TXRXEN bit to provide flexibility in supporting network mode configurations. The TXRXEN bit reverses the functions of transmit and receive data lines where the transmit line is configured as receive and transmit line to be configured as transmit line. This function is provided so that mastership of the serial bus can be passed among multiple external devices connected to a single port.

In addition to supporting the External Network mode (default), all ports support an internal network mode:

- With internal network mode, single point-to-multipoint network configuration with an arbitrary number of slaves can be supported if the external slaves are put into the high-impedance state (as defined in the SSI network mode protocol) and have pull-up resistors on their TxD pins. (Alternatively, this can be viewed as requiring a pull-up resistor on the corresponding AUDMUX RxD pin.)

Bit clock direction selection enables each port to be configured as a master or slave in the flow.

Possible scenarios include:

- SSI (hard wired to internal port) transmits data to a voice codec and a BT (Blue tooth) codec (both on external Port 4Port 5) and the Bottom Connector (on external Port 5Port 6) simultaneously using network mode. SSI is configured as the master.
- An external processor (external port - Port 4Port 3) drives a voice codec and a BT codec (both on external Port 5Port 4) and the Bottom Connector (on Port 6Port 5) simultaneously using network mode. The external processor is the master.

14.5.1.1 Port Receive Data Modes

Each port has logic to select which data lines are used to create the RXD line for the corresponding host interface.

[Figure 14-3](#) shows the logic used to create the RXD line for Port 1. This logic has the following modes of operation (as determined by MODE:

- Normal (not to be confused with SSI's normal mode)
- Internal network mode

The subsequent sections describe the various modes of the port receive data logic. The following terms are used to define the operation of the AUDMUX:

- Network mode- Time-Division Multiplexed protocol for sending unique data to multiple devices on a serial bus or single devices with multi-channel capabilities.
- Internal network mode-Physical bus configuration where multiple serial buses are effectively connected within the AUDMUX via digital logic to create point-to

multipoint connectivity. An arbitrary number of devices are supported. Devices must be put into the high-impedance state as specified by the network mode protocol.

- External network mode-Physical bus configuration where multiple serial buses are electrically connected together on a printed circuit board (that is, external to the AUDMUX). Devices must put their TXD lines into the high-impedance state as specified by the network mode protocol. TXD lines of devices must be pulled high.

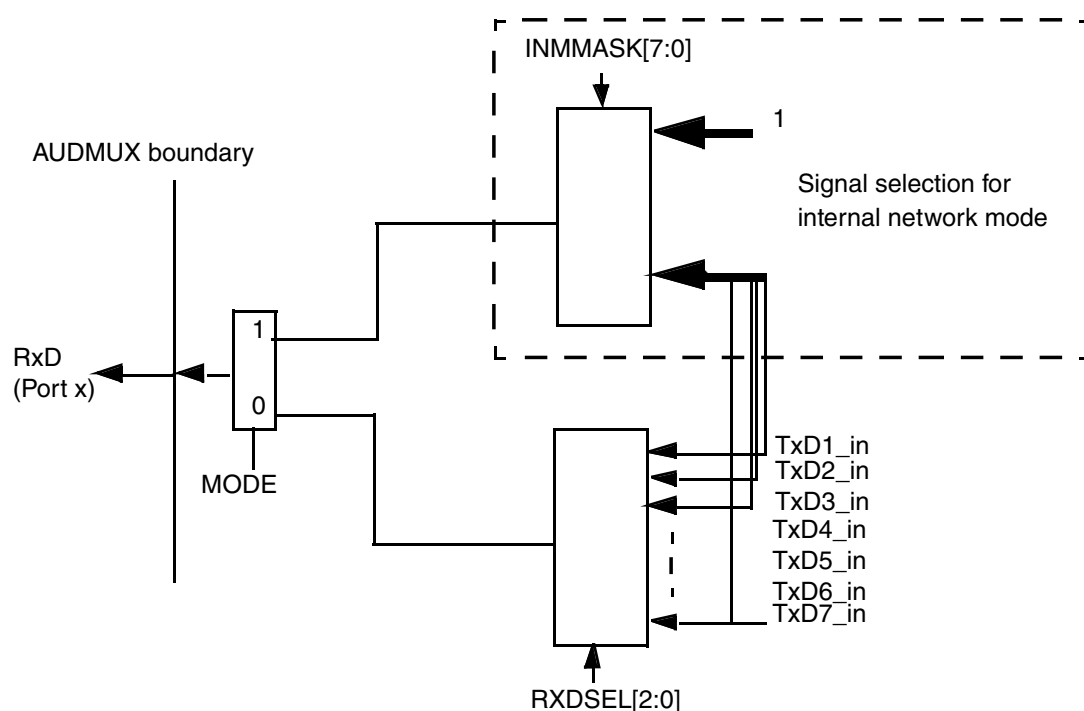

Figure 14-3. Receive Data Logic for Port x

14.5.1.1.1 Normal Mode

In normal mode (MODE = 0), not to be confused with SSI's Normal Mode, the port is connected in a single device point-to-single device port configuration (as a master or a slave) and the RXDSEL[2:0] setting selects the transmit signal from any port. In normal mode, any data format can be used (that is, SSI normal mode, SSI network mode, AC-97, and others).

If a user wishes to transmit SSI1's data (TXD) to port 5, PDCR5's RXDSEL[2:0] must be set to 000b. If the clock (TCK) and frame clock (TFS) are sent out to the external device from SSI1, PTCR5's TFSEL[3:0] and TCSEL[3:0] must be set to 0000b (port1) and 0000b (port1), while setting PTCR5's TFSDIR and TCLKDIR to 1.

If either or both of the clocks are to be received from external device to SSI1, PTCR5's TCLKDIR and/or TFSDIR must be set to 0 (input), and PTCR1's TFSEL[3:0] and/or TCLKDIR[3:0] to 0100b (port5).

Likewise, if a user wishes to receive serial data from Port 4 and send the receiving data to SSI2's RXD, one must set PDCR2's RXDSEL[2:0] to 11b. If the frame (RXFS) and bit clocks (RXC) are to be received from the external device, PTCR2's RFSEL[3:0] and RCSEL[3:0] must be set to 011b while PTCR4's RFSDIR and RCLKDIR set to 0.

14.5.1.1.2 Internal Network Mode

In internal network mode (MODE = 1), the output of the AND gate is routed (via the output of the port) to the RXD signal of the corresponding host interface.

The INMMASK bit vector selects the transmit signals of the ports that are to be connected in network mode. The transmit signals received at the AUDMUX ports (TxDn_in) are ANDed together to form the output. In internal network mode, only one device can be transmitting in its predesignated timeslot and all other transmit signals must remain high (be in high-impedance state and pulled-up). Therefore, non-active signals in the selection will be high and do not influence the output of the AND gate.

Network mode is a protocol where a master SSI is connected to more than one slave SSI device and communication occurs on a time-slotted frame. Though network mode can allow master-slave and slave-slave communication, internal network mode supports only master-slave communication.

There are two scenarios where internal network mode can be used with external network mode:

1. Slave-only devices are attached to an external port.
2. A master device is attached to an external port and all slave devices connected to the same external port are disabled.

NOTE

When internal network mode is enabled at an external port, RXDSEL[3:0] for RxDn_obe selection is ignored and RxD_obe is always driven high (that is, asserted for all timeslots). All slave devices connected to the same port must be disabled.

Internal Network Mode Example 1

SSI_m and SSI_n are used with Port 3 in internal network mode as shown in [Figure 14-4](#). No pull-up resistors are required because the interfaces combined in internal network mode are on-chip interfaces.

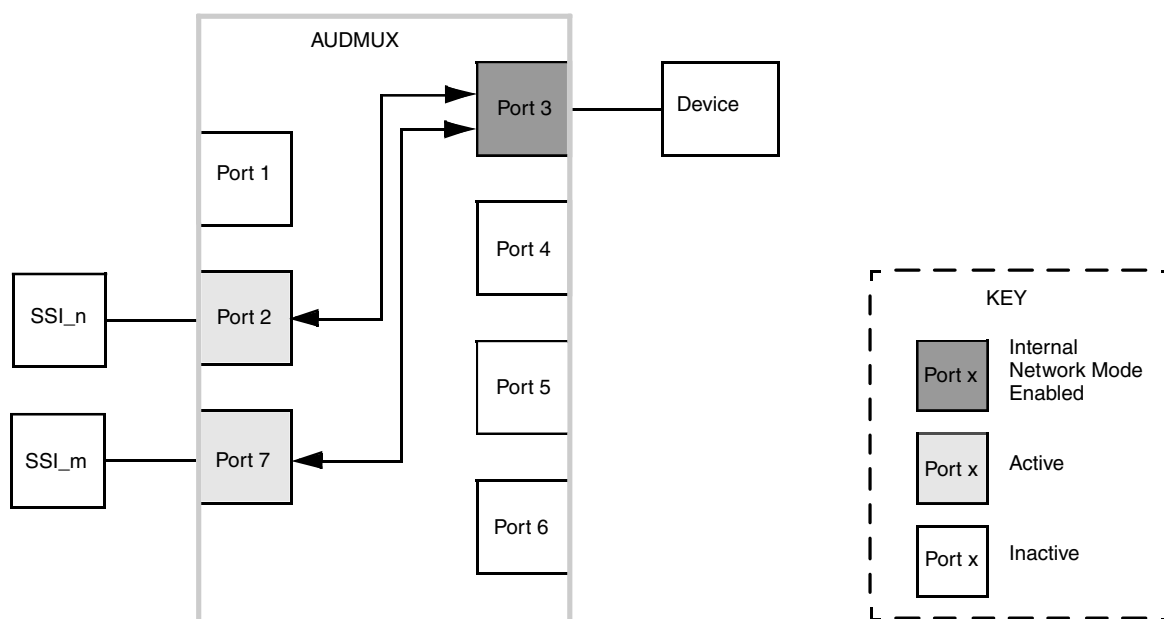

Figure 14-4. Block Diagram For Example 1

See [Figure 14-5](#) for the timing diagram of Example 1. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for SSI_m and SSI_n (as well as their output enables) are shown. Note that the on-chip interfaces drive a logic '1' when their output enables are logic '0'. The combined TXD line, which is the logical AND of the individual TXD lines, is used for Port 3's TXD line.

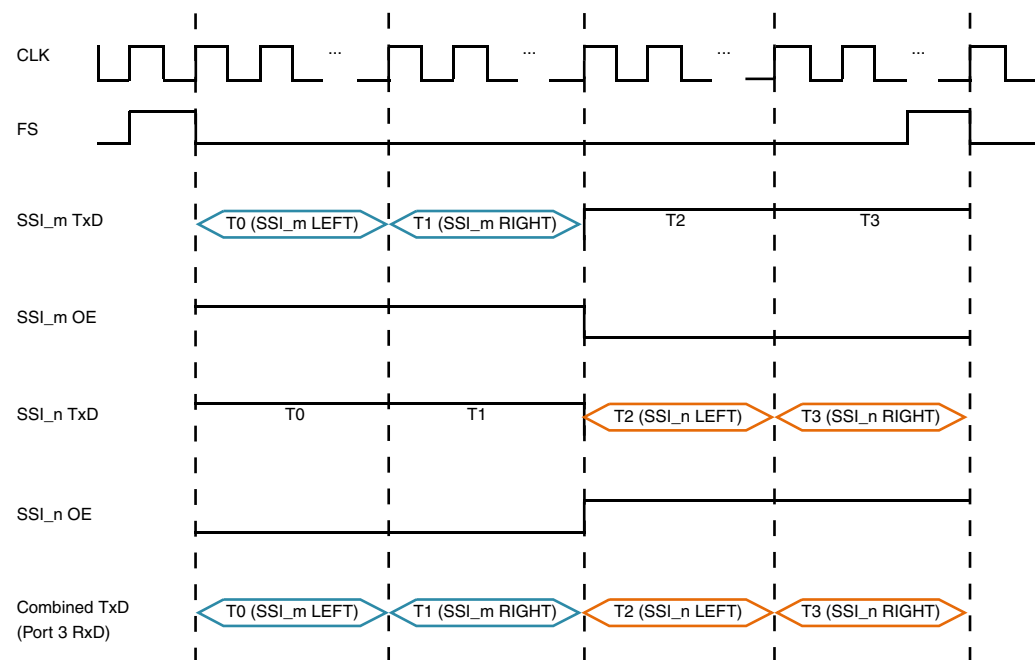

Figure 14-5. Example Using Internal Ports For Transmit Data

Internal Network Mode Example 2

The SSI, Port 3, and Port 4 are used with Port 5 in internal network mode, as shown in the following figure. Note that Port 3 and Port 4 are external ports. Therefore, pull-up resistors are required on the Port 3 RXD and Port 4 RXD pins. This example shows the timing associated with using adjacent timeslots for the SSI, Port 3 and Port 4 .

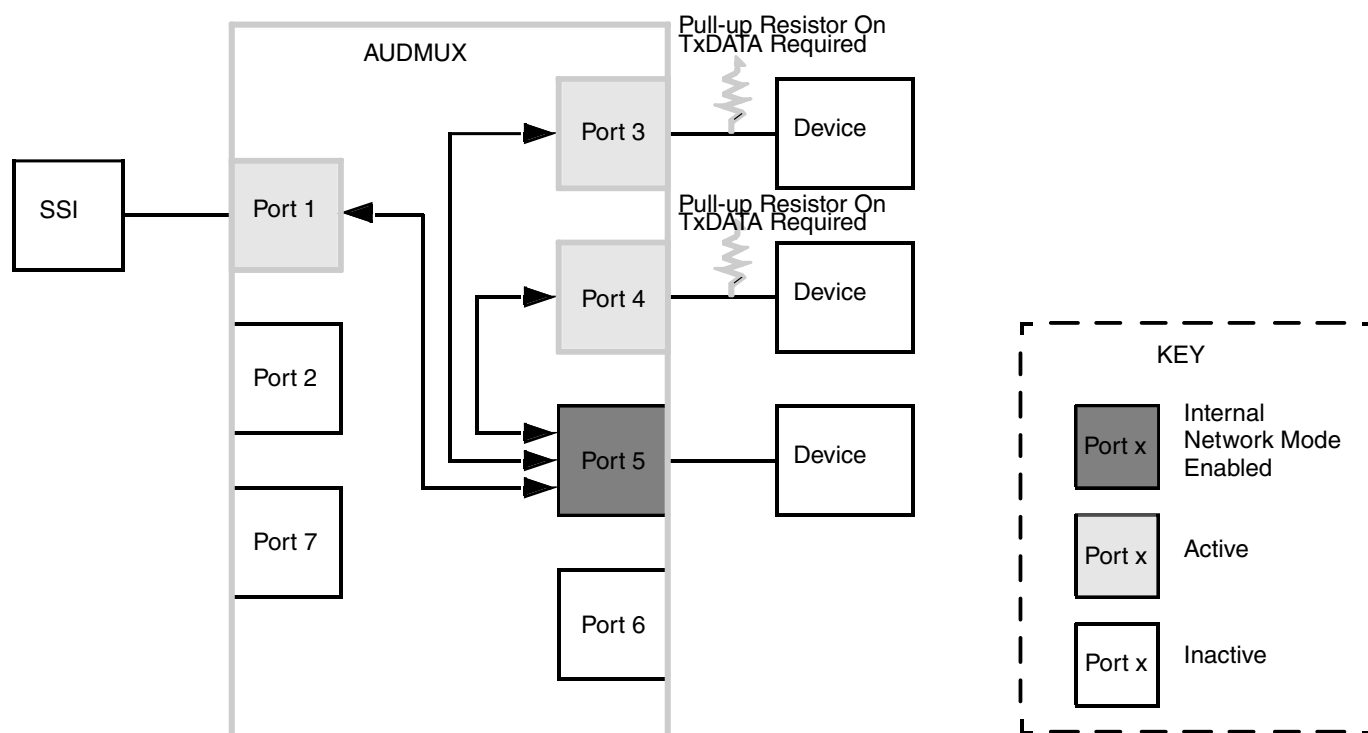

Figure 14-6. Block Diagram For Example 2

The resistance value of the pull-up resistors must be sufficiently high such that a value of '0' can be pulled up to logic '1' within half of a period of the bitclock. The required resistance must be no larger than:

$R_{max} = 1 / (2 * f_{bc} * C)$ where:

- f_{bc} is the frequency of the bitclock
- C is the total system capacitance (ICs, board traces, and so on)

The following figure shows the timing diagram for this example. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for the SSI, Port 3 and Port 4 are shown. Note that the SSI transmits a logic '1' when its corresponding output enable is a logic '0'. The data lines from Port 3 and Port 4 at the pad are pulled high by pull-up resistors when they are in the high-impedance state. The data lines from Port 3 and Port 4 at the AUDMUX are pure digital signals and are constantly driven. The combined TXD line, which is the logical AND of the SSI, Port 3 and Port 4's TXD lines, is used for Port 5's TXD line.

Note the highlighted areas in the [Figure 14-7](#). This shows the transition time that occurs while a TXD line is being pulled high. In this example, this transition time is a maximum of 1/2 the period of the serial bitclock. This prevents corruption of the first data bit of the next timeslot. It is critical that the pull-up resistance is sufficient for the given bitclock frequency and system capacitance.

Note that hysteresis should be enabled at Port 3's RXD pad and Port 4's RXD pad to prevent the digital signals created by the pad from toggling rapidly during the pull-up period. The pads typically require a transition within 25ns unless hysteresis is enabled. Instead of using hysteresis, one could select a pull-up resistor sufficiently high to pull-up the signal at the pad within 25 ns; however, that would result in a higher resistance value and higher current drain.

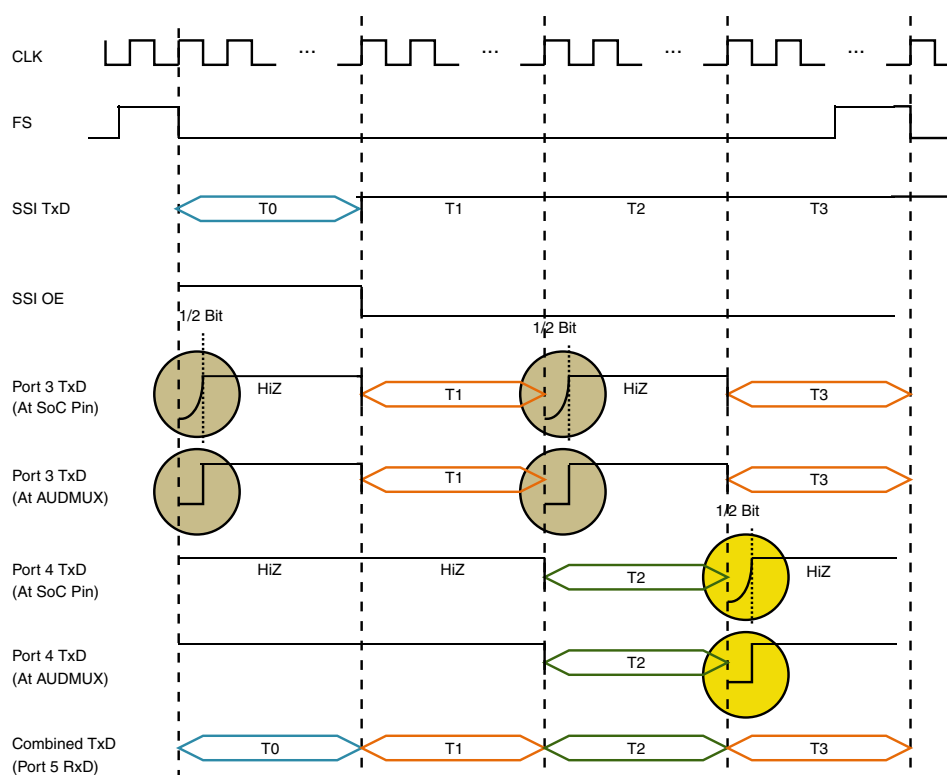

Figure 14-7. Example Using External Ports for Transmit Data in Consecutive Timeslots

Internal Network Mode Example 3

The SSI and Port 3 are used with Port 5 in internal network mode as shown in the following figure. Note that Port 3 is an external port. Therefore, a pull-up resistor is required on the Port 3TXD pin. This example shows the timing associated with inserting empty timeslots after the timeslots have been used by external ports.

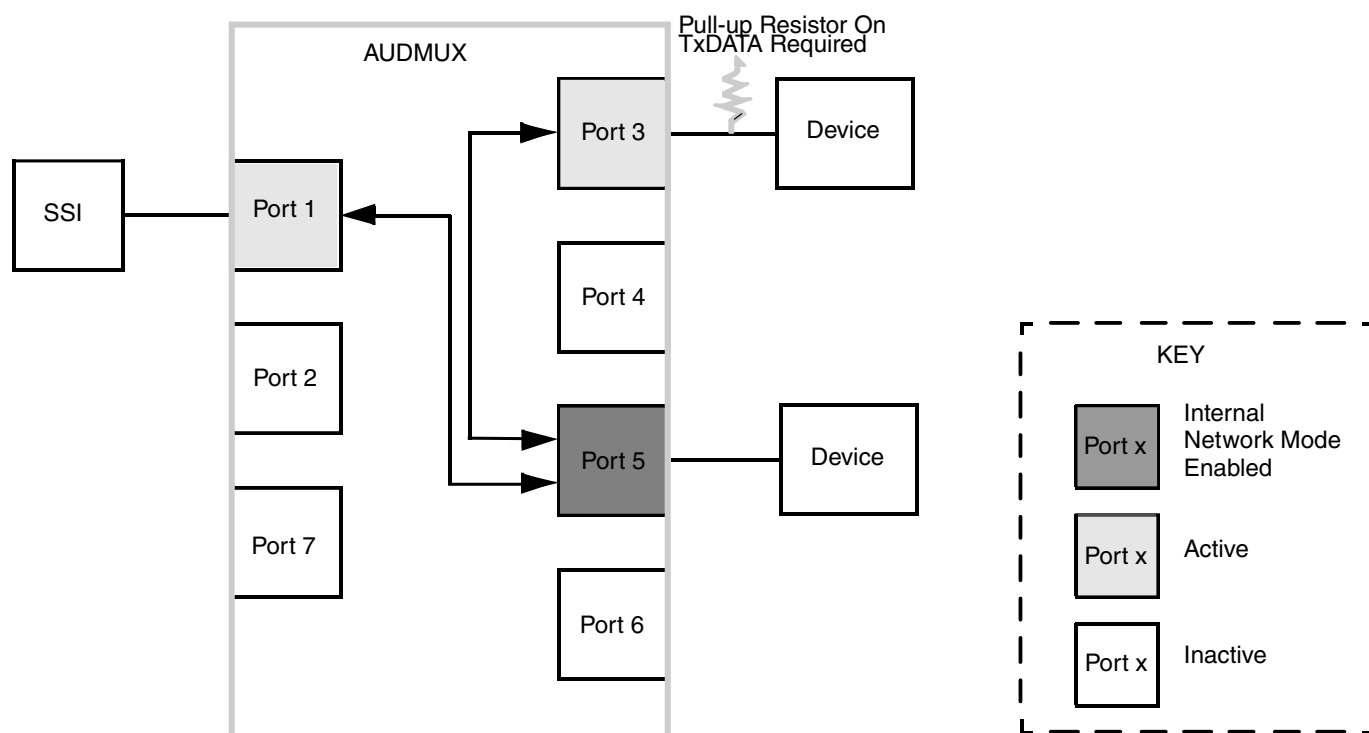

Figure 14-8. Block Diagram For Example 3

The resistance value of the pull-up resistors must be sufficiently high such that a value of '0' can be pulled up to logic '1' by the time that the next occupied timeslot occurs. This allows a much weaker pull-up to be used as compared to Example 2. The required resistance must be no larger than:

$R_{max} = (4 * n + 1) / (2 * f_{bc} * C)$ where:

- n is the number of bits per timeslot
- f_{bc} is the frequency of the bitclock
- C is the total system capacitance (ICs, board traces, and so on)

The figure below shows the timing diagram for this example. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for the SSI and Port 3 are shown. Note that the SSI transmits a logic '1' when its corresponding output enable is a logic '0'. The data line from Port 3 at the pad is pulled high by a pull-up resistor when they are in the high-impedance state. The data line from Port 3 at the AUDMUX is a pure digital signal and is constantly driven. The combined TXD line, which is the logical AND of the SSI and Port 3's TXD lines, is used for Port 5's RXD line.

Note the highlighted area in the [Figure 14-9](#). This shows the transition time that occurs while Port 3's TXD line is being pulled high. In this example, this transition time is a maximum of two timeslots plus 1/2 the period of the serial bitclock. This prevents corruption of the first data bit of the next timeslot. It is critical that the pull-up resistance is sufficient for the given bitclock frequency and system capacitance.

Note that hysteresis must be enabled at Port 3's RXD pad to prevent the digital signal created by the pad from toggling rapidly during the extended pull-up period. The pads typically require a transition within 25 ns unless hysteresis is enabled.

Figure 14-9. Example Using External Ports For Transmit Data In Nonconsecutive Timeslots

14.5.1.1.3 Transmit Data Output Enable Assertion

The TXD line from the internal network mode master (connected at any internal port) is put into the high-impedance state at the pad depending upon the assertion or deassertion of TxD_obe, its corresponding output enable generated by the network mode master.

In the case of an external network mode master (connected at an external port), the corresponding TxD_obe is always asserted after the port data register configuration.

14.5.1.2 Tx/Rx Switch and External Network Mode

External network mode is the traditional network mode connection. It is called external network mode to differentiate from the internal network mode. In external network mode, devices are connected to a single external port in a star or multi-drop configuration.

In network mode, there can be only one master (driving the frame sync and clock source) with the other devices configured in normal slave mode or network slave mode. Unlike internal network mode, both master-slave and slave-slave communication can take place in external network mode. Codec devices transmit on a single timeslot while processor serial interfaces (that is, SSI) can process more than one timeslot of data while in network master or slave mode.

The following figure shows the Tx/Rx data switch. `RxD_obe` is the output buffer enable signal and `RxD_out` is the data transmit signal from the serial interface. The `TxD_in` signal is the receive data signal going towards the `RXDSEL` muxes of all ports.

`D_TxRx` is the data pin which serves as the chip-level transmit data pin when the TxRx switch is not enabled. `D_RxTx` is the data pin which serves as the chip-level receive data pin when the TxRx switch is not enabled. The roles of these pins are reversed when the TxRx switch is enabled.

When `TXRXEN` is disabled (`TXRXEN=0`), `RxD_out` is routed to `D_TxRx` and `D_RxTx` is routed to `TxD_in`. The output buffer enable, selected by `RXDSEL[2:0]`, is routed to `Db_obe`.

When the Tx/Rx switch is enabled (`TXRXEN=1`), `RxD_out` is routed to `D_RxTx` and `D_TxRx` is routed to `TxD_in`. The output buffer enable, selected by `RXDSEL[2:0]`, is routed to `Da_obe`.

If the `RXDSELn[2:0]` field for any Port *n* is configured to select data from an internal port, the output buffer enable is selected by `RXDSELn[2:0]` and is routed to `Dan_obe/Dbn_obe`. In the case when the `RXDSELn[2:0]` field for Port *n* is configured to select data from an external port, the output buffer enable is always high and routed to `Dan_obe/Dbn_obe`, depending on the `TXRXENn` switch configuration.

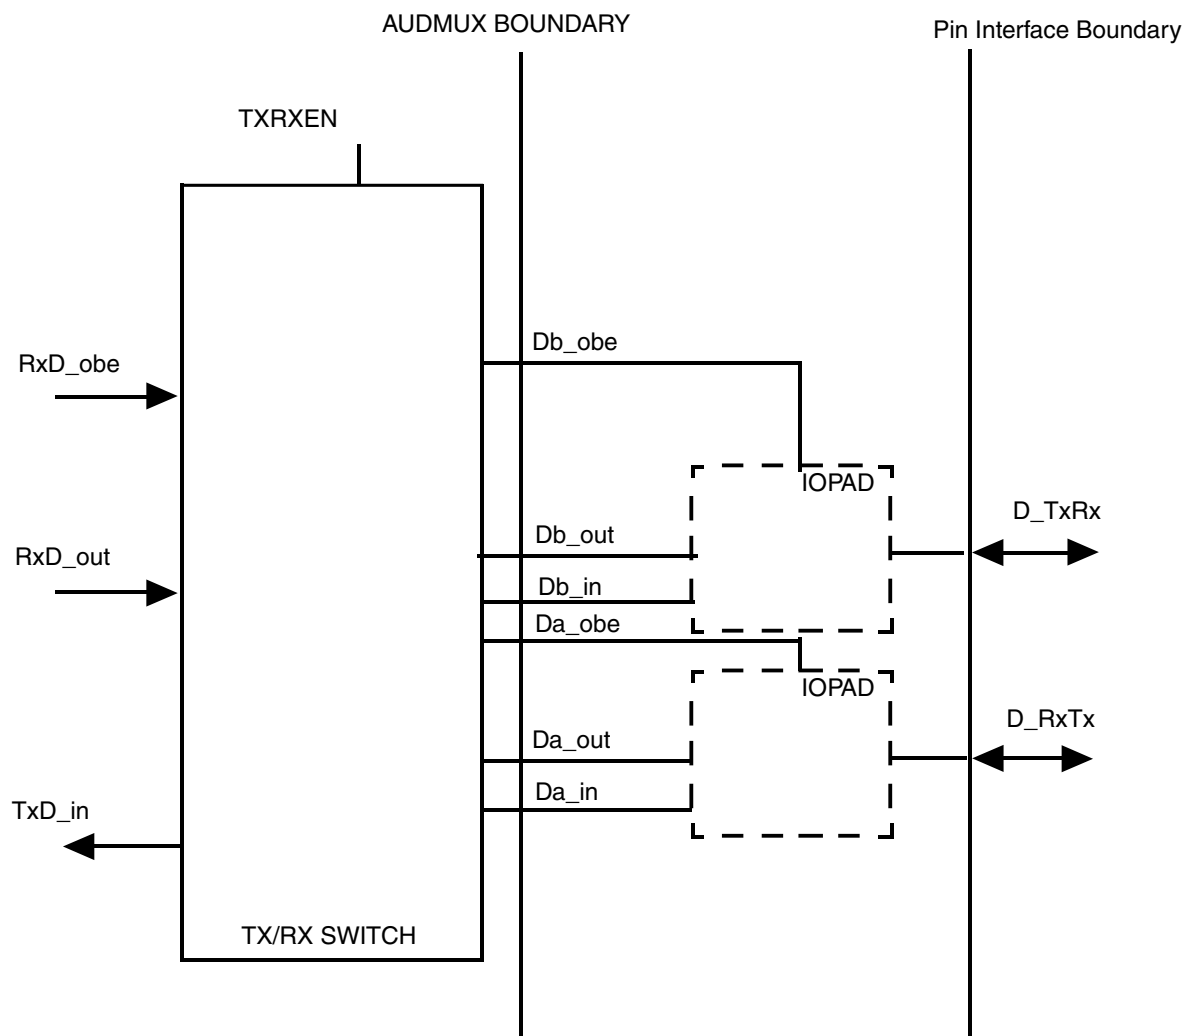

Figure 14-10. Tx/Rx Switch

14.5.1.3 Timing Modes

The AUDMUX ports are constructed as 6-wire interfaces. However, they can be used either in synchronous or asynchronous modes as determined by the SYN bit.

14.5.1.3.1 Synchronous Mode (4-Wire Interface)

In Synchronous mode, each port set in SYN=1 will be a 4-wire interface (that is, RXD, TXD, TXC, TXFS). In this setup, receive data timing is determined by TXC and TXFS..

As shown in the following figure, SSI signals interfaced to Port x signals are routed to Port y. When SYN = 1 the 6-wire signal from SSI is reduced to 4-wire within the internal logic.

TFS_in, RFS_in, TCLK_in, and RCLK_in are the input frame sync and bit clocks from the serial interface (Port x) with their corresponding output buffer enable signals (_obe). TFS_out, RFS_out, TCLK_out, and RCLK_out are the frame sync and bit clocks that are transmitted to the serial interface from the other ports.

The TFS_out and TCLK_out are selected at Port x by the TFSEL and TCSEL mux settings, respectively. RFS_out and RCLK_out are selected at Port x by the RFSEL and RCSEL mux settings, respectively. Similarly, in the external direction, Port y is configured as a 4-wire port; TFSEL selects the FS_obe and FS_out signals. In this mode, the configuration of RFSEL and RCSEL is not used, since the RFS_out and RCLK_out pins at Port y are not available.

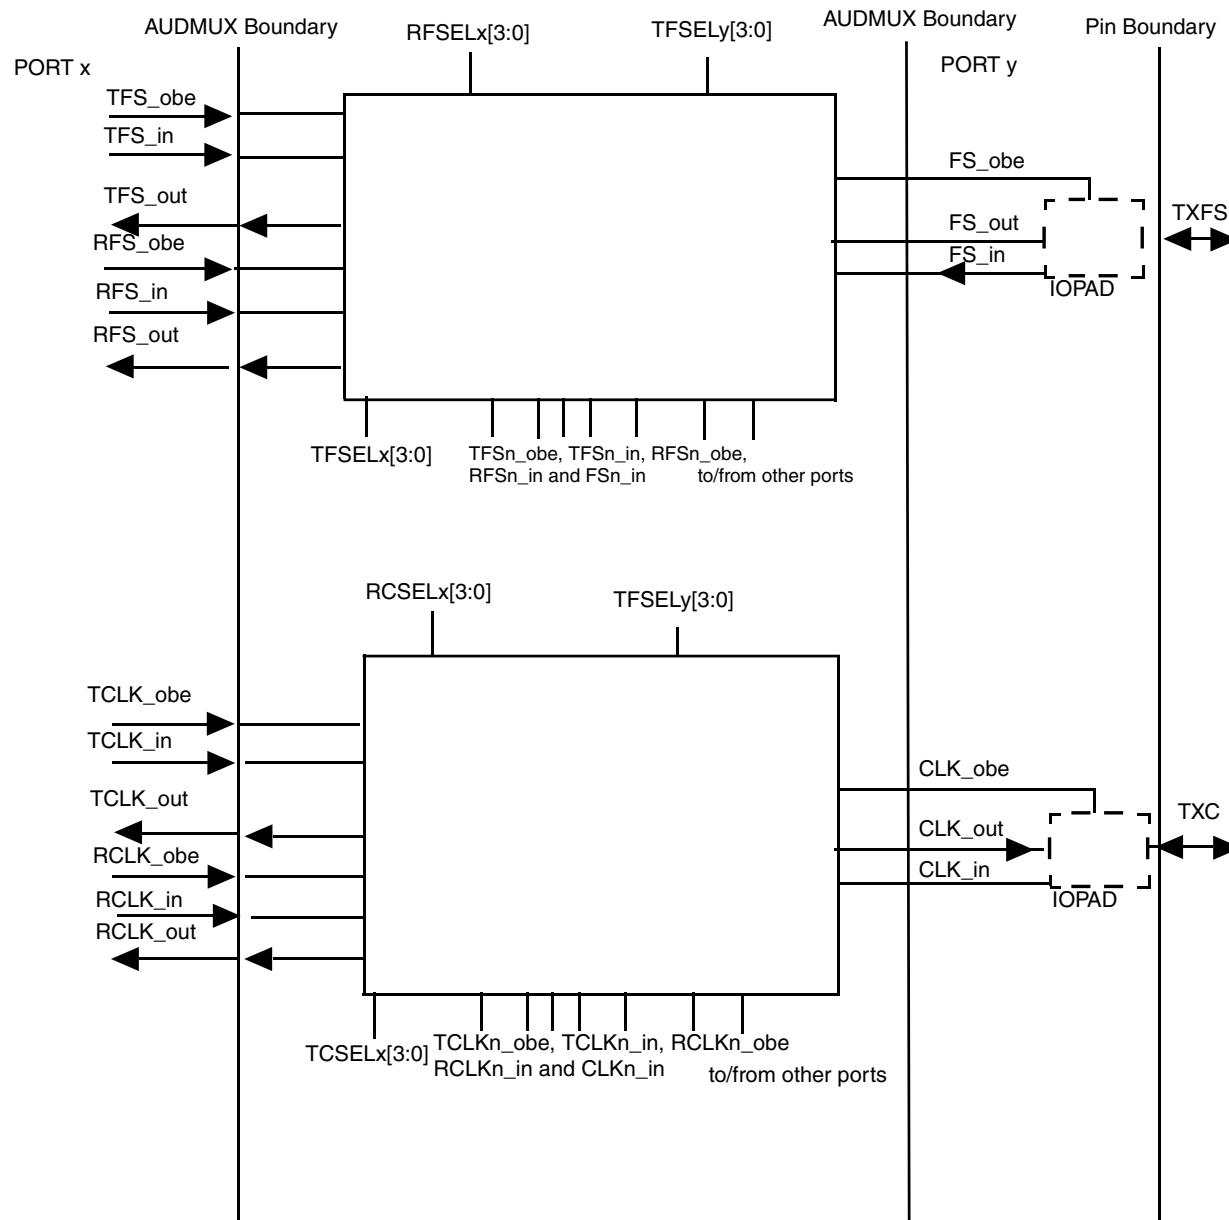

Figure 14-11. Frame Sync and Clock Routing When External Port Is 4-Wire

14.5.1.3.2 Asynchronous Mode (6-Wire Interface)

In Asynchronous mode, the port has a 6-wire interface (meaning RXD, TXD, TXC, TXFS, RXC, RXFS). This mode has additional receive clock (RXC) and frame sync (RXFS) signals as compared to the synchronous or 4-wire interface.

As shown in the figures below, Port x signals can be routed to Port y, producing 6-wire to 6-wire port connectivity.

TFS_in, RFS_in, TCLK_in, and RCLK_in are input frame sync and bit clocks from the serial interface (Port x) with their corresponding output buffer enable signals (_obe). TFS_out, RFS_out, TCLK_out, and RCLK_out are the frame sync and bit clocks that are transmitted to the serial interface from the other ports.

TFS_out and TCLK_out are selected by the TFSEL and TCSEL mux settings, respectively. RFS_out and RCLK_out are selected by the RFSEL and RCSEL mux settings, respectively. Similarly, in the external direction, the TFSEL selects the TxFS_obe and TxFS_out signals and TCSEL selects the TxCLK_obe and TxClk_out signals. The RFSEL selects the RxFS_obe and RxFS_out signals and RCSEL selects the RxCLK_obe and RxCLK_out signals.

NOTE

Because FS_in and CLK_in from external interfaces are also routed to the TFSEL and TCSEL muxes of the external ports, these signals do not have corresponding buffer enable signals. Consequently, their corresponding inputs to the TFSEL and TCSEL mux of the external ports have to be tied high.

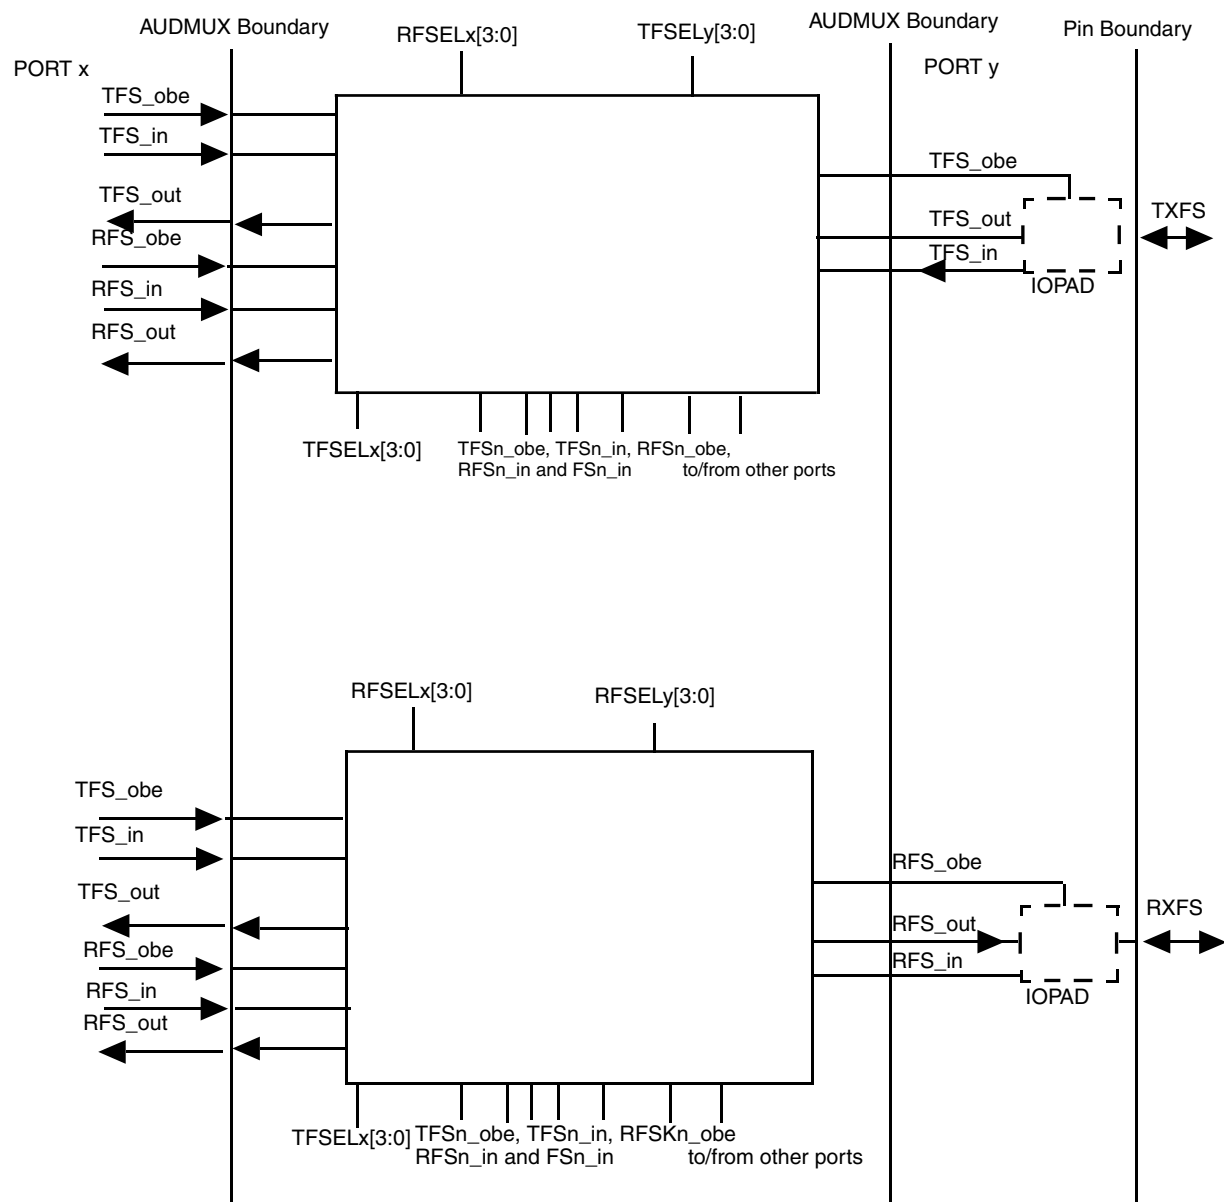

Figure 14-12. Frame Sync Routing When External Port Is 6-Wire

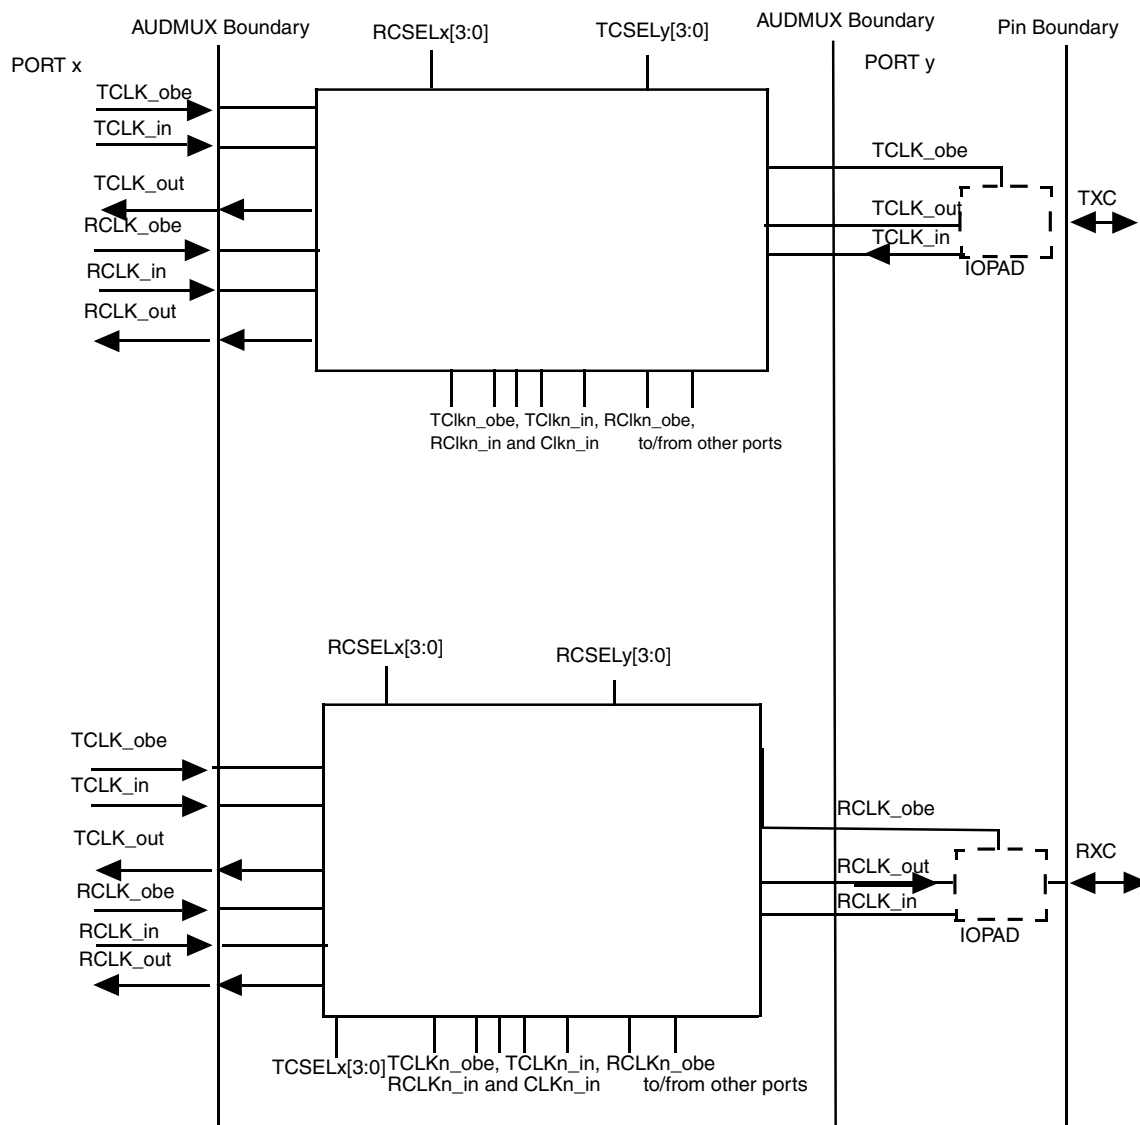

Figure 14-13. Clock Routing When External Port Is 6 Wire

14.5.2 Connectivity Between Ports

Four basic types of connections are provided by the AUDMUX:

- Internal port to external port
- External port to external port
- Internal port to internal port
- Loopback

The corresponding data connections are described in the following sections.

14.5.2.1 Internal Port to External Port Connectivity

The internal port is connected to a processor's serial interface. TxD_obe is the buffer enable signal from the serial interface, TxD_in is the input transmit data from the serial interface to the AUDMUX, and RxD_out is the receive data output from the AUDMUX to the serial interface.

RXDSEL[2:0] of the external port selects the buffer enable signal (TxD_obe) and transmit data output (TxD_out) signal from the TxD_obe and RxD_in signals. RXDSEL[2:0] is a common signal to both selection muxes.

NOTE

Because buffer TxD_in signals from external interfaces do not have corresponding buffer enable signals, their buffer enable signals into the selection mux are tied high. This will ensure that selection of TxD_in, as RxD_out will also drive the RxD_obe output high.

Transmit Data from the serial interface goes into the RXDSEL data mux and comes out as RxD_out. RxD_out is routed to Da_TxRx when TXRXEN is disabled and to D_RxTx when TXRXEN is enabled. Similarly, D_RxTx is routed to TxD_in when TXRXEN is disabled and D_TxRx is routed to TxD_in when TXRXEN is enabled. The routing of frame syncs is shown in [Figure 14-12](#) and the routing of interface clocks is shown in [Figure 14-10](#).

If internal network mode is disabled, then RXDSEL selects the TxD_in, which is sent from the AUDMUX to the serial interface connected at Port x. When the internal network mode is selected, RxD_out is constructed by ANDing selected TxD_in signals from the ports (as determined by INMMASK).

If there is more than one device attached to the external port at D_TxRx and D_RxTx and one of the devices is a network master, then two conditions must be noted:

1. When the external master is enabled in network mode, then the serial interface at Port x must be configured as a slave (normal or network mode). No Tx/Rx switching is required.
2. When the external master is disabled and the serial interface at Port x and other slave devices must communicate, then the serial interface at Port x must be configured as a network mode master and the Tx/Rx switch at Port y must be enabled (TXRXEN=1). This will ensure that the transmit and receive paths are connected appropriately.

To communicate with more than one port, internal network mode can be enabled at Port x. In internal network mode, it is possible to communicate with any device attached to the other ports. Internal network mode shall be enabled at the port that is the SSI network mode master.

14.5.2.2 External Port to External Port Connectivity

External ports can communicate with external ports directly.

External ports can communicate together in three ways:

1. Each port's receive logic is configured in normal mode (MODE = 0) . Each port's RXDSEL[2:0] field is configured to select the other port's transmit data. Bit fields associated with clock/frame sync selection and direction are configured for each port. Either port can be the master.
2. One port is configured in internal network mode (MODE = 1) . All desired data lines are combined by the AND gate as determined by INMMASK[7:0]. Since an external port is being used as the internal network mode master, all other devices on the same AUDMUX port as the internal network mode master must be disabled. This configuration can be used with a combination of internal and external ports. All external ports must have a pull-up resistor on its RXD pin. Bit fields associated with clock/frame sync selection and direction are configured for each port. Any port can be the master.

14.5.2.3 Internal Port to Internal Port Connectivity

Internal ports can communicate with other internal ports directly, thereby providing a means for synchronous interprocessor communication.

Internal ports can communicate together in two ways:

1. Each port's receive logic is configured in normal mode (MODE = 0) . Each port's RXDSEL[2:0] field is configured to select the other port's transmit data. Bit fields associated with clock/frame sync selection and direction are configured for each port. Either port can be the master.
2. One port is configured in internal network mode (MODE = 1) . All desired data lines are combined by the AND gate as determined by INMMASK[7:0]. This configuration can be used with a combination of internal and external ports. All external ports must have a pull-up resistor on its RXD pin. Bit fields associated with clock/frame sync selection and direction are configured for each port. Any port can be the master.

14.5.2.4 Loopback Connectivity

AUDMUX ports can communicate with themselves in order to provide loopback functionality. Port x can route its TXD signal to its own RxD_out signal by setting RXDSELx[2:0] to its own port number. This is supported by all ports in the AUDMUX.

In addition, ports can provide loopback support in internal network mode. With internal network mode, the internal network mode master can loop its TXD signal (combined with those of other ports, if desired) back into its RxD_out signal. Port x's INMMASK should be set such that bit (x - 1) is clear in order to enable the loopback.

14.6 AUDMUX Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a specific sub-block instantiation, see the system memory map in this manual.

The AUDMUX memory map is shown in the following table.

AUDMUX memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
21D_8000	Port Timing Control Register 1 (AUDMUX_PTCR1)	32	R/W	AD40_0800h	14.6.1/443
21D_8004	Port Data Control Register 1 (AUDMUX_PDCR1)	32	R/W	0000_A000h	14.6.2/445
21D_8008	Port Timing Control Register 2 (AUDMUX_PTCR2)	32	R/W	A500_0800h	14.6.3/446

AUDMUX_PTCR1 field descriptions

Field	Description
31 TFS_DIR	Transmit Frame Sync Direction Control. This bit sets the direction of the TXFS pin of the interface as an output or input. When set as an input, the TFSEL settings are ignored. When set as an output, the TFSEL settings determine the source port of the frame sync. 0 TXFS is an input. 1 TXFS is an output.
30–27 TFSEL[3:0]	Transmit Frame Sync Select. Selects the source port from which TXFS is sourced. 0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
26 TCLKDIR	Transmit Clock Direction Control. This bit sets the direction of the TXC pin of the interface as an output or input. When set as an input, the TCSEL settings are ignored. When set as an output, the TCSEL settings determine the source port of the clock. 0 TXC is an input. 1 TXC is an output.
25–22 TCSEL[3:0]	Transmit Clock Select. Selects the source port from which TXC is sourced. 0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1

Table continues on the next page...

AUDMUX_PTCR1 field descriptions (continued)

Field	Description
	x110 Port 7 x111 Reserved
21 RFS_DIR	Receive Frame Sync Direction Control. This bit sets the direction of the RXFS pin of the interface as an output or input. When set as an input, the RFSEL settings are ignored. When set as an output, the RFSEL settings determine the source port of the frame sync. 0 RXFS is an input. 1 RXFS is an output.
20–17 RFSEL[3:0]	Receive Frame Sync Select. Selects the source port from which RXFS is sourced. RXFS can be sourced from TXFS and RXFS from other ports. 0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
16 RCLKDIR	Receive Clock Direction Control. This bit sets the direction of the RXC pin of the interface as an output or input. When set as an input, the RCSEL settings are ignored. When set as an output, the RCSEL settings determine the source port of the clock. NOTE: RCLKDIR and SYN should not be changed at the same time. 0 RXC is an input. 1 RXC is an output.
15–12 RCSEL[3:0]	Receive Clock Select. Selects the source port from which RXC is sourced. RXC can be sourced from TXC and RXC from other ports. 0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1 x110 Port 7 x111 Reserved
11 SYN	Synchronous/Asynchronous Select. When SYN is set, synchronous mode is chosen and the transmit and receive sections use common clock and frame sync signals (that is, the port is a 4-wire interface). When SYN is cleared, asynchronous mode is chosen and separate clock and frame sync signals are used for the transmit and receive sections (that is, the port is a 6-wire interface). NOTE: RCLKDIR and SYN should not be changed at the same time. 0 Asynchronous mode 1 Synchronous mode (default)
Reserved	This read-only field is reserved and always has the value 0.

14.6.2 Port Data Control Register 1 (AUDMUX_PDCR1)

PDCR1 is the Port Data Control Register for Port 1.

Address: 21D_8000h base + 4h offset = 21D_8004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

AUDMUX_PTCR6 field descriptions

Field	Description
31 TFS_DIR	Transmit Frame Sync Direction Control. This bit sets the direction of the TXFS pin of the interface as an output or input. When set as an input, the TFSEL settings are ignored. When set as an output, the TFSEL settings determine the source port of the frame sync. 0 TXFS is an input. 1 TXFS is an output.
30–27 TFSEL[3:0]	Transmit Frame Sync Select. Selects the source port from which TXFS is sourced. 0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
26 TCLKDIR	Transmit Clock Direction Control. This bit sets the direction of the TXC pin of the interface as an output or input. When set as an input, the TCSEL settings are ignored. When set as an output, the TCSEL settings determine the source port of the clock. 0 TXC is an input. 1 TXC is an output.
25–22 TCSEL[3:0]	Transmit Clock Select. Selects the source port from which TXC is sourced. 0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1 x110 Port 7 x111 Reserved
21 RFS_DIR	Receive Frame Sync Direction Control. This bit sets the direction of the RXFS pin of the interface as an output or input. When set as an input, the RFSEL settings are ignored. When set as an output, the RFSEL settings determine the source port of the frame sync. 0 RXFS is an input. 1 RXFS is an output.
20–17 RFSEL[3:0]	Receive Frame Sync Select. Selects the source port from which RXFS is sourced. RXFS can be sourced from TXFS and RXFS from other ports. 0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
16 RCLKDIR	Receive Clock Direction Control. This bit sets the direction of the RXC pin of the interface as an output or input. When set as an input, the RCSEL settings are ignored. When set as an output, the RCSEL settings determine the source port of the clock. NOTE: RCLKDIR and SYN should not be changed at the same time. 0 RXC is an input. 1 RXC is an output.
15–12 RCSEL[3:0]	Receive Clock Select. Selects the source port from which RXC is sourced. RXC can be sourced from TXC and RXC from other ports.

Table continues on the next page...

Chapter 15

Clock Controller Module (CCM)

15.1 Overview

The Clock Control Module (CCM) generates and controls clocks to the various modules in the design and manages low power modes. This module uses the available clock sources to generate the clock roots.

The Clock Controller Module controls the following functions:

- Uses the available clock sources to generate clock roots to various parts of the chip:
 - PLL1 also referenced as ARM PLL
 - PLL2 also referenced as System PLL
 - PLL3 also referenced as USB1 PLL
 - PLL4 also referenced as Audio PLL
 - PLL5 also referenced as Video PLL
 - PLL6 also referenced as ENET PLL
 - PLL7 also referenced as USB2 PLL (This PLL is only used by the USB UTM interface through a direct connection.)
- Uses programmable bits to control frequencies of the clock roots.
- Controls the low power mechanism.
- Provides control signals to LPCG for gating clocks.
- Provides handshake with SRC for reset performance.
- Provides handshake with GPC for support of power gating operations.

15.1.1 Features

The CCM includes these distinctive features:

- Provides root clock to SoC modules based on several source clocks.
- ARM core root clock is generated from a dedicated source clock.

- Includes separate dividers to control generation of core and bus root clocks (AXI, AHB, IPG).
- Includes separate dividers and clock source selectors for each serial root clock.
- Optional external clocks to bypass PLL clocks.
- Selects clock signals to output on CCM_CLKO onto the pads for observability.
- Controllable registers are accessible via IP bus.
- Manages the Low Power Modes, namely RUN, WAIT and STOP. The gating of the peripheral clocks is programmable in RUN and WAIT modes.
- Manages frequency scaling procedure for ARM core clock by shifting between PLL sources, without loss of clocks.
- Manages frequency scaling procedure for peripheral root clock by programmable divider. The division is done on the fly without loss of clocks.
- Interface for the following IPs:
 - PLL - Interfaces for each PLL
 - LPCG - Low Power Clock Gating unit
 - SRC - System Reset Controller
 - GPC - General Power Controller

15.1.2 CCM Block Diagram

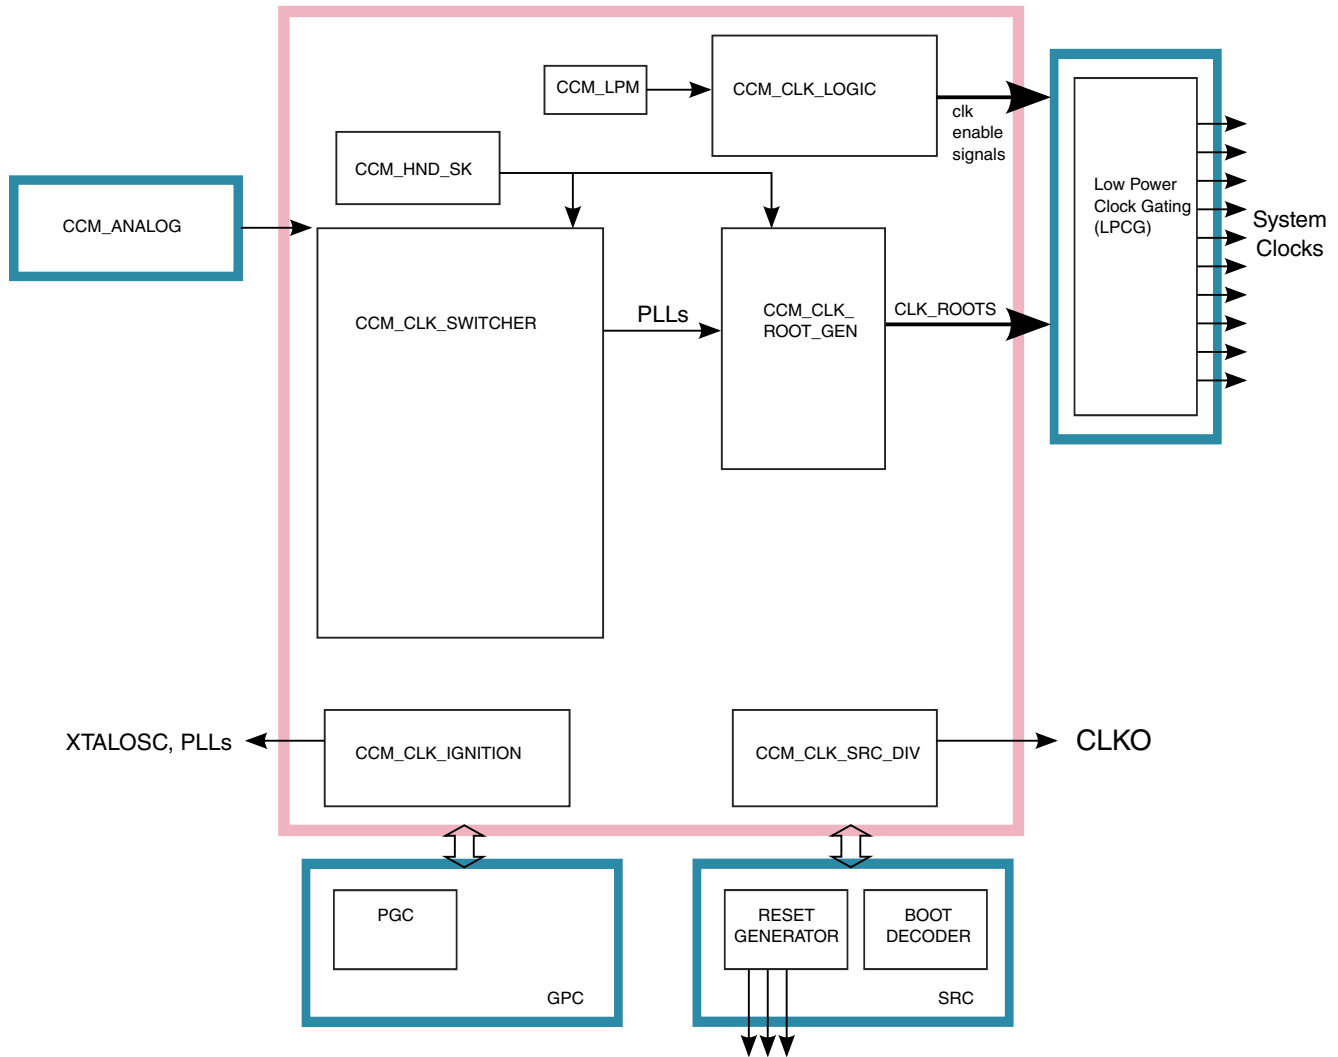

Figure 15-1. Block Diagram

CCM contains the following sub-blocks:

Table 15-1. CCM Sub-blocks

CCM_CLK_SRC_DIV Sub-block	Description
CCM_CLK_IGNITION	Manages the ignition process. This module starts its functionality once CCM comes out of reset. It manages the process that begins with starting the OSC, PLLs and finishes with creation of stable output root clocks after reset.
CCM_CLK_SWITCHER	Receives the clock outputs of the PLLs, together with the bypass clocks for the PLLs, and generates three switcher clock outputs (pll1_sw_clk, pll3_sw_clk) for the CCM_CLK_ROOT_GEN sub-module.
CCM_CLK_ROOT_GEN	Receives the main clocks (PLLs / PFDs) and generates the output root clocks.
CCM_CLK_LOGIC	Generates the clock enables. It generates the clock enable signals based on info from CCM_LPM and CCM_IP. The clock enables are used in LPCG to turn off and on the split clocks.

Table continues on the next page...

Table 15-1. CCM Sub-blocks (continued)

CCM_CLK_SRC_DIV Sub-block	Description
CCM_LPM	Manages the low power modes of the IC.
CCM_CLK_SRC_DIV	Passes CCM_CLKO output clock for observability. Output clock is connected to the pad and can provide support for testing.
CCM_HND_SK	Manages the handshake when changing certain root clock dividers that require handshake.

15.2 External Signals

The following table describes the external signals of CCM:

Table 15-2. CCM External Signals

Signal	Description	Pad	Mode	Direction
CCM_CLKO	Observability clock output	PWM1	ALT1	O
CCM_PLL3_BYP	PLL3 bypass clock	ECSP11_MISO	ALT6	I
CCM_PMIC_STBY_REQ	Goes to PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage.	PMIC_STBY_REQ	No Muxing (ALT0)	O

15.3 CCM Clock Tree

The following figures (Part 1 and Part 2) show the clock tree configuration and clock roots for CCM.

For detailed sub-block information, see:

- [Clock Switcher](#)
- [Clock Root Generator](#)
- [Low Power Clock Gating module \(LPCG\)](#)
- [System Clocks](#)

NOTE

The default frequency values (in MHz) for the PLLs and PFDs are shown in the Clock Tree diagram that follows. The PLLs and PFDs control registers may be reprogrammed according to the speed grade of the SoC being used, but should not exceed that maximum setting for that speed grade.

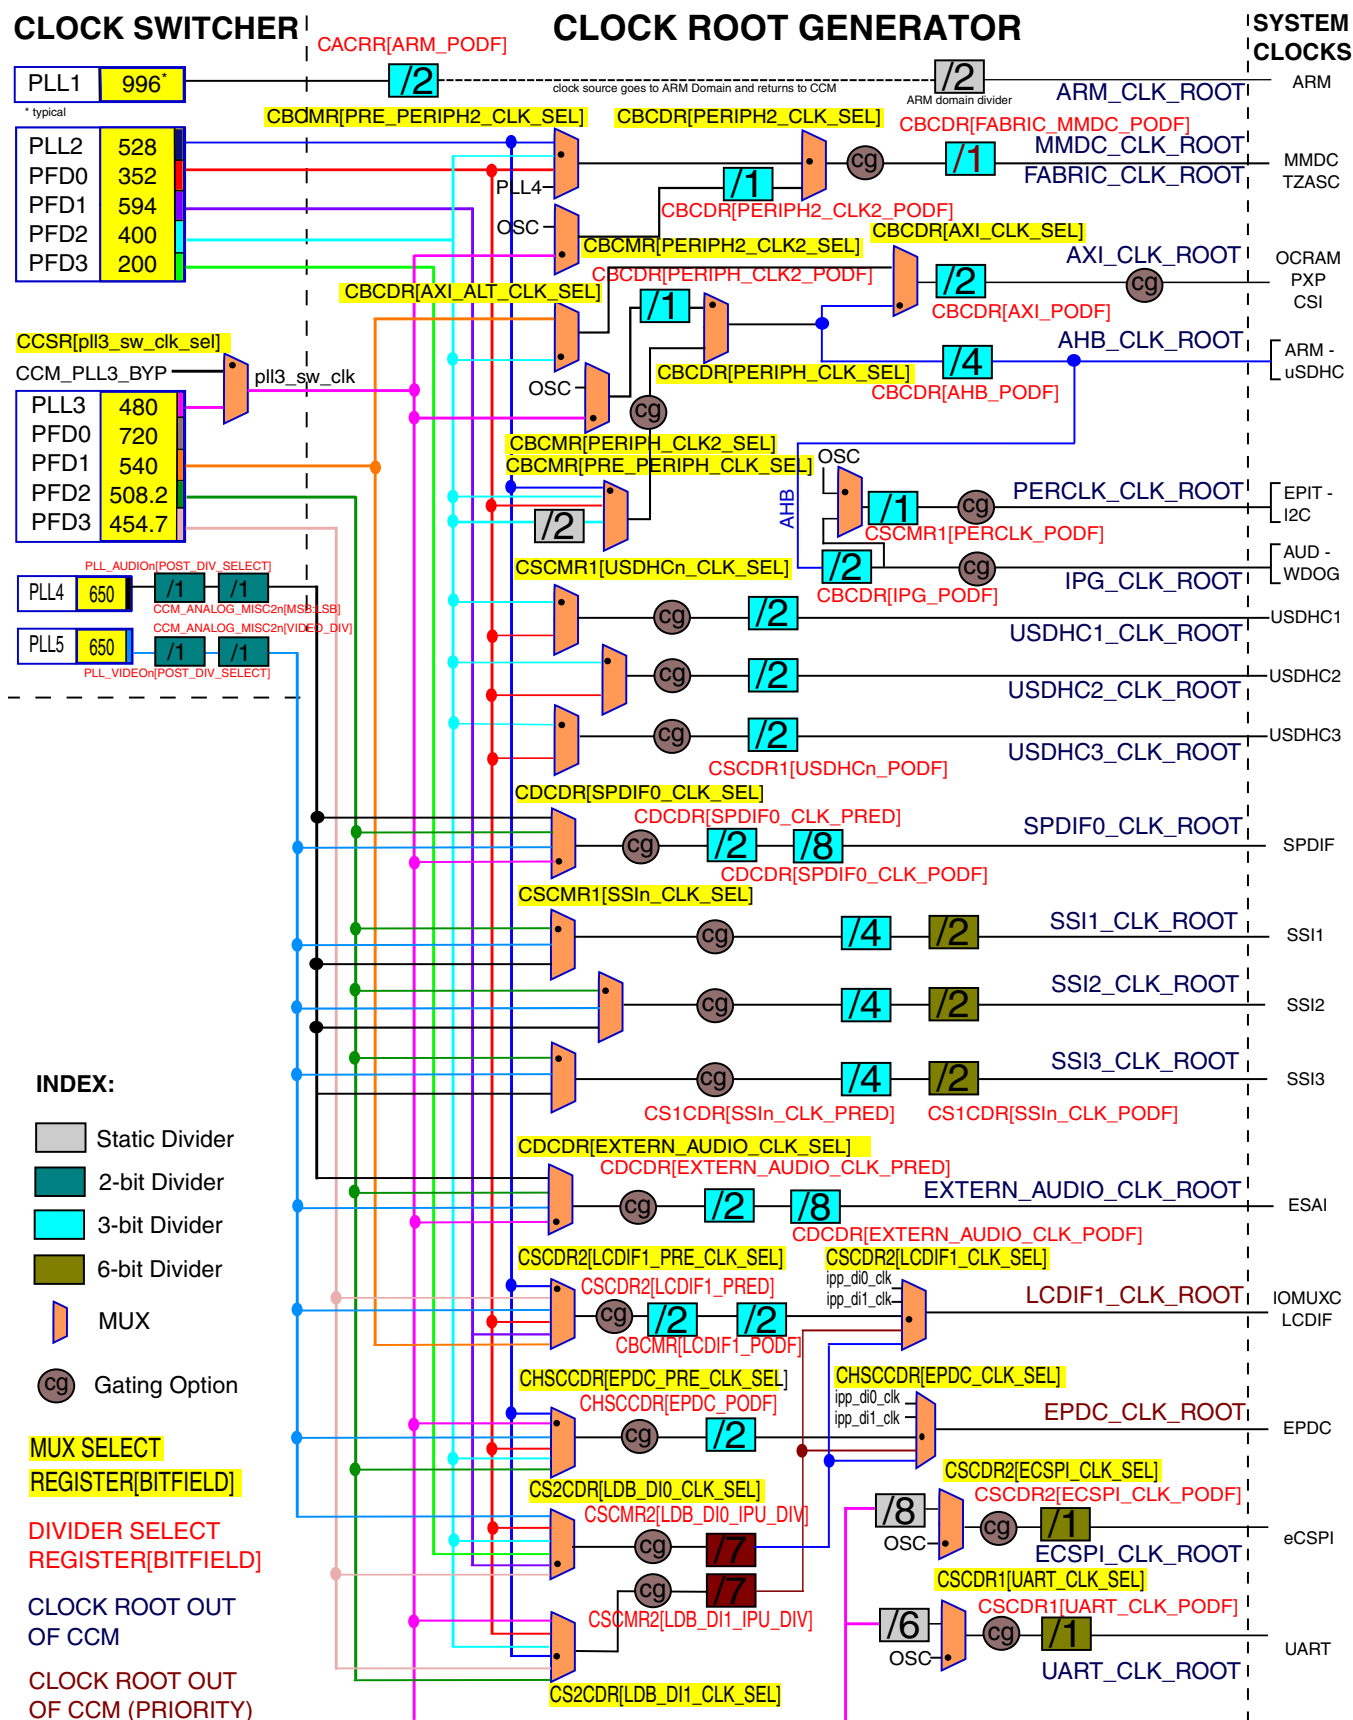

Figure 15-2. Clock Tree

15.4 System Clocks

The table found here shows the CCM output clocks' system-level connectivity.

The gating option in the table can either be CGR bit or clock enable from the block itself. Applicable override bits are also shown.

Table 15-3. System Clocks, Gating, and Override

15.5 Functional Description

This section provides a complete functional description of the block.

15.5.1 Clock Generation

15.5.1.1 External Low Frequency Clock - CKIL

The chip can use a 32 kHz or 32.768 kHz crystal as the external low-frequency source (XTALOSC). Throughout this chapter, the low-frequency crystal is referred to as the 32 kHz crystal.

This clock source should always be active when the chip is powered on. The 32 kHz entering the CCM are referred to as CKIL. CKIL is synchronized to IPG_CLK and supplied to modules that need it.

15.5.1.1.1 CKIL synchronizing to IPG_CLK

CKIL is synchronized to ipg_clk when the system is in functional mode. When the system is in STOP mode (when there is no IPG_CLK) the CKIL synchronizer is bypassed, and raw CKIL is supplied to the system.

15.5.1.2 External High Frequency Clock - CKIH and internal oscillator

The chip uses an internal oscillator to generate the reference clock (OSC). The internal oscillator is connected to the external crystal (XTALOSC) which generates the 24 MHz reference clock.

15.5.1.3 PLL reference clock

There are several PLLs in this chip.

PLL1 - ARM PLL (typical functional frequency 1 GHz)

PLL2 - System PLL (functional frequency 528 MHz)

PLL3 - USB1 PLL (functional frequency 480 MHz)

PLL4 - Audio PLL

PLL5 - Video PLL

PLL6 - ENET PLL

PLL7 - USB2 PLL (functional frequency 480 MHz)

Some of the PLLs are described in the sections below. See [CCM Analog Memory Map/ Register Definition](#) for register information.

15.5.1.3.1 ARM PLL

This PLL synthesizes a low jitter clock from a 24 MHz reference clock. The clock output frequency for this PLL ranges from 650 MHz to 1.3 GHz. The output frequency is selected by a 7-bit register field CCM_ANALOG_PLL_ARM[DIV_SELECT].

PLL output frequency = Fref * DIV_SEL/2

NOTE

The upper frequency range may exceed the maximum frequency supported. Please see the datasheet for more information.

15.5.1.3.2 USB PLLs

These PLLs synthesize a low jitter clock from the 24 MHz reference clock. USB1 PLL has 4 frequency-programmable PFD (phase fractional divider) outputs.

The output frequency of USB1 PLL is 480 MHz. Even though USB1 PLL has a DIV_SELECT register field, this PLL should always be set to 480 MHz in normal operation. USB2 PLL is only used by the USB UTM interface through a direct connection.

15.5.1.3.3 System PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock. The PLL has one output clock, plus 4 PFD outputs. The System PLL supports spread spectrum modulation for use in applications to minimize radiated emissions. The spread spectrum PLL output clock is frequency modulated so that the energy is spread over a wider bandwidth, thereby reducing peak radiated emissions. Due to this feature support, the associated lock time of this PLL is longer than other PLLs in the SoC that do not support spread spectrum modulation.

Spread spectrum operation is controlled by configuring the CCM_ANALOG_PLL_SYS_SS register. When enabled, the PLL output frequency will decrease by the amount defined in the STEP field, until it reaches the limiting frequency in the STOP field. The frequency will then similarly return to the original nominal frequency. The following equations control the spread-spectrum operation:

$$\text{Spread spectrum range} = \text{Fref} \times \frac{\text{CCM_ANALOG_PLL_SYS_SS[STOP]}}{\text{CCM_ANALOG_PLL_SYS_DENOM[B]}}$$

$$\text{Modulation frequency} = \text{Fref} \times \frac{\text{CCM_ANALOG_PLL_SYS_SS[STEP]}}{2 \times \text{CCM_ANALOG_PLL_SYS_SS[STOP]}}$$

Although this PLL does have a DIV_SELECT register field, it is intended that this PLL will only be run at the default frequency of 528 MHz.

15.5.1.3.4 Audio / Video PLL

The audio PLL and video PLL each synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4, /8, /16 post dividers for the Video PLL and /1, /2, /4, /8, /16 post dividers for the Audio PLL. The output frequency can be set by programming the fields in the CCM_ANALOG_PLL_AUDIO, CCM_ANALOG_PLL_VIDEO, and CCM_ANALOG_MISC2 register sets according to the following equation.

$$\text{PLL output frequency} = \text{Fref} * (\text{DIV_SELECT} + \text{NUM/DENOM})$$

15.5.1.3.5 Ethernet PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock.

The reference clocks generated by this PLL are:

- ref_enetpll0 programmable to 25, 50, 100 and 125 MHz by setting CCM_ANALOG_PLL_ENET[DIV_SELECT] bitfield
- ref_enetpll1 programmable to 25, 50, 100 and 125 MHz by setting CCM_ANALOG_PLL_ENET[DIV_SELECT] bitfield
- ref_enetpll2 fixed at 25 MHz

15.5.1.4 Phase Fractional Dividers (PFD)

There are several PFD outputs from the System PLL and USB1 PLL.

Each PFD output generates a fractional multiplication of the associated PLL's VCO frequency. Where the output frequency is equal to $F_{vco} * 18/N$, N can range from 12-35. The PFDs allow for clock frequency changes without forcing the relock of the root PLL. This feature is useful in support of dynamic voltage and frequency scaling (DVFS). See [CCM Analog Memory Map/Register Definition](#).

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx_CLKGATE bit in CCM_ANALOG_PFD_480n or CCM_ANALOG_PFD_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, *Configuration of Phase Fractional Dividers (EB790)* at www.nxp.com for procedure details.

15.5.1.5 CCM internal clock generation

The clock generation is comprised of two sub-modules:

CCM_CLK_SWITCHER

CCM_CLK_ROOT_GEN

15.5.1.5.1 Clock Switcher

The Clock Switcher (CCM_CLK_SWITCHER) sub-module receives the PLL output clocks and the PLL bypass clocks.

[Figure 15-3](#) describes the generation of the three switcher clocks.

The figure also includes the Frequency Switch Control sub-module responsible for frequency change.

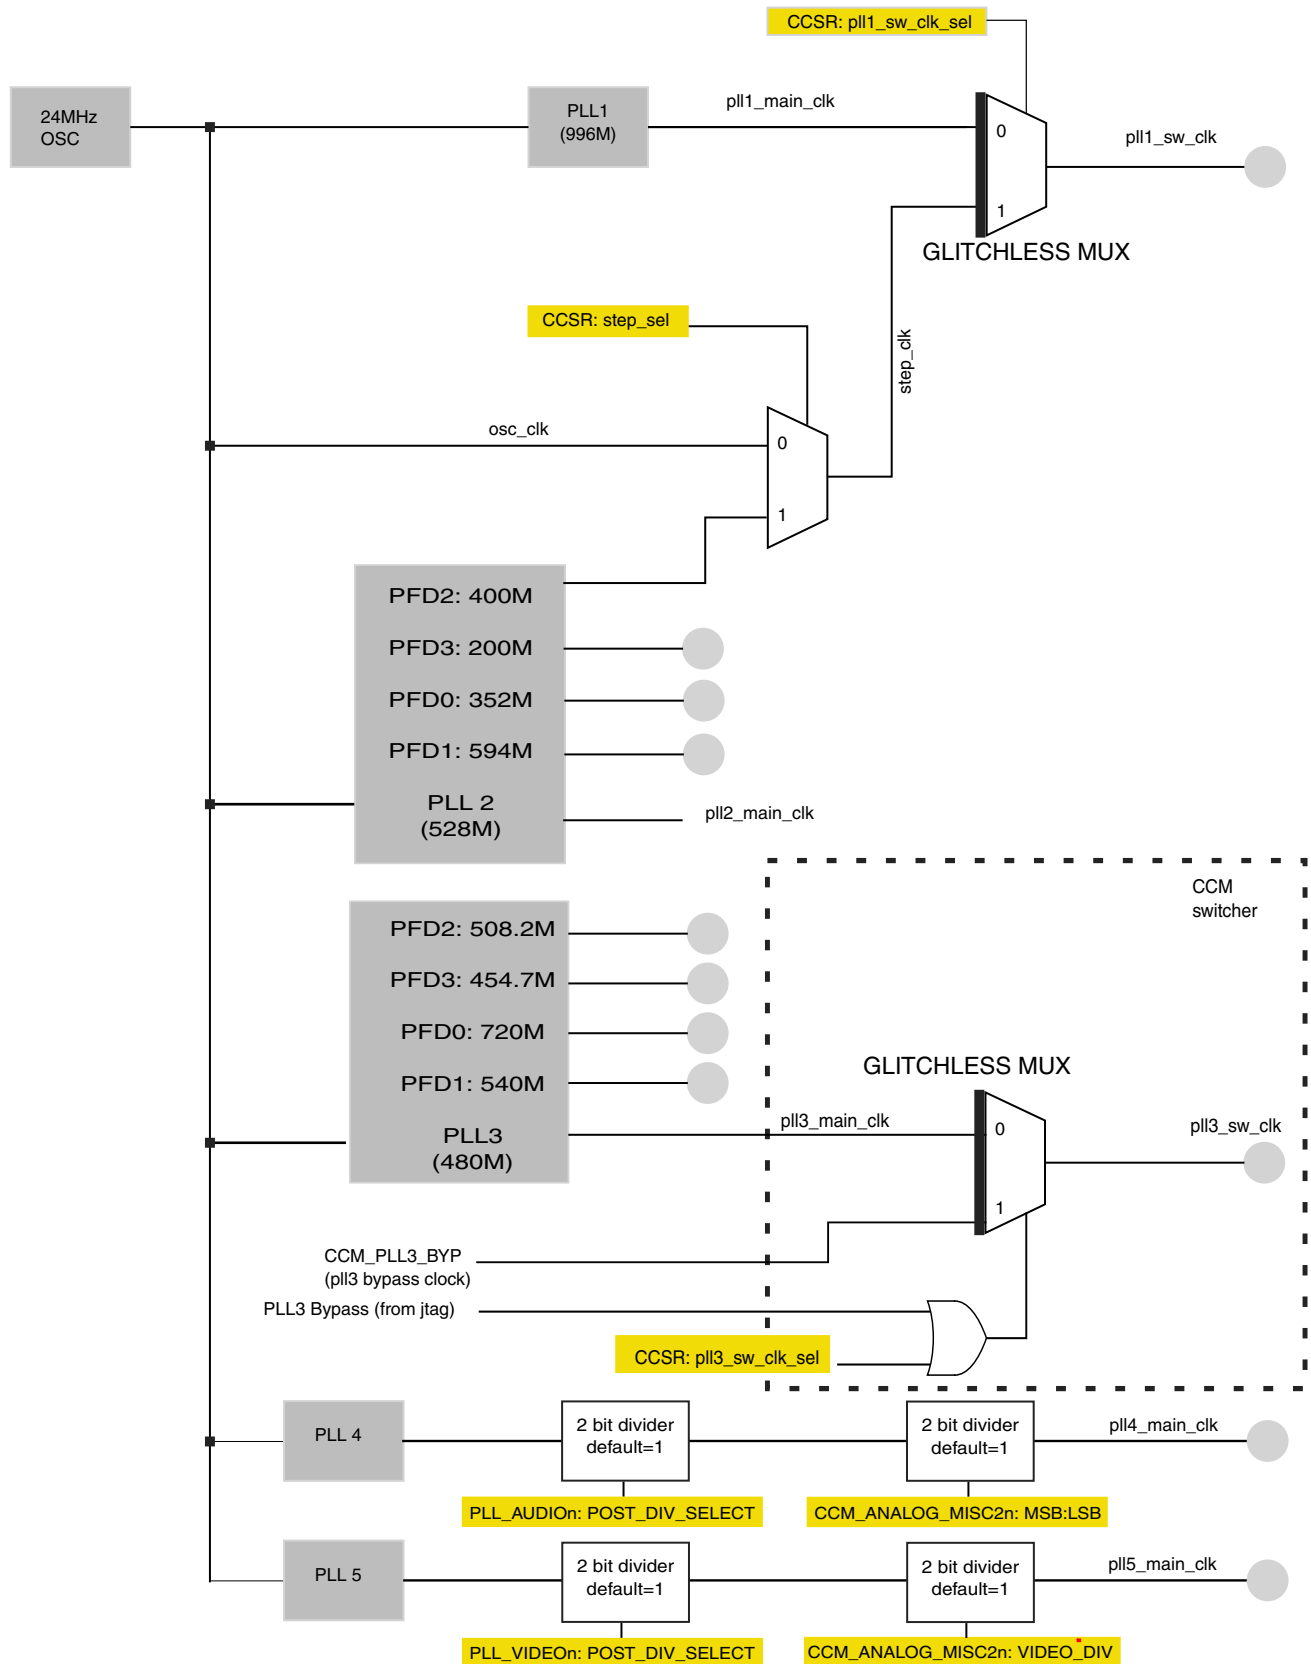

Figure 15-3. Switcher clock generation

15.5.1.5.2 PLL bypass procedure

In addition to PLL bypass options in CCM_ANALOG module, switcher and clk_root_gen sub-modules includes capability for each of the PLL clocks to be bypassed with an external bypass clock.

15.5.1.5.3 PLL clock change

In order to modify or stop the clock output of a specific PLL, all the clocks generated from the current PLL must be transitioned to the new PLL whose frequency is not being modified.

For clocks which can't be stopped (core and bus clocks), this should be done via the glitchless mux. Before changing the PLL setting, power it down. Power up the PLL after the change. See [Disabling / Enabling PLLs](#) for more information.

15.5.1.5.4 Clock Root Generator

The Clock Root Generator (CCM_CLK_ROOT_GEN) sub-module generates the root clocks to be delivered to LPCG.

The following figures describe clock generation. The frequencies in parantheses are the default typical frequencies.

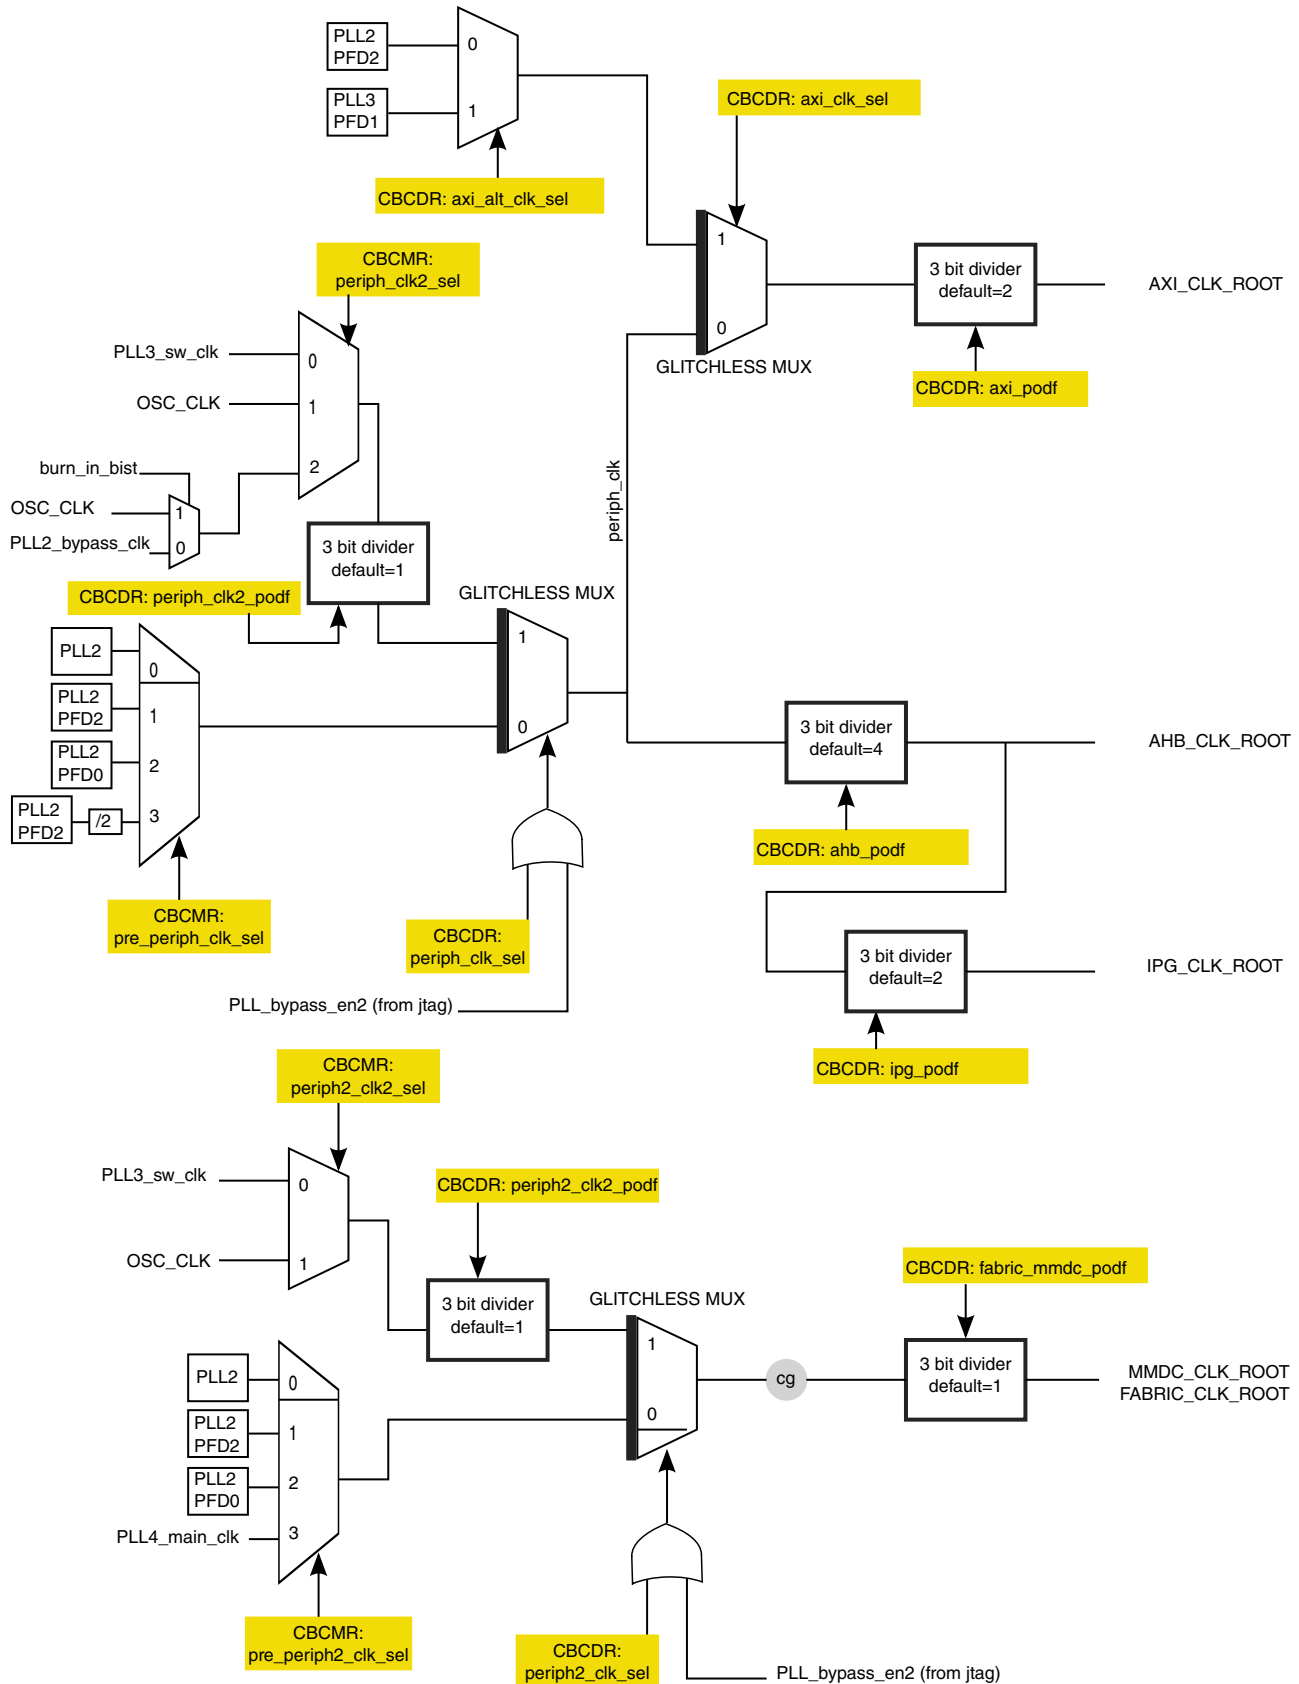

Figure 15-4. BUS clock generation

NOTE

All 6-bit PODF dividers found in the diagrams above can operate on low frequency.

15.5.1.5.5 Initial values controlled by the System JTAG Controller (SJC).

The initial values of the following dividers and muxes can be controlled by SJC.

In regular functional mode, the SJC will drive the reset values stated in the CCM register memory map. If SJC is programmed to change those values, then the reset value for those dividers/muxes will be taken from the SJC programability.

Software can update the changed reset value after reset sequence. The control signals and the dividers/muxes are listed below:

- [2:0] init_mmdc_axi_podf
- [2:0] init_periph2_clk2_podf
- [1:0] init_ipg_podf
- [2:0] init_ahb_podf
- [2:0] init_axi_podf
- [2:0] init_periph_clk2_podf
- init_periph_clk_sel
- init_periph2_clk_sel

15.5.1.5.6 Divider change handshake

Modifying the following dividers will start the handshake with MMDC.

- mmdc_podf
- periph_clk_sel
- periph2_clk_sel
- arm_podf
- ahb_podf

15.5.1.6 Disabling / Enabling PLLs

PLL disabling and enabling is done via analog module.

Before disabling a PLL using the analog registers, software should first move all the clocks generated from that specific PLL to another source. This alternate source could be another PLL, or a PFD driven by another PLL. Alternatively, software can bypass the PLL and use the PLL reference clock (usually 24 MHz) as the output clock. Bypassing the PLL is done by setting the analog BYPASS bit in the control register for that PLL.

15.5.1.7 Clock Switching Multiplexers

There are a multitude of multiplexers available throughout the clock generation logic that provide alternate clock sources for the system clocks controlled by the CCM. The CCM utilizes several synchronous glitchless clock multiplexers as well as asynchronous glitchy clock multiplexers.

Synchronous muxes ensure there are no glitches between the transition of two asynchronous clocks and that there will be no pulses that are of a frequency higher than either input clock. In order for the synchronous multiplexer to work properly, both the current clock and the clock to be selected must remain active during the entire selection process.

There are five glitchless (synchronous) muxes used in the CCM. The table below lists the muxes and the respective control bits.

Table 15-5. Glitchless Multiplexers

Glitchless Mux	Mux Select Bit	Handshake Bit
periph_clk_mux	CBCDR[periph_clk_sel]	CDHIPR[periph_clk_sel_busy]
periph2_clk_mux	CBCDR[periph2_clk_sel]	CDHIPR[periph2_clk_sel_busy]
axi_alt_clk_mux	CBCDR[axi_sel]	
pll3_sw_clk_mux	CCSR[pll3_sw_clk_sel]	
pll1_sw_clk_mux	CCSR[pll1_sw_clk_sel]	

NOTE

Any change of the `periph_clk_sel` and `periph2_clk_sel` sync mux select will involve handshake with the MMDC. Refer to the CCDCR and CDHIPR registers for the handshake bypass and busy bits.

For critical system bus clocks, changing the clock source can be done in the CCM using the glitchless clock muxes in [Figure 15-4](#). In the figure, the thick bar on the input side indicates the glitchless muxes. Those without the thick bar are regular muxes (not glitchless).

For example, before disabling PLL2, software can switch the `FABRIC_CLK_ROOT` away from the PLL2 or one of its PFDs by programming `CBCMR[PERIPH2_CLK2_SEL]` and `CBCDR[PERIPH2_CLK2_PODF]` to provide an appropriate frequency clock, then glitchlessly switch to it by programming `CBCDR[PERIPH2_CLK_SEL]`.

Asynchronous multiplexers or glitchy multiplexers, allow the clock to switch immediately after the multiplexer select changed. This immediate switch of two asynchronous clock domains can cause the output clock to glitch. Since both clock sources to the mux are asynchronous, switching the clocks from one source to the other can cause a glitch to be generated, regardless of the input clock source.

The input clocks to the mux are required to be gated before switching the source clock in the CCM clock mux and the output should also be gated. If the input and output clocks are not gated, clock glitches can propagate to the logic that follows the clock mux, causing the logic to behave unpredictably.

For serial clocks, software should first disable the module, then gate its clock in the LPCG. Then it should move the mux controlling the source of the clocks to another PLL, and reset the module and its clocks. Only then is it safe to disable the PLL. The mux for the serial clocks is not glitchless.

15.5.1.8 Low Power Clock Gating module (LPCG)

The LPCG module receives the root clocks and splits them to clock branches for each module. The clock branches are gated clocks.

The enables for those gates can come from four sources:

1. Clock enable signal from CCM - this signal is generated by configuring of the CGR bits in the CCM. It is based on the low power mode.
2. Clock enable signal from the module - this signal is generated by the module based on internal logic of the module. Not every enable signal from the module is used. For used clock enable signals from the module, CCM will generate an override signal based on a programable bit in CCM (CMEOR).
3. Clock enable signal from Reset controller (SRC) - this signal will enable the clock during the reset procedure. Please see the SRC chapter for details on the clock enable signal during reset procedure.
4. Hard-coded enable from fuse box.

These enable signals are ANDed to generate the enable signal for the gating cell.

The enable signal for the gating cell is synchronized with the clock it needs to gate in order to prevent glitches on the gated clock.

Notifications are generated for CCM to indicate when clock roots should be opened and closed. All notifications that correspond to the same clock root will be ORed to generate one notification signal to CCM for clock root gating.

The following figure describes the clock split inside the LPCG module. It describes the case of two modules; one module is without an enable signal and one is shown with an enable signal. SRC enable signals and sync flip flops are omitted from this figure.

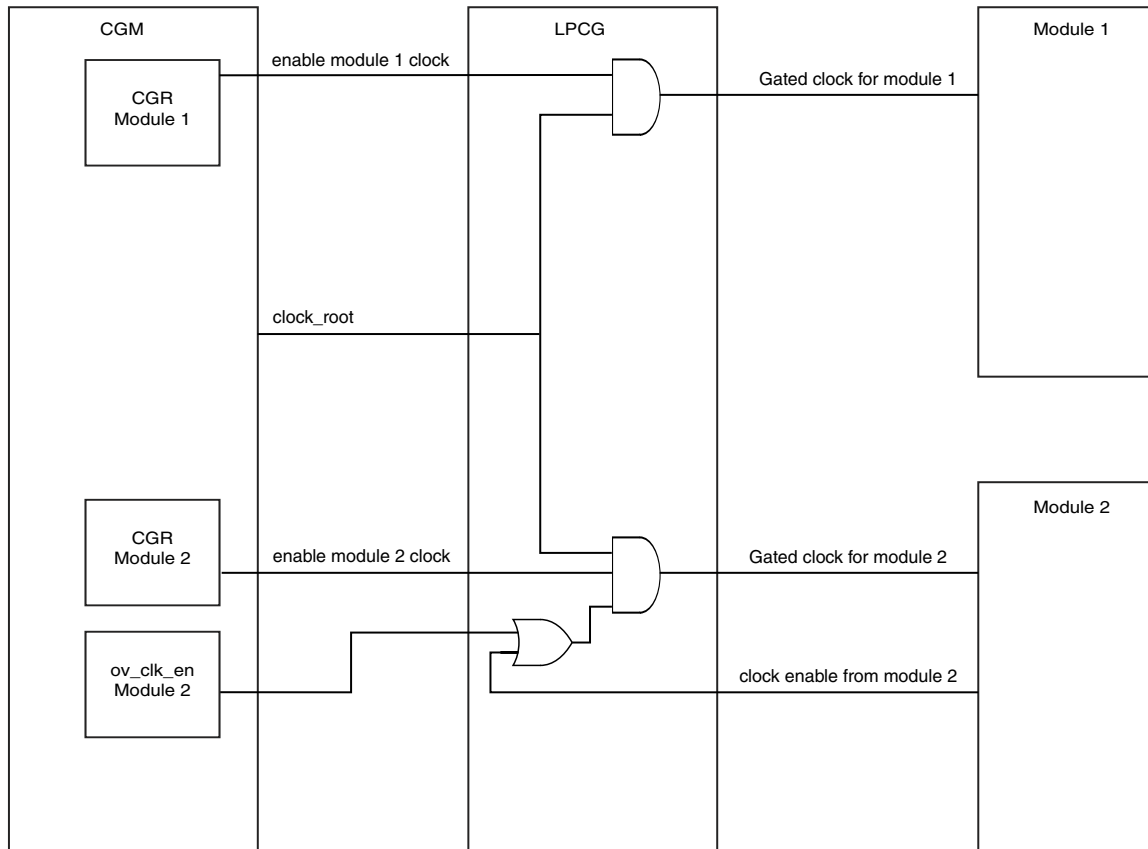

Figure 15-5. Clock split in LPCG

15.5.1.9 MMDC handshake

CCM will assert the `mmdc_freq_change_req` signal.

MMDC will assert the `mmdc_freq_change_ack` signals to acknowledge that the frequency change request has been received and that the frequency can now be changed safely.

CCM will commence the actual change of division ratio of mmdc dividers or apply mux change on root clocks once both of the non-masked acknowledges are asserted.

NOTE

MMDC handshakes can be masked.

NOTE

Set register CCDDR[17] to 1 before beginning any operation that initiates a handshake. It is acceptable to program and leave this override bit asserted.

15.5.2 DVFS support

When performing DVFS, the frequency shift procedure for the ARM core clock domain can be performed by software.

CPU PLL frequency and CCM ARM clock divider is controlled by CCM and CPU power domain supply voltage value is controlled by CCM_ANALOG module.

NOTE

The frequency should be shifted down first and then voltage value reduced, and vice-versa, when shifting the frequency up.

NOTE

CCM_ANALOG will not control the voltage value in Bypass mode

15.5.3 Power modes

The chip supports 3 low power modes: RUN mode, WAIT mode, STOP mode.

15.5.3.1 RUN mode

This is the normal/functional operating mode. In this mode, the CPU runs in its normal operational mode. Clocks to the modules can be gated by configuring the corresponding CCGRx bits.

15.5.3.2 WAIT mode

In this mode the CPU clock is gated. All other clocks are functional and can be gated by programming their CGR bits when all ARM cores are in WFI, and L2 cache and SCU are idle.

15.5.3.2.1 Entering WAIT mode

If the CLPCR[LPM] bit is set by software to WAIT mode, when CPU executes the next wait for interrupt (WFI) instruction, WAIT mode sequence will start.

As part of the WFI routine, alternative interrupt controller in GPC should be updated; the CPU platform interrupt controller will be disabled first by software and will be not functional, due to clock gating. Interrupts during WAIT mode are monitored by alternative interrupt controller.

After execution of the WFI routine, the CPU platform will assert idle signals for each component of the platform and CCM will gate clock to the platform.

The next actions can be programmed during WAIT mode:

1. CCM requests an acknowledge to close clocks to MMDC if its CGR bits indicate to close its clocks on WAIT mode, and if those clocks are not already closed in run mode. The request will be issued if the handshake is not bypassed by programming the CLPCR register. If the corresponding bits are set, the request signal will not be issued to the corresponding module and CCM will not wait for its acknowledge in the process of entering low power mode. Once CCM receives all the acknowledge signals needed, then it will enter WAIT mode.
2. Close the clocks to the modules which were defined to be shut at WAIT mode in the CCGR bits.
3. Observability to indicate WAIT mode.

NOTE

Setting MMDC CGR bits to 01 can hang the entire system since the MMDC clock and fabric clock share the same clock root.

Any enabled interrupt assertion will start the exit from WAIT mode.

15.5.3.2.2 Exiting WAIT mode

As soon as enabled interrupt is asserted, CPU supply will be restored if CPU SRPG was applied and clocks are enabled to CPU and other modules.

15.5.3.3 STOP mode

In this mode all system clocks are stopped, along with the CPU, system buses and all PLLs. Power gating can be applied for ARM platform. External supply voltage can be reduced to decrease leakage.

15.5.3.3.1 Entering STOP mode

Procedure entering STOP mode is the same, as entering WAIT mode until the moment of disabling clocks to modules. (LPM bit should be configured to STOP mode.)

After clocks to modules are gated, the following actions will be taken:

- PLLs are disabled
- CCM_PMIC_STBY_REQ asserted, if vstby bit is set
- osc_en signal is negated
- osc_pwrdsn is asserted, if sbyos bit is set

Counter will be triggered after CCM_PMIC_STBY_REQ assertion to allow to external regulator or PMIC to decrease voltage until valid voltage range. On counter completion, stop_mode signal will be asserted, that will trigger disabling analog elements in anatop.

CCM's low power state machine will remain in state STOP_GPC until STOP mode is exited.

15.5.3.3.2 Exiting STOP mode

As soon as an enabled interrupt is asserted, the CCM will begin the process of exiting STOP mode.

The following will take place:

1. If vstby bit was set, deassert PMIC_STBY_REQ to notify power management IC to change voltage from standby voltage to functional voltage.
2. If well bias was enabled, deasserted well bias controls.
3. If sbyos was set, and CCM closed either external oscillator or on board oscillator, then CCM will start oscillator by asserting ref_en_b signal and deasserting cosc_pwrdown signal respectively.
4. After the number of cycles of CKILs defined in stby_count bits, wait until PMIC functional voltage is ready. This is the notification from power management IC that the voltage is ready at its functional value. Only then will CCM continue the steps.
5. Start osc. If oscillator was started, wait until oscnt has finished its counting to make sure that oscillator is ready.
6. Start PLLs. Only the PLLs that were configured to be on prior to the entrance to STOP mode will be started.
7. CCM will request GPC to restore ARM power by GPC_PUP_REQ. If power was removed from the ARM platform, GPC will notify CCM by asserting signal GPC_PUP_ACK that power to ARM is back on, and its safe to exit from STOP mode. Only then will the CCM progress to the next step.
8. Once assertion of notification from src that the resets for the power gated modules has been finished, (src_power_gating_reset_done is set) negate the low power

request signals to all modules and enable all module clocks including ARM clocks and CKIL sync, and return to run mode. (Clocks whose CCGR bits are not to be opened in RUN mode will not be opened; they will continued to be gated.)

Once the system is in run mode, negate signals `ccm_ipg_stop` and `system_in_stop_mode`.

15.6 CCM Memory Map/Register Definition

NOTE

The register reset values for CCM change depending on the boot configuration. See [Clocks at boot time](#) for more information.

CCM memory map

15.6.1 CCM Control Register (CCM_CCR)

The figure below represents the CCM Control Register (CCR), which contains bits to control general operation of CCM. The table below provides its field descriptions.

Address: 20C_4000h base + 0h offset = 20C_4000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0				RBC_EN	REG_BYPASS_COUNT						0				
W																
Reset	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0			COSC_EN	0					OSCNT						
W																
Reset	0	0	0	1	0	1	1	0	0	1	1	1	1	1	1	1

CCM_CCR field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 RBC_EN	Enable for REG_BYPASS_COUNTER. If enabled, analog_reg_bypass signal will be asserted after REG_BYPASS_COUNT clocks of CKIL, after standby voltage is requested. If standby voltage is not requested analog_reg_bypass won't be asserted, event if counter is enabled. 1 REG_BYPASS_COUNTER enabled. 0 REG_BYPASS_COUNTER disabled

Table continues on the next page...

CCM_CCR field descriptions (continued)

Field	Description
26–21 REG_BYPASS_COUNT	<p>Counter for analog_reg_bypass signal assertion after standby voltage request by PMIC_STBY_REQ. Should be zeroed and reconfigured after exit from low power mode.</p> <p>REG_BYPASS_COUNT can also be used for holding off interrupts when the PGC unit is sending signals to power gate the core.</p> <p>000000 no delay 000001 1 CKIL clock period delay 111111 63 CKIL clock periods delay</p>
20–13 Reserved	This read-only field is reserved and always has the value 0.
12 COSC_EN	<p>On chip oscillator enable bit - this bit value is reflected on the output cosc_en. The system will start with on chip oscillator enabled to supply source for the PLLs. Software can change this bit if a transition to the bypass PLL clocks was performed for all the PLLs. In cases that this bit is changed from '0' to '1' then CCM will enable the on chip oscillator and after counting oscnt ckil clock cycles it will notify that on chip oscillator is ready by a interrupt cosc_ready and by status bit cosc_ready. The cosc_en bit should be changed only when on chip oscillator is not chosen as the clock source.</p> <p>0 disable on chip oscillator 1 enable on chip oscillator</p>
11–7 Reserved	<p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
OSCNT	<p>Oscillator ready counter value. These bits define value of 32KHz counter, that serve as counter for oscillator lock time. This is used for oscillator lock time. Current estimation is ~5ms. This counter will be used in ignition sequence and in wake from stop sequence if sbyos bit was defined, to notify that on chip oscillator output is ready for the dpll_ip to use and only then the gate in dpll_ip can be opened.</p> <p>0000000 count 1 ckil 1111111 count 128 ckil's</p>

15.6.2 CCM Control Divider Register (CCM_CCDCR)

The figure below represents the CCM Control Divider Register (CCDR), which contains bits that control the loading of the dividers that need handshake with the modules they affect. The table below provides its field descriptions.

Address: 20C_4000h base + 4h offset = 20C_4004h

CCM_CCDCR field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 -	This field is reserved. This field value should be set to 1 for normal operation.
16 MMDC_MASK	During divider ratio mmdc_axi_podf change or sync mux periph2_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc module. 0 Allow handshake with mmdc module. 1 Mask handshake with mmdc. Request signal will not be generated.
Reserved	This read-only field is reserved and always has the value 0.

15.6.3 CCM Status Register (CCM_CSR)

The figure below represents the CCM status Register (CSR). The status bits are read-only bits. The table below provides its field descriptions.

Address: 20C_4000h base + 8h offset = 20C_4008h

CCM_CSR field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

CCM_CSR field descriptions (continued)

Field	Description
5 COSC_READY	Status indication of on board oscillator. This bit will be asserted if on chip oscillator is enabled and on chip oscillator is not powered down, and if oscnt counter has finished counting. 0 on board oscillator is not ready. 1 on board oscillator is ready.
4 Reserved	This read-only field is reserved and always has the value 1.
3–1 Reserved	This read-only field is reserved and always has the value 0.
0 REF_EN_B	Status of the value of CCM_REF_EN_B output of ccm 0 value of CCM_REF_EN_B is '0' 1 value of CCM_REF_EN_B is '1'

15.6.4 CCM Clock Switcher Register (CCM_CCSR)

The figure below represents the CCM Clock Switcher register (CCSR). The CCSR register contains bits to control the switcher sub-module dividers and multiplexers. The table below provides its field descriptions.

Address: 20C_4000h base + Ch offset = 20C_400Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

W																
Reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

CCM_CCSR field descriptions

Field	Description
31–9 Reserved	This read-only field is reserved and always has the value 0.
8 STEP_SEL	Selects the option to be chosen for the step frequency when shifting ARM frequency. This will control the step_clk. NOTE: This mux is allowed to be changed only if its output is not used, i.e. ARM uses the output of pll1, and step_clk is not used. 0 derive clock from osc_clk (24M) - source for lp_apm. 1 derive clock from secondary_clk
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 SECONDARY_CLK_SEL	Select source to generate secondary_clk 0 PLL2 PFD2 (400 M) 1 PLL2 (528 M)
2 PLL1_SW_CLK_SEL	Selects source to generate pll1_sw_clk. 0 pll1_main_clk 1 step_clk
1 -	This field is reserved. Reserved
0 PLL3_SW_CLK_SEL	Selects source to generate pll3_sw_clk. This bit should only be used for testing purposes. 0 pll3_main_clk 1 pll3 bypass clock

15.6.5 CCM Arm Clock Root Register (CCM_CACRR)

The figure below represents the CCM Arm Clock Root register (CACRR). The CACRR register contains bits to control the ARM clock root generation. The table below provides its field descriptions.

Address: 20C_4000h base + 10h offset = 20C_4010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15.6.7 CCM Bus Clock Multiplexer Register (CCM_CBCMR)

The figure below represents the CCM Bus Clock Multiplexer Register (CBCMR). The CBCMR register contains bits to control the multiplexers that generate the bus clocks. The table below provides its field descriptions.

NOTE

Any change on the above multiplexer will have to be done while the module that its clock is affected is not functional and the respective clock is gated in LPCG. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

The change for arm_clk_sel should be done through sdma so that ARM will not use this clock during the change and the clock will be gated in LPCG.

CCM_CLPCR field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 MASK_L2CC_IDLE	Mask L2CC IDLE for entering low power mode. NOTE: Assertion of all bits[27:22] will generate low power mode request 1 L2CC IDLE is masked 0 L2CC IDLE is not masked
26 MASK_SCU_IDLE	Mask SCU IDLE for entering low power mode NOTE: Assertion of all bits[27:22] will generate low power mode request 1 SCU IDLE is masked 0 SCU IDLE is not masked

Table continues on the next page...

CCM_CLPCR field descriptions (continued)

Field	Description
25–23 Reserved	This read-only field is reserved and always has the value 0.
22 MASK_CORE0_WFI	Mask WFI of core0 for entering low power mode NOTE: Assertion of all bits[27:22] will generate low power mode request 0 WFI of core0 is not masked 1 WFI of core0 is masked
21 BYPASS_MMDC_LPM_HS	Bypass handshake with mmdc on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. Handshake also will be bypassed, if CGR3 CG10 is set to gate fast mmdc clock. 0 handshake with mmdc on next entrance to low power mode will be performed. . 1 handshake with mmdc on next entrance to low power mode will be bypassed.
20–12 -	This field is reserved. Reserved
11 COSC_PWRDOWN	In run mode, software can manually control powering down of on chip oscillator, i.e. generating '1' on cosc_pwrdown signal. If software manually powered down the on chip oscillator, then sbyos functionality for on chip oscillator will be bypassed. The manual closing of onchip oscillator should be performed only in case the reference oscillator is not the source of all the clocks generation. 0 On chip oscillator will not be powered down, i.e. cosc_pwrdown = '0'. 1 On chip oscillator will be powered down, i.e. cosc_pwrdown = '1'.
10–9 STBY_COUNT	Standby counter definition. These two bits define, in the case of stop exit (if VSTBY bit was set). NOTE: Clock cycles ratio depends on pmic_delay_scaler, defined by CGPR[0] bit. 00 CCM will wait (1*pmic_delay_scaler)+1 ckil clock cycles 01 CCM will wait (3*pmic_delay_scaler)+1 ckil clock cycles 10 CCM will wait (7*pmic_delay_scaler)+1 ckil clock cycles 11 CCM will wait (15*pmic_delay_scaler)+1 ckil clock cycles
8 VSTBY	Voltage standby request bit. This bit defines if PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage, will be asserted in STOP mode. 0 Voltage will not be changed to standby voltage after next entrance to STOP mode. (PMIC_STBY_REQ will remain negated - '0') 1 Voltage will be requested to change to standby voltage after next entrance to stop mode. (PMIC_STBY_REQ will be asserted - '1').
7 DIS_REF_OSC	dis_ref_osc - in run mode, software can manually control closing of external reference oscillator clock, i.e. generating '1' on CCM_REF_EN_B signal. If software closed manually the external reference clock, then sbyos functionality will be bypassed. The manual closing of external reference oscillator should be performed only in case the reference oscillator is not the source of any clock generation. NOTE: When returning from stop mode, the PMIC_STBY_REQ will be deasserted (if it was asserted when entering stop mode). See stby_count bits. 0 external high frequency oscillator will be enabled, i.e. CCM_REF_EN_B = '0'. 1 external high frequency oscillator will be disabled, i.e. CCM_REF_EN_B = '1'

Table continues on the next page...

CCM_CLPCR field descriptions (continued)

Field	Description
6 SBYOS	Standby clock oscillator bit. This bit defines if cosc_pwrdown, which power down the on chip oscillator, will be asserted in STOP mode. This bit is discarded if cosc_pwrdown='1' for the on chip oscillator. 0 On-chip oscillator will not be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will remain asserted - '0' and cosc_pwrdown will remain de asserted - '0') 1 On-chip oscillator will be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will be deasserted - '1' and cosc_pwrdown will be asserted - '1'). When returning from STOP mode, external oscillator will be enabled again, on-chip oscillator will return to oscillator mode, and after oscnt count, CCM will continue with the exit from the STOP mode process.
5 ARM_CLK_DIS_ON_LPM	Define if ARM clocks (arm_clk, soc_mxclk, soc_pclk, soc_dbg_pclk, vl_wrck) will be disabled on wait mode. This is useful for debug mode, when the user still wants to simulate entering wait mode and still keep ARM clock functioning. NOTE: Software should not enable ARM power gating in wait mode if this bit is cleared. 0 ARM clock enabled on wait mode. 1 ARM clock disabled on wait mode. .
4-3 -	This field is reserved. Reserved
2 -	This field is reserved. Reserved
LPM	Setting the low power mode that system will enter on next assertion of dsm_request signal. 00 Remain in run mode 01 Transfer to wait mode 10 Transfer to stop mode 11 Reserved

15.6.18 CCM Interrupt Status Register (CCM_CISR)

The figure below represents the CCM Interrupt Status Register (CISR). This is a write one to clear register. Once a interrupt is generated, software should write one to clear it. The table below provides its field descriptions.

NOTE

CCM interrupt request 1 can be masked by CCM interrupt request 1 mask bit. CCM interrupt request 2 can be masked by CCM interrupt request 2 mask bit.

Address: 20C_4000h base + 58h offset = 20C_4058h

17 INT_MEM_CLK_LPM	

Table continues on the next page...

CCM_CGPR field descriptions (continued)

Field	Description
	Control for the Deep Sleep signal to the ARM Platform memories with additional control logic based on the ARM WFI signal. Used to keep the ARM Platform memory clocks enabled if an interrupt is pending when entering low power mode. NOTE: This bit should always be set when the CCM_CLPCR_LPM bits are set to 01(WAIT Mode) or 10 (STOP mode) without power gating. This bit does not have to be set for STOP mode entry. 0 Disable the clock to the ARM platform memories when entering Low Power Mode 1 Keep the clocks to the ARM platform memories enabled only if an interrupt is pending when entering Low Power Modes (WAIT and STOP without power gating)
16 FPL	Fast PLL enable. 0 Engage PLL enable default way. 1 Engage PLL enable 3 CKIL clocks earlier at exiting low power mode (STOP). Should be used only if 24MHz OSC was active in low power mode.
15–14 SYS_MEM_DS_CTRL	System memory DS control 00 Disable memory DS mode always 01 Enable memory (outside ARM platform) DS mode when system STOP and PLL are disabled 1x enable memory (outside ARM platform) DS mode when system is in STOP mode
13–9 Reserved	This read-only field is reserved and always has the value 1.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–5 Reserved	This read-only field is reserved and always has the value 1.
4 EFUSE_PROG_SUPPLY_GATE	Defines the value of the output signal cgpr_dout[4]. Gate of program supply for efuse programming 0 fuse programming supply voltage is gated off to the efuse module 1 allow fuse programming.
3 -	This field is reserved. Reserved
2 MMDC_EXT_CLK_DIS	Disable external clock driver of MMDC during STOP mode 1 disable during stop mode 0 don't disable during stop mode.
1 -	Reserved. Keep default value set to '1' for proper operation.
0 PMIC_DELAY_SCALER	Defines clock division of clock for stby_count (pmic delay counter) 0 clock is not divided 1 clock is divided /8

15.6.22 CCM Clock Gating Register 0 (CCM_CCGR0)

CG(i) bits CCGR 0-6

These bits are used to turn on/off the clock to each module independently. The following table details the possible clock activity conditions for each module.

CGR value	Clock Activity Description
00	Clock is off during all modes. Stop enter hardware handshake is disabled.
01	Clock is on in run mode, but off in WAIT and STOP modes
10	Not applicable (Reserved).
11	Clock is on during all modes, except STOP mode.

Module should be stopped, before set its bits to "0"; clocks to the module will be stopped immediately.

The tables above show the register mappings for the different CGRs. The clock connectivity table should be used to match the "CCM output affected" to the actual clocks going into the modules.

The figure below represents the CCM Clock Gating Register 0 (CCM_CCGR0). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 7 CGR registers. The number of registers required is according to the number of peripherals in the system.

Address: 20C_4000h base + 68h offset = 20C_4068h

15.7 CCM Analog Memory Map/Register Definition

This section describes the registers for the analog PLLs. The registers which have the same description are grouped within { }. The register offsets for the various PLLs are:

- ARM PLL: {0h000, 0h004, 0h008, 0h00C}.
- USB1 PLL: {0h010, 0h014, 0h018, 0h01C}, {0h0F0, 0h0F4, 0h0F8, 0h0FC}.
- System PLL: {0h030, 0h034, 0h038, 0h03C}, 0h040, 0h050, 0h060, {0h100, 0h104, 0h108, 0h10C}.
- Audio / Video PLL: {0h070, 0h074, 0h078, 0h07C}, 0h080, 0h090, {0h0A0, 0h0A4, 0h0A8, 0h0AC}, 0h0B0, 0h0C0

15.7.1 Analog ARM PLL control Register (CCM_ANALOG_PLL_ARMn)

The control register provides control for the system PLL.

Address: 20C_8000h base + 0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_ARMn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–20 -	Always set to zero (0).
19 PLL_SEL	Reserved

Table continues on the next page...

CCM_ANALOG_PLL_ARM_n field descriptions (continued)

Field	Description
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. NOTE: Changing the Bypass clock source also changes the PLL reference clock source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 Reserved — 0x3 Reserved —
13 ENABLE	Enable the clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for divider value: 54-108. $F_{out} = F_{in} * div_select / 2.0$.

15.7.2 Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1n)

The control register provides control for USBPHY0 480MHz PLL.

Address: 20C_8000h base + 10h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_USB1n field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.

Table continues on the next page...

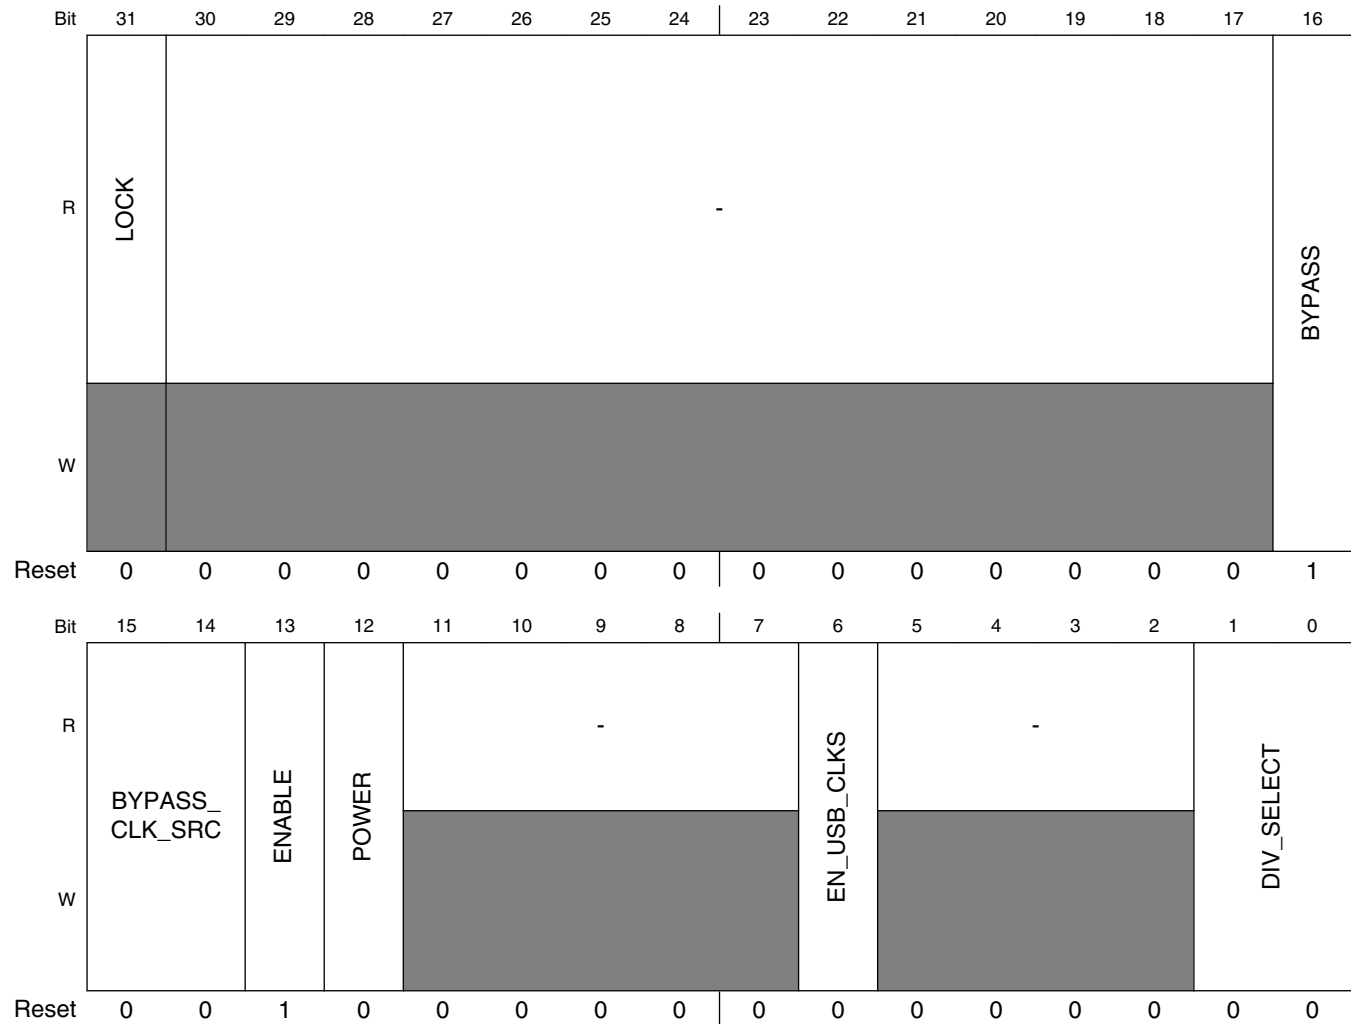

CCM_ANALOG_PLL_USB1_n field descriptions (continued)

Field	Description
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 GPANAIO — 0x3 CHRG_DET_B —
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY0 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	Powers the 9-phase PLL outputs for USBPHY _n . Additionally, the UTMI clock gate must be deasserted in the USBPHY _n to enable USB _n operation (clear CLKGATE bit in USBPHY _n _CTRL). This bit will be set automatically when USBPHY _n remote wakeup event occurs. 0 PLL outputs for USBPHY _n off. 1 PLL outputs for USBPHY _n on.
5–2 -	Always set to zero (0).
DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

15.7.3 Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2n)

The control register provides control for USBPHY1 480MHz PLL.

Address: 20C_8000h base + 20h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_USB2n field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.

Table continues on the next page...

CCM_ANALOG_PLL_USB2_n field descriptions (continued)

Field	Description
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 Reserved — 0x3 Reserved —
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY1 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	0: 8-phase PLL outputs for USBPHY1 are powered down. If set to 1, 8-phase PLL outputs for USBPHY1 are powered up. Additionally, the utmi clock gate must be deasserted in the USBPHY1 to enable USB0 operation (clear CLKGATE bit in USBPHY1_CTRL). This bit will be set automatically when USBPHY1 remote wakeup event happens.
5–2 -	Always set to zero (0).
DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

15.7.4 Analog System PLL Control Register (CCM_ANALOG_PLL_SYSn)

The control register provides control for the 528MHz PLL.

Address: 20C_8000h base + 30h offset + (4d × i), where i=0d to 3d

CCM Analog Memory Map/Register Definition

CCM_ANALOG_PLL_SYSn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–19 -	Always set to zero (0).
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 GPANAIO — 0x3 CHRG_DET_B —
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–1 -	Always set to zero (0).
0 DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

15.7.5 528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS)

This register contains the 528 PLL spread spectrum controls.

Address: 20C_8000h base + 40h offset = 20C_8040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	STOP															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ENABLE	STEP														
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CCM_ANALOG_PLL_SYS_SS field descriptions

Field	Description
31–16 STOP	Frequency change = stop/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.
15 ENABLE	Enable bit 0 — Spread spectrum modulation disabled 1 — Spread spectrum modulation enabled
STEP	Frequency change step = step/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.

15.7.6 Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_NUM)

This register contains the numerator of 528MHz PLL fractional loop divider (signed number).

Absolute value should be less than denominator

CCM Analog Memory Map/Register Definition

Address: 20C_8000h base + 50h offset = 20C_8050h

CCM_ANALOG_PLL_SYS_NUM field descriptions

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator (A) of fractional loop divider (signed integer).

15.7.7 Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_DENOM)

This register contains the Denominator of 528MHz PLL fractional loop divider.

Address: 20C_8000h base + 60h offset = 20C_8060h

CCM_ANALOG_PLL_SYS_DENOM field descriptions

Field	Description
31–30 -	Always set to zero (0).
B	30 bit Denominator (B) of fractional loop divider (unsigned integer).

15.7.8 Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDIO_n)

The control register provides control for the audio PLL.

Address: 20C_8000h base + 70h offset + (4d × i), where i=0d to 3d

CCM Analog Memory Map/Register Definition

CCM_ANALOG_PLL_AUDION field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Reserved
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 Reserved — 0x3 Reserved —

Table continues on the next page...

CCM_ANALOG_PLL_AUDIO_n field descriptions (continued)

Field	Description
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

15.7.9 Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM)

This register contains the numerator (A) of Audio PLL fractional loop divider.(Signed number), absolute value should be less than denominator

Absolute value should be less than denominator

Address: 20C_8000h base + 80h offset = 20C_8080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CCM_ANALOG_PLL_AUDIO_NUM field descriptions

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator of fractional loop divider.

15.7.10 Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM)

This register contains the Denominator (B) of Audio PLL fractional loop divider. (unsigned number)

Address: 20C_8000h base + 90h offset = 20C_8090h

CCM_ANALOG_PLL_AUDIO_DENOM field descriptions

Field	Description
31–30 -	Always set to zero (0).
B	30 bit Denominator of fractional loop divider.

15.7.11 Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEOn)

The control register provides control for the Video PLL.

Address: 20C_8000h base + A0h offset + (4d × i), where i=0d to 3d

CCM Analog Memory Map/Register Definition

CCM_ANALOG_PLL_VIDEOn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Reserved
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 Reserved — 0x3 Reserved —

Table continues on the next page...

CCM_ANALOG_PLL_VIDEO_n field descriptions (continued)

Field	Description
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

15.7.12 Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM)

This register contains the numerator (A) of Video PLL fractional loop divider.(Signed number)

Absolute value should be less than denominator

Address: 20C_8000h base + B0h offset = 20C_80B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CCM_ANALOG_PLL_VIDEO_NUM field descriptions

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator of fractional loop divider(Signed number), absolute value should be less than denominator

15.7.13 Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM)

This register contains the Denominator (B) of Video PLL fractional loop divider.
(Unsigned number)

Address: 20C_8000h base + C0h offset = 20C_80C0h

CCM_ANALOG_PLL_VIDEO_DENOM field descriptions

Field	Description
31–30 -	Always set to zero (0).
B	30 bit Denominator of fractional loop divider.

15.7.14 Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENETn)

The control register provides control for the ENET PLL.

Address: 20C_8000h base + E0h offset + (4d × i), where i=0d to 3d

[illegible]

CCM Analog Memory Map/Register Definition

CCM_ANALOG_PLL_ENETn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 ENET_25M_REF_EN	Enable the PLL providing ENET 25 MHz reference clock
20 ENET2_125M_EN	Enable the PLL providing the ENET2 125 MHz reference clock
19 ENABLE_125M	Enables an offset in the phase frequency detector.
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 Reserved — 0x3 Reserved —

Table continues on the next page...

CCM_ANALOG_PLL_ENET n field descriptions (continued)

Field	Description
13 ENET1_125M_EN	Enable the PLL providing the ENET1 125 MHz reference clock.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–4 -	Always set to zero (0).
3–2 ENET1_DIV_SELECT	Controls the frequency of the ethernet1 reference clock. 00 25MHz 01 50MHz 10 100MHz (not 50% duty cycle) 11 125MHz
ENET0_DIV_SELECT	Controls the frequency of the ethernet0 reference clock. 00 25MHz 01 50MHz 10 100MHz (not 50% duty cycle) 11 125MHz

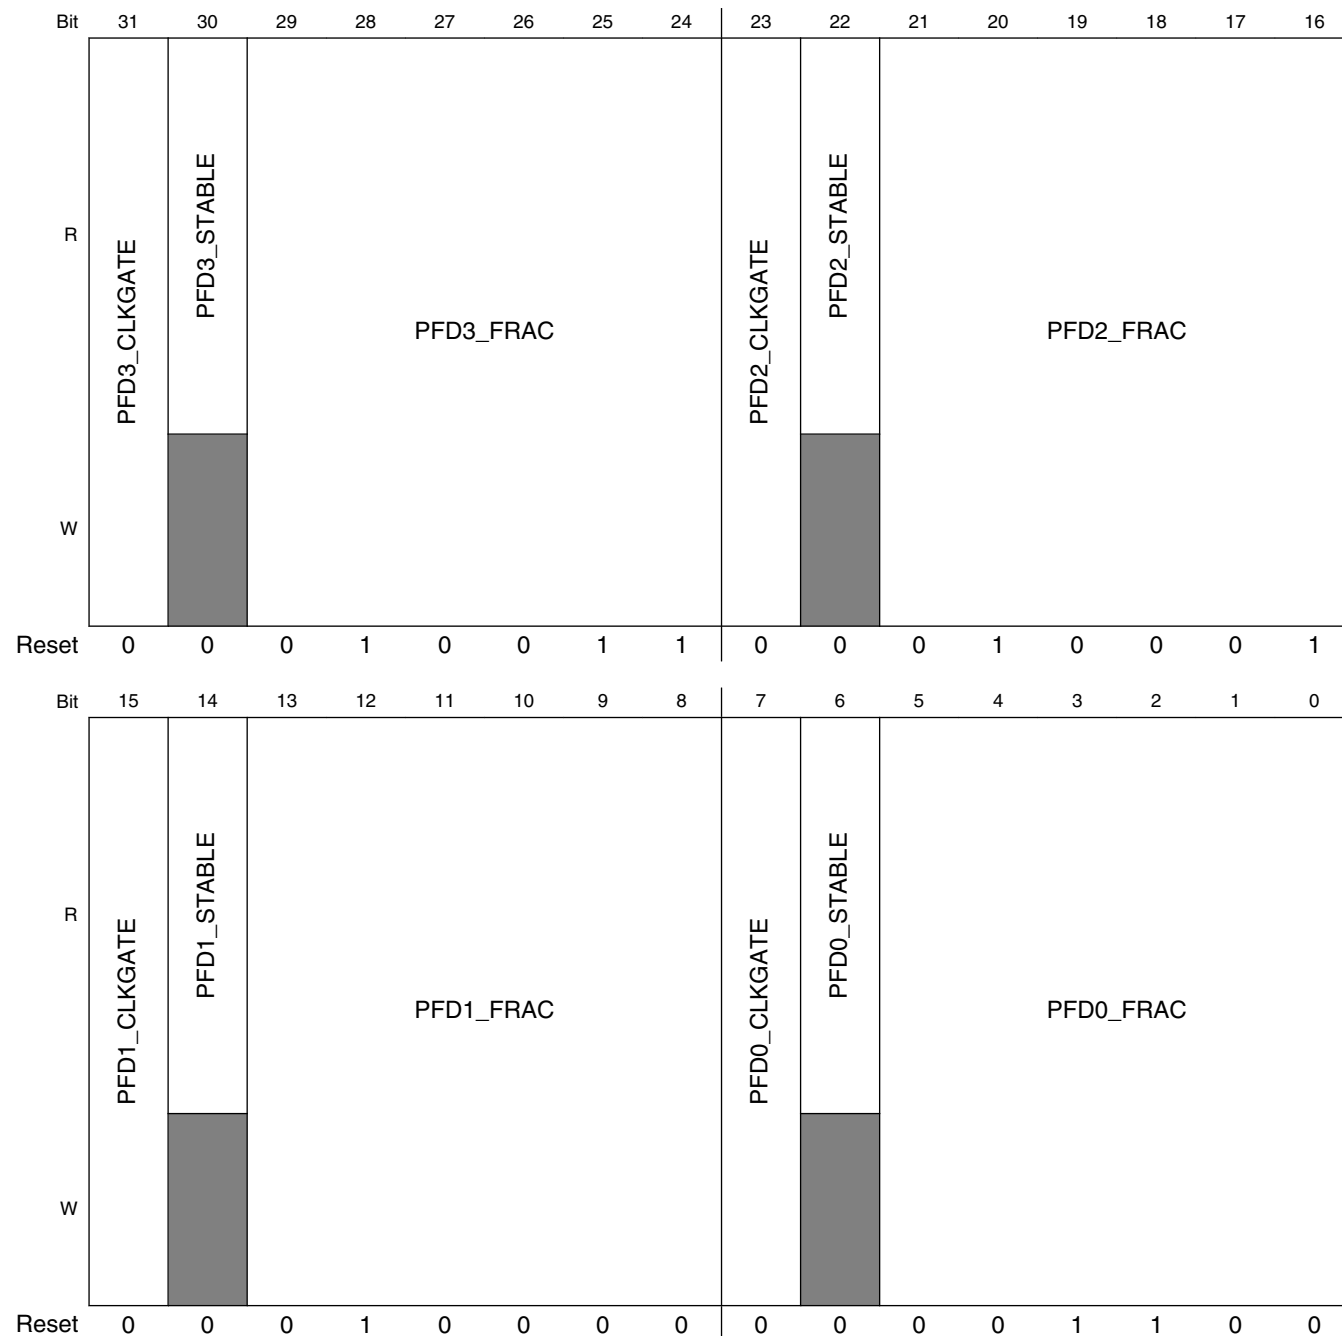

15.7.15 480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480 n)

The PFD_480 control register provides control for PFD clock generation.

This register controls the 4-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

CCM Analog Memory Map/Register Definition

Address: 20C_8000h base + F0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PFD_480n field descriptions

Field	Description
31 PFD3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

Table continues on the next page...

CCM_ANALOG_PFD_480n field descriptions (continued)

Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD3_FRAC}$ where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD2_FRAC}$ where PFD2_FRAC is in the range 12-35.
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD1_FRAC}$ where PFD1_FRAC is in the range 12-35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD0_FRAC}$ where PFD0_FRAC is in the range 12-35.

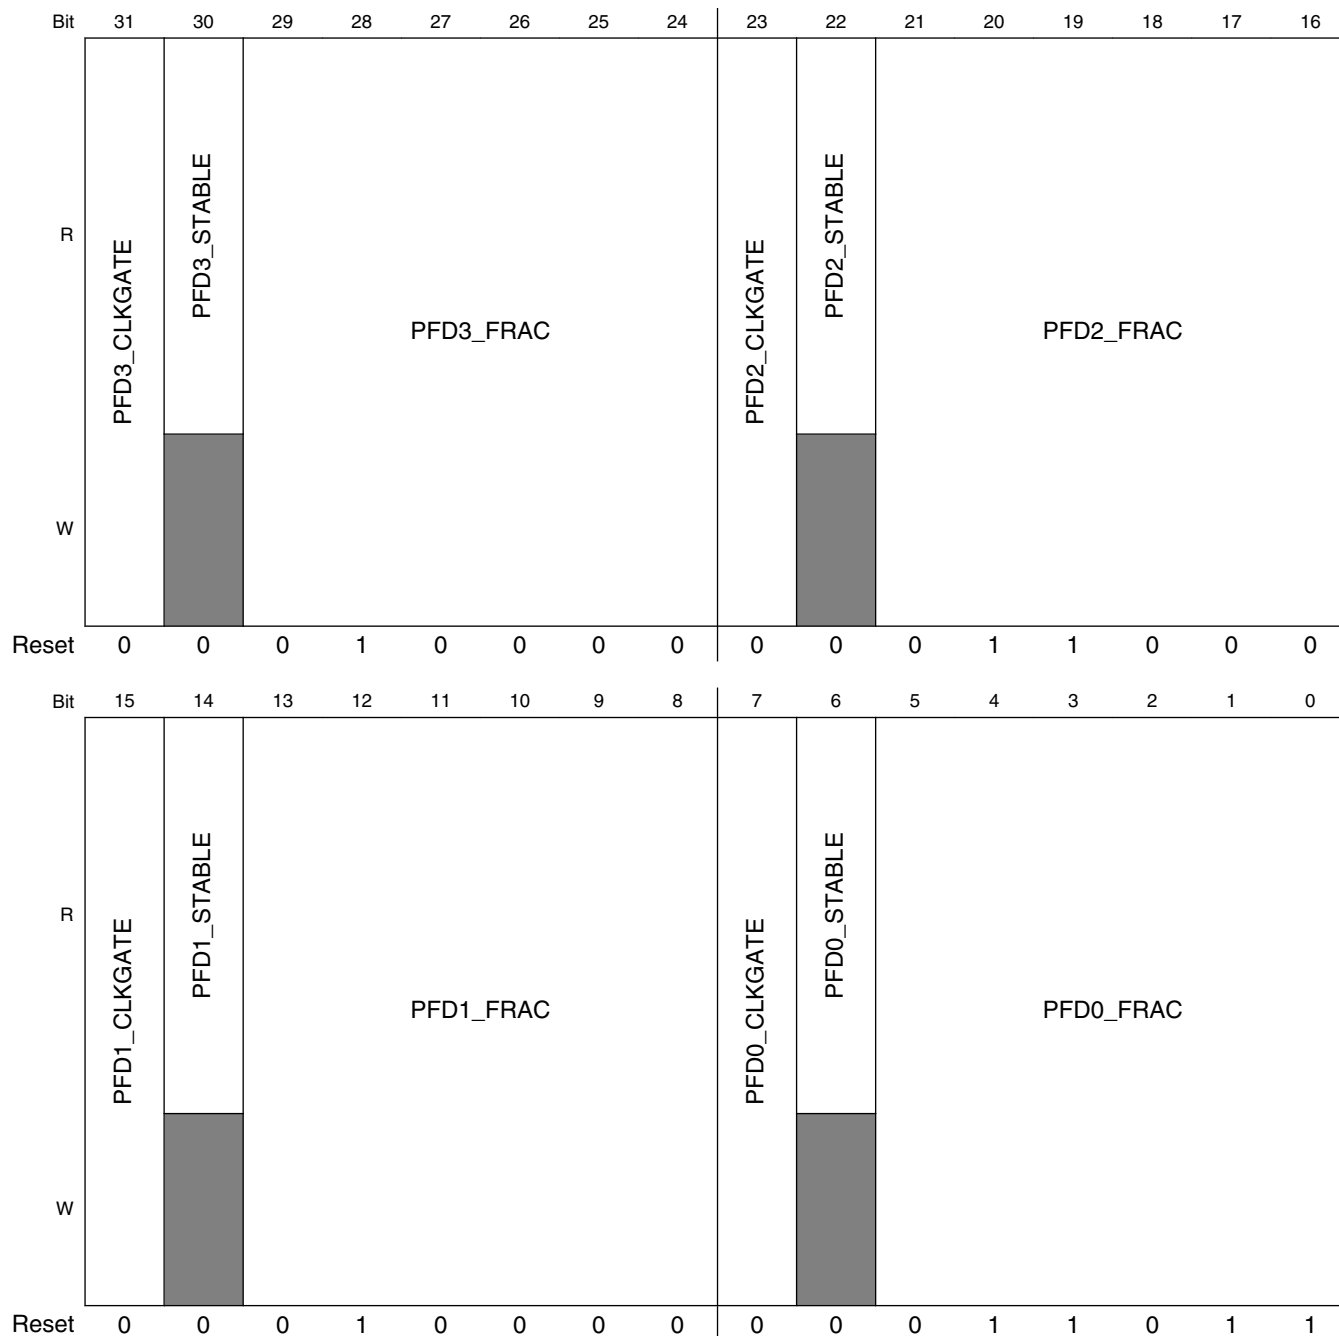

15.7.16 528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528n)

The PFD_528 control register provides control for PFD clock generation.

This register controls the 3-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528 \times 18 / \text{PFD0_FRAC}$ where PFD0_FRAC is in the range 12-35.

15.7.17 Miscellaneous Register 0 (CCM_ANALOG_MISC0n)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 20C_8000h base + 150h offset + (4d × i), where i=0d to 3d

[illegible]

CCM_ANALOG_MISC0n field descriptions

Field	Description
31 VID_PLL_ PREDIV	Predivider for the source clock of the PLL's. 0 Divide by 1 1 Divide by 2
30 XTAL_24M_PWD	This field powers down the 24M crystal oscillator if set true. NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC)
29 RTC_XTAL_ SOURCE	This field indicates which chip source is being used for the rtc clock. NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC) 0 Internal ring oscillator 1 RTC_XTAL
28–26 CLKGATE_ DELAY	This field specifies the delay between powering up the XTAL 24MHz clock and releasing the clock to the digital logic inside the analog block. NOTE: Do not change the field during a low power event. This is not a field that the user would normally need to modify. NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC) 000 0.5ms 001 1.0ms 010 2.0ms 011 3.0ms 100 4.0ms 101 5.0ms 110 6.0ms 111 7.0ms
25 CLKGATE_CTRL	This bit allows disabling the clock gate (always ungated) for the xtal 24MHz clock that clocks the digital logic in the analog block. NOTE: Do not change the field during a low power event. This is not a field that the user would normally need to modify. NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC) 0 ALLOW_AUTO_GATE — Allow the logic to automatically gate the clock when the XTAL is powered down. 1 NO_AUTO_GATE — Prevent the logic from ever gating off the clock.
24–17 -	This field is reserved. Always set to zero.
16 OSC_XTALOK_ EN	This bit enables the detector that signals when the 24MHz crystal oscillator is stable. NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC)
15 OSC_XTALOK	Status bit that signals that the output of the 24-MHz crystal oscillator is stable. Generated from a timer and active detection of the actual frequency. NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC)

Table continues on the next page...

CCM_ANALOG_MISC0n field descriptions (continued)

Field	Description
14–13 OSC_I	<p>This field determines the bias current in the 24MHz oscillator. The aim is to start up with the highest bias current, which can be decreased after startup if it is determined to be acceptable.</p> <p>NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC)</p> <p>00 NOMINAL — Nominal 01 MINUS_12_5_PERCENT — Decrease current by 12.5% 10 MINUS_25_PERCENT — Decrease current by 25.0% 11 MINUS_37_5_PERCENT — Decrease current by 37.5%</p>
12 DISCON_HIGH_SNVS	<p>This bit controls a switch from VDD_HIGH_IN to VDD_SNVS_IN.</p> <p>0 Turn on the switch 1 Turn off the switch</p>
11–10 STOP_MODE_CONFIG	<p>Configure the analog behavior in stop mode.</p> <p>00 All analog except rtc powered down on stop mode assertion. XtalOsc=on, RCOsc=off; 01 Certain analog functions such as certain regulators left up. XtalOsc=on, RCOsc=off; 10 XtalOsc=off, RCOsc=on, Old BG=on, New BG=off. 11 XtalOsc=off, RCOsc=on, Old BG=off, New BG=on.</p>
9–8 -	<p>This field is reserved. Reserved</p>
7 REFTOP_VBGUP	<p>Status bit that signals the analog bandgap voltage is up and stable. 1 - Stable.</p> <p>NOTE: Not related to CCM. See Power Management Unit (PMU)</p>
6–4 REFTOP_VBGADJ	<p>NOTE: Not related to CCM. See Power Management Unit (PMU)</p> <p>000 Nominal VBG 001 VBG+0.78% 010 VBG+1.56% 011 VBG+2.34% 100 VBG-0.78% 101 VBG-1.56% 110 VBG-2.34% 111 VBG-3.12%</p>
3 REFTOP_SELFBIASOFF	<p>Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap.</p> <p>NOTE: Value should be returned to zero before removing vddhigh_in or asserting bit 0 of this register (REFTOP_PWD) to assure proper restart of the circuit.</p> <p>NOTE: Not related to CCM. See Power Management Unit (PMU)</p> <p>0 Uses coarse bias currents for startup 1 Uses bandgap-based bias currents for best performance.</p>
2–1 -	<p>This field is reserved.</p>

Table continues on the next page...

CCM_ANALOG_MISC0n field descriptions (continued)

Field	Description
0 REFTOP_PWD	<p>Control bit to power-down the analog bandgap reference circuitry.</p> <p>NOTE: A note of caution, the bandgap is necessary for correct operation of most of the LDO, PLL, and other analog functions on the die.</p> <p>NOTE: Not related to CCM. See Power Management Unit (PMU)</p>

15.7.18 Miscellaneous Register 1 (CCM_ANALOG_MISC1n)

This register defines the control and status bits for miscellaneous analog blocks. The LVDS1 and LVDS2 controls below control the behavior of the anack1/1b LVDS IO.

Address: 20C_8000h base + 160h offset + (4d × i), where i=0d to 3d

3 REG0_BO_ STATUS	Reg0 brownout status bit. NOTE: Not related to CCM. See Power Management Unit (PMU) 1 Brownout, supply is below target minus brownout offset.
REG0_BO_ OFFSET	This field defines the brown out voltage offset for the CORE power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. Some steps may be irrelevant because of input supply limitations or load operation. NOTE: Not related to CCM. See Power Management Unit (PMU) 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V

Chapter 16

CMOS Sensor Interface (CSI)

16.1 Overview

This chapter presents the CMOS Sensor Interface (CSI) architecture, operation principles, and programming model.

The CSI enables the chip to connect directly to external CMOS image sensors. CMOS image sensors are separated into two classes, dumb and smart. Dumb sensors are those that support only traditional sensor timing (Vertical SYNC and Horizontal SYNC) and output only Bayer and statistics data, while smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The capabilities of the CSI include:

- Configurable interface logic to support most commonly available CMOS sensors.
- Support for CCIR656 video interface as well as traditional sensor interface.
- 8-bit / 16-bit / 24-bit data port for YCbCr, YUV, or RGB data input.
- 8-bit / 10-bit / 16-bit data port for Bayer data input.
- Full control of 8-bit/pixel, 10-bit/pixel or 16-bit / pixel data format to 32-bit receive FIFO packing.
- 256 x 64 FIFO to store received image pixel data.
- Receive FIFO overrun protection mechanism.
- Embedded DMA controllers to transfer data from receive FIFO or statistic FIFO through AHB bus.
- Support 2D DMA transfer from the receive FIFO to the frame buffers in the external memory.
- Support double buffering two frames in the external memory.
- Single interrupt source to interrupt controller from maskable interrupt sources: Start of Frame, End of Frame, Change of Field, FIFO full, FIFO overrun, DMA transfer done, CCIR error and AHB bus response error.
- Configurable master clock frequency output to sensor.

- Statistic data generation for Auto Exposure (AE) and Auto White Balance (AWB) control of the camera (only for Bayer data and 8-bit/pixel format).
- Supports simple deinterlacing of interlaced input.

16.2 External Signals

The table below describes the external signals for the CSI. The external signals are tied between the CSI module and an external CMOS sensor.

Table 16-1. CSI External Signals

Signal	Description	Pad	Mode	Direction
CSI_DATA00	Data Sensor Signal, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	EPDC_D0	ALT3	IO
		LCD_DATA17	ALT2	
		SD2_CLK	ALT3	
CSI_DATA01	Data Sensor Signal, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	EPDC_D1	ALT3	IO
		LCD_DATA16	ALT2	
		SD2_CMD	ALT3	
CSI_DATA02	Data Sensor Signal, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	EPDC_D2	ALT3	IO

ipg_clk_s	ipg_clk_root	Peripheral access clock
ipg_clk_s_raw	ipg_clk_root	Peripheral raw data clock

16.4 Principles of Operation

The information found here describes the modes of operation of the sensor interface.

The CSI is designed to support generic sensor interface timing as well as CCIR656 video interface timing. Traditional CMOS sensors typically use VSYNC (SOF), HSYNC (BLANK), and PIXCLK signals to output Bayer or YUV data. Smart CMOS sensors, that

come with on-chip imaging processing, usually support video mode transfer. They use an embedded timing codec to replace the VSYNC and HSYNC signal. The timing codec is defined by the CCIR656 standard.

The CSI can support connection with the sensor as follows.

- To connect with one 8-bit sensor, the sensor data interface should connect to CSI_DATA[9:2].
- To connect with one 10-bit sensor, the sensor data interface should connect to CSI_DATA[9:0].
- To connect with one 16-bit sensor, the sensor data interface should connect to CSI_DATA[15:0].
- To connect with two 8-bit sensors, the sensor data interfaces should connect to CSI_DATA[7:0] and CSI_DATA[15:8].

16.4.1 Data Transfer with the Embedded DMA Controllers

The CSI has two embedded DMA controllers, one for the receive FIFO and the other for the statistic FIFO. It supports 2D DMA transfer from the receive FIFO to the frame buffers in the external memory and linear DMA transfer from the statistic FIFO.

To transfer data from the RxFIFO to the external memory, the user should set the start address in the frame buffer where the transferred data is stored, the parameters of the frame buffers, and the parameters of the image coming from the sensor. The user can have two frame buffers in the external memory. Each one will store a frame of image coming from the sensor. The embedded DMA controller will first write the frame buffer1 and then frame buffer2. These two frame buffers will be written by turns. The start address should be aligned in word and set in the CSIDMASA-FB1 and CSIDMASA-FB2 registers. In the CSIFBUF_PARA register, the user should set the stride of the frame buffer to show how many words to skip before starting to write the next row of the image. In the CSIIMAG_PARA register, the user should set the width and height of the image coming from the sensor. The RxFF_LEVEL and DMA_REQ_EN_RFF bits in CSICR3 registers also need to be set before the data transfer starts. When the number of the data in the RxFIFO reaches the trigger level, a DMA request will be sent to the

embedded DMA controller and the data will be read out from the RxFIFO and written through AHB bus into the external frame buffers. The burst type of transfer can be INCR4, INCR8 and INCR16 by setting DMA_BURST_TYPE_RFF bits in CSICR2 register. After all data in an image frame are transferred, the DMA_TSF_DONE_FB1 or DMA_TSF_DONE_FB2 bit will be set in CSISR register and the interrupt can be triggered if the corresponding enable bit is set in CSICR1 register. The DMA_REFLASH_RFF bit in CSICR3 can be used to activate or restart the embedded DMA controller.

The RxFIFO has the overrun protection mechanism in case the RxFIFO is overrun during data transfer. If the RxFIFO is full and more data needs to be received during the data transfer, the RxFIFO will be overwritten continuously and all 128 words of data in the RxFIFO before overrun occurred will be discarded; the corresponding 128 words memory space in the frame buffer will keep the previous values.

To transfer data from the statistic FIFO to the external memory, the user should set the start address of the external memory where the transferred data is stored and the total transfer sizes. The start address and the transfer sizes are all aligned in word and should be set in the CSIDMASA-STATFIFO and CSIDMATS-STATFIFO registers. The STATFF_LEVEL and DMA_REQ_EN_SFF bits in CSICR3 registers should also be set before the data transfer starts. When the number of the data in the STATFIFO reaches the trigger level, a dma request will be sent to the embedded DMA controller and the data will be read out from the STATFIFO and written through AHB bus into the external memory. The burst type of transfer can be INCR4, INCR8 and INCR16 by setting DMA_BURST_TYPE_SFF bits in CSICR2 register. After all expected data (defined by the total transfer sizes) are transferred, the DMA_TSF_DONE_SFF bit will be set in CSISR register and an interrupt can be triggered if the SFF_DMA_DONE_INTEN is enabled in CSICR1 register. The DMA_REFLASH_SFF bit in CSICR3 can be used to activate or re-start the embedded DMA controller.

16.4.2 Gated Clock Mode

VSYNC, HSYNC, and PIXCLK signals are used in gated clock mode.

A frame starts with an active edge on VSYNC, then HSYNC asserts and holds for the entire line. The Pixel clock is valid as long as HSYNC is asserted. Data is latched at the active edge of the valid pixel clocks. HSYNC deasserts at the end of line. Pixel clocks then become invalid and CSI stops receiving data from the stream. For the next line the HSYNC timing repeats. For the next frame the VSYNC timing repeats.

16.4.3 Non-Gated Clock Mode

In non-gated clock mode, only the VSYNC and PIXCLK signals are used; the HSYNC signal is ignored.

Figure 16-1. Non-Gated Clock Mode Timing Diagram

The overall timing of non-gated mode is the same as the gated-clock mode, except for the HSYNC signal. HSYNC signal is ignored by the CSI. All incoming pixel clocks are valid and cause data to be latched into RxFIFO. The PIXCLK signal is inactive (states low) until valid data is ready to be transmitted over the bus.

Figure 16-1 shows the timing of a typical sensor. Other sensors may have the slightly different timing from that shown. The CSI can be programmed to support rising/falling-edge triggered VSYNC, active-high/low HSYNC, and rising/falling-edge triggered PIXCLK.

16.4.4 CCIR656 Interlace Mode

In CCIR656 interlace mode, only the PIXCLK and CSI_DATA[9:2] signals are used (see the following table). The start of frame and blank signals are replaced by a timing codec which is embedded in the data stream. Each active line starts with an Start of Active Video (SAV) code and ends with an End of Active Video (EAV) code. In some cases, digital blanking is inserted in between EAV and SAV code. The CSI decodes and filters out the timing-coding from the data stream, recovering VSYNC and HSYNC signals for internal use, such as statistical block control. Data is forwarded to the data receive and packing block in a sequential manner without reordering—that is, field 1 followed by field 2. The fields must be reordered in software to get back the original image.

Change of Field (COF) interrupt is triggered upon every field change. The interrupt service routine reads the status register to check for the current field.

The data bus is connected as follows:

Table 16-4. Data bus connections

Ball Name	Signal Name	Sensor Signal
LCD_DAT8	CSI_DATA[9]	Data[7]
LCD_DAT9	CSI_DATA[8]	Data[6]
LCD_DAT10	CSI_DATA[7]	Data[5]
LCD_DAT11	CSI_DATA[6]	Data[4]
LCD_DAT12	CSI_DATA[5]	Data[3]
LCD_DAT13	CSI_DATA[4]	Data[2]
LCD_DAT14	CSI_DATA[3]	Data[1]
LCD_DAT15	CSI_DATA[2]	Data[0]

According to the CCIR656 specification, the image must be in 625/50 PAL or 525/60 NTSC format. In addition, the image is interlaced into odd and even fields with vertical and horizontal blank data being filled into certain lines. Data must be in YCbCr422 format, each pixel contains 2 bytes, either Y + Cr or Y + Cb. These requirements are set for TV systems. The CSI module supports PAL and NTSC format only.

The following figure describes the frame structure in PAL system, showing vertical and horizontal blanking.

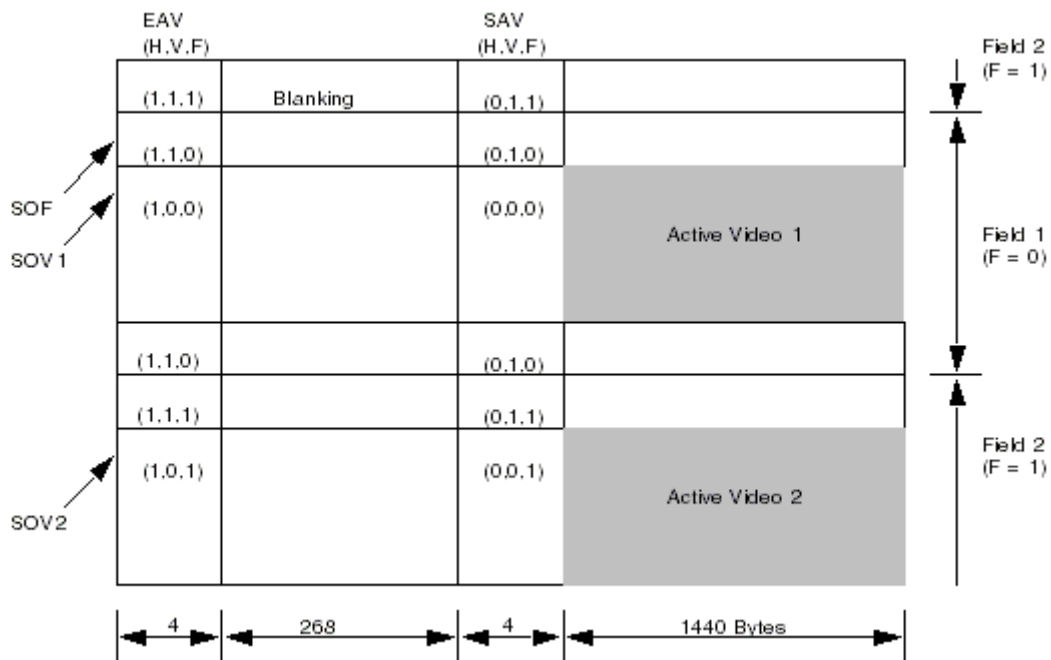

Figure 16-2. CCIR656 Interlace Mode (PAL)

The following figure describes the general timing for a single line, showing SAV and EAV.

Figure 16-3. CCIR656 General Line Timing

The coding tables recommended by the CCIR656 specification are shown below. It is used in the CCIR656 mode to decode the video stream. An interrupt is generated for SOF, which is decoded from the embedded timing codec.

Table 16-5. Coding for SAV and EAV

Data Bit Number	1st Byte 0xFF	2nd Byte 0x00	3rd Byte 0x00	4th Byte 0xXY
7 (MSB)	1	0	0	1
6	1	0	0	F
5	1	0	0	V
4	1	0	0	H
3	1	0	0	P3
2	1	0	0	P2
1	1	0	0	P1
0	1	0	0	P0

0	0	0	0	0	0	0
0	0	1	1	1	0	1
0	1	0	1	0	1	1
0	1	1	0	1	1	0
1	0	0	0	1	1	1
1	0	1	1	0	1	0
1	1	0	1	1	0	0
1	1	1	0	0	0	1

Table 16-7. Representations by F-Bit

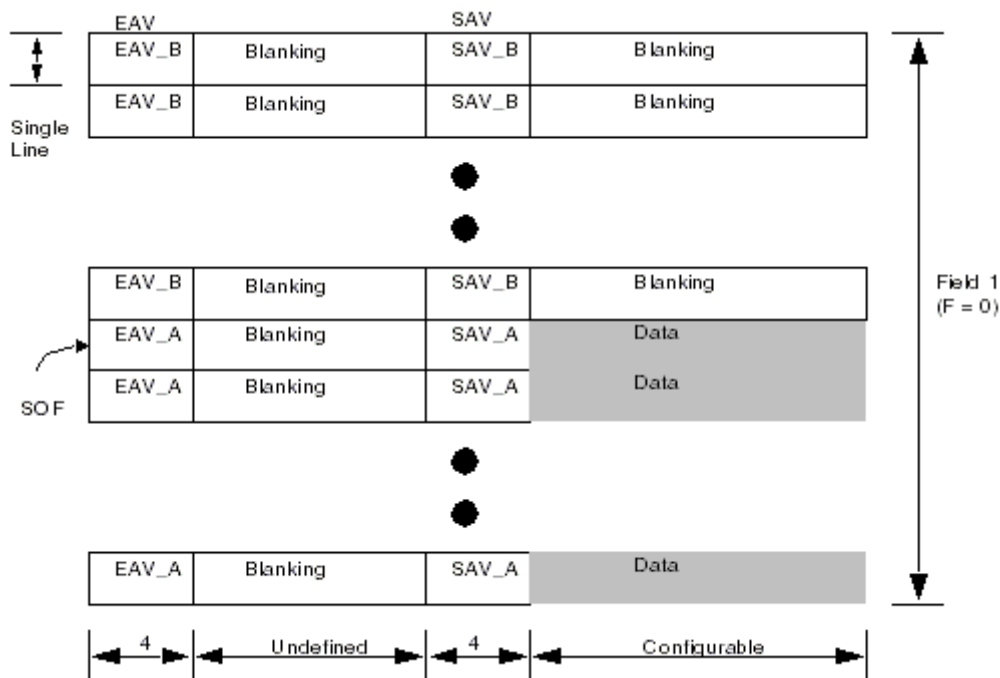

F-Bit	Representations
0	ODD FIELD (FIELD 1)
1	EVEN FIELD (FIELD 2)

16.4.5 CCIR656 Progressive Mode

For a CMOS camera system of VGA or CIF resolution, strict adherence to the interlace requirements stated in the CIR standard is not required.

The image is considered to have only 1 active field which is scanned in a progressive manner. This active field is regarded as field 1 and the F-bit in the timing codec is ignored by the decoder. Most sensors support CCIR timing in this mode (progressive) by default.

The following figure shows the typical flow of progressive mode.

**Figure 16-4. CCIR656 Progressive Mode (General Case)**

An interrupt is generated for SOF but not for COF. In the general case, when SOF information is retrieved from the embedded coding, it is known as internal VSYNC mode. In other cases, when the VSYNC signal is provided by the sensor, it is known as external VSYNC mode. The CSI can be operated in internal or external VSYNC mode.

16.4.6 Error Correction for CCIR656 Coding

According to the algorithm for CCIR coding, protection bits in the SAV and EAV are encoded in the way that allows a 1-bit error to be corrected, or a 2-bit error to be detected by the decoder. This feature is supported by the interlace mode CCIR decoder in CSI.

For the 1-bit error case, users can select the error to be corrected automatically, or simply shown as a status flag instead. For the 2-bit error case, because the decoder is unable to make a correction, the error would be shown as a status flag only.

An interrupt can be generated upon the detection of an error. This signal can be enabled or disabled without affecting the operation of the status bit.

16.4.7 Deinterlacer

Deinterlacing is the process of converting interlaced video, such as CCIR656 input, into a non-interlaced form.

The CSI uses the weaving method to do deinterlacing. Weaving is done by adding consecutive fields together. CSI uses top-field detection function. No matter input is NTSC or PAL mode, the combined frame will always put the top-field first and then bottom-field.

16.5 Interrupt Generation

The information found here describes CSI events that generate interrupts.

16.5.1 Start Of Frame Interrupt (SOF_INT)

The source of an SOF interrupt is dependent on the mode of operation.

In traditional mode, VSYNC signal is taken from sensor and SOF_INT is generated at the rising or falling edge (programmable) of VSYNC.

In CCIR interlace mode, the SOF interrupt information is retrieved from the embedded coding and SOF_INT is generated.

In CCIR progressive mode, there are two sources of an SOF interrupt:

- In *internal* VSYNC mode, SOF is retrieved from the embedded coding.
- In *external* VSYNC mode, VSYNC is taken from the sensor and SOF is generated at the rising edge of VSYNC.

16.5.2 End Of Frame Interrupt (EOF_INT)

An EOF interrupt is generated when the frame ends and the complete frame data in RXFIFO is read.

The EOF event triggering works with the RX count register (CSIRXCNT). Software sets the RX count register to the frame size (in words). The CSI RX logic then counts the number of pixel data being received and compares it with the RX count. If the preset value is reached, an EOF interrupt is generated and the data in the RXFIFO are read. If a SOF event is detected before this happens, the EOF interrupt is not generated.

16.5.3 Change Of Field Interrupt (COF_INT)

The Change of Field interrupt is only valid in CCIR Interlace mode. The COF interrupt is generated when the field toggles, either from field 1 to field 2, or field 2 to field 1.

Software should first check COF_INT bit in the CSI Status Register (CSISTAT) before checking that F1_INT or F2_INT is turned on.

In PAL systems, the field changes at the beginning of the frame and coincides with SOF. For the first field, a COF interrupt is not generated, only an SOF. The COF interrupt is generated for the second field.

16.5.4 CCIR Error Interrupt (ECC_INT)

The CCIR Error Interrupt is only valid for CCIR Interlace mode. An ECC interrupt is generated when an error is found on the SAV or EAV codes in the incoming stream. When this happens, the ECC_INT status bit is set.

16.5.5 RxFIFO Full Interrupt (RxFF_INT)

A RxFIFO full interrupt is generated when the number of data in RXFIFO reaches the water mark defined by RxFF_LEVEL in CSICR3.

16.5.6 Statistic FIFO Full Interrupt (STATFF_INT)

A StatFIFO full interrupt is generated when the number of data in STATFIFO reaches the water mark defined by STATFF_LEVEL in CSICR3.

16.5.7 RxFIFO Overrun Interrupt (RFF_OR_INT)

A RxFIFO Overrun interrupt is generated when the RxFIFO has 128 words data and more data is being written in.

16.5.8 Statistic FIFO Overrun Interrupt (SFF_OR_INT)

A StatFIFO Overrun interrupt is generated when the STATFIFO has 64 words data and more data is being written in.

16.5.9 Frame Buffer1 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB1)

A DMA transfer done interrupt of frame buffer1 is generated when one frame of data are transferred from RxFIFO to the frame buffer1 in the external memory.

16.5.10 Frame Buffer2 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB2)

A DMA transfer done interrupt of frame buffer2 is generated when one frame of data are transferred from RxFIFO to the frame buffer2 in the external memory.

16.5.11 Statistic FIFO DMA Transfer Done Interrupt (DMA_TSF_DONE_SFF)

A StatFIFO DMA transfer done interrupt is generated when all the data are transferred from StatFIFO to the external memory. The transfer size is defined in the STATFIFO DMA Transfer Size Register.

16.5.12 AHB Bus Response Error Interrupt (HRESP_ERR_INT)

An AHB Bus response error interrupt is generated when a bus error is detected.

16.5.13 DMA Field 0 Transfer Done Interrupt (DMA_FIELD0_DONE)

A DMA transfer done interrupt of field 0 is generated when one field of data are transferred from RxFIFO to the frame buffer in external memory. This signal should work on interlaced mode.

16.5.14 DMA Field 1 Transfer Done Interrupt (DMA_FIELD1_DONE)

A DMA transfer done interrupt of field 1 is generated when one field of data are transferred from RxFIFO to the frame buffer in external memory. This signal should work on interlaced mode.

16.5.15 Base Address Change Error Interrupt (BASEADDR_CHANGE_ERROR)

A Base Address change error is generated when the base address changed while the last frame data transfer are not finished.

16.6 Data Packing Style

Careful attention to endianness is needed given the different port sizes at different stages of the image capture path.

To enable flexible packing of image data before storage in the FIFOs, the CSI module can swap data fields by use of the PACK_DIR and the SWAP16_EN bit in CSI Control Register 1 (CSICR1).

The CSI module accepts 8-bit, 10-bit or 16-bit data from the sensor by configuring `PIXEL_BIT` bit in CSI Control Register 1 (CSICR1) and `TWO_8BIT_SENSOR` bit in CSI Control Register3 (CSICR3). The input data is packed according to the setting of `PACK_DIR` bit. The packed data is stored in the RX FIFO according to the setting of the `SWAP16_EN` bit.

For 10-bit per pixel data format, each pixel is expanded to 16 bits by appending 6 zeros bits to the most significant bit. For 16-bit data format, the data path can be a combination by two 8-bit sensors. One sensor is connected to the `CSI_DATA[7:0]`. The other sensor is connected to `CSI_DATA[15:8]`.

16.6.1 RX FIFO Path

16.6.1.1 Bayer Data

Bayer data is a type of raw data from the image sensor. This byte-wide data must be converted to the RGB space or YUV space by software. The data path for Bayer data is from the CSI to memory. If the system is in little endian, then the `PACK_DIR` bit should be set to 0. 8-bit data format from a sensor is packed to 32 bits as `P3.P2.P1.P0`, where `P0` is the pixel coming in time slot 0 (first data) and `P3` is the pixel coming in time slot 3 (the last data in the 32-bit word). When the data is addressed as bytes by software, `P0` is transferred first, `P1` is transferred next, and so on. 10-bit data format is packed to 32 bits as `000000.P1.000000.P0`, where `P0` is the 10-bit data coming in time slot 0 (first pixel) and `P1` is the 10-bit data coming in time slot 1 (second pixel). 16-bit data, from two sensors, is packed to 32 bits as `P3.P2.P1.P0`, where `P0` and `P1` are the two 8-bit data coming in time slot 0 (`P0` is the first pixel of the sensor connected with `CSI_DATA[7:0]` and `P1` is the first pixel of the sensor connected with `CSI_DATA[15:8]`). `P2` and `P3` are the two 8-bit data coming in time slot 1 (second pixels of the two sensors).

16.6.1.2 RGB565 Data

RGB565 data is processed data from the image sensor, which can be put directly into the display buffer. The data is 16 bits wide. The data path is from CSI to memory to the display controller. On the sensor side, data must be transmitted as `P0` first, followed by `P1`, and so on. For each pixel, whether the MSB or LSB is sent first depends on the endianness of the sensor. Data is 16 bits wide with the MSB labeled `RG`, and the LSB labeled `GB`. `P0` is represented as `RG0` and `GB0`.

CSI receives data in one of the following sequence:

- RG0, GB0, RG1, GB1, while RG0 comes out at time slot 0 (first data), and GB1 comes out at time slot 3 (last data)
- GB0, RG0, GB1, RG1

Using the first sequence as an example, and assuming the system is running in little endian, the data is presented as:

- 8-bit data from sensor: RG0, GB0, RG1, GB1, ...
- 32-bit data before storage in the CSI RX FIFO (PACK_DIR bit = 1):
RG0GB0RG1GB1
- 32-bit data in CSI RX FIFO (SWAP16_EN bit enabled): RG1GB1RG0GB0
- 32-bit transfer to system memory: RG1GB1RG0GB0
- 16-bit read by display controller: RG0GB0, RG1GB1

16.6.1.3 RGB888 Data

This is another kind of processed data from image sensor, which can be used for further image processing directly. Each of the data consist of 8-bit Red, 8-bit Green, and 8-bit Blue data. An example of timing scheme is shown in the following figure.

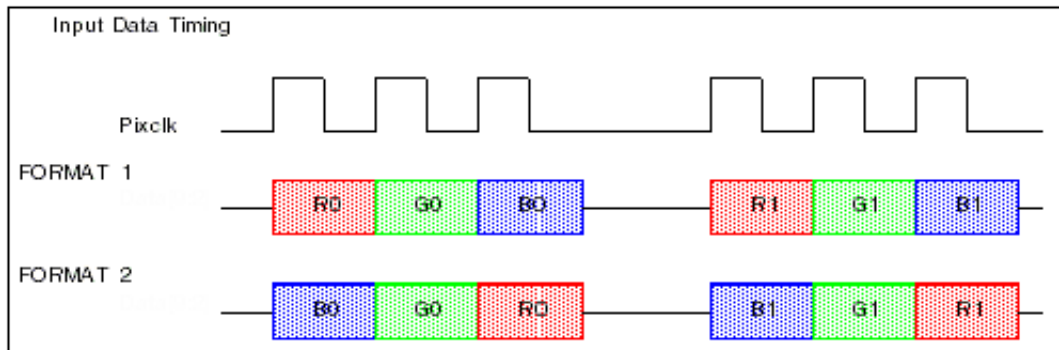

Figure 16-5. Sample Timing Diagram for RGB888 8 bits/cycle Data

An optional scheme to pack a dummy byte is provided. For every group of 3 bytes data, a dummy zero is packed to form a 32-bit word as shown in the following figure. The dummy zero can be packed at the LSB position or MSB position. Using RGB888A_FORMAT_SEL in CSI_CSICR18[18] to determine to put the dummy bytes packed at LSB or MSB position.

16.6.2 STAT FIFO Path

Statistics only works for Bayer data in 8-bit per pixel format. It generates 16-bit statistical output from the 8-bit Bayer input (CSI_DATA[13:6]). The outputs are Sum of Green (G), Sum of Red (R), Sum of Blue (B), and Auto Focus (F). Each output is 16-bits wide.

The settings of PACK_DIR and SWAP16_EN bits in the CSICR1 register have no effect on the input path. The PACK_DIR only controls how the 16-bit stat output is packed into the 32-bit STAT FIFO.

When the PACK_DIR bit = 1, the stat data is packed as:

First 32-bit: RG

Second 32-bit: BF

...

When the PACK_DIR bit = 0, the stat data is packed as:

First 32-bit GR

Second 32-bit: FB

...

16.7 CSI Memory Map/Register Definition

All the 32-bit registers of the CSI module are summarized in the Memory Map below:

CSI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20E_8000	CSI Control Register 1 (CSI_CSICR1)	32	R/W	4000_0800h	16.7.1/603
20E_8004	CSI Control Register 2 (CSI_CSICR2)	32	R/W	0000_0000h	16.7.2/607
20E_8008	CSI Control Register 3 (CSI_CSICR3)	32	R/W	0000_0000h	16.7.3/609
20E_800C	CSI Statistic FIFO Register (CSI_CSISTATFIFO)	32	R	0000_0000h	16.7.4/611
20E_8010	CSI RX FIFO Register (CSI_CSIRFIFO)	32	R	0000_0000h	16.7.5/612
20E_8014	CSI RX Count Register (CSI_CSIRXCNT)	32	R/W	0000_9600h	16.7.6/612
20E_8018	CSI Status Register (CSI_CSISR)	32	R/W	0000_4000h	16.7.7/613

Table continues on the next page...

CSI memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20E_8020	CSI DMA Start Address Register - for STATFIFO (CSI_CSIDMASA_STATFIFO)	32	R/W	0000_0000h	16.7.8/616
20E_8024	CSI DMA Transfer Size Register - for STATFIFO (CSI_CSIDMATS_STATFIFO)	32	R/W	0000_0000h	16.7.9/616
20E_8028	CSI DMA Start Address Register - for Frame Buffer1 (CSI_CSIDMASA_FB1)	32	R/W	0000_0000h	16.7.10/617

16.7.1 CSI Control Register 1 (CSI_CSICR1)

This register controls the sensor interface timing and interrupt generation. The interrupt enable bits in this register control the interrupt signals and the status bits. That means status bits will only function when the corresponding interrupt bits are enabled.

Address: 20E_8000h base + 0h offset = 20E_8000h

CSI_CSICR1 field descriptions

Field	Description
31 SWAP16_EN	<p>SWAP 16-Bit Enable. This bit enables the swapping of 16-bit data. Data is packed from 8-bit or 10-bit to 32-bit first (according to the setting of PACK_DIR) and then swapped as 16-bit words before being put into the RX FIFO. The action of the bit only affects the RX FIFO and has no affect on the STAT FIFO.</p> <p>NOTE: Example of swapping enabled: Data input to FIFO = 0x11223344 Data in RX FIFO = 0x 33441122</p> <p>NOTE: Example of swapping disabled: Data input to FIFO = 0x11223344 Data in RX FIFO = 0x11223344</p>

Table continues on the next page...

CSI_CSICR1 field descriptions (continued)

Field	Description
	0 Disable swapping 1 Enable swapping
30 EXT_VSYNC	External VSYNC Enable. This bit controls the operational VSYNC mode. NOTE: This only works when the CSI is in CCIR progressive mode. 0 Internal VSYNC mode 1 External VSYNC mode
29 EOF_INT_EN	End-of-Frame Interrupt Enable. This bit enables and disables the EOF interrupt. 0 EOF interrupt is disabled. 1 EOF interrupt is generated when RX count value is reached.
28 PrP_IF_EN	CSI-PrP Interface Enable. This bit controls the CSI to PrP bus. When enabled the RxFIFO is detached from the AHB bus and connected to PrP. All CPU reads or DMA accesses to the RxFIFO register are ignored. All CSI interrupts are also masked. 0 CSI to PrP bus is disabled 1 CSI to PrP bus is enabled
27 CCIR_MODE	CCIR Mode Select. This bit controls the CCIR mode of operation. This bit only works in CCIR interface mode. 0 Progressive mode is selected 1 Interlace mode is selected
26 COF_INT_EN	Change Of Image Field (COF) Interrupt Enable. This bit enables the COF interrupt. This bit works only in CCIR interlace mode which is when CCIR_EN = 1 and CCIR_MODE = 1. 0 COF interrupt is disabled 1 COF interrupt is enabled
25 SF_OR_INTEN	STAT FIFO Overrun Interrupt Enable. This bit enables the STATFIFO overrun interrupt. 0 STATFIFO overrun interrupt is disabled 1 STATFIFO overrun interrupt is enabled
24 RF_OR_INTEN	RxFIFO Overrun Interrupt Enable. This bit enables the RX FIFO overrun interrupt. 0 RxFIFO overrun interrupt is disabled 1 RxFIFO overrun interrupt is enabled
23 -	This field is reserved. Reserved. This bit is reserved and should read 0.
22 SFF_DMA_DONE_INTEN	STATFIFO DMA Transfer Done Interrupt Enable. This bit enables the interrupt of STATFIFO DMA transfer done. 0 STATFIFO DMA Transfer Done interrupt disable 1 STATFIFO DMA Transfer Done interrupt enable
21 STATFF_INTEN	STATFIFO Full Interrupt Enable. This bit enables the STAT FIFO interrupt. 0 STATFIFO full interrupt disable 1 STATFIFO full interrupt enable

Table continues on the next page...

CSI_CSICR1 field descriptions (continued)

Field	Description
20 FB2_DMA_ DONE_INTEN	Frame Buffer2 DMA Transfer Done Interrupt Enable. This bit enables the interrupt of Frame Buffer2 DMA transfer done. 0 Frame Buffer2 DMA Transfer Done interrupt disable 1 Frame Buffer2 DMA Transfer Done interrupt enable
19 FB1_DMA_ DONE_INTEN	Frame Buffer1 DMA Transfer Done Interrupt Enable. This bit enables the interrupt of Frame Buffer1 DMA transfer done. 0 Frame Buffer1 DMA Transfer Done interrupt disable 1 Frame Buffer1 DMA Transfer Done interrupt enable
18 RXFF_INTEN	RxFIFO Full Interrupt Enable. This bit enables the RxFIFO full interrupt. 0 RxFIFO full interrupt disable 1 RxFIFO full interrupt enable
17 SOF_POL	SOF Interrupt Polarity. This bit controls the condition that generates an SOF interrupt. 0 SOF interrupt is generated on SOF falling edge 1 SOF interrupt is generated on SOF rising edge
16 SOF_INTEN	Start Of Frame (SOF) Interrupt Enable. This bit enables the SOF interrupt. 0 SOF interrupt disable 1 SOF interrupt enable
15–12 Reserved	This field is reserved. Reserved. This field is reserved.
11 HSYNC_POL	HSYNC Polarity Select. This bit controls the polarity of HSYNC. This bit only works in gated-clock-that is, GCLK_MODE = 1 and CCIR_EN = 0. 0 HSYNC is active low 1 HSYNC is active high
10 CCIR_EN	CCIR656 Interface Enable. This bit selects the type of interface used. When the CCIR656 timing decoder is enabled, it replaces the function of timing interface logic. 0 Traditional interface is selected. Timing interface logic is used to latch data. 1 CCIR656 interface is selected.
9 Reserved	This field is reserved. This field is reserved.
8 FCC	FIFO Clear Control. This bit determines how the RXFIFO and STATFIFO are cleared. When Synchronous FIFO clear is selected the RXFIFO and STATFIFO are cleared, and STAT block is reset, on every SOF. FIFOs and STAT block restarts immediately after reset. For information on the operation when Asynchronous FIFO clear is selected, refer to the descriptions for the CLR_RXFIFO and CLR_STATFIFO bits. 0 Asynchronous FIFO clear is selected. 1 Synchronous FIFO clear is selected.
7 PACK_DIR	Data Packing Direction. This bit Controls how 8-bit/10-bit image data is packed into 32-bit RX FIFO, and how 16-bit statistical data is packed into 32-bit STAT FIFO.

Table continues on the next page...

CSI_CSICR1 field descriptions (continued)

Field	Description
	<p>0 Pack from LSB first. For image data, 0x11, 0x22, 0x33, 0x44, it will appear as 0x44332211 in RX FIFO. For stat data, 0xAAAA, 0xBBBB, it will appear as 0xB BBBBAAAA in STAT FIFO.</p> <p>1 Pack from MSB first. For image data, 0x11, 0x22, 0x33, 0x44, it will appear as 0x11223344 in RX FIFO. For stat data, 0xAAAA, 0xBBBB, it will appear as 0xAAAABBBB in STAT FIFO.</p>
6 CLR_STATFIFO	<p>Asynchronous STATFIFO Clear. This bit clears the STATFIFO and Reset STAT block.</p> <p>This bit works only in async FIFO clear mode-that is, FCC = 0. Otherwise this bit is ignored.</p> <p>Writing 1 will clear STATFIFO and reset STAT block immediately, STATFIFO and STAT block then wait and restart after the arrival of next SOF.</p> <p>The bit is restored to 0 automatically after finish. Normally reads 0.</p>
5 CLR_RXFIFO	<p>Asynchronous RXFIFO Clear. This bit clears the RXFIFO.</p> <p>This bit works only in async FIFO clear mode-that is, FCC = 0. Otherwise this bit is ignored.</p> <p>Writing 1 clears the RXFIFO immediately, RXFIFO restarts immediately after that.</p> <p>The bit is restored to 0 automatically after finish. Normally reads 0.</p>
4 GCLK_MODE	<p>Gated Clock Mode Enable. Controls if CSI is working in gated or non-gated mode.</p> <p>This bit works only in traditional mode-that is, CCIR_EN = 0. Otherwise this bit is ignored.</p> <p>0 Non-gated clock mode. All incoming pixel clocks are valid. HSYNC is ignored.</p> <p>1 Gated clock mode. Pixel clock signal is valid only when HSYNC is active.</p>
3 INV_DATA	<p>Invert Data Input. This bit enables or disables internal inverters on the data lines.</p> <p>0 CSI_D[7:0] data lines are directly applied to internal circuitry</p> <p>1 CSI_D[7:0] data lines are inverted before applied to internal circuitry</p>
2 INV_PCLK	<p>Invert Pixel Clock Input. This bit determines if the Pixel Clock (CSI_PIXCLK) is inverted before it is applied to the CSI module.</p> <p>0 CSI_PIXCLK is directly applied to internal circuitry</p> <p>1 CSI_PIXCLK is inverted before applied to internal circuitry</p>
1 REDGE	<p>Valid Pixel Clock Edge Select. Selects which edge of the CSI_PIXCLK is used to latch the pixel data.</p> <p>0 Pixel data is latched at the falling edge of CSI_PIXCLK</p> <p>1 Pixel data is latched at the rising edge of CSI_PIXCLK</p>
0 PIXEL_BIT	<p>Pixel Bit. This bit indicates the bayer data width for each pixel. This bit should be configured before activating or re-starting the embedded DMA controller.</p> <p>0 8-bit data for each pixel</p> <p>1 10-bit data for each pixel</p>

16.7.2 CSI Control Register 2 (CSI_CSICR2)

This register provides the statistic block with data about which live view resolution is being used, and the starting sensor pixel of the Bayer pattern. It also contains the horizontal and vertical count used to determine the number of pixels to skip between the 64 x 64 blocks of statistics when generating statistics on live view image that are greater than 512 x 384.

Address: 20E_8000h base + 4h offset = 20E_8004h

CSI_CSICR3 field descriptions (continued)

Field	Description
12 DMA_REQ_EN_RFF	DMA Request Enable for RxFIFO. This bit enables the dma request from RxFIFO to the embedded DMA controller. 0 Disable the dma request 1 Enable the dma request
11 DMA_REQ_EN_SFF	DMA Request Enable for STATFIFO. This bit enables the dma request from STATFIFO to the embedded DMA controller. 0 Disable the dma request 1 Enable the dma request
10–8 STATFF_LEVEL	STATFIFO Full Level. When the number of data in STATFIFO reach this level, STATFIFO full interrupt is generated, or STATFIFO DMA request is sent. 000 4 Words 001 8 Words 010 12 Words 011 16 Words 100 24 Words 101 32 Words 110 48 Words 111 64 Words
7 HRESP_ERR_EN	Hresponse Error Enable. This bit enables the hresponse error interrupt. 0 Disable hresponse error interrupt 1 Enable hresponse error interrupt
6–4 RxFF_LEVEL	RxFIFO Full Level. When the number of data in RxFIFO reaches this level, a RxFIFO full interrupt is generated, or an RXFIFO DMA request is sent. 000 4 Words 001 8 Words 010 16 Words 011 24 Words 100 32 Words 101 48 Words 110 64 Words 111 96 Words
3 TWO_8BIT_SENSOR	Two 8-bit Sensor Mode. This bit indicates one 16-bit sensor or two 8-bit sensors are connected to the 16-bit data ports. This bit should be set if there is one 16-bit sensor or two 8-bit sensors are connected. This bit should be configured before activating or restarting the embedded DMA controller. 0 Only one sensor is connected. 1 Two 8-bit sensors are connected or one 16-bit sensor is connected.
2 ZERO_PACK_EN	Dummy Zero Packing Enable. This bit causes a dummy zero to be packed with every 3 incoming bytes, forming a 32-bit word. The dummy zero is always packed to the LSB position. This packing function is only available in 8-bit/pixel mode. 0 Zero packing disabled 1 Zero packing enabled

Table continues on the next page...

CSI_CSICR3 field descriptions (continued)

Field	Description
1 ECC_INT_EN	Error Detection Interrupt Enable. This bit enables and disables the error detection interrupt. This feature only works in CCIR interlace mode. 0 No interrupt is generated when error is detected. Only the status bit ECC_INT is set. 1 Interrupt is generated when error is detected.
0 ECC_AUTO_EN	Automatic Error Correction Enable. This bit enables and disables the automatic error correction. If an error occurs and error correction is disabled only the ECC_INT status bit is set. This feature only works in CCIR interlace mode. 0 Auto Error correction is disabled. 1 Auto Error correction is enabled.

16.7.4 CSI Statistic FIFO Register (CSI_CSISTATFIFO)

The StatFIFO is a read-only register containing statistic data from the sensor. Writing to this register has no effect.

Address: 20E_8000h base + Ch offset = 20E_800Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CSI_CSIRFIFO field descriptions

Field	Description
IMAGE	Received image data

16.7.6 CSI RX Count Register (CSI_CSIRXCNT)

This register works for EOF interrupt generation. It should be set to the number of words to receive that would generate an EOF interrupt.

There is an internal counter that counts the number of words read from the RX FIFO. Whenever the RX FIFO is being read, by either the CPU or the embedded DMA controller, the counter value is updated and compared with this register. If the values match, then an EOF interrupt is triggered.

Address: 20E_8000h base + 14h offset = 20E_8014h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CSI_CSISR field descriptions

Field	Description
31–29 -	Reserved. These bits are reserved and should read 0.
28 BASEADDR_CHHANGE_ERROR	When using base address switching enable, this bit will be 1 when switching occur before DMA complete. This bit will be clear by writing 1. When this interrupt happens, follow the steps listed below. 1. Unassert the CSI enable, CSIx_CSICR18 bit31, 2. Reflash the DMA, assert the CSIX_CSICR3 bit 14, 3. Assert the CSI enable, CSIx_CSICR18 bit31.
27 DMA_FIELD0_DONE	When DMA field 0 is complete, this bit will be set to 1(clear by writing 1).

Table continues on the next page...

CSI_CSISR field descriptions (continued)

Field	Description
26 DMA_FIELD1_DONE	When DMA field 0 is complete, this bit will be set to 1 (clear by writing 1).
25 SF_OR_INT	STATFIFO Overrun Interrupt Status. Indicates the overflow status of the STATFIFO register. (Cleared by writing 1) 0 STATFIFO has not overflowed. 1 STATFIFO has overflowed.
24 RF_OR_INT	RxFIFO Overrun Interrupt Status. Indicates the overflow status of the RxFIFO register. (Cleared by writing 1) 0 RxFIFO has not overflowed. 1 RxFIFO has overflowed.
23 -	This field is reserved. Reserved. This bit is reserved and should read 0.
22 DMA_TSF_DONE_SFF	DMA Transfer Done from StatFIFO. Indicates that the dma transfer from StatFIFO is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by writing 1 or reflashing the StatFIFO dma controller in CSICR3. (Cleared by writing 1) 0 DMA transfer is not completed. 1 DMA transfer is completed.
21 STATFF_INT	STATFIFO Full Interrupt Status. Indicates the number of data in the STATFIFO reaches the trigger level. (this bit is cleared automatically by reading the STATFIFO) 0 STATFIFO is not full. 1 STATFIFO is full.
20 DMA_TSF_DONE_FB2	DMA Transfer Done in Frame Buffer2. Indicates that the DMA transfer from RxFIFO to Frame Buffer2 is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by by writing 1 or reflashing the RxFIFO dma controller in CSICR3. (Cleared by writing 1) 0 DMA transfer is not completed. 1 DMA transfer is completed.
19 DMA_TSF_DONE_FB1	DMA Transfer Done in Frame Buffer1. Indicates that the DMA transfer from RxFIFO to Frame Buffer1 is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by by writing 1 or reflashing the RxFIFO dma controller in CSICR3. (Cleared by writing 1) 0 DMA transfer is not completed. 1 DMA transfer is completed.
18 RxFF_INT	RxFIFO Full Interrupt Status. Indicates the number of data in the RxFIFO reaches the trigger level. (this bit is cleared automatically by reading the RxFIFO) 0 RxFIFO is not full. 1 RxFIFO is full.
17 EOF_INT	End of Frame (EOF) Interrupt Status. Indicates when EOF is detected. (Cleared by writing 1) 0 EOF is not detected. 1 EOF is detected.
16 SOF_INT	Start of Frame Interrupt Status. Indicates when SOF is detected. (Cleared by writing 1)

Table continues on the next page...

CSI_CSISR field descriptions (continued)

Field	Description
	0 SOF is not detected. 1 SOF is detected.
15 F2_INT	CCIR Field 2 Interrupt Status. Indicates the presence of field 2 of video in CCIR mode. (Cleared automatically when current field does not match) NOTE: Only works in CCIR Interlace mode. 0 Field 2 of video is not detected 1 Field 2 of video is about to start
14 F1_INT	CCIR Field 1 Interrupt Status. Indicates the presence of field 1 of video in CCIR mode. (Cleared automatically when current field does not match) NOTE: Only works in CCIR Interlace mode. 0 Field 1 of video is not detected. 1 Field 1 of video is about to start.
13 COF_INT	Change Of Field Interrupt Status. Indicates that a change of the video field has been detected. Only works in CCIR Interlace mode. Software should read this bit first and then dispatch the new field from F1_INT and F2_INT. (Cleared by writing 1) 0 Video field has no change. 1 Change of video field is detected.
12–8 -	This field is reserved. Reserved. These bits are reserved and should read 0.
7 HRESP_ERR_INT	Hresponse Error Interrupt Status. Indicates that a hresponse error has been detected. (Cleared by writing 1) 0 No hresponse error. 1 Hresponse error is detected.
6–2 -	This field is reserved. Reserved. These bits are reserved and should read 0.
1 ECC_INT	CCIR Error Interrupt. This bit indicates an error has occurred. This only works in CCIR Interlace mode. (Cleared by writing 1) 0 No error detected 1 Error is detected in CCIR coding
0 DRDY	RXFIFO Data Ready. Indicates the presence of data that is ready for transfer in the RxFIFO. (Cleared automatically by reading FIFO) 0 No data (word) is ready 1 At least 1 datum (word) is ready in RXFIFO.

16.7.8 CSI DMA Start Address Register - for STATFIFO (CSI_CSIDMASA_STATFIFO)

This register provides the start address for the embedded DMA controller of STATFIFO. The embedded DMA controller will read data from STATFIFO and write it to the external memory from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 20E_8000h base + 20h offset = 20E_8020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CSI_CSIDMATS_STATFIFO field descriptions

Field	Description
DMA_TSF_SIZE_SFF	DMA Transfer Size for STATFIFO. Indicates how many words to be transfered by the embedded DMA controller. The size should be words aligned.

16.7.10 CSI DMA Start Address Register - for Frame Buffer1 (CSI_CSIDMASA_FB1)

This register provides the start address in the frame buffer1 for the embedded DMA controller of RxFIFO. The embedded DMA controller will read data from RxFIFO and write it to the frame buffer1 from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 20E_8000h base + 28h offset = 20E_8028h

Field	Description
31–2 DMA_START_ADDR_FB2	DMA Start Address in Frame Buffer2. Indicates the start address to write data. The embedded DMA controller will read data from RxFIFO and write it from this address through AHB bus. The address should be words aligned.
-	This field is reserved. Reserved. These bits are reserved and should read 0.

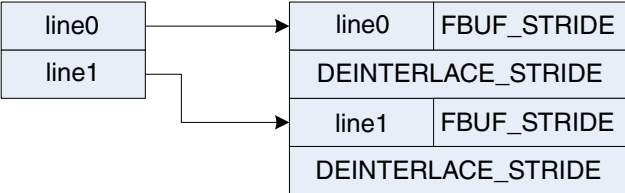

16.7.12 CSI Frame Buffer Parameter Register (CSI_CSIFBUF_PARA)

This register provides the stride of the frame buffer to show how many words to skip before starting to write the next row of the image. The width of the frame buffer minus the width of the image is the stride. This register should be configured before activating or restarting the embedded DMA controller.

Address: 20E_8000h base + 30h offset = 20E_8030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CSI_CSIFBUF_PARA field descriptions

Field	Description
31–16 DEINTERLACE_STRIDE	<p>DEINTERLACE_STRIDE is only used in the deinterlace mode. If line stride feature is supported in deinterlace mode, FBUF_STRIDE and DEINTERLACE_STRIDE need to be configured at the same time. DEINTERLACE_STRIDE is configured the same as line width. In normal line stride feature, only FBUF_STRIDE needs to be configured.</p>  <p>The diagram illustrates the relationship between line0 and line1 and their corresponding stride parameters. For line0, FBUF_STRIDE and DEINTERLACE_STRIDE are shown. For line1, FBUF_STRIDE is shown, and DEINTERLACE_STRIDE is also indicated, suggesting it is shared or derived from line0's configuration.</p>
FBUF_STRIDE	<p>Frame Buffer Parameter. Indicates the stride of the frame buffer. The width of the frame buffer(in word) minus the width of the image(in word) is the stride. The stride should be word aligned. The embedded DMA controller will skip the stride before starting to write the next row of the image.</p>

16.7.13 CSI Image Parameter Register (CSI_CSIMAG_PARA)

This register provides the width and the height of the image from the sensor. The width and height should be aligned in pixel. The width of the image multiplied by the height is the total pixel size that will be transferred in a frame by the embedded DMA controller. This register should be configured before activating or restarting the embedded DMA controller.

Address: 20E_8000h base + 34h offset = 20E_8034h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

4 BASEADDR_ SWITCH_EN	When this bit is enabled, CSI DMA will switch the base address according to BASEADDR_SWITCH_SEL rather than atomically by DMA completed.
3 PARALLEL24_ EN	When input is parallel rgb888/yuv444 24bit, this bit can be enabled.
2 DEINTERLACE_ EN	This bit is used to select the output method When input is standard CCIR656 video. 0 Deinterlace disabled 1 Deinterlace enabled
-	This field is reserved. Reserved.

16.7.15 CSI Control Register 19 (CSI_CSICR19)

This read/write register acts as an extension of the functionality of the CSI Control register 1

Address: 20E_8000h base + 4Ch offset = 20E_804Ch

CSI_CSICR19 field descriptions

Field	Description
31–8 -	This field is reserved.
DMA_RFIFO_HIGHEST_FIFO_LEVEL	This byte stores the highest FIFO level achieved by CSI FIFO timely and will be clear by writing 8'ff to it.

Chapter 17

Enhanced Configurable SPI (ECSPI)

17.1 Overview

The Enhanced Configurable Serial Peripheral Interface (ECSPI) is a full-duplex, synchronous, four-wire serial communication block.

The ECSPI contains a 64 x 32 receive buffer (RXFIFO) and a 64 x 32 transmit buffer (TXFIFO). With data FIFOs, the ECSPI allows rapid data communication with fewer software interrupts. The figure below shows a block diagram of the ECSPI.

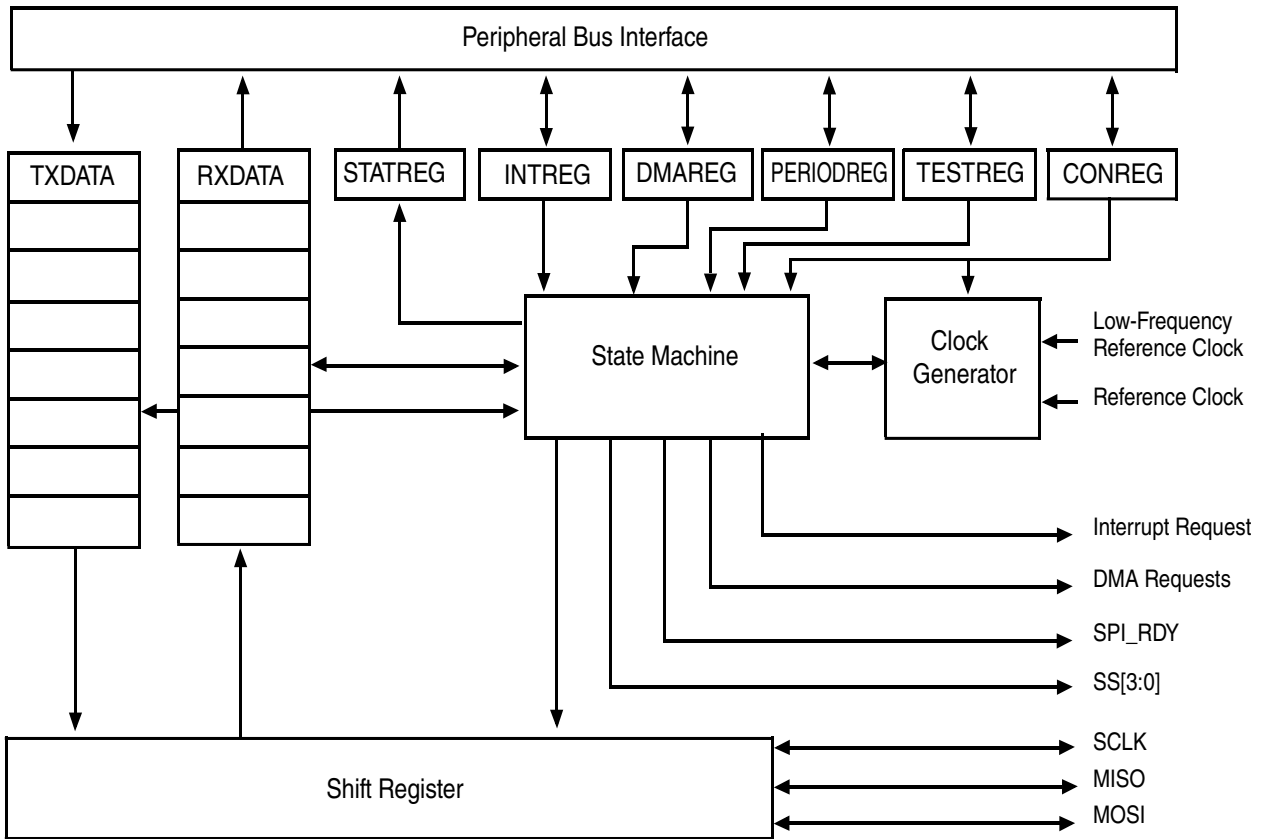

Figure 17-1. ECSPI Block Diagram

17.1.1 Features

Key features of the ECSPI include:

- Full-duplex synchronous serial interface
- Master/Slave configurable
- Four Chip Select (SS) signals to support multiple peripherals
- Transfer continuation function allows unlimited length data transfers
- 32-bit wide by 64-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SS) and SPI Clock (SCLK) are configurable
- Direct Memory Access (DMA) support
- Max operation frequency up to the reference clock frequency.

17.1.2 Modes and Operations

The ECSPI supports the modes described in the indicated sections:

- [Master Mode](#)
- [Slave Mode](#)
- [Low Power Modes](#)

As described in [Operations](#), the ECSPI supports the operations described in the indicated sections:

- [Typical Master Mode](#)
 - [Master Mode with SPI_RDY](#)
 - [Master Mode with Wait States](#)
 - [Master Mode with SS_CTL\[3:0\] Control](#)
 - [Master Mode with Phase Control](#)
- [Typical Slave Mode](#)

17.2 External Signals

The following table describes the external signals of ECSPI:

Table 17-1. ECSPI1 External Signals

Signal	Description	Pad	Mode	Direction
ECSPI1_MISO (MISO)	Master data in; slave data out	ECSPI1_MISO	ALT0	IO
		LCD_DATA01	ALT1	
ECSPI1_MOSI (MOSI)	Master data out; slave data in	ECSPI1_MOSI	ALT0	IO

Figure 17-2 shows the ECSPI in master mode connected to four external devices in a one-way communication link.

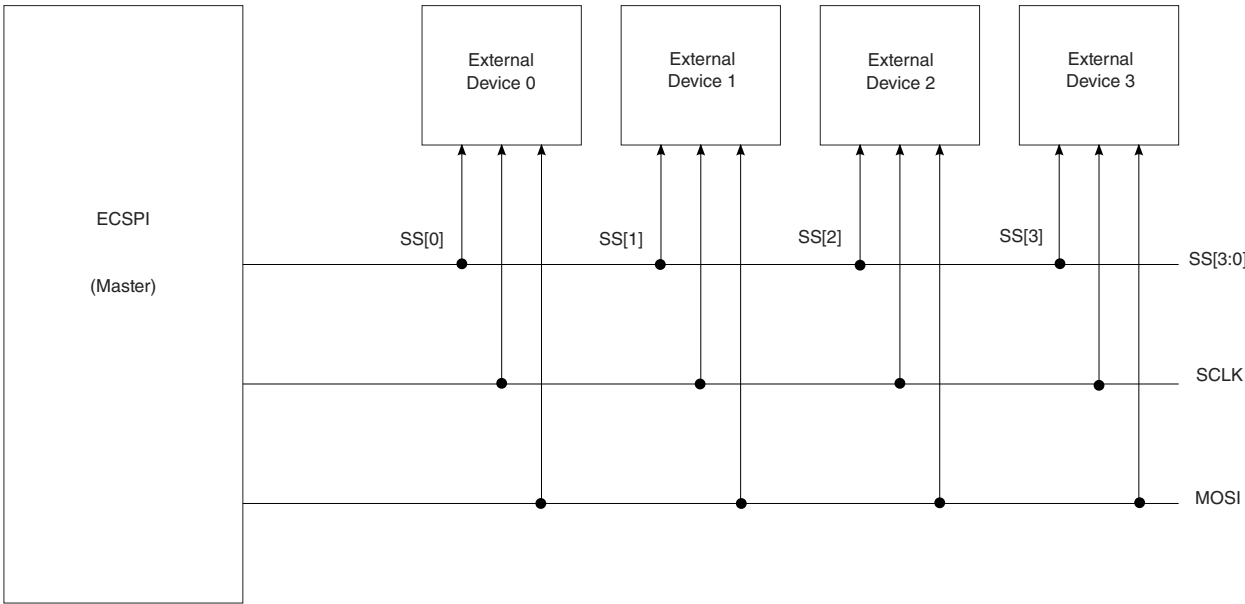

Figure 17-2. Example Connection Diagram

17.3 Clocks

The following table describes the clock sources for eCSPI. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 17-5. eCSPI Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_per	ecspi_clk_root	eCSPI module clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

17.4 Functional Description

This section provides a complete functional description of the ECSPI. The figure found here shows the relationship of SCLK and data lines while ECSPI has been configured with different POL and PHA settings.

Figure 17-3. ECSPI SCLK, MISO, and MOSI Relationship

17.4.1 Master Mode

When the ECSPI is configured as a master, it uses a serial link to transfer data between the ECSPI and an external slave device.

One of the Chip Select (SS) signals and the clock signal (SCLK) are used to transfer data between two devices. If the external device is a transmit-only device, the ECSPI master's output port can be ignored and used for other purposes. In order to use the internal TXFIFO and RXFIFO, two auxiliary output signals, Chip Select (SS) and SPI_RDY, are used for data transfer rate control. Software can also configure the sample period control register to a fixed data transfer rate.

17.4.2 Slave Mode

When the ECSPI is configured as a slave, software can configure the ECSPI Control register to match the external SPI master's timing.

In this configuration, Chip Select (\overline{SS}) becomes an input signal, and is used to control data transfers through the Shift register, as well as to load/store the data FIFO.

Slave mode only supports the case when ECSPIx_CONFIGREG[SS_CTL] is cleared. The accurate burst length should always be specified using the BURST_LENGTH parameter. ECSPIx_CONFIGREG[SS_CTL] set to 1 is not supported in slave mode.

17.4.3 Low Power Modes

The ECSPI does not operate under low power mode.

It holds its operation when its clock is gated off in master mode. In slave mode, the ECSPI does not respond when its clock is gated off.

17.4.4 Operations

The information found here describes the ECSPI's operations.

17.4.4.1 Typical Master Mode

The ECSPI master uses the Chip Select (SS) signal to enable an external SPI device, and uses the SCLK signal to transfer data in and out of the Shift register.

The SPI_RDY enables fast data communication with fewer software interrupts. By programming the ECSPI_PERIODREG register accordingly, the ECSPI can be used for a fixed data transfer rate.

When the ECSPI is in Master mode the SS, SCLK, and MOSI are output signals, and the MISO signal is an input.

Figure 17-4. Typical SPI Burst (8-bit Transfer)

In the above figure, the Chip Select (SS) signal enables the selected external SPI device, and the SCLK synchronizes the data transfer. The MOSI and MISO signals change on rising edge of SCLK and the MISO signal is latched on the falling edge of the SCLK. The figure above shows a data of 0xD2 is shifted out, and a data of 0x66 is shifted in.

17.4.4.1.1 Master Mode with SPI_RDY

By default, the ECSPI does not use the SPI_RDY signal in master mode (MODE = 1).

A SPI burst begins when the following events happen:

- The ECSPI is enabled, TXFIFO has data in it, and ECSPI_CONREG[XCH] bit or the ECSPI_CONREG[SMC] bit is set.
- When the SPI Data Ready Control (ECSPI_CONREG[DRCTL]) bits contains either 01 or 10, the SPI_RDY signal controls when a SPI burst starts.

A SPI burst is defined as a bus transaction that starts when the slave select is asserted and ends when the slave select is negated. The Chip Select (SS) signal will remain asserted until all the bits in a SPI burst are shifted out.

If ECSPI_CONREG[DRCTL] is set to 01, the SPI burst can be triggered only if a falling edge of the SPI_RDY signal has been detected.

The following figure shows the relationship between a SPI burst and the falling edge of SPI_RDY signal.

Figure 17-5. Relationship Between a SPI Burst and SPI_RDY: Falling-Edge Triggered

A SPI burst does not start until the falling edge of the SPI_RDY signal is detected. The next SPI burst starts when the next SPI_RDY falling edge is detected, after the last burst has finished.

If SPI Data Ready Control (ECSPI_CONREG[DRCTL]) is set to 10, the SPI burst can be triggered only if the SPI_RDY signal is low.

The following figure shows the relationship between a SPI burst and the SPI_RDY signal. The SPI burst does not begin until the SPI_RDY signal goes low. The ECSPI will keep transmitting SPI burst if the SPI_RDY signal remains low.

Figure 17-6. Relationship Between a SPI Burst and SPI_RDY: Low-Level Triggered

17.4.4.1.2 Master Mode with Wait States

Wait states can be inserted between SPI bursts. This provides a way for software to slow down the SPI burst to meet the timing requirements of a slower SPI device.

The following figure shows wait states inserted between SPI bursts.

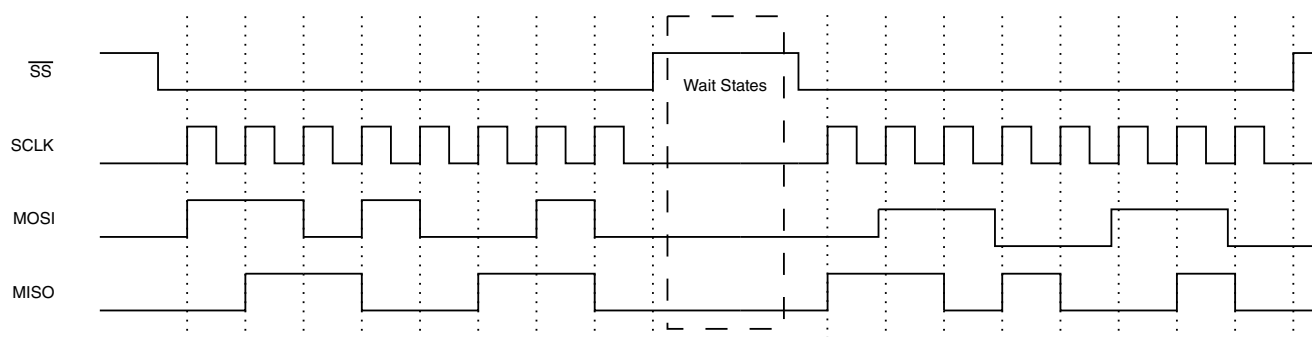

Figure 17-7. SPI Bursts with Wait States

In this case, the number of wait states is controlled by ECSPI_PERIODREG[SAMPLE PERIOD] and the wait states' clock source is selected by ECSPI_PERIODREG[CSRC].

17.4.4.1.3 Master Mode with SS_CTL[3:0] Control

The SPI SS Control (SS_CTL[3:0]) controls whether the current operation is single burst or multiple bursts.

When the SPI SS Wave Form Select (SS_CTL[3:0]) is set, the current operation is multiple bursts transfer. When the SPI SS Wave Form Select (SS_CTL[3:0]) bit is cleared, the current operation is single burst transfer. A SPI burst can contains multiple words as defined in the BURST LENGTH field of the ECSPI_CONREG register.

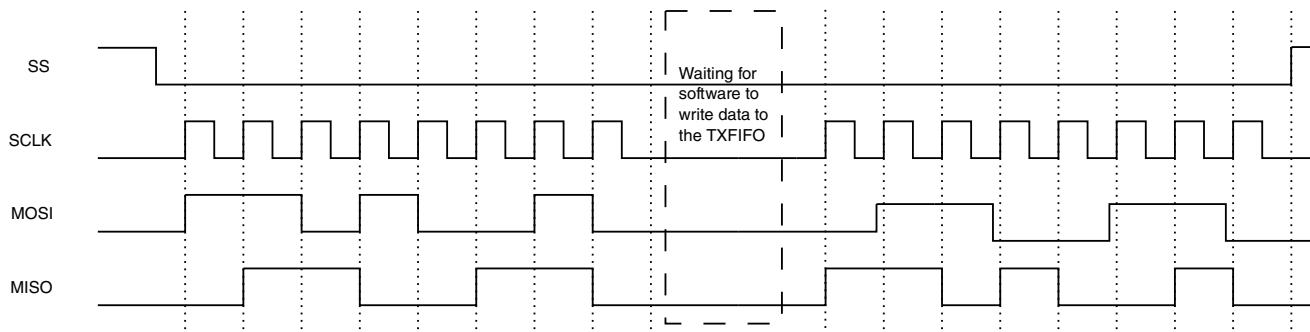

Figure 17-8. SPI Burst While SS_CTL[3:0] is Clear

In [Figure 17-8](#), two 8-bit bursts in the TXFIFO have been combined and transmitted in one SPI burst. The maximum length of a single SPI burst is defined in the BURST LENGTH field of the ECSPI_CONREG control register. ([Figure 17-8](#) corresponds to a BURST LENGTH of 8.) This provides a way for transferring a longer SPI burst by writing data into TXFIFO while the ECSPI is transmitting.

Figure 17-9. SPI Bursts While SS_CTL[3:0] is Set

In [Figure 17-9](#), two FIFO entries are transmitted, one entry with each SPI burst. The ECSPI will continue to transmit SPI bursts until the TXFIFO is empty. When wait states can be inserted between SPI bursts, the SS will negate between SPI bursts until the wait states finish.

17.4.4.1.4 Master Mode with Phase Control

The Phase Control (ECSPI_CONREG[PHA]) bit controls how the transmit data shifts out and the receive data shifts in.

When the Phase control (ECSPI_CONREG[PHA]) bit is set, the transmit data will shift out on the rising edge of SCLK, and the receive data is latched on the falling edge of SCLK. The most-significant bit is output on the first rising SCLK edge.

When ECSPI_CONREG[PHA] is cleared, the transmit data is shifted out on the falling edge of SCLK and the receive data is latched on the rising edge of SCLK. The MSB is output when the host processor loads the transmitted data.

Inverting the SCLK polarity does not impact the edge-triggered operations because they are internal to the serial peripheral interface master. [Figure 17-10](#) shows how SPI burst works with different POL and PHA configuration.

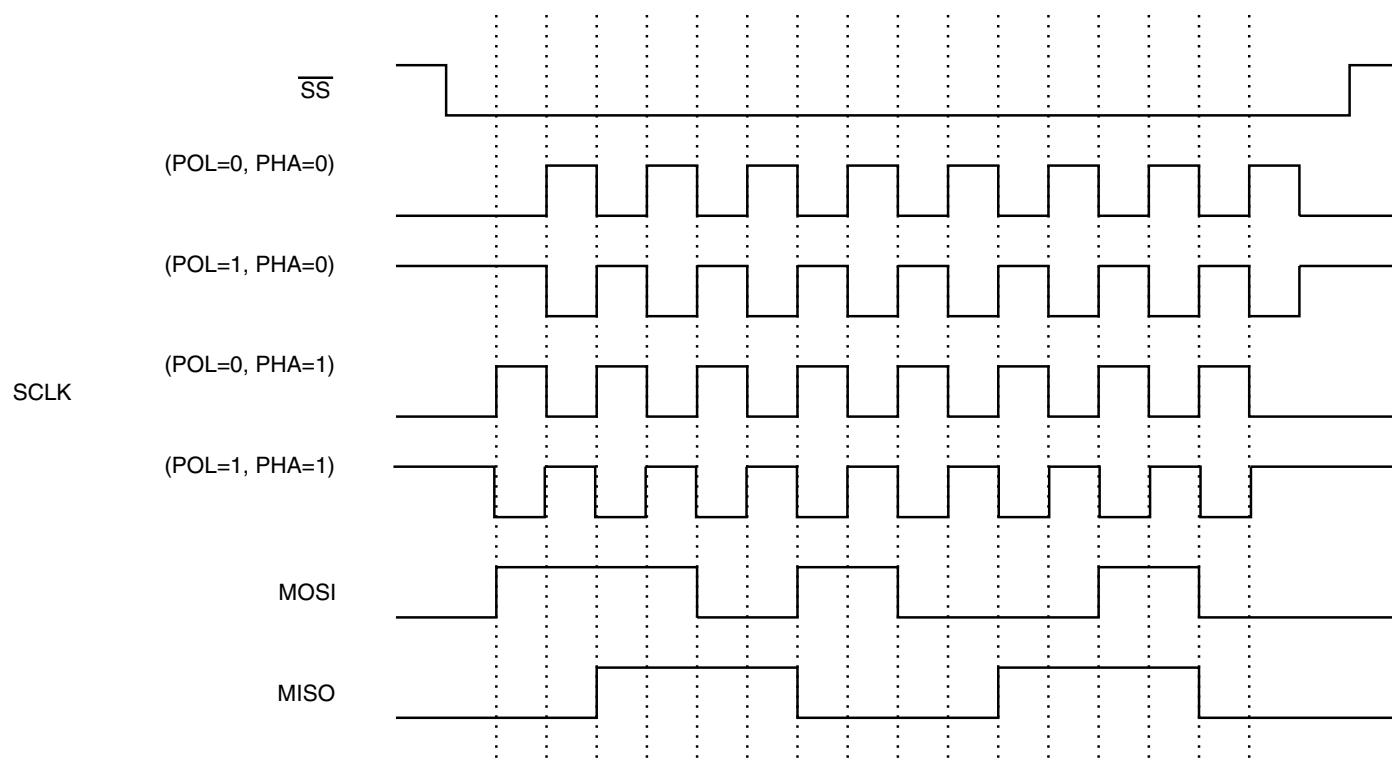

Figure 17-10. SPI Burst with Different POL and PHA Configurations

17.4.4.2 Typical Slave Mode

When the ECSPI is configured as a slave (Mode = 0), software can configure the ECSPI Control register to match the external SPI master's timing. In this configuration, \overline{SS} becomes an input signal, and is used to latch data in and out of the internal data Shift registers, as well as to advance the data FIFO.

The SS, SCLK, and MOSI are inputs and MISO is output. Most of the timing diagrams are similar to the diagrams shown previously for the SPI in Master mode (Mode = 1), because the inputs come from a SPI master device.

However, the timing is different when SS is used to advance the data FIFO. When the SS_POL=0 is set while the ECSPI is configured in Slave mode, the data FIFO will advance on the rising edge of the SS signal. When the polarity is reversed (SS_POL = 1), the data FIFO will advance on the falling edge of the SS signal.

The figure below shows a SPI burst in which the data FIFO is advanced by the rising edge of the SS signal.

Figure 17-11. Advancing the Data FIFO on the Rising Edge of \overline{SS}

In the above case, only the most significant 7 bits are loaded to the RXFIFO.

17.4.5 Reset

Whenever a device reset occurs, a reset is performed on the ECSPI, resetting all registers to their default values.

Software can reset the block using the CONREG[EN] bit; see [ECSPI](#).

17.4.6 Interrupts

Interrupt control provides a way to manage the ECSPI FIFOs:

- For transmitting data, software can enable the TXFIFO empty, TXFIFO data request, and TXFIFO full interrupts to maintain the TXFIFO using an interrupt service routine.
- For receiving data, software can enable the RXFIFO ready, RXFIFO data request, and RXFIFO full interrupts to retrieve data from the RXFIFO using an interrupt service routine.

Other interrupt sources can be used to control or debug the SPI bursts:

- The transfer-completed interrupt means that there is no data left in the TXFIFO and that the data in the Shift register has been shifted out.
- The RXFIFO overflow interrupt means that the RXFIFO received more than 64 words and will not accept any other words.

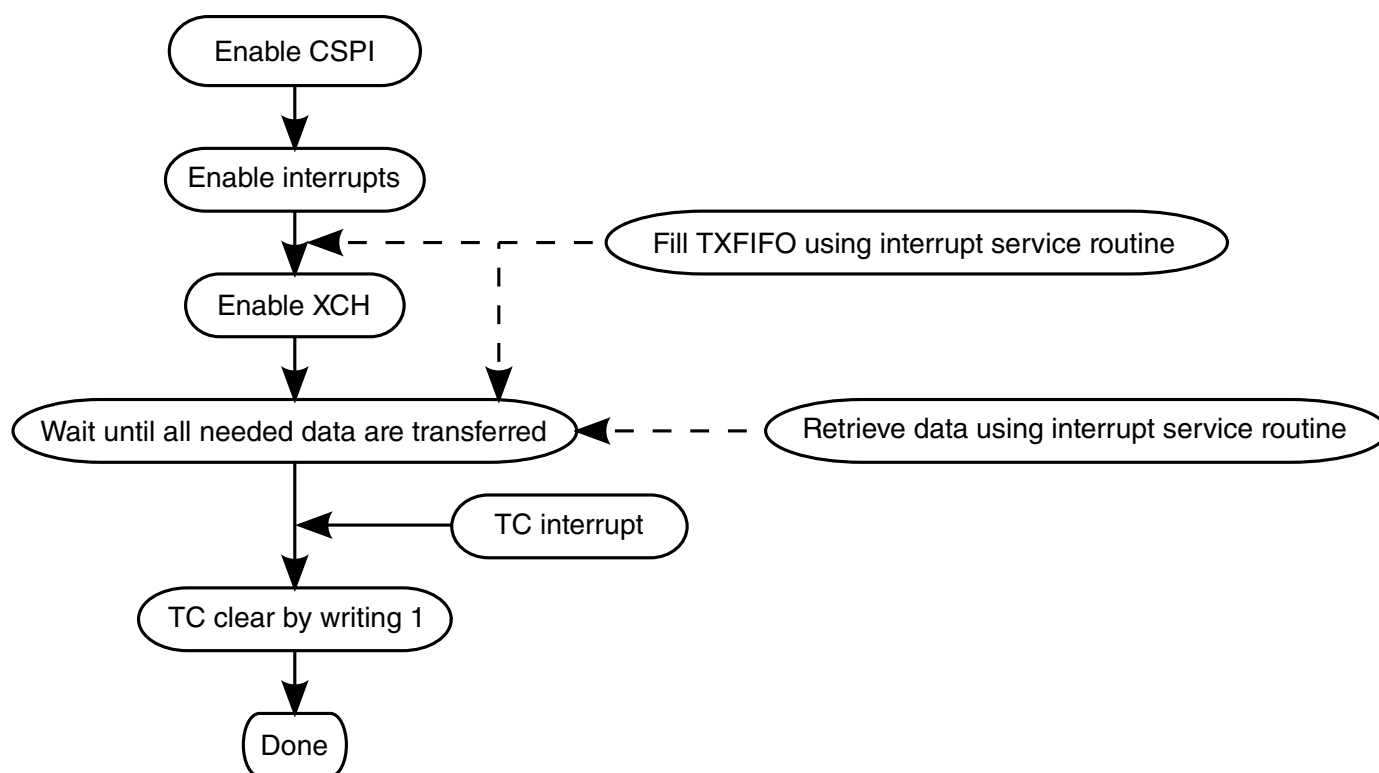

Figure 17-12. Program Sequence of SPI Burst Using Interrupt Control

17.4.7 DMA

DMA control provides another method to utilize the FIFOs in the ECSPI. By using DMA request and acknowledge signals, larger amounts of data can be transferred, and will reduce interrupts and host processor loading. When the appropriate conditions are matched, the block will send out a DMA request.

The DMA can deal with the following conditions:

- TXFIFO empty
- TXFIFO data request
- RXFIFO data request
- RXFIFO full

The figure below shows a program sequence of SPI bursts using DMA control.

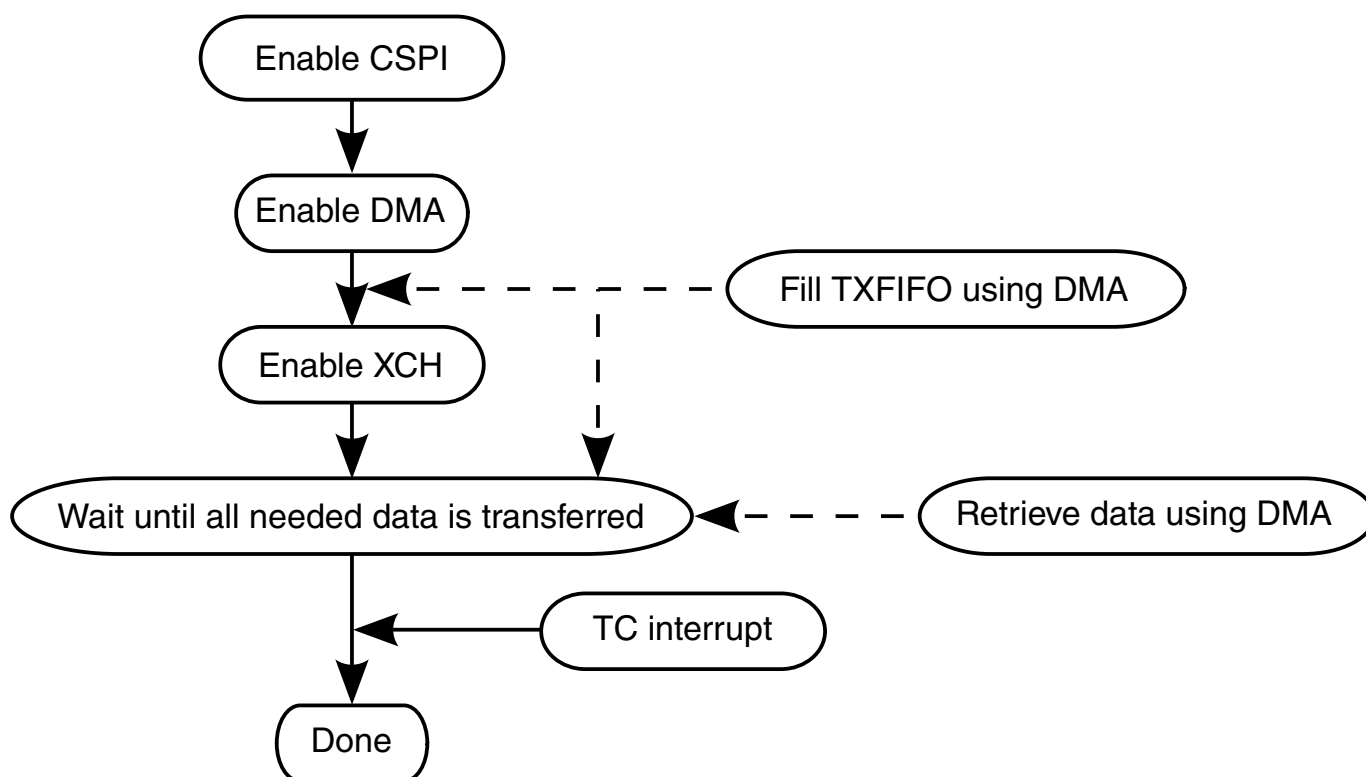

Figure 17-13. Program Sequence of SPI Burst Using DMA

17.4.8 Byte Order

The ECSPI does not support byte re-ordering in hardware.

17.5 Initialization

This section provides initialization information for ECSPI.

To initialize the block:

1. Clear the EN bit in ECSPI_CONREG to reset the block.
2. Enable the clocks for ECSPI within the CCM.
3. Configure the Control Register and then set the EN bit in the ECSPI_CONREG to put ECSPI out of reset.
4. Configure corresponding IOMUX for ECSPI external signals.
5. Configure registers of ECSPI properly according to the specifications of the external SPI device.

17.6 Applications

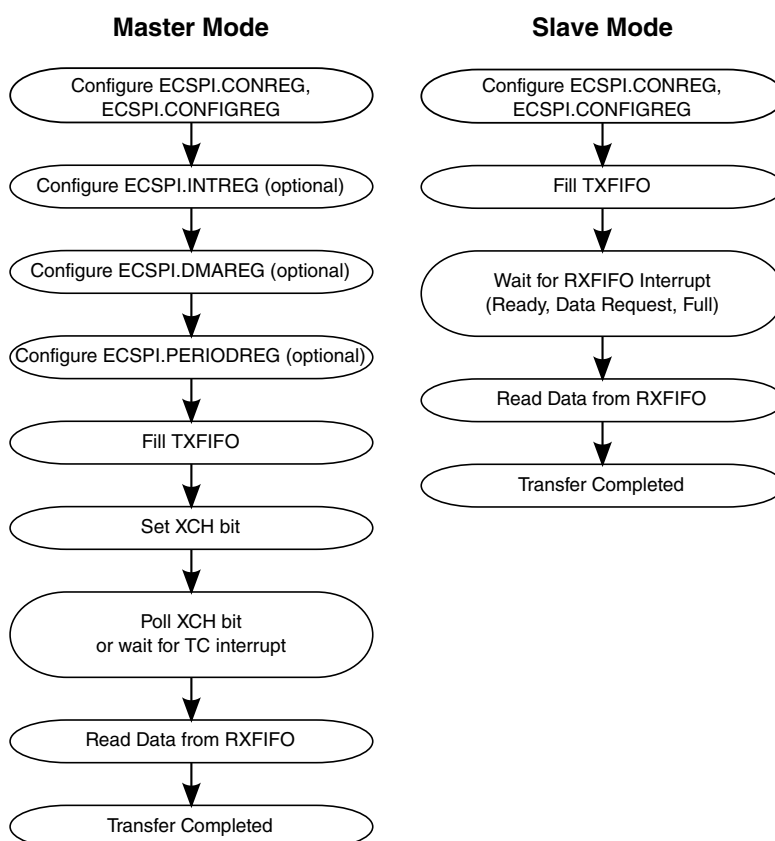

Figure 17-14. Flowchart of the ECSPI Operation

17.7 ECSPI Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a particular block instantiation, see the system memory map.

ECSPI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

17.7.1 Receive Data Register (ECSPIx_RXDATA)

The Receive Data register (ECSPI_RXDATA) is a read-only register that forms the top word of the 64 x 32 receive FIFO. This register holds the data received from an external SPI device during a data transaction. Only word-sized read operations are allowed.

Address: Base address + 0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECSPIx_RXDATA field descriptions

Field	Description
ECSPI_RXDATA	Receive Data. This register holds the top word of the receive data FIFO. The FIFO is advanced for each read of this register. The data read is undefined when the Receive Data Ready (RR) bit in the Interrupt Control/Status register is cleared. Zeros are read when ECSPI is disabled.

17.7.2 Transmit Data Register (ECSPIx_TXDATA)

The Transmit Data (ECSPI_TXDATA) register is a write-only data register that forms the bottom word of the 64 x 32 TXFIFO. The TXFIFO can be written to as long as it is not full, even when the SPI Exchange bit (XCH) in ECSPI_CONREG is set. This allows software to write to the TXFIFO during a SPI data exchange process. Writes to this register are ignored when the ECSPI is disabled (ECSPI_CONREG[EN] bit is cleared).

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECSPIx_TXDATA field descriptions

Field	Description
ECSPI_TXDATA	Transmit Data. This register holds the top word of data loaded into the FIFO. Data written to this register must be a word operation. The number of bits actually transmitted is determined by the BURST_LENGTH field of the corresponding SPI Control register. If this field contains more bits than the number specified by BURST_LENGTH, the extra bits are ignored. For example, to transfer 10 bits of data, a 32-bit word must be written to this register. Bits 9-0 are shifted out and bits 31-10 are ignored. When the ECSPI is operating in Slave mode, zeros are shifted out when the FIFO is empty. Zeros are read when ECSPI is disabled.

17.7.3 Control Register (ECSPIx_CONREG)

The Control Register (ECSPI_CONREG) allows software to enable the ECSPI , configure its operating modes, specify the divider value, and SPI_RDY control signal, and define the transfer length.

Address: Base address + 8h offset

ECSPiX_CONREG field descriptions

Field	Description
31–20 BURST_LENGTH	<p>Burst Length. This field defines the length of a SPI burst to be transferred. The Chip Select (SS) will remain asserted until all bits in a SPI burst are shifted out. A maximum of 2^{12} bits can be transferred in a single SPI burst.</p> <p>In master mode, it controls the number of bits per SPI burst. Since the shift register always loads 32-bit data from transmit FIFO, only the n least-significant ($n = \text{BURST_LENGTH} + 1$) will be shifted out. The remaining bits will be ignored.</p> <p>Number of Valid Bits in a SPI burst.</p> <p>0x000 A SPI burst contains the 1 LSB in a word. 0x001 A SPI burst contains the 2 LSB in a word. 0x002 A SPI burst contains the 3 LSB in a word. ... 0x01F A SPI burst contains all 32 bits in a word. 0x020 A SPI burst contains the 1 LSB in first word and all 32 bits in second word. 0x021 A SPI burst contains the 2 LSB in first word and all 32 bits in second word. ... 0xFFE A SPI burst contains the 31 LSB in first word and $2^7 - 1$ words. 0xFFF A SPI burst contains 2^7 words.</p>
19–18 CHANNEL_SELECT	<p>SPI CHANNEL SELECT bits. Select one of four external SPI Master/Slave Devices. In master mode, these two bits select the external slave devices by asserting the Chip Select (SS$_n$) outputs. Only the selected Chip Select (SS$_n$) signal can be active at a given time; the remaining three signals will be negated.</p> <p>00 Channel 0 is selected. Chip Select 0 (SS0) will be asserted. 01 Channel 1 is selected. Chip Select 1 (SS1) will be asserted. 10 Channel 2 is selected. Chip Select 2 (SS2) will be asserted. 11 Channel 3 is selected. Chip Select 3 (SS3) will be asserted.</p>
17–16 DRCTL	<p>SPI Data Ready Control. This field selects the utilization of the SPI_RDY signal in master mode. ECSPI checks this field before it starts an SPI burst.</p> <p>00 The SPI_RDY signal is a don't care. 01 Burst will be triggered by the falling edge of the SPI_RDY signal (edge-triggered). 10 Burst will be triggered by a low level of the SPI_RDY signal (level-triggered). 11 Reserved.</p>
15–12 PRE_DIVIDER	<p>SPI Pre Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the pre-divisor of the reference clock.</p> <p>0000 Divide by 1. 0001 Divide by 2. 0010 Divide by 3. ... 1101 Divide by 14. 1110 Divide by 15. 1111 Divide by 16.</p>
11–8 POST_DIVIDER	<p>SPI Post Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the post-divisor of the reference clock using the equation: 2^n.</p> <p>0000 Divide by 1. 0001 Divide by 2.</p>

Table continues on the next page...

ECSPIx_CONREG field descriptions (continued)

Field	Description
	0010 Divide by 4. ... 1110 Divide by 2^{14} . 1111 Divide by 2^{15} .
7–4 CHANNEL_ MODE	SPI CHANNEL MODE selects the mode for each SPI channel. CHANNEL MODE[3] is for SPI channel 3. CHANNEL MODE[2] is for SPI channel 2. CHANNEL MODE[1] is for SPI channel 1. CHANNEL MODE[0] is for SPI channel 0. 0 Slave mode. 1 Master mode.
3 SMC	Start Mode Control. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). It controls how the ECSPI starts a SPI burst, either through the SPI exchange bit, or immediately when the TXFIFO is written to. 0 SPI Exchange Bit (XCH) controls when a SPI burst can start. Setting the XCH bit will start a SPI burst or multiple bursts. This is controlled by the SPI SS Wave Form Select (SS_CTL). Refer to XCH and SS_CTL descriptions. 1 Immediately starts a SPI burst when data is written in TXFIFO.
2 XCH	SPI Exchange Bit. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). If the Start Mode Control (SMC) bit is cleared, writing a 1 to this bit starts one SPI burst or multiple SPI bursts according to the SPI SS Wave Form Select (SS_CTL). The XCH bit remains set while either the data exchange is in progress, or when the ECSPI is waiting for an active input if SPIRDY is enabled through DRCTL. This bit is cleared automatically when all data in the TXFIFO and the shift register has been shifted out. 0 Idle. 1 Initiates exchange (write) or busy (read).
1 HT	Hardware Trigger Enable. This bit is used in master mode only. It enables hardware trigger (HT) mode. Note, HT mode is not supported by this product. 0 Disable HT mode. 1 Enable HT mode.
0 EN	SPI Block Enable Control. This bit enables the ECSPI. This bit must be set before writing to other registers or initiating an exchange. Writing zero to this bit disables the block and resets the internal logic with the exception of the ECSPI_CONREG. The block's internal clocks are gated off whenever the block is disabled. 0 Disable the block. 1 Enable the block.

17.7.4 Config Register (ECSPIx_CONFIGREG)

The Config Register (ECSPI_CONFIGREG) allows software to configure each SPI channel, configure its operating modes, specify the phase and polarity of the clock, configure the Chip Select (SS), and define the HT transfer length. Note, HT mode is not supported by this product.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECSPIx_CONFIGREG field descriptions

Field	Description
31–29 -	This field is reserved. Reserved
28–24 HT_LENGTH	HT LENGTH. This field defines the message length in HT Mode. Note, HT mode is not supported by this product. The length in bits of one message is (HT LENGTH + 1).
23–20 SCLK_CTL	SCLK CTL. This field controls the inactive state of SCLK for each SPI channel. SCLK CTL[3] is for SPI channel 3. SCLK CTL[2] is for SPI channel 2. SCLK CTL[1] is for SPI channel 1. SCLK CTL[0] is for SPI channel 0. 0 Stay low. 1 Stay high.
19–16 DATA_CTL	DATA CTL. This field controls inactive state of the data line for each SPI channel. DATA CTL[3] is for SPI channel 3. DATA CTL[2] is for SPI channel 2. DATA CTL[1] is for SPI channel 1. DATA CTL[0] is for SPI channel 0. 0 Stay high. 1 Stay low.
15–12 SS_POL	SPI SS Polarity Select. In both Master and Slave modes, this field selects the polarity of the Chip Select (SS) signal. SS POL[3] is for SPI channel 3. SS POL[2] is for SPI channel 2. SS POL[1] is for SPI channel 1. SS POL[0] is for SPI channel 0.

Table continues on the next page...

ECSPiX_CONFIGREG field descriptions (continued)

Field	Description
	0 Active low. 1 Active high.
11–8 SS_CTL	<p>SPI SS Wave Form Select. In master mode, this field controls the output wave form of the Chip Select (SS) signal when the SMC (Start Mode Control) bit is cleared. The SS_CTL are ignored if the SMC bit is set.</p> <p>SS_CTL[3] is for SPI channel 3. SS_CTL[2] is for SPI channel 2. SS_CTL[1] is for SPI channel 1. SS_CTL[0] is for SPI channel 0.</p> <p>In slave mode, this bit controls when the SPI burst is completed.</p> <p>An SPI burst is completed by the Chip Select (SS) signal edges. (SSPOL = 0: rising edge; SSPOL = 1: falling edge) The RXFIFO is advanced whenever a Chip Select (SS) signal edge is detected or the shift register contains 32-bits of valid data.</p> <p>0 In master mode - only one SPI burst will be transmitted. 1 In master mode - Negate Chip Select (SS) signal between SPI bursts. Multiple SPI bursts will be transmitted. The SPI transfer will automatically stop when the TXFIFO is empty.</p> <p>0 In slave mode - an SPI burst is completed when the number of bits received in the shift register is equal to (BURST LENGTH + 1). Only the n least-significant bits (n = BURST LENGTH[4:0] + 1) of the first received word are valid. All bits subsequent to the first received word in RXFIFO are valid. 1 Reserved</p>
7–4 SCLK_POL	<p>SPI Clock Polarity Control. This field controls the polarity of the SCLK signal. See Figure 17-10 for more information.</p> <p>SCLK_POL[3] is for SPI channel 3. SCLK_POL[2] is for SPI channel 2. SCLK_POL[1] is for SPI channel 1. SCLK_POL[0] is for SPI channel 0.</p> <p>0 Active high polarity (0 = Idle). 1 Active low polarity (1 = Idle).</p>
SCLK_PHA	<p>SPI Clock/Data Phase Control. This field controls the clock/data phase relationship. See Figure 17-10 for more information.</p> <p>SCLK_PHA[3] is for SPI channel 3. SCLK_PHA[2] is for SPI channel 2. SCLK_PHA[1] is for SPI channel 1. SCLK_PHA[0] is for SPI channel 0.</p> <p>0 Phase 0 operation. 1 Phase 1 operation.</p>

17.7.5 Interrupt Control Register (ECSPIx_INTREG)

The Interrupt Control Register (ECSPI_INTREG) enables the generation of interrupts to the host processor. If the ECSPI is disabled, this register reads zero.

Address: Base address + 10h offset

Field	Description
2 TFEN	TXFIFO Full Interrupt enable. This bit enables the TXFIFO Full Interrupt. 0 Disable 1 Enable
1 TDREN	TXFIFO Data Request Interrupt enable. This bit enables the TXFIFO Data Request Interrupt when the number of data entries in the TXFIFO is less than or equal to TX_THRESHOLD. 0 Disable 1 Enable
0 TEEN	TXFIFO Empty Interrupt enable. This bit enables the TXFIFO Empty Interrupt. 0 Disable 1 Enable

17.7.6 DMA Control Register (ECSPIx_DMAREG)

The Direct Memory Access Control Register (ECSPI_DMAREG) provides software a way to use an on-chip DMA controller for ECSPI data. Internal DMA request signals enable direct data transfers between the ECSPI FIFOs and system memory. The ECSPI sends out DMA requests when the appropriate FIFO conditions are matched.

If the ECSPI is disabled, this register is read as 0.

Address: Base address + 14h offset

ECSPIx_DMAREG field descriptions

Field	Description
31 RXTDEN	RXFIFO TAIL DMA Request/Interrupt Enable. This bit enables an internal counter that is increased at each read of the RXFIFO. This counter is cleared automatically when it reaches RX DMA LENGTH. If the number of words remaining in the RXFIFO is greater than or equal to RX DMA LENGTH, a DMA request/interrupt is generated even if it is less than or equal to RX_THRESHOLD. 0 Disable 1 Enable
30 -	This field is reserved. Reserved
29–24 RX_DMA_LENGTH	RX DMA LENGTH. This field defines the burst length of a DMA operation. Applies only when RXTDEN is set.
23 RXDEN	RXFIFO DMA Request Enable. This bit enables/disables the RXFIFO DMA Request. 0 Disable 1 Enable
22 -	This field is reserved. Reserved
21–16 RX_THRESHOLD	RX THRESHOLD. This field defines the FIFO threshold that triggers a RX DMA/INT request. A RX DMA/INT request is issued when the number of data entries in the RXFIFO is greater than RX_THRESHOLD.
15–8 -	This field is reserved. Reserved
7 TEDEN	TXFIFO Empty DMA Request Enable. This bit enables/disables the TXFIFO Empty DMA Request. 0 Disable 1 Enable
6 -	This field is reserved. Reserved
TX_THRESHOLD	TX THRESHOLD. This field defines the FIFO threshold that triggers a TX DMA/INT request. A TX DMA/INT request is issued when the number of data entries in the TXFIFO is not greater than TX_THRESHOLD.

17.7.7 Status Register (ECSPiX_STATREG)

The ECSPI Status Register (ECSPI_STATREG) reflects the status of the ECSPI's operating condition. If the ECSPI is disabled, this register reads 0x0000_0003.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Field	Description
	0 TXFIFO is not Full. 1 TXFIFO is Full.
1 TDR	TXFIFO Data Request. 0 Number of valid data slots in TXFIFO is greater than TX_THRESHOLD. 1 Number of valid data slots in TXFIFO is not greater than TX_THRESHOLD.
0 TE	TXFIFO Empty. This bit is set if the TXFIFO is empty. 0 TXFIFO contains one or more words. 1 TXFIFO is empty.

17.7.8 Sample Period Control Register (ECSPIx_PERIODREG)

The Sample Period Control Register (ECSPI_PERIODREG) provides software a way to insert delays (wait states) between consecutive SPI transfers. Control bits in this register select the clock source for the sample period counter and the delay count indicating the number of wait states to be inserted between data transfers.

The delay counts apply only when the current channel is operating in Master mode (ECSPI_CONREG[CHANNEL MODE] = 1). ECSPI_PERIODREG also contains the CSD CTRL field used to insert a delay between the Chip Select's active edge and the first SPI Clock edge.

Address: Base address + 1Ch offset

SAMPLE_ PERIOD	Sample Period Control. These bits control the number of wait states to be inserted in data transfers. During the idle clocks, the state of the SS output will operate according to the SS_CTL control field in the ECSPiX_CONREG register. 0x0000 0 wait states inserted 0x0001 1 wait state inserted 0x7FFE 32766 wait states inserted 0x7FFF 32767 wait states inserted

17.7.9 Test Control Register (ECSPIx_TESTREG)

The Test Control Register (ECSPI_TESTREG) provides software a mechanism to internally connect the receive and transmit devices of the ECSPI, and monitor the contents of the receive and transmit FIFOs.

Address: Base address + 20h offset

ECSPIx_TESTREG field descriptions

Field	Description
31 LBC	<p>Loop Back Control. This bit is used in Master mode only. When this bit is set, the ECSPI connects the transmitter and receiver sections internally, and the data shifted out from the most-significant bit of the shift register is looped back into the least-significant bit of the Shift register. In this way, a self-test of the complete transmit/receive path can be made. The output pins are not affected, and the input pins are ignored.</p> <p>0 Not connected. 1 Transmitter and receiver sections internally connected for Loopback.</p>

ECSPiX_MSGDATA field descriptions

Field	Description
ECSPI_MSGDATA	ECSPI_MSGDATA holds the top word of MSG Data FIFO. The MSG Data FIFO is advanced for each write of this register. The data read is zero. The data written to this register is stored in the MSG Data FIFO.

Chapter 18

Enhanced LCD Interface (eLCDIF)

18.1 Overview

The enhanced Liquid Crystal Display Interface (eLCDIF) is a general purpose display controller used to drive a wide range of display devices varying in size and capability.

The eLCDIF block supports the following:

- Displays with an asynchronous parallel MPU interface for command and data transfer to an integrated frame buffer.
- Displays that support moving pictures and require the RGB interface mode (DOTCLK interface).
- VSYNC mode for high-speed data transfers.
- Digital video encoders that accept ITU-R BT.656 format 4:2:2 YCbCr digital component video and convert it to analog TV signals.

The eLCDIF provides fully programmable functionality to supported interfaces:

- Bus master interface to source frame buffer data for display refresh. This interface can also be used to drive data for "Smart" displays.
- PIO interface to manage data transfers between "Smart" displays and SoC.
- 8/16/18/24/32 bit LCD data bus support available depending on I/O mux options.
- Programmable timing and parameters for MPU, VSYNC, and DOTCLK LCD interfaces to support a wide variety of displays.
- ITU-R BT.656 mode (called Digital Video Interface or DVI mode here) including progressive-to-interlace feature and RGB to YCbCr 4:2:2 color space conversion to support 525/60 and 625/50 operation.

18.3 Clocks

The following table describes the clock sources for eLCDIF. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 18-2. eLCDIF Clocks

Clock name	Clock Root	Description
apb_clk	lcdif_axi_clk_root	AXI clock
pix_clk	lcdif_pix_clk_root	Pixel clock

18.4 Functional Description

[Bus Interface Mechanisms](#) through [Initializing the eLCDIF](#), describe the internal pipeline for the eLCDIF interfaces. Differences for each mode are then described in separate sections, as follows:

- [MPU Interface](#)
- [VSYNC Interface](#)
- [DOTCLK Interface](#)
- [ITU-R BT.656 Digital Video Interface \(DVI\)](#)

eLCDIF pin usage by interface mode is described in [eLCDIF Pin Usage by Interface Mode](#).

Figure 18-1. Top-Level Block Diagram of eLCDIF subsystem

18.4.1 Bus Interface Mechanisms

The LCDIF module has memory-mapped control, data and status registers. It provides several interfaces to transfer data between the display and SoC.

The bus master interface is used to initiate the requests to transfer data from external memory to the display. It is completely autonomous, or no CPU intervention is required, to manage the cyclical nature of refreshing standard display types. Bus mastering can also be used for MPU mode data writes.

The PIO interface is used to interface to "Smart" displays to transfer frame buffer data and control information to/from the external display. The host CPU executes display drivers to manage the display solution. The following sections describe the system bus interface mechanisms.

18.4.1.1 Bus Master Operation in Write/Display Modes

The eLCDIF block has a bus master interface that initiates requests for data to drive the display. The LCDIF_MASTER bit must be set to 1 to enable the bus master interface. Software should program all control registers required to transfer the frame sequence.

In the MPU and VSYNC mode, single frames are transferred. When a complete frame is transferred, eLCDIF enters idle and clears the RUN bit in the CTRL register. For subsequent frame transmission, the eLCDIF setup sequence should be repeated.

The DOTCLK and DVI mode are used to refresh the display at the desired refresh rate and resolution, and drive displays that don't integrate a display buffer memory. When the display is refreshed, the eLCDIF will automatically update the LCDIF_CUR_BUF_ADDR register with the value in LCDIF_NEXT_BUF_ADDR at the end of current frame and start fetching the next frame from the new address. If the LCDIF_NEXT_BUF_ADDR register was not updated within a frame refresh cycle, eLCDIF will keep transmitting the last frame until a new value is programmed into that register.

eLCDIF also provides the capability of interlacing a progressive frame by fetching odd lines in the first field and then fetching even lines in the second field. This feature can be used in the DVI mode and can be turned on by setting the INTERLACE_FIELDS bit in the LCDIF_CTRL1 register.

18.4.1.2 System Bus Master Performance

The performance of the eLCDIF block can be controlled by changing the burst length and the outstanding cycle issuing capability depending on the memory bandwidth requirements. Two fields in the LCDIF_CTRL2 register will throttle system memory requests. The LCDIF_CTRL2_OUTSTANDING_REQS field will control how many requests the eLCDIF can have in flight on any given clock cycle. This should be programmed based on the expected system bus latency for returned read data. Also, the LCDIF_CTRL2_BURST_LEN_8 bit will set the number of 64 bit words requested for each eLCDIF system bus request to either 8 or 16 QWORDS. Generally, 4 outstanding requests of length 16 will provide enough performance to drive any standard display

resolution. These configuration bits are intended to change the access pattern of the eLCDIF to optimize system bus throughput when other system masters will contend for system memory resources.

The LCDIF_THRES register can also be used to optimize bus throughput and power consumption. The LCDIF_THRES_FASTCLOCK value can be used to change the BUS_CLK frequency when the number of pixels in the LFIFO is below this programmed threshold. The BUS_CLK should be set to a frequency that will exceed the bandwidth requirements of the desired display. In systems supporting the dynamic frequency modulation of the bus clock frequency, the BUS_CLK will be driven at the desired frequency when the number of pixels is below the FASTCLOCK threshold. When the number of pixels is above this threshold, the BUS_CLK will be reduced by a divide factor selected in the centralized clock control module. This will provide an average clock frequency that will exactly meet the pixel bandwidth requirements over time, and minimize power consumption to meet the display bandwidth requirements. During horizontal or vertical blanking intervals, when the LFIFO is full with data for the next active display interval, the clock can be reduced to a slow frequency for extended periods to reduce power consumption.

The LCDIF_THRES_PANIC value can be used to raise the priority of requests initiated by the eLCDIF to alter how the eLCDIF requests are arbitrated by the system bus infrastructure. The panic output control signal is raised when the number of 32bpp pixel equivalents in the LFIFO is less than this programmed value. Since the LFIFO is arranged as a 256x64bit quadword FIFO, it contains two 32bpp pixels per quadword, or 512 32bpp pixels total. To set the panic output when 3/4s of the LFIFO is empty, set the LCDIF_THRES_PANIC value to $3/4 * 512$, or 128. The panic signal output is used to assess higher priority to eLCDIF system requests to avoid eLCDIF under run errors during periods of high system bandwidth utilization.

The features available with the LCDIF_THRES register require support from system clocking and dynamic priority control. Refer to the appropriate block documentation to assess the system support for these features.

18.4.2 Write Data Path

eLCDIF supports raster based frame buffers and there is no support for tiled buffers.

There are several options to accommodate endianness of display buffers in memory before the data is processed for the external display. The LCDIF_CTRL[INPUT_DATA_SWIZZLE] field provides the following options for data word multiplexing:

Functional Description

00 (0): No swizzle (little-endian)
01 (1): Swap bytes 0 and 3, swap bytes 1 and 2 (big-endian)
10 (2): Swap half-words
11 (3): Swap bytes within each half-word

The LCDIF_CTRL[WORD_LENGTH] field indicates the input data/pixel format. LCDIF_TRANSFER_COUNT register denotes how much data is contained in each frame. The LCDIF_TRANSFER_COUNT[H_COUNT] field indicates the number of pixels per line and LCDIF_TRANSFER_COUNT[V_COUNT] indicates the total number of lines per frame. The LCDIF_CTRL1[BYTE_PACKING_FORMAT] field can be used to specify which bytes within the 32-bit word are going to be valid. For example, if the entire 32-bit word is valid, LCDIF_CTRL1[BYTE_PACKING_FORMAT] should be set to 0xF, if only lower 3 bytes of each word in the frame buffer are valid, then LCDIF_CTRL1[BYTE_PACKING_FORMAT] should be set to 0x7.

The LCDIF_CTRL[LCD_DATABUS_WIDTH] field suggests the width of the bus going to the display controller. There is an option to source all 32 bits of the input word and transfer it to the output I/O display interface. If the LCDIF_CTRL[LCD_DATABUS_WIDTH] is not the same as LCDIF_CTRL[WORD_LENGTH], eLCDIF will perform RGB to RGB color space conversion. For example, if the input frame has fewer bits per pixel than the display, as in a 16 bpp input frame going to 24 bpp LCD, eLCDIF will pad the MSBs of each color to the LSBs of the same color for each pixel. If the input frame has more bits per pixel than the display, for example, 24 bpp input frame going to 16 bpp LCD, eLCDIF will drop the LSBs of each color channel to convert to the lower color depth. eLCDIF also has the capability to support delta pixel displays by swizzling the R, G and B colors of each pixel in the odd and even lines of the frame separately by programming the LCDIF_CTRL2[ODD_LINE_PATTERN] and the LCDIF_CTRL2[EVEN_LINE_PATTERN] bit fields. This operation occurs after the RGB-to-RGB color space conversion operation.

eLCDIF also supports RGB to YCbCr 4:2:2 color space conversion. This is useful in the DVI mode since the TV encoder requires input in YCbCr 4:2:2 format. The LCDIF_CSC* registers have complete programmability over the CSC coefficients and offsets. The values must be written into these registers in the signed two's complement format.

The following list shows how the different input/output combinations can be obtained:

- LCDIF_CTRL[WORD_LENGTH]=1 indicates that the input is 8-bit data. This is most likely going to be used for sending commands in MPU interface, or maybe a gray scale image. Any combination of LCDIF_CTRL1[BYTE_PACKING_FORMAT] is permissible.

Limitation: LCDIF_TRANSFER_COUNT[H_COUNT] must be a multiple of the sum of BYTE_PACKING_FORMAT [3], BYTE_PACKING_FORMAT [2], BYTE_PACKING_FORMAT [1] and BYTE_PACKING_FORMAT [0].

LCDIF_CTRL[LCD_DATABUS_WIDTH] must be 1, indicating an 8-bit data bus.

- LCDIF_CTRL[WORD_LENGTH]=0 implies the input frame buffer is RGB 16 bits per pixel. LCDIF_CTRL[DATA_FORMAT_16_BIT] field determines the pixels are RGB 555 or RGB 565.

Limitation: LCDIF_CTRL1[BYTE_PACKING_FORMAT] should be 0x3 or 0xC if there is only one pixel per word. If there are two pixels per word, it should be 0xF and LCDIF_TRANSFER_COUNT[H_COUNT] will be restricted to be a multiple of 2 pixels.

- LCDIF_CTRL[WORD_LENGTH]=2 indicates that input frame buffer is RGB 18 bits per pixel, that is, RGB 666. The valid RGB values can be left-aligned or right-aligned within a 32-bit word. The alignment of the valid 18 bits within a word is indicated by the LCDIF_CTRL[DATA_FORMAT_18_BIT] bit.

Limitation: LCDIF_CTRL1[BYTE_PACKING_FORMAT] can be 0x7, 0xE or 0xF. Packed pixels are not supported in this case.

LCDIF_TRANSFER_COUNT[H_COUNT] can be any number.

- LCDIF_CTRL[WORD_LENGTH]=3 indicates that the input frame-buffer is RGB 24 bits per pixel (RGB 888). If LCDIF_CTRL1[BYTE_PACKING_FORMAT] is 0x7, it indicates that there is only one pixel per 32-bit word and there is no restriction on LCDIF_TRANSFER_COUNT[H_COUNT]. This is also the option that provides 32 bit output depending on the I/O muxing options available. The fourth byte, or bits [31:24], and connected to the I/Os if this muxing is available in the chip package.

Limitation: If LCDIF_CTRL1[BYTE_PACKING_FORMAT] is 0xF, it indicates that the pixels are packed, that is, there are 4 pixels in 3 words or 12 bytes and LCDIF_TRANSFER_COUNT[H_COUNT] must be a multiple of 4 pixels.

- LCDIF_CTRL1[YCBCR422_INPUT]=1 implies that the input frame is in YCbCr 4:2:2 format. LCDIF_CTRL1[BYTE_PACKING_FORMAT] must be 0xF.

Limitation: LCDIF_CTRL[LCD_DATABUS_WIDTH] must be 8-bit and LCDIF_TRANSFER_COUNT[H_COUNT] must be a multiple of 2 pixels.

LCDIF_CTRL2[ODD_LINE_PATTERN] and LCDIF_CTRL2[EVEN_LINE_PATTERN] must be 0 when any of LCDIF_CTRL[RGB_TO_YCBCR422_CSC] or LCDIF_CTRL1[INTERLACE_FIELDS] or LCDIF_CTRL[YCBCR422_INPUT] bits is 1.

After the RGB to RGB or RGB to YCbCr 4:2:2 color space conversions, there is one more opportunity to swizzle the data before sending it out to the display or the encoder. This can be done with the LCDIF_CTRL[CSC_DATA_SWIZZLE] field, and it provides the same options as the LCDIF_CTRL[INPUT_DATA_SWIZZLE] register.

Finally, there is an option to shift the output data before sending it out to the display. This is done based on the LCDIF_CTRL[SHIFT_DIR] and LCDIF_CTRL[SHIFT_NUM_BITS] fields.

Figure 18-2. General Operations in Write Data Path

The examples in the following figures illustrate some different combinations of register programming for write mode. Assume that the data transferred over the system bus within a 32 bit word is organized as {A7-A0, B7-B0, C7-C0, D7-D0} in 8-bit mode and {A15-A0, B15-B0} in 16-bit mode.

In this example, all 32 bits of the input word are transferred out over an 8 bit display bus. Each byte within the 32 bit word is shifted to the right with zeros appended to bits D[7:6]. The input data bits [7:2] are shifted to the right by 2 bits and presented on the D[5:0].

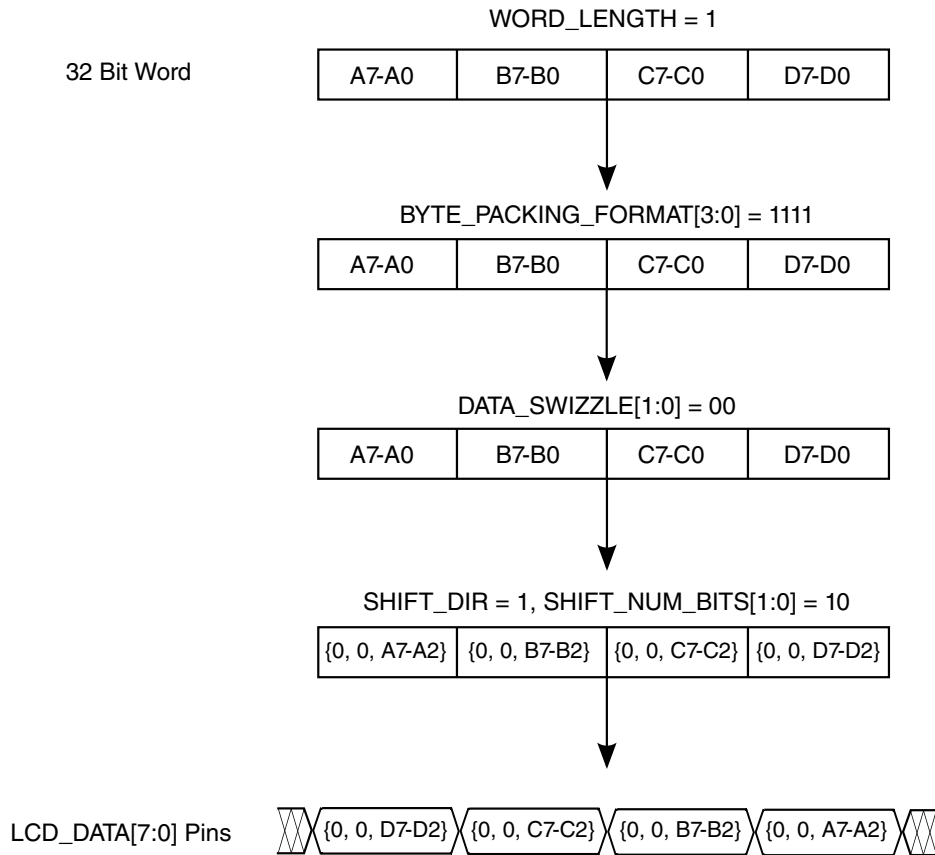

Figure 18-3. Register programming for write mode

In this 8 bit display interface example, one byte of the input word is deleted and not transferred over the external 8 bit display interface. This mode could be used to transfer 24bpp pixels over the 8 bit interface. In this case, the 4th unused byte is not transferred.

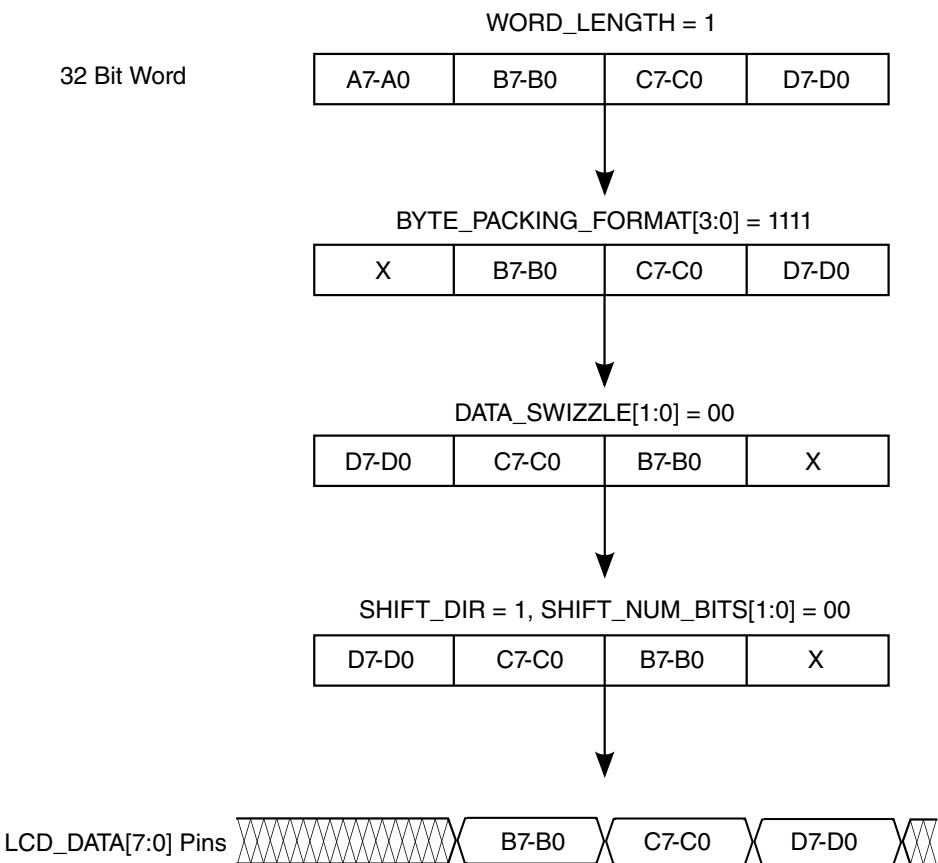

Figure 18-4. Register programming for write mode

The following example uses a 16 bit display interface. Each 16 bit half word is shifted to the right by two bits with zeros appended to the most significant two bits.

Figure 18-5. Register programming for write mode

This example indicates how an unpacked frame buffer can be sourced for display. Only a single 16 bit half word within the 32 bit word is transferred out via the 16 display bus.

Figure 18-6. Register programming for write mode

18.4.3 Read Data Path

Figure 18-7 shows the MPU read data path in detail.

eLCDIF can read from an external display that follows the 6800/8080 MPU protocol.

The display bus width is determined by the LCD_DATABUS_WIDTH bit field. The data sampled at every read strobe is called a subword and the number of subwords that can be packed in a 32-bit word is given by the READ_MODE_NUM_PACKED_SUBWORDS bit field. The INITIAL_DUMMY_READ bit field directs the eLCDIF to skip the number of programmed subwords before starting to process read data. This feature is useful in the case of an LCD controller that returns the last written data the first time a read is issued, and then sends the correct data thereafter. SHIFT_DIR and SHIFT_NUM_BITS bit fields indicate whether the data needs to be shifted before getting stored in the internal registers. For example, a value of 2 in READ_MODE_NUM_PACKED_SUBWORDS if lcd

data bus width is 8 bits indicates two bytes should be packed in a 32-bit word, while if the lcd databus width is 16 bits, it indicates that two half words (or 4 bytes) should be packed.

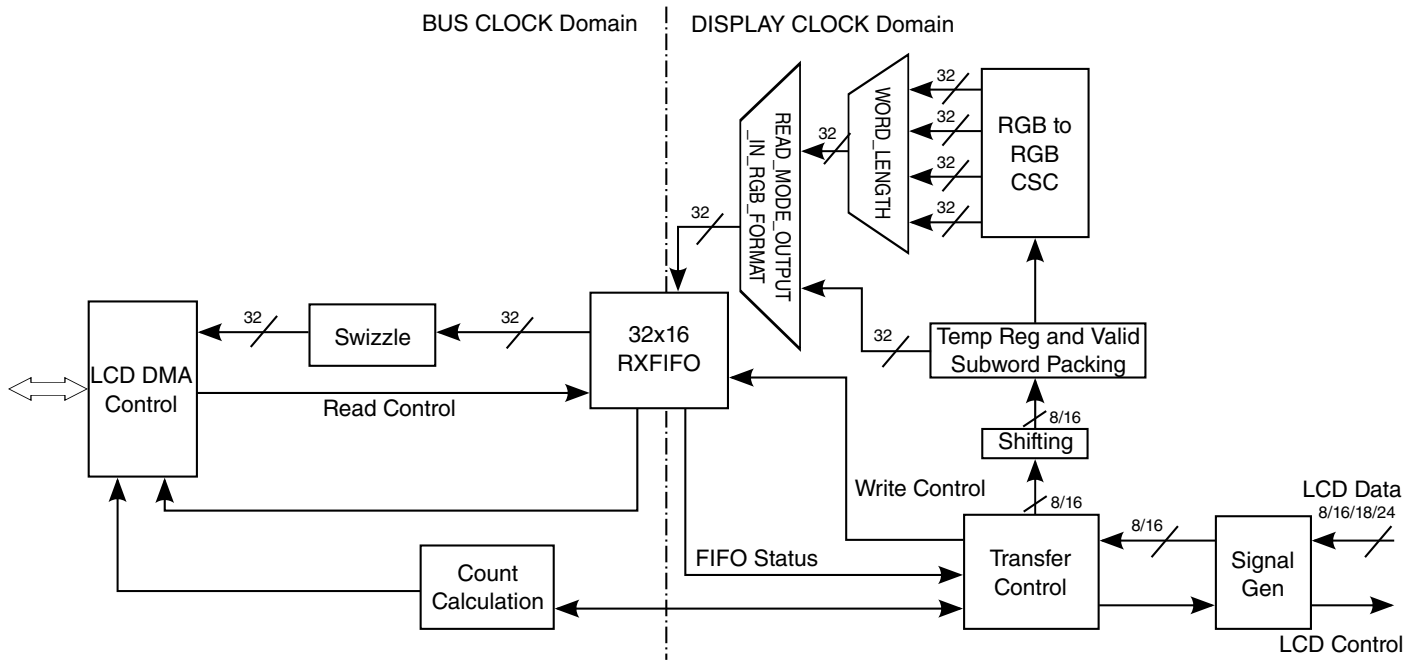

Figure 18-7. MPU Read Data Path

After the last subword within a word is reached, the block looks at the `READ_PACK_DIR` in the `HW_LCDIF_CTRL2` register. If this bit is set, the block will swizzle the data, but only within the valid bytes, unlike in the write mode, where swizzle occurs across all 4 bytes. If the `READ_MODE_OUTPUT_IN_RGB_FORMAT` bit is set, eLCDIF will convert the data obtained from the `READ_PACK_DIR` operation into 24-bit unpacked RGB and then re-convert it into 16/18/24 bpp RGB depending on the `WORD_LENGTH` field. The `DATA_FORMAT_16/18/24_BIT` bit fields are also considered while converting to 24-bit unpacked RGB format. For example, if `DATA_FORMAT_18_BIT` is 1, the RGB666 data will be packed in the upper bits [31:4] of a 32-bit word, and that bit is 0, the data will be packed in the lower bits [17:0]. After all these operations, the data gets written into the RXFIFO.

The following figures show some examples of how data is handled in different MPU read modes.

Functional Description

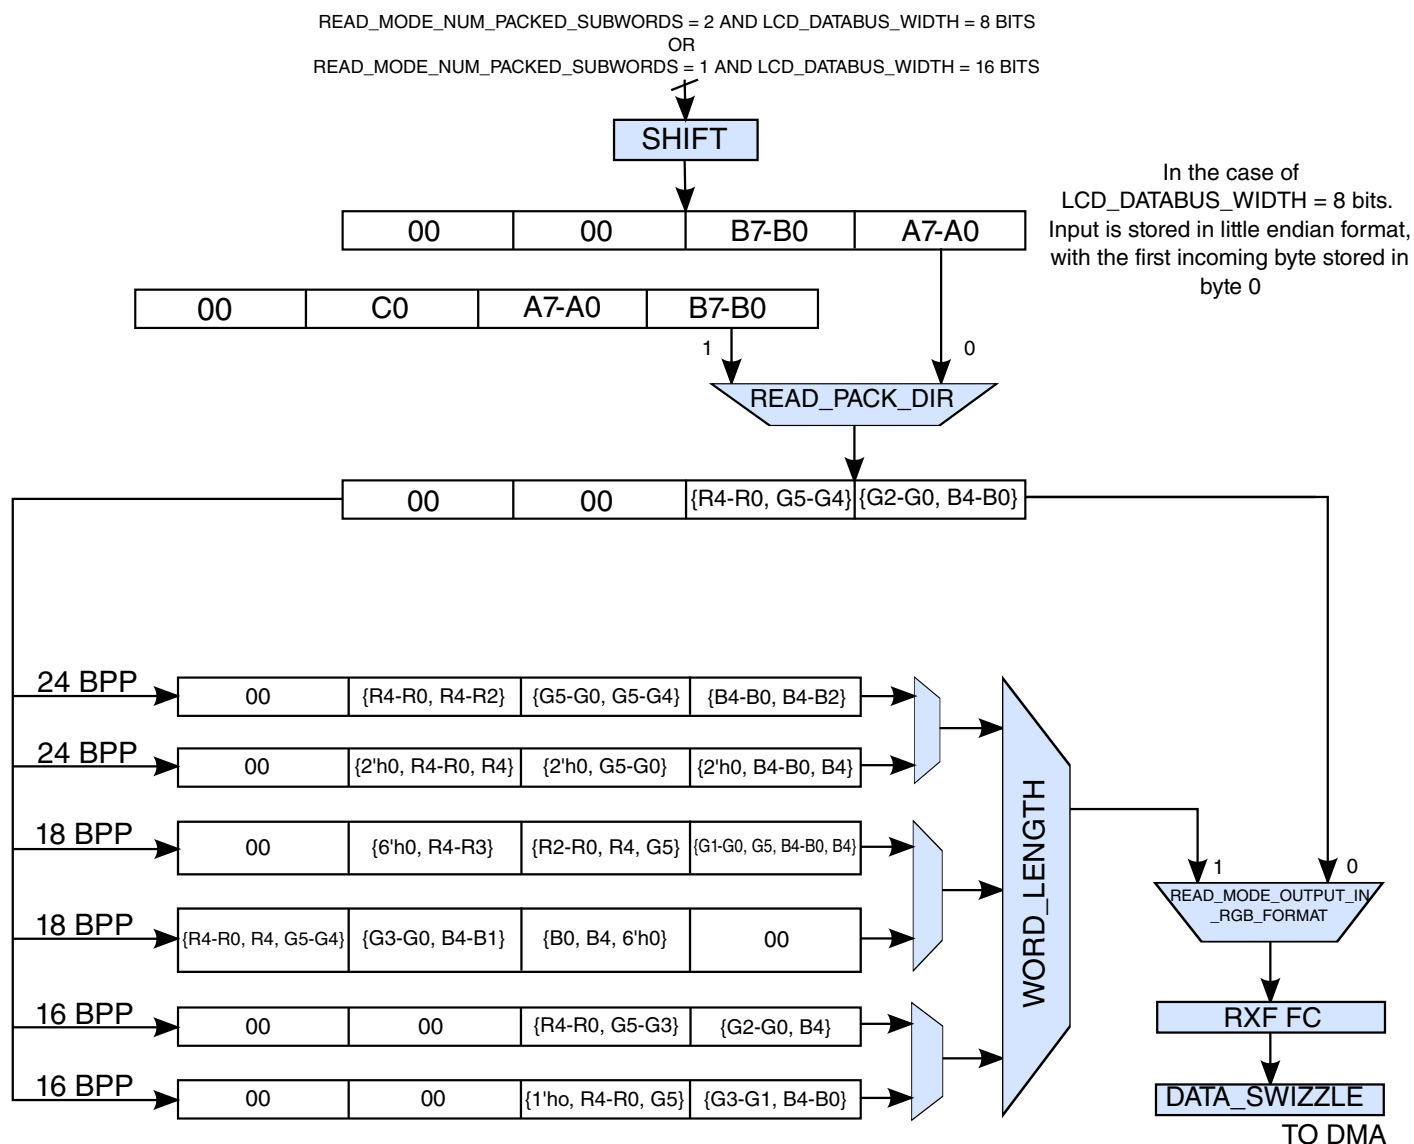

Figure 18-8. Data in MPU read mode

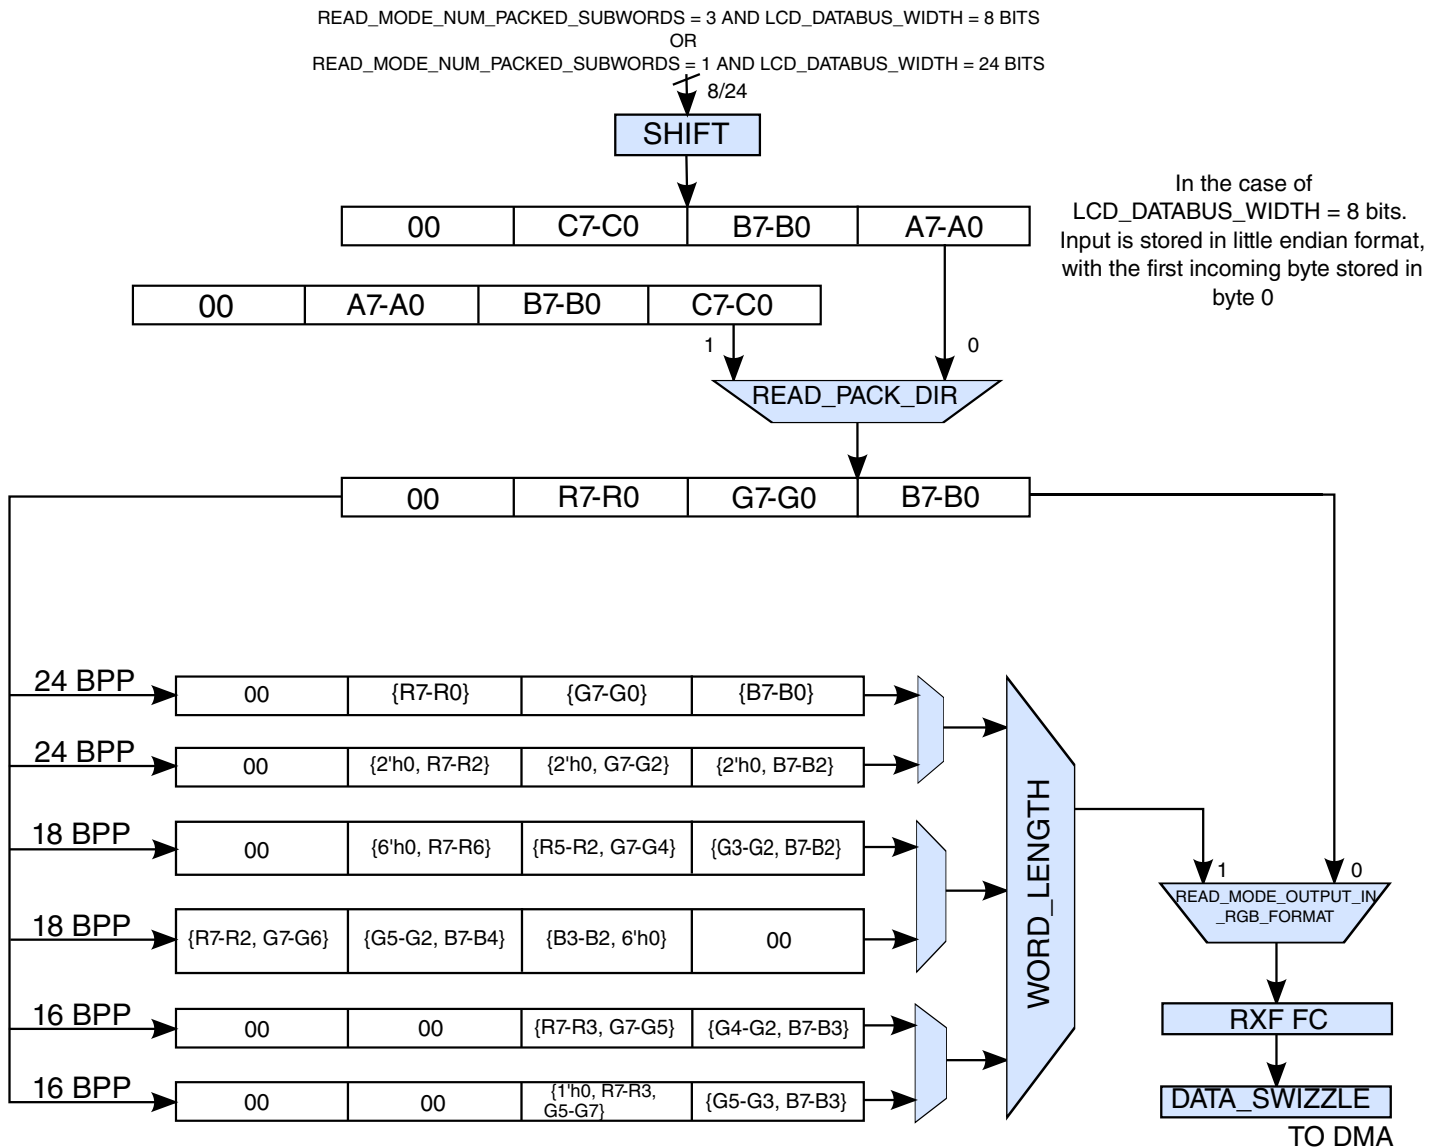

Figure 18-9. Data in MPU read mode

Functional Description

READ_MODE_NUM_PACKED_SUBWORDS = 1 AND LCD_DATABUS_WIDTH = 18 BITS

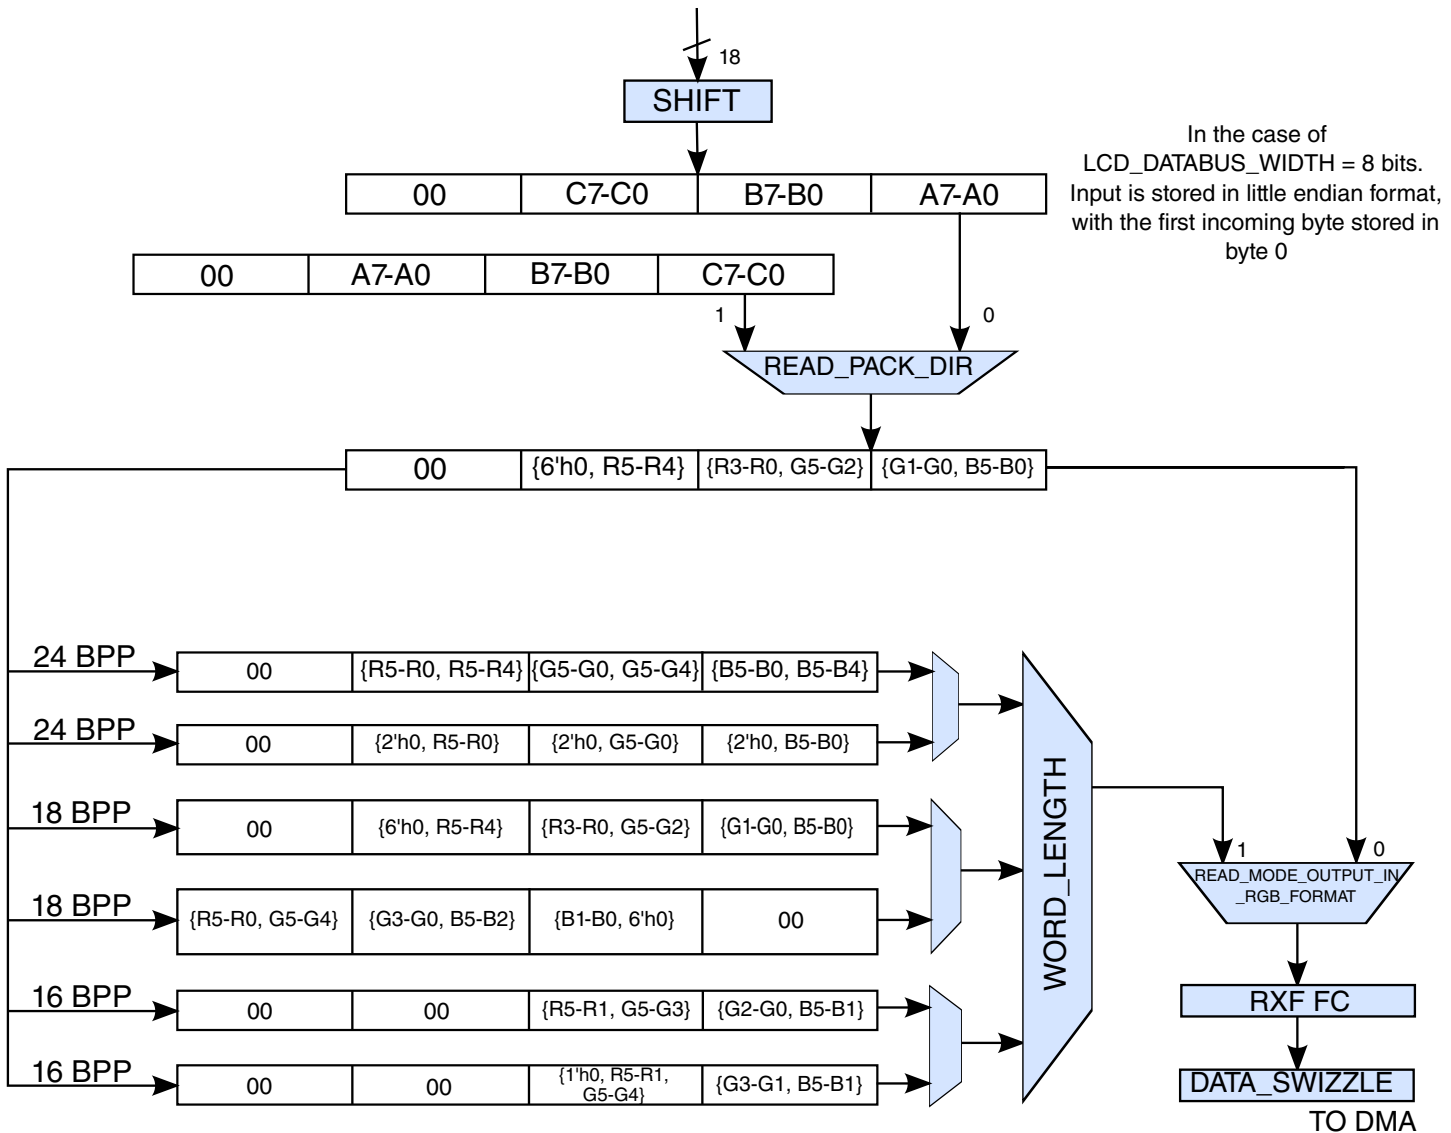

Figure 18-10. Data in MPU read mode

Restrictions:

READ_PACK_DIR should only be used if it is required to swizzle the subwords before doing RGB to RGB CSC, otherwise the DATA_SWIZZLE field should be used to swizzle across bytes.

READ_PACK_DIR must be 0 if LCD_DATABUS_WIDTH is 8 bits and READ_MODE_NUM_PACKED_SUBWORDS = 1

If READ_MODE_OUTPUT_IN_RGB_FORMAT bit is set, the following restrictions should be followed:

- If LCD_DATABUS_WIDTH = 8 bits, then
READ_MODE_NUM_PACKED_SUBWORDS ≤ 3.
- If LCD_DATABUS_WIDTH = 16/18/24 bits, then
READ_MODE_NUM_PACKED_SUBWORDS = 1.

18.4.4 eLCDIF Interrupts

eLCDIF supports a number of interrupts to aid controlling and status reporting of the block.

All the interrupts have individual mask bits for enabling or disabling each of them. They all get funneled through a single interrupt line connected to the interrupt collector (ICOLL).

The following list describes the different interrupts supported by eLCDIF:

- Underflow interrupt is asserted when the clock domain crossing FIFO (TXFIFO) becomes empty but the block is in active display portion during that time. Software should take corrective action to make sure that this does not happen.
- In the bus master mode, the overflow interrupt will be asserted if the block has requested more data than its FIFOs could hold. In the read mode, it will be asserted if the RxFIFO becomes full and the block reads more data.
- VSYNC edge interrupt will be asserted every time a leading VSYNC edge occurs.
- Cur_frame_done interrupt occurs at the end of every frame in all modes except DVI. In DVI mode, if IRQ_ON_ALTERNATE_FIELDS bit is set, it will occur at the end of every frame, otherwise it will occur at the end of every field.

18.4.5 Initializing the eLCDIF

This section describes write modes and MPU read mode.

18.4.5.1 Write Modes

The following initialization steps are common to all eLCDIF write modes of operation before entering any particular mode.

Initialization steps:

1. Configure the external I/Os to correctly interface the external display, when required.
2. Start the DISPLAY CLOCK (pix_clk) clock and set the appropriate frequency by programming the registers in CCM.

3. Start the BUS CLOCK (apb_clk) and set the appropriate frequency by programming the registers in CCM.
4. Bring the eLCDIF out of soft reset and disable the clock gate bit.
5. Reset the LCD controller by setting LCDIF_CTRL1[RESET] bit appropriately, being careful to observe the reset requirements of the controller. See [Behavior During Reset](#) for more information on Reset requirements.
6. Make sure LCDIF_CTRL[READ_WRITEB] bit is 0.
7. Select the transfer mode of operation. The LCDIF_CTRL[MASTER] bit determines the transfer mode selected. Bus master (LCDIF_CTRL[MASTER] =1), or PIO (LCDIF_CTRL[MASTER] =0) mode are the transfer modes to select.
8. Set the LCDIF_CTRL[INPUT_DATA_SWIZZLE] according to the endianness of the LCD controller. Also, set the LCDIF_CTRL[DATA_SHIFT_DIR] and LCDIF_CTRL[SHIFT_NUM_BITS] if it is required to shift the data left or right before it is output.
9. Set the LCDIF_CTRL[WORD_LENGTH] field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24/32-bit input. Also, select the correct 16/18/24 bit data format with the corresponding fields in LCDIF_CTRL register.
10. Set the LCDIF_CTRL1[BYTE_PACKING_FORMAT] field according to the input frame.
11. Set the LCDIF_CTRL[LCD_DATABUS_WIDTH] appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24/32-bit output.
12. Enable the necessary IRQs.

18.4.5.2 MPU Read Mode

The following initialization steps should be done to enter the MPU read mode of operation:

Initialization steps:

1. Configure the external I/Os to correctly interface the external display.
2. Start the DISPLAY CLOCK (pix_clk) and set the appropriate frequency by programming the registers in CCM.
3. Start the BUS CLOCK (apb_clk) and set the appropriate frequency by programming the registers in CCM.
4. Bring the eLCDIF out of soft reset and clock gate.
5. Reset the LCD controller by setting LCDIF_CTRL1_RESET bit appropriately, being careful to observe the reset requirements of the controller.
6. Set the READ_WRITEB bit in LCDIF_CTRL register to 1.
7. Set the LCDIF_MASTER bit in LCDIF_CTRL register to 0. Bus master mode is not supported for reading data from the display.

8. Also, set the DATA_SHIFT_DIR and SHIFT_NUM_BITS if it is required to shift the data left or right before it is output.
9. Indicate if the read data needs to color-space-converted and stored in a different RGB format by setting the READ_MODE_OUTPUT_IN_RGB_FORMAT field accordingly.
10. Set the WORD_LENGTH field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24-bit input if READ_MODE_OUTPUT_IN_RGB_FORMAT is required. Also, select the correct 16/18/24 bit data format with the corresponding fields in LCDIF_CTRL register.
11. Set the READ_MODE_NUM_PACKED_SUBWORDS field in LCDIF_CTRL2 according to the number of subwords per word required to be packed.
12. Set the READ_PACK_DIR to 1 if it is required to store the data in big-endian format.
13. Set the LCD_DATABUS_WIDTH appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24-bit output.
14. Enable the necessary IRQs.

18.4.6 MPU Interface

The MPU interface is used to transfer data and commands between the SoC via the eLCDIF and the external display at modest data rates.

Bus master or PIO transactions using the LCDIF_DATA register can be used for MPU mode write operations. For MPU mode read operations, only PIO can be used. eLCDIF can support the 6800 as well as the 8080 MPU protocol. If DOTCLK_MODE, DVI_MODE and VSYNC_MODE bits in LCDIF_CTRL registers are 0, it implies that the block is in MPU interface mode of operation. The LCDIF MPU mode has four basic timing parameters: Setup and Hold for the Command/Data register selection (TCS, TCH) and Setup and Hold for the Data bus (TDS, TDH). These parameters are expressed in DISPLAY CLOCK (pix_clk) cycles. The LCD_WR signal is used as the write strobe while LCD_RS signal is typically used to switch between command and data modes.

Functional Description

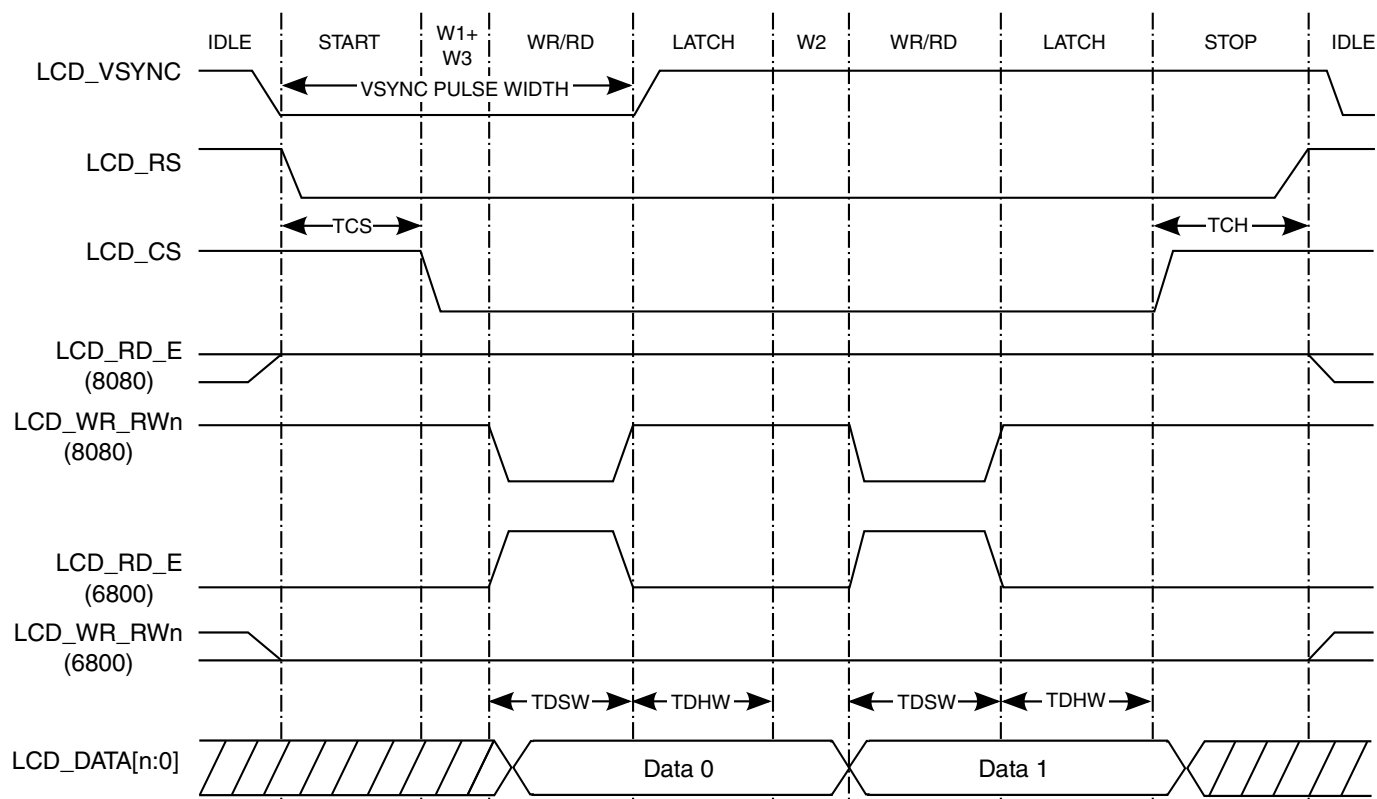

Figure 18-11. Timing in write mode of 6800 and 8080 protocols

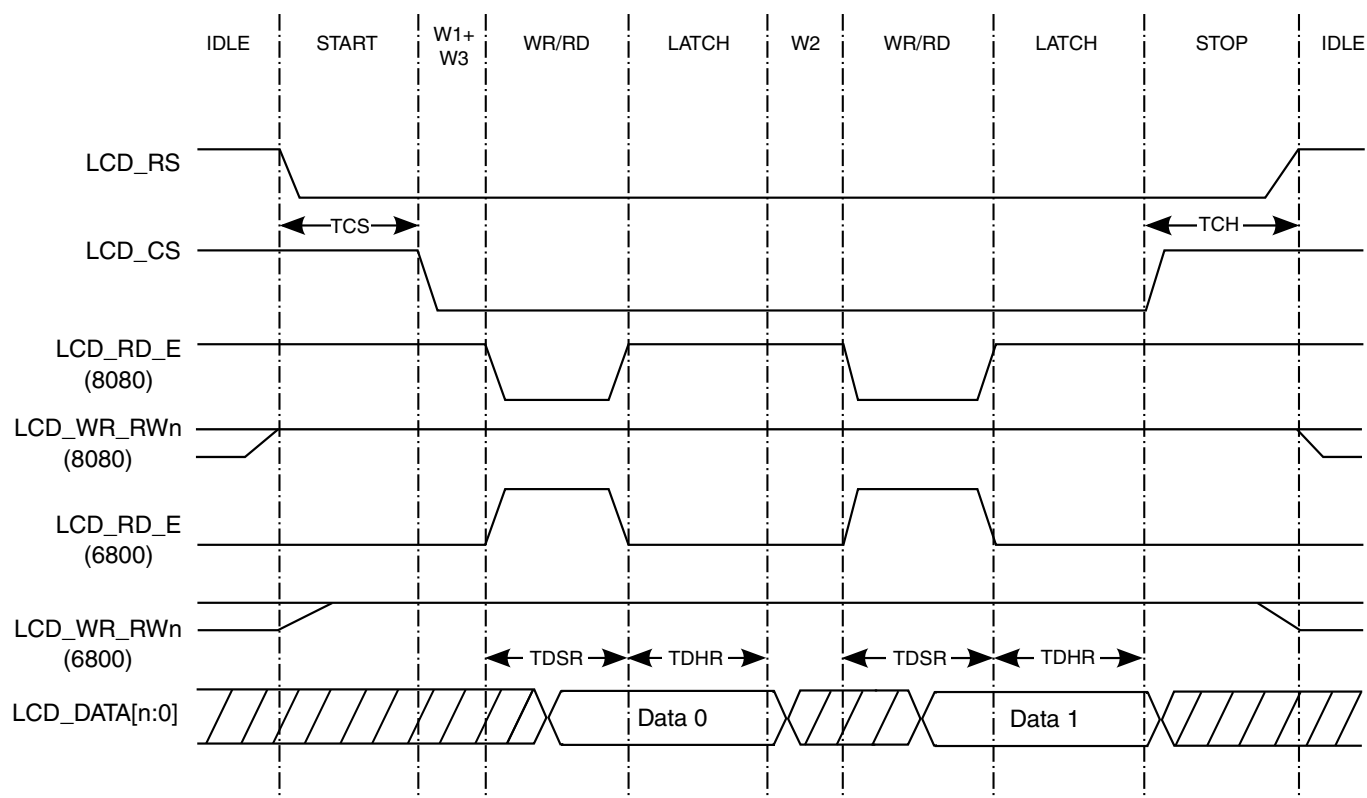

Figure 18-12. Read timing interface in 6800 and 8080 protocols

The eLCDIF has flexible pin and strobe timings which enable it to optimally support a wide range of LCDs. The minimum cycle time is two DISPLAY CLOCK (pix_clk) cycles (TDS=TDH=1). For example, this results in a maximum LCD data rate of 12 MB/s when DISPLAY CLOCK (pix_clk) is 24 MHz. TDS and TDH are 8-bit values, so the minimum eLCDIF period is 510 DISPLAY CLOCK (pix_clk) cycles (47 KHz with a 24 MHz DISPLAY CLOCK (pix_clk)). The timings are not automatically adjusted if the DISPLAY CLOCK (pix_clk) frequency changes, so it may be necessary to adjust the timings if DISPLAY CLOCK (pix_clk) changes.

In the MPU interface mode, the LCDIF_CTRL_BYPASS_COUNT bit must be 0. The RUN bit is cleared automatically once the eLCDIF has received/transmitted all the data as per the LCDIF_TRANSFER_COUNT register and has completed the transfer to the panel. The current transfer can be cancelled/aborted if the RUN bit is manually made 0.

18.4.6.1 Code Example to Initialize the eLCDIF in MPU Write Mode

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1(LCDIF_CTRL, DATA_SELECT, 1); // 0 if sending command, 1 if sending data. Note that the
// idle state for LCD_RS signal is high, regardless of the
// programming of the DATA_SELECT register.

BF_CS1 (LCDIF_CTRL, MODE86, 8080_MODE);
BF_CS1 (LCDIF_CTRL, READ_WRITEB, 0);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 0); //Must be 0 in MPU mode
BF_CS1 (LCDIF_CTRL1, BUSY_ENABLE, 1); //Only if LCD controller implements a busy line
BF_CS4 (LCDIF_TIMING, CMD_HOLD, 2, CMD_SETUP, 2, DATA_HOLD, 2, DATA_SETUP, 2); //Values
based
// on DISPLAY CLOCK (pix_clk) frequency and timing requirements
of controller.
// Note that these register must be non-zero for correct
operation.
BF_CS2 (LCDIF_TRANSFER_COUNT, H_COUNT, 320, V_COUNT, 240); //For a 320 RGB x 240 display
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

The eLCDIF is now ready to receive data via bus master PIO write transactions using the LCDIF_DATA register. Note that when using the PIO write operations to the LCDIF_DATA register, the software will need to poll the FIFO STATUS bits to ensure that it does not overflow the eLCDIF data buffers. When eLCDIF is done transmitting H_COUNT x V_COUNT pixels, it will stop, turn off the RUN bit and assert the cur_frame_done interrupt.

18.4.7 VSYNC Interface

The VSYNC interface uses the same protocol as the MPU interface, with an additional signal VSYNC at the frame rate of the display, as shown in the figure given in MPU Interface section.

It is used in the moving picture display mode where data has to be written to the internal LCD buffer at a speed higher than the display rate and displayed in synchronization with the VSYNC signal. This mode is selected by setting the VSYNC_MODE bit in LCDIF_CTRL register. The VSYNC signal is programmable for period, polarity and direction. Many other programmable parameters are shared with the MPU interface. The VSYNC_OEB bit in LCDIF_VDCTRL0 register indicates whether the display controller will send the VSYNC signal, or whether it should be generated by eLCDIF. The timing of the VSYNC signal is based on the DISPLAY CLOCK (pix_clk) (make sure VSYNC_PULSE_WIDTH_UNIT = VSYNC_PERIOD_UNIT = 0 and VSYNC_ONLY = 1) and it is determined by the VSYNC_PERIOD, VSYNC_PULSE_WIDTH and VSYNC_POL fields in LCDIF_VDCTRL0-4 registers. The SYNC_SIGNALS_ON bit in LCDIF_VDCTRL4 register must be set if the target requires the VSYNC signal to be generated by eLCDIF. If the WAIT_FOR_VSYNC_EDGE bit in LCDIF_CTRL register is set, it indicates that the hardware should wait until it sees the leading VSYNC edge before starting the data transfer. The VERTICAL_WAIT_CNT indicates the number of DISPLAY CLOCK (pix_clk) cycles from the leading VSYNC edge after which data transfer will be started on the interface.

In the VSYNC interface mode, the LCDIF_CTRL_BYPASS_COUNT bit must be 0. The RUN bit is cleared automatically once the eLCDIF has received/transmitted all the data as per the LCDIF_TRANSFER_COUNT register and has completed the transfer to the panel. The current transfer can be cancelled/aborted if the RUN bit is manually made 0.

18.4.7.1 Code Example to Initialize eLCDIF in VSYNC Mode

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DATA_SELECT, 1); // 0 if sending command, 1 if sending data. Note that
//the idle state for LCD_RS signal is high, regardless of the programming of the DATA_SELECT
//register.

BF_CS1 (LCDIF_CTRL, MODE86, 8080_MODE);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 0); //Must be 0 in MPU mode
BF_CS1 (LCDIF_CTRL1, BUSY_ENABLE, 0);
BF_CS4 (LCDIF_TIMING, CMD_HOLD, 2, CMD_SETUP, 2, DATA_HOLD, 2, DATA_SETUP, 2); //Values
//based on DISPLAY CLOCK (pix_clk) frequency and timing requirements of controller. Note
that these
//register must be non-zero for the MPU and VSYNC modes.
BF_CS2 (LCDIF_TRANSFER_COUNT, H_COUNT, 320, V_COUNT, 240); //For a 320 RGB x 240 display
//The following section indicates setting up the VSYNC signal timing when VSYNC is an output
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Making VSYNC signal an output
BF_CS1 (LCDIF_VDCTRL4, VSYNC_ONLY, 1); //Only need to generate VSYNC signal
BF_CS1 (VDCTRL0, VSYNC_POL, 0); //Setting the polarity of VSYNC signal to be low during
//VSYNC_PULSE_WIDTH time
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 0, VSYNC_PULSE_WIDTH_UNIT, 0);
BF_CS2 (LCDIF_VDCTRL1, VSYNC_PERIOD, 400000, VSYNC_PULSE_WIDTH, 100); //Frame display rate in
//terms of number of DISPLAY CLOCKS (pix_clk).
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 0, HSYNC_PERIOD, 0);
BF_CS1 (LCDIF_VDCTRL3, VERTICAL_WAIT_CNT, 50);
```

```
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);
BF_CS2 (LCDIF_CTRL, VSYNC_MODE, 1, WAIT_FOR_VSYNC_EDGE, 1); //set WAIT_FOR_VSYNC_EDGE if
//software wishes to transfer the next frame after the VSYNC edge occurs.
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

The eLCDIF is now ready to receive data via bus master requests or PIO writes to the LCDIF_DATA register. When eLCDIF is done transmitting $H_COUNT \times V_COUNT$ pixels, it will stop, turn off the RUN bit and assert the cur_frame_done interrupt.

18.4.8 DOTCLK Interface

The DOTCLK interface is another mode used in moving picture displays.

It includes the VSYNC, HSYNC, DOTCLK and (optional) ENABLE signals. The interface is popularly called the RGB interface if the ENABLE signal is present.

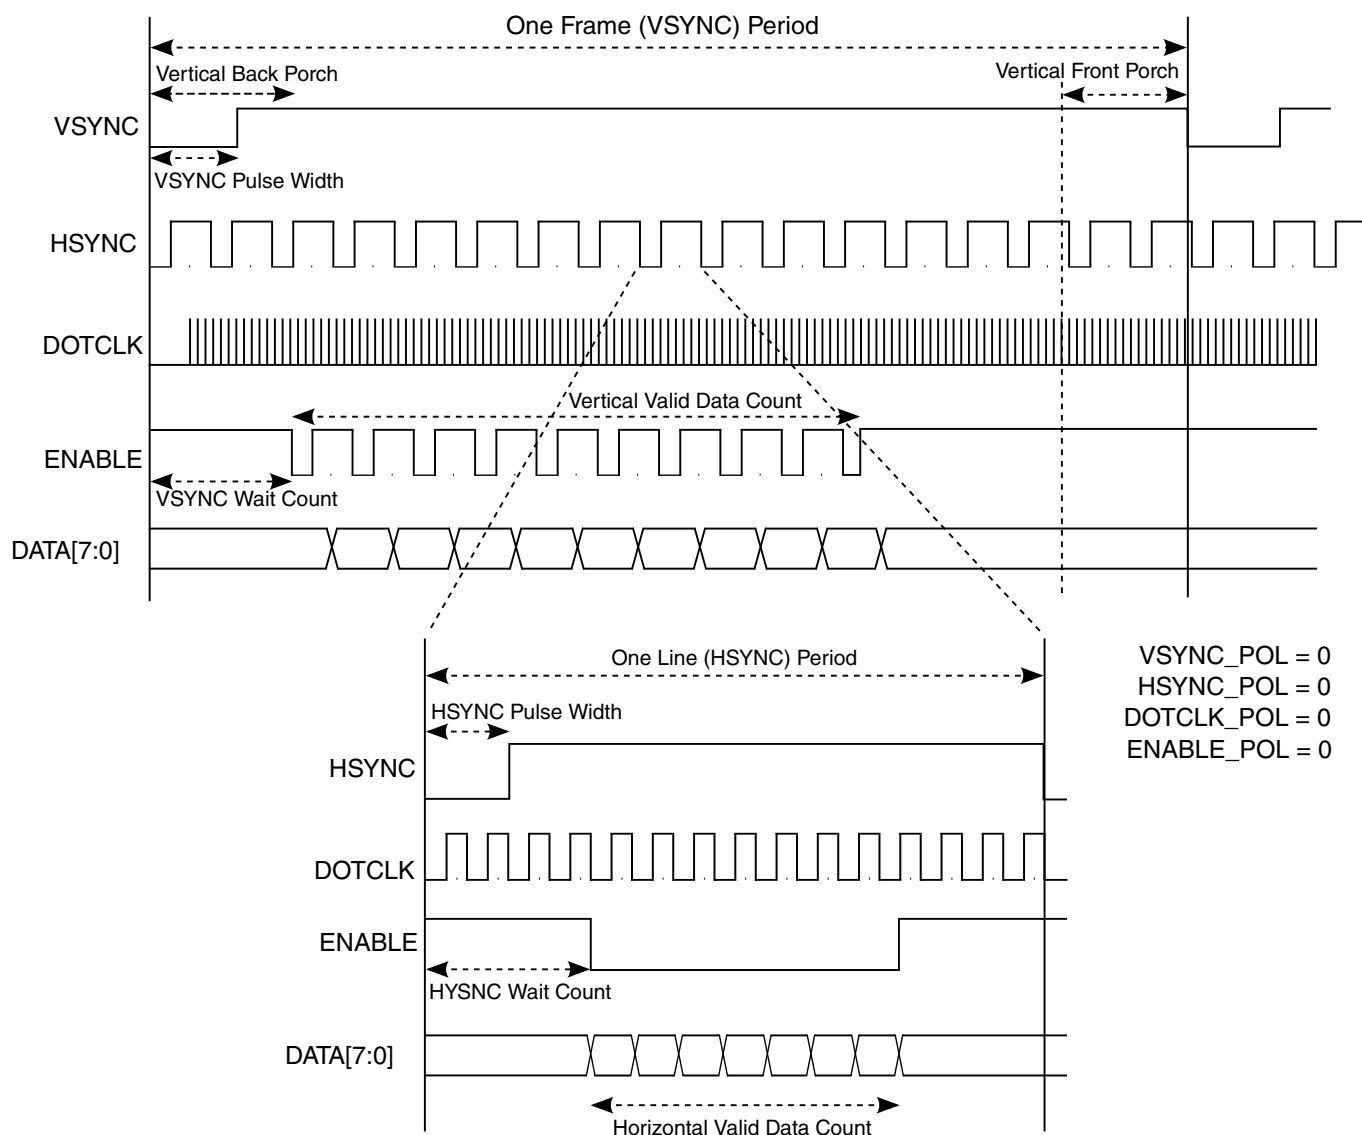

Figure 18-13. DOTCLK protocol with programmable parameters

The DOTCLK mode writes data at high speed to the LCD, and the display operation is synchronized with the VSYNC, HSYNC, ENABLE and DOTCLK signals. The polarities, periods and pulse-widths of the sync signals are programmable using the LCDIF_VDCTRL0-4 registers. The units for the VSYNC signal must be number of horizontal lines and can be selected using the VSYNC_PULSE_WIDTH_UNIT and VSYNC_PERIOD_UNIT bit fields. The VERTICAL_WAIT_CNT is by default given the same unit as the VSYNC_PERIOD. The DISPLAY CLOCK (pix_clk) frequency is managed by the CCM.

In DOTCLK mode, LCDIF_CTRL_BYPASS_COUNT bit must be set to 1. To end the current transfer, the software should make the DOTCLK_MODE bit 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and issue the cur_frame_done interrupt.

18.4.8.1 Code Example

The following code shows an example for programming a 320x240 display.

NOTE

Setting up the display must be done through the MPU mode or via SPI.

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DOTCLK_MODE, 1);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 1); //Always for DOTCLK mode
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Vsync is always an output in the DOTCLK mode
BF_CS4 (LCDIF_VDCTRL0, VSYNC_POL, 0, HSYNC_POL, 0, DOTCLK_POL, 0, ENABLE_POL, 0);
BF_CS1 (LCDIF_VDCTRL0, ENABLE_PRESENT, 1);
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 1, VSYNC_PULSE_WIDTH_UNIT, 1);
BF_CS1 (LCDIF_VDCTRL0, VSYNC_PULSE_WIDTH, 2);
BF_CS1 (LCDIF_VDCTRL1, VSYNC_PERIOD, 280);
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 10, HSYNC_PERIOD, 360); //Assuming
// LCD_DATABUS_WIDTH is 24bit
BF_CS2 (LCDIF_VDCTRL3, VSYNC_ONLY, 0);
BF_CS2 (LCDIF_VDCTRL3, HORIZONTAL_WAIT_CNT, 20, VERTICAL_WAIT_CNT, 20);
BF_CS1 (LCDIF_VDCTRL4, DOTCLK_H_VALID_DATA_CNT, 320); //Note that DOTCLK_V_VALID_DATA_CNT is
//implicitly assumed to be HW_LCDIF_TRANSFER_COUNT_V_COUNT
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

To stop the transfer completely, the ideal way is to make DOTCLK_MODE = 0. In that case, the block will transmit the contents in the FIFO and reset the RUN bit.

18.4.9 CSI HANDSHAKE INTERFACE

The LCDIF and CSI support a pipeline mode to use double buffers inside OGRAM for the video pass through from CSI to LCDIF, the pipeline buffer size can be 8 line or 16 line as configurable. The pipeline will be handle by hardware handshake signals between CSI and LCDIF. The LCDIF will have the capability to synchronize display with CSI based on the VSYNC signal from CSI. When LCDIF is enabled to start display, it can optionally wait for the VSYNC edge from CSI before it starts the display for next frame, The delay from VSYNC input to the start of next frame is programmable by LCDIF_SYNC_DELAY register.

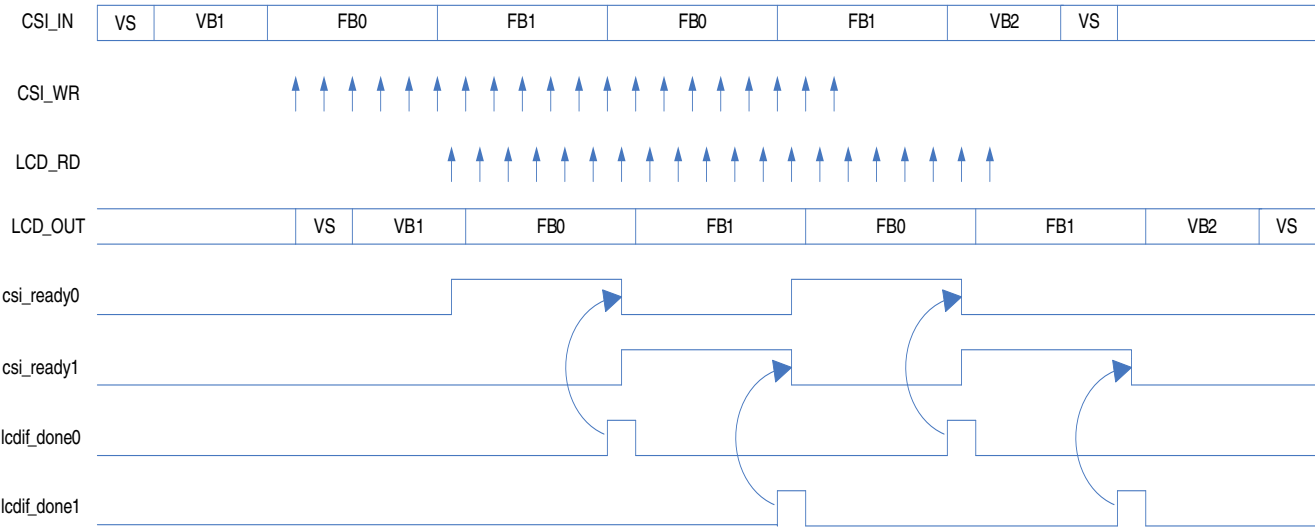

Figure 18-14. CSI HandShake Interface

When this mode is enabled, the hardware handshake protocol will process. At the start of CSI with camera input, the CSI will put the input data to one frame buffer. When the frame buffer is ready for LCDIF display, CSI will assert `csi_ready` signal to indicate LCDIF to read the buffer and LCDIF will display data in this buffer. When one frame buffer reading finished, LCDIF will set the `lcdif_done` signal to indicate CSI this buffer has been displayed and can be written again. With this double buffer handshake mode, the LCDIF can display the video input within very short delay and minimize DRAM bandwidth.

18.4.10 Alpha Blending Interface

The LCDIF has the capability to add an extra overlay on the normal display buffer. LCDIF can fetch data from two buffers and combine them before display; one buffer data can have the alpha value with the RGB pixels. With `LCDIF_AS_CTRL[AS_ENABLE]` is set, the LCDIF will start fetching alpha surface buffer data in bus master mode and combine it with another buffer.

The `LCDIF_AS_CTRL[ALPHA_CTRL]` bits determine how the alpha value is constructed for the alpha surface and the alpha blending process is the same as in the PXP block; for the alpha blend and color key process refer to the PXP block descriptions.

18.4.11 ITU-R BT.656 Digital Video Interface (DVI)

ITU-R BT.656 Digital Video Interface shown below transmits 4:2:2 YCbCr digital component video to a digital video encoder that can translate it into 525/60 or 625/50 analog TV signal.

Unique timing codes (timing reference signals) are embedded within the video stream to indicate the different timing events that would have been otherwise indicated by VSYNC, HSYNC and BLANK signals. The hardware supports 8-bit data transfers; the pins are shared with the lower 8 bits of LCD data bus. The LCD_RS pin is shared with the clock signal of the interface (called CCIRCLK here for uniqueness). CCIRCLK also can be obtained on the LCD_DOTCLK pin. The mode shares the write FIFO with the LCD interface and the associated pipeline. The programmable parameters in registers LCDIF_DVICTRL0-3 allow setting the total number of horizontal lines per frame, vertical and horizontal blanking interval, odd and even field start and end positions, and so on. In short, these parameters are provided to ensure that the hardware has enough flexibility to generate the right 525/60 or 625/50 data streams. Most of the initialization steps in [Initializing the eLCDIF](#) such as data shifting, swizzle, and so on, are applicable to DVI mode also. The register descriptions in the programmable registers section at the end of this chapter include example code for programming the DVICTRL0-3 registers.

In DVI mode, LCDIF_CTRL_BYPASS_COUNT bit must be set to 1. To end the current transfer, the software should make the DVI_MODE bit the value 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and assert the cur_frame_done interrupt.

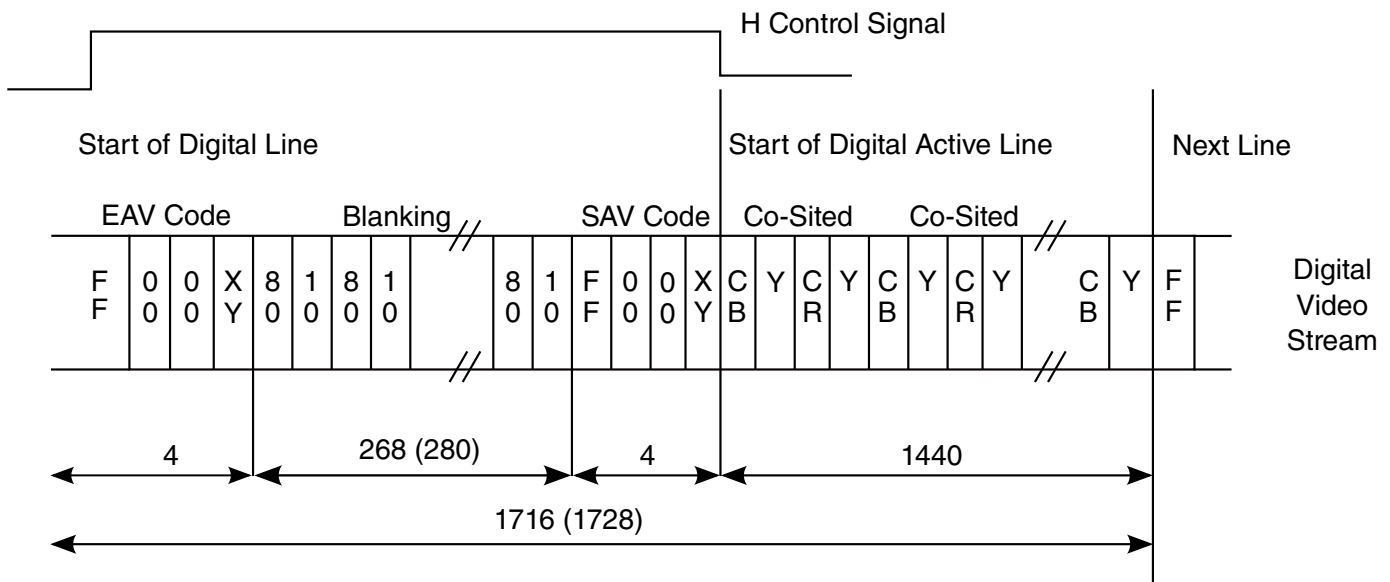

Figure 18-15. Digital Video Interface

18.4.12 LUT

The Lookup Table (LUT) is used to expand the 8 bits pixel to 24 bits pixel before output to external display. This module is used when input data from memory is 8-bits in width under limited bandwidth system and external display has a 24-bits requirement. There are two 256x24 bits LUT memory in LCDIF module in case of changing LUT during active display. When using LUT function, it should be initialized through single PIO register writing first. Writing data to register HW_LCDIF_LUT0_DATA will trigger storing data to lut0 memory and increase the lut0 memory address HW_LCDIF_LUT0_ADDR automatically. Writing data again to register HW_LCDIF_LUT0_DATA will store the data to memory and increase the memory address accordingly. The same operation is performed while writing to HW_LCDIF_LUT1_DATA and HW_LCDIF_LUT1_ADDR. After initialization, HW_LCDIF_CUR_BUF_ADDR bit 0 determines which LUT is used during active display. Lastly, when there is active display, it will use the lowest 8 bits LCDIF data as LUT address and output the 24 bits from the lookup table.

18.4.13 eLCDIF Pin Usage by Interface Mode

The following tables detail how the eLCDIF level interface pins are used based on the desired mode of operation. The chip level I/Os should also be configured to be consistent with the desired eLCDIF operating mode.

The VSYNC signal has been mapped onto two pins, LCD_BUSY and LCD_VSYNC. The pin multiplexing can be programmed to select either of those pins to function as VSYN.

NOTE

There is an option to internally mux the HSYNC, DOTCLK and ENABLE signals in the DOTCLK mode by setting the MUX_SYNC_SIGNALS bit in the VDCTRL0 register.

18.5 Behavior During Reset

BUS CLOCK (apb_clk) and DISPLAY CLOCK (pix_clk) must be running before making any changes to SFTRST or CLKGATE bits.

A soft reset (SFTRST) can take multiple clock periods to complete, so do not set CLKGATE when setting SFTRST.

The reset process gates the clocks automatically.

18.6 ELCDIF Memory Map/Register Definition

Some of the LCDIF registers (XXX_SET, XXX_CLR, and XXX_TOG) allow direct bit field masking and access.

- When writing 1 to XXX_SET bit fields, these registers allow setting the masked 1 bit fields, while keeping unchanged all bit fields which remain on 0 logic state.

- When writing 1 to XXX_CLR bit fields, these registers allow clearing the masked 1 bit fields, while keeping unchanged all other bit fields which remained on 0 logic state.
- When writing 1 to XXX_TOG bit fields, these registers allow inverting the logic state of all masked 1 bit fields, while they keep unchanged the remaining bit fields which were kept on 0 logic state.

eLCDIF Hardware Register Format Summary

LCDIF memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20F_8000	eLCDIF General Control Register (LCDIF_CTRL)	32	R/W	C000_0000h	18.6.1/693

18.6.1 eLCDIF General Control Register (LCDIF_CTRLn)

The LCD Interface Control Register provides overall control of the eLCDIF block. The eLCDIF Control Register provides a variety of control functions to the programmer. These functions allow the interface to be very flexible to work with a variety of LCD controllers, and to minimize overhead and increase performance of LCD programming. The register has been organized such that switching between the different LCD modes can be done with minimum PIO writes.

Address: 20F_8000h base + 0h offset + (4d × i), where i=0d to 3d

LCDIF_CTRLn field descriptions

Field	Description
31 SFTRST	This bit must be set to zero to enable normal operation of the eLCDIF. When set to one, it forces a block level reset.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 YCBCR422_ INPUT	Zero implies input data is in RGB color space. One implies input data is in YCbCr 4:2:2 format, such that YCbYCr are packed in a 32-bit word. It also means that there are 2 pixels in 4 bytes. If this bit is set, software should program the H_COUNT field in the TRANSFER_COUNT register to the total number of pixels that will have to be fetched by the eLCDIF block per line and the BYTE_PACKING_FORMAT should be 0xF. The WORD_LENGTH does not matter in this case.
28 READ_WRITEB	By default, eLCDIF is in the write mode. Setting this bit to 1 will make the hardware go into 6800/8080 MPU read mode. The LCDIF_MASTER bit must be 0, since bus master mode can only be used for writing the display.
27 WAIT_FOR_ VSYNC_EDGE	Setting this bit to 1 will make the hardware wait for the triggering VSYNC edge before starting write transfers to the LCD. Used only in the VSYNC mode of operation.
26 DATA_SHIFT_ DIR	Use this bit to determine the direction of shift of transmit data. In the DVI mode, it works only on the active data, not on the timing codes and ancillary data. 0x0 TXDATA_SHIFT_LEFT — Data to be transmitted is shifted LEFT by SHIFT_NUM_BITS bits. 0x1 TXDATA_SHIFT_RIGHT — Data to be transmitted is shifted RIGHT by SHIFT_NUM_BITS bits.
25–21 SHIFT_NUM_ BITS	The data to be transmitted is shifted left or right by this number of bits.
20 DVI_MODE	Set this bit to 1 to get into the ITU-R BT.656 digital video interface mode. Toggle this bit from 1 to 0 to make the hardware go out of DVI mode after completing all data transfer and after the RUN bit has been deasserted.
19 BYPASS_ COUNT	When this bit is 0, it means that eLCDIF will stop the block operation and turn off the RUN bit after the amount of data indicated by the LCDIF_TRANSFER_COUNT register has been transferred out. When this bit is set to 1, the block will continue normal operation indefinitely until it is told to stop. This bit must be 0 in MPU and VSYNC modes, and must be 1 in DOTCLK and DVI modes of operation.
18 VSYNC_MODE	Setting this bit to 1 will make the eLCDIF hardware go into VSYNC mode. WAIT_FOR_VSYNC_EDGE can be used only if this bit is set. If VSYNC signal is required to be an output from the block, SYNC_SIGNALS_ON bit in LCDIF_VDCTRL4 register must be set.
17 DOTCLK_MODE	Set this bit to 1 to make the hardware go into the DOTCLK mode, i.e. VSYNC/HSYNC/DOTCLK/ENABLE interface mode. ENABLE is optional, selected by the ENABLE_PRESENT bit. Toggle this bit from 1 to 0 to make the hardware go out of DOTCLK mode after completing all data transfer and deasserting the RUN bit.
16 DATA_SELECT	Command Mode polarity bit. This bit should only be changed when RUN is 0. 0x0 CMD_MODE — Command Mode. LCD_RS signal is Low. 0x1 DATA_MODE — Data Mode. LCD_RS signal is High.
15–14 INPUT_DATA_ SWIZZLE	This field specifies how to swap the bytes fetched by the bus master interface. The swizzle function is independent of the WORD_LENGTH bit. The supported swizzle configurations are: 0x0 NO_SWAP — No byte swapping.(Little endian) 0x0 LITTLE_ENDIAN — Little Endian byte ordering (same as NO_SWAP). 0x1 BIG_ENDIAN_SWAP — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 SWAP_ALL_BYTES — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian).

Table continues on the next page...

LCDIF_CTRLn field descriptions (continued)

Field	Description
	0x2 HWD_SWAP — Swap half-words. 0x3 HWD_BYTE_SWAP — Swap bytes within each half-word.
13–12 CSC_DATA_SWIZZLE	This field specifies how to swap the bytes after the data has been converted into an internal representation of 24 bits per pixel and before it is transmitted over the LCD interface bus. The data is always transmitted with the least significant byte/hword (half word) first after the swizzle takes place. So, INPUT_DATA_SWIZZLE takes place first on the incoming data, and then CSC_DATA_SWIZZLE is applied. The swizzle function is independent of the WORD_LENGTH or the LCD_DATABUS_WIDTH fields. If RGB_TO_YCBCR422_CSC bit is set, the swizzle occurs on the Y, Cb, Cr values. The supported swizzle configurations are: 0x0 NO_SWAP — No byte swapping.(Little endian) 0x0 LITTLE_ENDIAN — Little Endian byte ordering (same as NO_SWAP). 0x1 BIG_ENDIAN_SWAP — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 SWAP_ALL_BYTES — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 HWD_SWAP — Swap half-words. 0x3 HWD_BYTE_SWAP — Swap bytes within each half-word.
11–10 LCD_DATABUS_WIDTH	LCD Data bus transfer width. 0x0 16_BIT — 16-bit data bus mode. 0x1 8_BIT — 8-bit data bus mode. 0x2 18_BIT — 18-bit data bus mode. 0x3 24_BIT — 24-bit data bus mode.
9–8 WORD_LENGTH	Input data format. 0x0 16_BIT — Input data is 16 bits per pixel. 0x1 8_BIT — Input data is 8 bits wide. 0x2 18_BIT — Input data is 18 bits per pixel. 0x3 24_BIT — Input data is 24 bits per pixel.
7 RGB_TO_YCBCR422_CSC	Set this bit to 1 to enable conversion from RGB to YCbCr colorspace. See the LCDIF_CSC_ registers for further details.
6 ENABLE_PXP_HANDSHAKE	If this bit is set and LCDIF_MASTER bit is set, the eLCDIF will act as bus master and the handshake mechanism between eLCDIF and PXP will be turned on. If LCDIF_MASTER bit is not set, this bit becomes a don't care.
5 MASTER	Set this bit to make the eLCDIF act as a bus master.
4 RSRVD0	This field is reserved. Reserved bits. Write as 0.
3 DATA_FORMAT_16_BIT	When this bit is 1 and WORD_LENGTH = 0, it implies that the 16-bit data is in ARGB555 format. When this bit is 0 and WORD_LENGTH = 0, it implies that the 16-bit data is in RGB565 format. When WORD_LENGTH is not 0, this bit does not care.
2 DATA_FORMAT_18_BIT	Used only when WORD_LENGTH = 2, i.e. 18-bit. 0x0 LOWER_18_BITS_VALID — Data input to the block is in 18 bpp format, such that lower 18 bits contain RGB 666 and upper 14 bits do not contain any useful data. 0x1 UPPER_18_BITS_VALID — Data input to the block is in 18 bpp format, such that upper 18 bits contain RGB 666 and lower 14 bits do not contain any useful data.

Table continues on the next page...

LCDIF_CTRLn field descriptions (continued)

Field	Description
1 DATA_ FORMAT_24_ BIT	Used only when WORD_LENGTH = 3, i.e. 24-bit. Note that this applies to both packed and unpacked 24-bit data. 0x0 ALL_24_BITS_VALID — Data input to the block is in 24 bpp format, such that all RGB 888 data is contained in 24 bits. 0x1 DROP_UPPER_2_BITS_PER_BYTE — Data input to the block is actually RGB 18 bpp, but there is 1 color per byte, hence the upper 2 bits in each byte do not contain any useful data, and should be dropped.
0 RUN	When this bit is set by software, the eLCDIF will begin transferring data between the SoC and the display. This bit must remain set until the operation is complete.

18.6.2 eLCDIF General Control1 Register (LCDIF_CTRL1n)

The eLCDIF Control Register provides overall control of the eLCDIF block.

The eLCDIF Control1 Register provides additional programming to the eLCDIF. It implements some bits which are unlikely to change often in a particular application. It also carries interrupt-related bits which are common across more than one mode of operation.

Address: 20F_8000h base + 10h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

LCDIF_CTRL1n field descriptions

Field	Description
31–28 RSRVD1	This field is reserved. Reserved bits. Write as 0.
27 COMBINE_ MPU_WR_STRB	If this bit is not set, the write strobe will be driven on LCD_WR_RWn pin in the 8080 mode and on the LCD_RD_E pin in the 6800 mode. If it is set, the write strobe of both the 6800 and 8080 modes will be driven only on the LCD_WR_RWn pin. Note that this does not work for read strobe.
26 BM_ERROR_ IRQ_EN	This bit is set to enable bus master error interrupt in the eLCDIF master mode.
25 BM_ERROR_ IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. This bit will be set when the eLCDIF is in master mode and an error response was returned by the slave. 0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.
24 RECOVER_ON_ UNDERFLOW	Set this bit to enable the eLCDIF block to recover in the next field/frame if there was an underflow in the current field/frame.
23 INTERLACE_ FIELDS	Set this bit if it is required that the eLCDIF block fetches odd lines in one field and even lines in the other field. It will work only in LCDIF_MASTER is set to 1.
22 START_ INTERLACE_ FROM_ SECOND_FIELD	The default is to grab the odd lines first and then the even lines. Set this bit if it is required to grab the even lines first and then the odd lines. (Line numbers start from 1, so odd lines are 1,3,5,etc. and even lines are 2,4,6, etc.)
21 FIFO_CLEAR	Set this bit to clear all the data in the latency FIFO (LFIFO), TXFIFO and the RXFIFO.
20 IRQ_ON_ ALTERNATE_ FIELDS	If this bit is set, the eLCDIF block will assert the cur_frame_done interrupt only on alternate fields, otherwise it will issue the interrupt on both odd and even field. This bit is mostly relevant if INTERLACE_FIELDS is set.
19–16 BYTE_ PACKING_ FORMAT	This bitfield is used to show which data bytes in a 32-bit word are valid. Default value 0xf indicates that all bytes are valid. For 8-bit transfers, any combination in this bitfield will mean valid data is present in the corresponding bytes. In the 16-bit mode, a 16-bit half-word is valid only if adjacent bits [1:0] or [3:2] or both are 1. A value of 0x0 will mean that none of the bytes are valid and should not be used. For example, set the bit field value to 0x7 if the display data is arranged in the 24-bit unpacked format (A-R-G-B where A value does not have to be transmitted). When input data is in YCbCr 4:2:2 format (YCBCR422_INPUT is 1), H_COUNT should be the number of pixels that should be fetched by the block and the BYTE_PACKING_FORMAT should be 0xF. (Note - YCBCR422_INPUT = 1 implies 2 pixels per 32 bits).
15 OVERFLOW_ IRQ_EN	This bit is set to enable an overflow interrupt in the TXFIFO in the write mode.
14 UNDERFLOW_ IRQ_EN	This bit is set to enable an underflow interrupt in the TXFIFO in the write mode.
13 CUR_FRAME_ DONE_IRQ_EN	This bit is set to 1 enable an interrupt every time the hardware enters in the vertical blanking state.

Table continues on the next page...

LCDIF_CTRL1n field descriptions (continued)

Field	Description
12 VSYNC_EDGE_IRQ_EN	This bit is set to enable an interrupt every time the hardware encounters the leading VSYNC edge in the VSYNC and DOTCLK modes, or the beginning of every field in DVI mode.
11 OVERFLOW_IRQ	<p>This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A latency FIFO (LFIFO) overflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected, data samples have been lost.</p> <p>0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.</p>
10 UNDERFLOW_IRQ	<p>This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A TXFIFO underflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected. Could produce an error in the DOTCLK / DVI modes.</p> <p>0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.</p>
9 CUR_FRAME_DONE_IRQ	<p>This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It indicates that the hardware has completed transmitting the current frame and is in the vertical blanking period in the DOTCLK/DVI modes. In the MPU and VSYNC modes, this IRQ is asserted at the end of the data transfer indicated by LCDIF_TRANSFER_COUNT register.</p> <p>0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.</p>
8 VSYNC_EDGE_IRQ	<p>This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It is set whenever the leading VSYNC edge is detected in the VSYNC and DOTCLK modes. In the DVI mode, it is asserted every time the block enters a new field.</p> <p>0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.</p>
7–3 RSRVD0	This field is reserved. Reserved bits. Write as 0.
2 BUSY_ENABLE	<p>This bit enables the use of the interface's busy signal input. This should be enabled for LCD controllers that implement a busy line (to stall the eLCDIF from sending more data until ready). Otherwise this bit should be cleared.</p> <p>0x0 BUSY_DISABLED — The busy signal from the LCD controller will be ignored. 0x1 BUSY_ENABLED — Enable the use of the busy signal from the LCD controller.</p>
1 MODE86	<p>This bit is used to select between the 8080 and 6800 series of microprocessor modes. This bit should only be changed when RUN is 0.</p> <p>0x0 8080_MODE — Pins LCD_WR_RWn and LCD_RD_E function as active low WR and active low RD signals respectively. 0x1 6800_MODE — Pins LCD_WR_RWn and LCD_RD_E function as Read/Write and active high Enable signals respectively.</p>
0 RESET	<p>Reset bit for the external LCD controller. This bit can be changed at any time. It CANNOT be reset by SFTRST.</p> <p>0x0 LCDRESET_LOW — LCD_RESET output signal is low. 0x1 LCDRESET_HIGH — LCD_RESET output signal is high.</p>

18.6.3 eLCDIF General Control2 Register (LCDIF_CTRL2n)

The eLCDIF Control Register provides overall control of the eLCDIF block.

The eLCDIF Control2 Register provides additional programming to the eLCDIF. It implements some bits which are unlikely to change often in a particular application.

Address: 20F_8000h base + 20h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

LCDIF_CTRL2n field descriptions

Field	Description
31–24 RSRVD5	This field is reserved. Reserved bits. Write as 0.
23–21 OUTSTANDING_ REQS	This bitfield indicates the maximum number of outstanding transactions that eLCDIF should request when it is acting as a bus master. Default is 2 outstanding transactions. 0x0 REQ_1 — 0x1 REQ_2 — 0x2 REQ_4 — 0x3 REQ_8 — 0x4 REQ_16 —
20 BURST_LEN_8	By default, when the eLCDIF is in the bus master mode, it will issue AXI bursts of length 16 (except when in packed 24 bpp mode, it will issue bursts of length 15). When this bit is set to 1, the block will issue bursts of length 8 (except when in packed 24 bpp mode, it will issue bursts of length 9). Note that this bitfield is only applicable when LCDIF_MASTER is set to 1.

Table continues on the next page...

LCDIF_CTRL2n field descriptions (continued)

Field	Description
19 RSRVD4	This field is reserved. Reserved bits. Write as 0.
18–16 ODD_LINE_ PATTERN	This field determines the order of the RGB components of each pixel in ODD lines (line numbers 1,3,5,...). This bitfield must be 0 in DVI mode. 0x0 RGB — 0x1 RBG — 0x2 GBR — 0x3 GRB — 0x4 BRG — 0x5 BGR —
15 RSRVD3	This field is reserved. Reserved bits. Write as 0.
14–12 EVEN_LINE_ PATTERN	This field determines the order of the RGB components of each pixel in EVEN lines (line numbers 2,4,6,...). This bitfield must be 0 in DVI mode. 0x0 RGB — 0x1 RBG — 0x2 GBR — 0x3 GRB — 0x4 BRG — 0x5 BGR —
11 RSRVD2	This field is reserved. Reserved bits. Write as 0.
10 READ_PACK_DIR	The default value of 0 indicates data is stored in the little endian format. When LCD_DATABUS_WIDTH is 8-bit, this bit provides the option of rearranging the data byte-wise in the big endian format. For example, if READ_MODE_NUM_PACKED_SUBWORDS = 3 and the order of incoming data is 0x11, 0x22 and 0x33, then setting this bit to 1 will cause the data to be stored as 0x00112233 as opposed to the default 0x00332211. This operation occurs after the shifting operation done by SHIFT_NUM_BITS bitfield.
9 READ_MODE_ OUTPUT_IN_ RGB_FORMAT	Setting this bit will enable the eLCDIF to convert the incoming data to the RGB format given by WORD_LENGTH bitfield. This feature is not available when WORD_LENGTH is set to 8 bits. eLCDIF performs this operation of converting to RGB format after the endianness has been determined by the READ_PACK_DIR bitfield.
8 READ_MODE_6_ BIT_INPUT	Setting this bit to 1 indicates to eLCDIF that even though LCD_DATABUS_WIDTH is set to 8 bits, the input data is actually only 6 bits wide and exists on D5-D0.
7 RSRVD1	This field is reserved. Reserved bits. Write as 0.
6–4 READ_MODE_ NUM_PACKED_ SUBWORDS	Indicates the number of valid 8/16/18/24-bit subwords that will be packed into the 32-bit word in read mode. The subword size (8,16, 18 or 24 bits) is determined by the LCD_DATABUS_WIDTH field. The swizzle operation is performed after READ_MODE_NUM_PACKED_SUBWORDS number of subwords has been received and stored in little-endian format. For example, if LCD_DATABUS_WIDTH is set to 8-bit and data to be read back has to be stored in memory in 24-bit unpacked RGB format, set READ_MODE_NUM_PACKED_SUBWORDS to 0x3 so that each 32-bit word will contain only 3 valid bytes (RGB). Maximum value of READ_MODE_NUM_PACKED_SUBWORDS is 4 for 8-bit databus, 2 for 16-bit databus and 1 for 18/24-bit databus.

Table continues on the next page...

LCDIF_CTRL2n field descriptions (continued)

Field	Description
3–1 INITIAL_DUMMY_READ	The value in this field determines the number of dummy 8/16/18/24-bit subwords that have to be read back from the LCD panel/controller. They will then not be stored in the read FIFO.
0 RSRVD0	This field is reserved. Reserved bits. Write as 0.

18.6.4 eLCDIF Horizontal and Vertical Valid Data Count Register (LCDIF_TRANSFER_COUNT)

This register tells the eLCDIF how much data will be sent for this frame, or transaction. The total number of words is a product of the V_COUNT and H_COUNT fields. The word size is specified by the WORD_LENGTH field.

This register gives the dimensions of the input frame. For normal operation, but V_COUNT and H_COUNT should be non-zero.

Address: 20F_8000h base + 30h offset = 20F_8030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	V_COUNT																H_COUNT															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_TRANSFER_COUNT field descriptions

Field	Description
31–16 V_COUNT	Number of horizontal lines per frame which contain valid data. In DOTCLK mode, V_COUNT should be the same as the number of active horizontal lines in a progressive frame. In DVI mode, V_COUNT should be the number of active horizontal lines per frame, and not per field.
H_COUNT	Total valid data (pixels) in each horizontal line. The data size is given by the WORD_LENGTH. When input data is in YCbCr 4:2:2 format (YCBCR422_INPUT is 1), H_COUNT should be the number of 32-bit words that should be fetched by the block and the BYTE_PACKING_FORMAT should be 0xF. In 24-bit packed format (WORD_LENGTH=0x3, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 4 pixels. In 16-bit packed format (WORD_LENGTH=0x0, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 2 pixels.

18.6.5 LCD Interface Current Buffer Address Register (LCDIF_CUR_BUF)

This register indicates the address of the current frame being transmitted by eLCDIF.

When the eLCDIF is behaving as a master, this address points to the address of the current frame of data being sent out via the LCDIF. When the current frame is done, the LCDIF block will assert the cur_frame_done interrupt for software to take action. The

block will also copy the LCDIF_NEXT_BUF_ADDR into this bitfield so that the software can program the next frame address into the LCDIF_NEXT_BUF_ADDR bitfield. This address must always be double-word aligned.

Address: 20F_8000h base + 40h offset = 20F_8040h

LCDIF_CUR_BUF field descriptions

Field	Description
ADDR	Address of the current frame being transmitted by eLCDIF.

18.6.6 LCD Interface Next Buffer Address Register (LCDIF_NEXT_BUF)

This register indicates the address of next frame that will be transmitted by eLCDIF.

When the eLCDIF is behaving as a master, this address points to the address of the next frame of data that will be sent out via the eLCDIF. It is up to the software to make sure that this register is programmed before the end of the current frame, otherwise it might result in old data going out the eLCDIF. This address must always be double-word aligned.

Address: 20F_8000h base + 50h offset = 20F_8050h

LCDIF_NEXT_BUF field descriptions

Field	Description
ADDR	Address of the next frame that will be transmitted by eLCDIF.

18.6.7 LCD Interface Timing Register (LCDIF_TIMING)

The LCD interface timing register controls the various setup and hold times enforced by the LCD interface in the 6800/8080 MPU and VSYNC modes of operation.

The values used in this register are dependent on the particular LCD controller used, consult the users manual for the particular controller for required timings. Each field of the register must be non-zero, therefore the minimum value is: 0x01010101. NOTE: the timings are not automatically adjusted if the DISPLAY CLOCK (pix_clk) frequency changes—it may be necessary to adjust the timings if DISPLAY CLOCK (pix_clk) changes. NOTE: Each field in this register must be non-zero for the MPU and VSYNC modes to function. The settings in this register do not affect the DOTCLK and DVI modes.

Address: 20F_8000h base + 60h offset = 20F_8060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_TIMING field descriptions

Field	Description
31–24 CMD_HOLD	Number of DISPLAY CLOCK (pix_clk) cycles that the LCD_RS signal is active after LCD_CS is deasserted.
23–16 CMD_SETUP	Number of DISPLAY CLOCK (pix_clk) cycles that the LCD_RS signal is active before LCD_CS is asserted.
15–8 DATA_HOLD	Data bus hold time in DISPLAY CLOCK (pix_clk) cycles. Also the time that the data strobe is deasserted in a cycle
DATA_SETUP	Data bus setup time in DISPLAY CLOCK (pix_clk) cycles. Also the time that the data strobe is asserted in a cycle.

18.6.8 eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF_VDCTRL0n)

This register is used to control the VSYNC and DOTCLK modes of the LCDIF so as to work with different types of LCDs like moving picture displays and delta pixel displays.

This register gives general programmability to the VSYNC signal including polarity, direction, pulse width, etc.

Address: 20F_8000h base + 70h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ELCDIF Memory Map/Register Definition

LCDIF_VDCTRL0n field descriptions

Field	Description
31–30 RSRVD2	This field is reserved. Reserved bits. Write as 0.
29 VSYNC_OEB	0 means the VSYNC signal is an output, 1 means it is an input. Should be set to 0 in the DOTCLK mode. 0x0 VSYNC_OUTPUT — The VSYNC pin is in the output mode and the VSYNC signal has to be generated by the eLCDIF block. 0x1 VSYNC_INPUT — The VSYNC pin is in the input mode and the LCD controller sends the VSYNC signal to the block.
28 ENABLE_PRESENT	Setting this bit to 1 will make the hardware generate the ENABLE signal in the DOTCLK mode, thereby making it the true RGB interface along with the remaining three signals VSYNC, HSYNC and DOTCLK.
27 VSYNC_POL	Default 0 active low during VSYNC_PULSE_WIDTH time and will be high during the rest of the VSYNC period. Set it to 1 to invert the polarity.
26 HSYNC_POL	Default 0 active low during HSYNC_PULSE_WIDTH time and will be high during the rest of the HSYNC period. Set it to 1 to invert the polarity.
25 DOTCLK_POL	Default is data launched at negative edge of DOTCLK and captured at positive edge. Set it to 1 to invert the polarity. Set it to 0 in DVI mode.
24 ENABLE_POL	Default 0 active low during valid data transfer on each horizontal line.
23–22 RSRVD1	This field is reserved. Reserved bits. Write as 0.
21 VSYNC_PERIOD_UNIT	Default 0 for counting VSYNC_PERIOD in terms of DISPLAY CLOCK (pix_clk) cycles. Set it to 1 to count in terms of complete horizontal lines. DISPLAY CLOCK (pix_clk) cycles should be used in the VSYNC mode, while horizontal line should be used in the DOTCLK mode.
20 VSYNC_PULSE_WIDTH_UNIT	Default 0 for counting VSYNC_PULSE_WIDTH in terms of DISPLAY CLOCK (pix_clk) cycles. Set it to 1 to count in terms of complete horizontal lines.
19 HALF_LINE	Setting this bit to 1 will make the total VSYNC period equal to the VSYNC_PERIOD field plus half the HORIZONTAL_PERIOD field (i.e. VSYNC_PERIOD field plus half horizontal line), otherwise it is just VSYNC_PERIOD. Should be only used in the DOTCLK mode, not in the VSYNC interface mode.
18 HALF_LINE_MODE	When this bit is 0, the first field (VSYNC period) will end in half a horizontal line and the second field will begin with half a horizontal line. When this bit is 1, all fields will end with half a horizontal line, and none will begin with half a horizontal line.
VSYNC_PULSE_WIDTH	Number of units for which VSYNC signal is active. For the DOTCLK mode, the unit is determined by the VSYNC_PULSE_WIDTH_UNIT. If the VSYNC_PULSE_WIDTH_UNIT is 0 for DOTCLK mode, VSYNC_PULSE_WIDTH must be less than HSYNC_PERIOD. For the VSYNC interface mode, it should be in terms of number of DISPLAY CLOCK (pix_clk) cycles only.

18.6.9 eLCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIF_VDCTRL1)

This register is used to control the VSYNC signal in the VSYNC and DOTCLK modes of the block.

This register determines the period and duty cycle of the VSYNC signal when it is generated in the block.

Address: 20F_8000h base + 80h offset = 20F_8080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_VDCTRL1 field descriptions

Field	Description
VSYNC_PERIOD	Total number of units between two positive or two negative edges of the VSYNC signal. If HALF_LINE is set, it is implicitly calculated to be VSYNC_PERIOD plus half HSYNC_PERIOD.

18.6.10 LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIF_VDCTRL2)

This register is used to control the HSYNC signal in the DOTCLK mode of the block.

This register determines the period and duty cycle of the HSYNC signal when it is generated in the block.

Address: 20F_8000h base + 90h offset = 20F_8090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_VDCTRL2 field descriptions

Field	Description
31–18 HSYNC_PULSE_WIDTH	Number of DISPLAY CLOCK (pix_clk) cycles for which HSYNC signal is active.
HSYNC_PERIOD	Total number of DISPLAY CLOCK (pix_clk) cycles between two positive or two negative edges of the HSYNC signal.

18.6.11 eLCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIF_VDCTRL3)

This register is used to determine the vertical and horizontal wait counts.

This register determines the back porches of HSYNC and VSYNC signals when they are generated by the block.

Address: 20F_8000h base + A0h offset = 20F_80A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	VERTICAL_WAIT_CNT															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_VDCTRL3 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29 MUX_SYNC_SIGNALS	When this bit is set, the eLCDIF block will internally mux HSYNC with LCD_D14, DOTCLK with LCD_D13 and ENABLE with LCD_D12, otherwise these signals will go out on separate pins. This feature can be used to maintain backward compatible with 37xx.
28 VSYNC_ONLY	This bit must be set to 1 in the VSYNC mode of operation, and 0 in the DOTCLK mode of operation.
27–16 HORIZONTAL_WAIT_CNT	In the DOTCLK mode, wait for this number of clocks from falling edge (or rising if HSYNC_POL is 1) of HSYNC signal to account for horizontal back porch plus the number of DOTCLKs before the moving picture information begins.
VERTICAL_WAIT_CNT	In the VSYNC interface mode, wait for this number of DISPLAY CLOCK (pix_clk) cycles from the falling VSYNC edge (or rising if VSYNC_POL is 1) before starting LCD transactions and is applicable only if WAIT_FOR_VSYNC_EDGE is set. Minimum is CMD_SETUP+5. In the DOTCLK mode, it accounts for the vertical back porch lines plus the number of horizontal lines before the moving picture begins. The unit for this parameter is inherently the same as the VSYNC_PERIOD_UNIT.

18.6.12 eLCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIF_VDCTRL4)

This register is used to control the DOTCLK mode of the block.

This register determines the active data in each horizontal line in the DOTCLK mode.

Note that the total number of active horizontal lines in the DOTCLK mode is the same as the V_COUNT bitfield in the LCDIF_TRANSFER_COUNT register.

Address: 20F_8000h base + B0h offset = 20F_80B0h

LCDIF_VDCTRL4 field descriptions

Field	Description
31–29 DOTCLK_DLY_SEL	This bitfield selects the amount of time by which the DOTCLK signal should be delayed before coming out of the LCD_DOTCK pin. 0 = 2ns; 1=4ns;2=6ns;3=8ns. Remaining values are reserved.
28–19 RSRVD0	This field is reserved. Reserved bits, write as 0.
18 SYNC_ SIGNALS_ON	Set this field to 1 if the LCD controller requires that the VSYNC or VSYNC/HSYNC/DOTCLK control signals should be active at least one frame before the data transfers actually start and remain active at least one frame after the data transfers end. The hardware does not count the number of frames automatically. Rather, the VSYNC edge interrupt can be monitored by software to count the number of frames that have occurred after this bit is set and then the RUN bit can be set to start the data transactions. This bit must always be set in the DOTCLK mode of operation, and it must be set in the VSYNC mode of operation when VSYNC signal is an output.
DOTCLK_H_ VALID_DATA_ CNT	Total number of DISPLAY CLOCK (pix_clk) cycles on each horizontal line that carry valid data in DOTCLK mode.

18.6.13 Digital Video Interface Control0 Register (LCDIF_DVICTRL0)

The Digital Video interface Control0 register provides the overall control of the Digital Video interface.

This register gives information about the horizontal active, horizontal blanking and total number of lines in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL0_H_ACTIVE_CNT_WR(0x5A0); //1440
HW_LCDIF_DVICTRL0_H_BLANKING_CNT_WR(0x106); //262
//625/50 video system
HW_LCDIF_DVICTRL0_H_ACTIVE_CNT_WR(0x5A0); //1440
HW_LCDIF_DVICTRL0_H_BLANKING_CNT_WR(0x112); //274
```

Address: 20F_8000h base + C0h offset = 20F_80C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				H_ACTIVE_CNT												Reserved				H_BLANKING_CNT											
W	Reserved				H_ACTIVE_CNT												Reserved				H_BLANKING_CNT											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

LCDIF_DVICTRL0 field descriptions

Field	Description
31–28 RSRVD1	This field is reserved. Reserved bits, write as 0.
27–16 H_ACTIVE_CNT	Number of active video samples to be transmitted. (Mostly will be 1440 for both PAL and NTSC). Must always be a multiple of 4.
15–12 RSRVD0	This field is reserved. Reserved bits, write as 0.
H_BLANKING_CNT	Number of blanking samples to be inserted between EAV and SAV during horizontal blanking interval.

18.6.14 Digital Video Interface Control1 Register (LCDIF_DVICTRL1)

The Digital Video interface Control1 register provides the overall control of the Digital Video interface.

This register contains information about the Field1 start and end, and the Field2 start in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL1_F1_START_LINE_WR(0x4); //4
HW_LCDIF_DVICTRL1_F1_END_LINE_WR(0x109); //265
HW_LCDIF_DVICTRL1_F2_START_LINE_WR(0x10A); //266
//625/50 video system
HW_LCDIF_DVICTRL1_F1_START_LINE_WR(0x1); //1
HW_LCDIF_DVICTRL1_F1_END_LINE_WR(0x138); //312
HW_LCDIF_DVICTRL1_F2_START_LINE_WR(0x139); //313
```

Address: 20F_8000h base + D0h offset = 20F_80D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved			F1_START_LINE								F1_END_LINE

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_DVICTRL1 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 F1_START_LINE	Vertical line number from which Field 1 begins.
19–10 F1_END_LINE	Vertical line number at which Field1 ends.
F2_START_LINE	Vertical line number from which Field 2 begins.

18.6.15 Digital Video Interface Control2 Register (LCDIF_DVICTRL2)

The Digital Video interface Control2 register provides the overall control of the Digital Video interface.

This register contains information about the Field2 end, and the Vertical Blanking1 interval in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL2_F2_END_LINE_WR(0x3); //3
HW_LCDIF_DVICTRL2_V1_BLANK_START_LINE_WR(0x108); //264
HW_LCDIF_DVICTRL2_V1_BLANK_END_LINE_WR(0x11A); //282
//625/50 video system
HW_LCDIF_DVICTRL2_F2_END_LINE_WR(0x271); //625
HW_LCDIF_DVICTRL2_V1_BLANK_START_LINE_WR(0x137); //311
HW_LCDIF_DVICTRL2_V1_BLANK_END_LINE_WR(0x14F); //335
```

ELCDIF Memory Map/Register Definition

Address: 20F_8000h base + E0h offset = 20F_80E0h

LCDIF_DVICTRL2 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 F2_END_LINE	Vertical line number at which Field 2 ends.
19–10 V1_BLANK_START_LINE	Vertical line number towards the end of Field1 where first Vertical Blanking interval starts.
V1_BLANK_END_LINE	Vertical line number in the beginning part of Field2 where first Vertical Blanking interval ends.

18.6.16 Digital Video Interface Control3 Register (LCDIF_DVICTRL3)

The Digital Video interface Control3 register provides the overall control of the Digital Video interface.

This register contains information about the Vertical Blanking2 interval in the ITU-R BT. 656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL3_V2_BLANK_START_LINE_WR(0x1); //1
HW_LCDIF_DVICTRL3_V2_BLANK_END_LINE_WR(0x13); //19
HW_LCDIF_DVICTRL0_V_LINES_CNT_WR(0x20D); //525
//625/50 video system
HW_LCDIF_DVICTRL3_V2_BLANK_START_LINE_WR(0x270); //624
HW_LCDIF_DVICTRL3_V2_BLANK_END_LINE_WR(0x16); //22
HW_LCDIF_DVICTRL0_V_LINES_CNT_WR(0x271); //625
```

Address: 20F_8000h base + F0h offset = 20F_80F0h

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_DVICTRL3 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 V2_BLANK_START_LINE	Vertical line number towards the end of Field2 where second Vertical Blanking interval starts.
19–10 V2_BLANK_END_LINE	Vertical line number in the beginning part of Field1 where second Vertical Blanking interval ends.
V_LINES_CNT	Total number of vertical lines per frame (generally 525 or 625)

18.6.17 Digital Video Interface Control4 Register (LCDIF_DVICTRL4)

The Digital Video interface Control4 register provides the overall control of the Digital Video interface.

This register is used to add side borders to the output if the input frame width is less than 720 pixels.

EXAMPLE

```
//If input frame has only 640 pixels per line, but output is supposed to have
720 pixels per line.
HW_LCDIF_DVICTRL4_H_FILL_CNT_WR(0x50); //80
HW_LCDIF_DVICTRL4_Y_FILL_VALUE_WR(0x10); //16
HW_LCDIF_DVICTRL4_CB_FILL_VALUE_WR(0x80); //128
HW_LCDIF_DVICTRL4_CR_FILL_VALUE_WR(0x80); //128
```

Address: 20F_8000h base + 100h offset = 20F_8100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Y_FILL_VALUE								CB_FILL_VALUE								CR_FILL_VALUE								H_FILL_CNT							
W

LCDIF_DVICTRL4 field descriptions

Field	Description
31–24 Y_FILL_VALUE	Value of Y component of filler data

Table continues on the next page...

LCDIF_DVICTRL4 field descriptions (continued)

Field	Description
23–16 CB_FILL_VALUE	Value of CB component of filler data
15–8 CR_FILL_VALUE	Value of CR component of filler data.
H_FILL_CNT	Number of active video samples that have to be filled with the filler data in the front and back portions of the active horizontal interval. Must be a multiple of 4. This field will have to be programmed if the input frame has less than 720 pixels per line.

18.6.18 RGB to YCbCr 4:2:2 CSC Coefficient0 Register (LCDIF_CSC_COEFF0)

LCDIF_CSC_COEFF0 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0 \cdot R + C1 \cdot G + C2 \cdot B + Y_offset$ $Cb = C3 \cdot R + C4 \cdot G + C5 \cdot B + CbCr_offset$ $Cr = C6 \cdot R + C7 \cdot G + C8 \cdot B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF0_C0_WR(0x41) ; // 0.257x256=65
HW_LCDIF_CSC_COEFF0_CSC_SUBSAMPLE_FILTER_WR(0x3) ;
```

Address: 20F_8000h base + 110h offset = 20F_8110h

LCDIF_CSC_COEFF0 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C0	Two's complement red multiplier coefficient for Y
15–2 RSRVD0	This field is reserved. Reserved bits, write as 0.

Table continues on the next page...

LCDIF_CSC_COEFF0 field descriptions (continued)

Field	Description
CSC_SUBSAMPLE_FILTER	This register describes the filtering and subsampling scheme to be performed on the chroma components in order to convert from YCbCr 4:4:4 to YCbCr 4:2:2 space. Note that the following descriptions apply individually to Cb and Cr.
0x0	SAMPLE_AND_HOLD — No filtering, simply keep every chroma value for samples numbered 2n and discard chroma values associated with all samples numbered 2n+1.
0x1	RSRVD — Reserved
0x2	INTERSTITIAL — Chroma samples numbered 2n and 2n+1 are averaged (weights 1/2, 1/2) and that chroma value replaces the two chroma values at 2n and 2n+1. This chroma now exists horizontally halfway between the two luma samples.
0x3	COSITED — Chroma samples numbered 2n-1, 2n, and 2n+1 are averaged (weights 1/4, 1/2, 1/4) and that chroma value exists at the same site as the luma sample numbered 2n and the chroma samples at 2n+1 are discarded.

18.6.19 RGB to YCbCr 4:2:2 CSC Coefficient1 Register (LCDIF_CSC_COEFF1)

LCDIF_CSC_COEFF1 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0 \cdot R + C1 \cdot G + C2 \cdot B + Y_offset$ $Cb = C3 \cdot R + C4 \cdot G + C5 \cdot B + CbCr_offset$ $Cr = C6 \cdot R + C7 \cdot G + C8 \cdot B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF1_C1_WR(0x81); //0.504x256=129
HW_LCDIF_CSC_COEFF1_C2_WR(0x19); //0.098x256=25
```

Address: 20F_8000h base + 120h offset = 20F_8120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_CSC_COEFF1 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C2	Two's complement blue multiplier coefficient for Y
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C1	Two's complement green multiplier coefficient for Y

18.6.20 RGB to YCbCr 4:2:2 CSC Coefficient2 Register (LCDIF_CSC_COEFF2)

LCDIF_CSC_COEFF2 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0 \cdot R + C1 \cdot G + C2 \cdot B + Y_offset$ $Cb = C3 \cdot R + C4 \cdot G + C5 \cdot B + CbCr_offset$ $Cr = C6 \cdot R + C7 \cdot G + C8 \cdot B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF2_C3_WR(0x3DB); //-0.148x256=-37
HW_LCDIF_CSC_COEFF2_C4_WR(0x3B6); //-0.291x256=-74
```

Address: 20F_8000h base + 130h offset = 20F_8130h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_CSC_COEFF2 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C4	Two's complement green multiplier coefficient for Cb
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C3	Two's complement red multiplier coefficient for Cb

18.6.21 RGB to YCbCr 4:2:2 CSC Coefficient3 Register (LCDIF_CSC_COEFF3)

LCDIF_CSC_COEFF3 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0 \cdot R + C1 \cdot G + C2 \cdot B + Y_offset$ $Cb = C3 \cdot R + C4 \cdot G + C5 \cdot B + CbCr_offset$ $Cr = C6 \cdot R + C7 \cdot G + C8 \cdot B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF3_C5_WR(0x70) ; //0.439x256=112
HW_LCDIF_CSC_COEFF3_C6_WR(0x70) ; //0.439x256=112
```

Address: 20F_8000h base + 140h offset = 20F_8140h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

C5	Two's complement blue multiplier coefficient for Cb

18.6.22 RGB to YCbCr 4:2:2 CSC Coefficient4 Register (LCDIF_CSC_COEFF4)

LCDIF_CSC_COEFF4 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0 \cdot R + C1 \cdot G + C2 \cdot B + Y_offset$ $Cb = C3 \cdot R + C4 \cdot G + C5 \cdot B + CbCr_offset$ $Cr = C6 \cdot R + C7 \cdot G + C8 \cdot B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF4_C7_WR(0x3A2) ; //-0.368x256=-94
HW_LCDIF_CSC_COEFF4_C8_WR(0x3EE) ; //-0.071x256=-18
```

Address: 20F_8000h base + 150h offset = 20F_8150h

C7	Two's complement green multiplier coefficient for Cr

18.6.23 RGB to YCbCr 4:2:2 CSC Offset Register (LCDIF_CSC_OFFSET)

LCDIF_CSC_ register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0*R + C1*G + C2*B + Y_offset$ $Cb = C3*R + C4*G + C5*B + CbCr_offset$ $Cr = C6*R + C7*G + C8*B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

Address: 20F_8000h base + 160h offset = 20F_8160h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								CBCR_OFFSET								Reserved								Y_OFFSET

LCDIF_CSC_OFFSET field descriptions

Field	Description
31–25 RSRVD1	This field is reserved. Reserved bits, write as 0.
24–16 CBCR_OFFSET	Two's complement offset for the Cb and Cr components
15–9 RSRVD0	This field is reserved. Reserved bits, write as 0.
Y_OFFSET	Two's complement offset for the Y component

18.6.24 RGB to YCbCr 4:2:2 CSC Limit Register (LCDIF_CSC_LIMIT)

LCDIF_CSC_CTRL0 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0*R + C1*G + C2*B + Y_offset$ $Cb = C3*R + C4*G + C5*B + CbCr_offset$ $Cr = C6*R + C7*G + C8*B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC. Note that the values in this register are unsigned.

EXAMPLE

```
HW_LCDIF_CSC_LIMIT_CBCR_MIN_WR(0x10); //16
HW_LCDIF_CSC_LIMIT_CBCR_MAX_WR(0xF0); //240
HW_LCDIF_CSC_LIMIT_Y_MIN_WR(0x10); //16
HW_LCDIF_CSC_LIMIT_Y_MAX_WR(0xEB); //235
```

Address: 20F_8000h base + 170h offset = 20F_8170h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_CSC_LIMIT field descriptions

Field	Description
31–24 CBCR_MIN	Lower limit of Cb and Cr after RGB to 4:2:2 YCbCr conversion
23–16 CBCR_MAX	Upper limit of Cb and Cr after RGB to 4:2:2 YCbCr conversion
15–8 Y_MIN	Lower limit of Y after RGB to 4:2:2 YCbCr conversion
Y_MAX	Upper limit of Y after RGB to 4:2:2 YCbCr conversion

18.6.25 LCD Interface Data Register (LCDIF_DATA)

This register is used to transfer data using the PIO interface mode of operation. In MPU mode, data written to this register will be transferred out to the display device. When receiving data from the display, data is read from this register using PIO operations. During write operations, data can be written to this register (from the processor's perspective) as bytes, half-words (16 bits), or words (32 bits) as desired.

This register holds the 32-bit word written by the ARM platform into LCDIF. This data then gets sent out by the block across the interface.

Address: 20F_8000h base + 180h offset = 20F_8180h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W	DATA_THREE								DATA_TWO								DATA_ONE								DATA_ZERO							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

LCDIF_DATA field descriptions

Field	Description
31–24 DATA_THREE	Byte 3 (most significant byte) of data written to LCDIF.
23–16 DATA_TWO	Byte 2 of data written to eLCDIF.
15–8 DATA_ONE	Byte 1 of data written to eLCDIF.
DATA_ZERO	Byte 0 (least significant byte) of data written to eLCDIF.

18.6.26 Bus Master Error Status Register (LCDIF_BM_ERROR_STAT)

This register reflects the virtual address at which the AXI master received an error response from the slave.

When the BM_ERROR_IRQ is asserted, the address of the bus error is updated in the register.

Address: 20F_8000h base + 190h offset = 20F_8190h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_BM_ERROR_STAT field descriptions

Field	Description
ADDR	Virtual address at which bus master error occurred.

18.6.27 CRC Status Register (LCDIF_CRC_STAT)

This register reflects the CRC value of each frame sent out by eLCDIF. The CRC is done on the final output bus, so the value will be dependent on the LCD_DATABUS_WIDTH bitfield even if the input data is the same.

This register will be updated when the CUR_FRAME_DONE_IRQ is asserted. In the case of DVI mode, the CRC is calculated for the entire frame, not separately for each field in the frame.

Address: 20F_8000h base + 1A0h offset = 20F_81A0h

LCDIF_CRC_STAT field descriptions

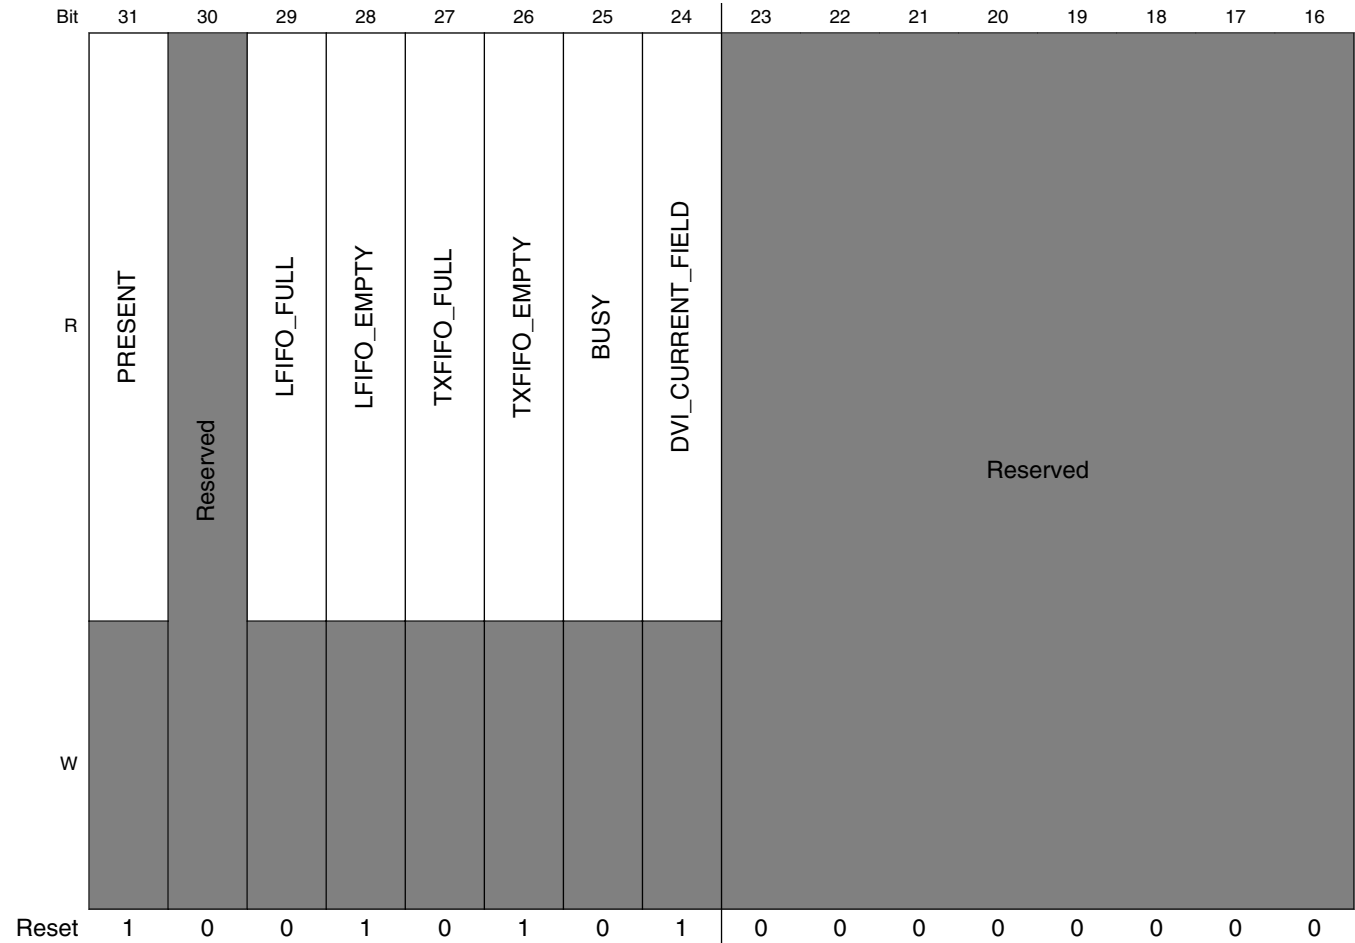

Field	Description
CRC_VALUE	Calculated CRC value.

18.6.28 LCD Interface Status Register (LCDIF_STAT)

The LCD interface status register can be used to check the current status of the eLCDIF block.

The LCD interface status register that contains read only views of some parameters or current state of the block.

Address: 20F_8000h base + 1B0h offset = 20F_81B0h

ELCDIF Memory Map/Register Definition

LCDIF_STAT field descriptions

Field	Description
31 PRESENT	0: eLCDIF not present on this product 1: eLCDIF is present.
30 -	This field is reserved. Reserved.
29 LFIFO_FULL	Read only view of the signals that indicates LCD LFIFO is full.
28 LFIFO_EMPTY	Read only view of the signals that indicates LCD LFIFO is empty.
27 TXFIFO_FULL	Read only view of the signals that indicates LCD TXFIFO is full.
26 TXFIFO_EMPTY	Read only view of the signals that indicates LCD TXFIFO is empty.
25 BUSY	Read only view of the input busy signal from the external LCD controller.
24 DVI_CURRENT_FIELD	Read only view of the current field being transmitted. DVI_CURRENT_FIELD = 0 means field 1. DVI_CURRENT_FIELD = 1 means field 2.
23–9 RSRVD0	This field is reserved. Reserved bits. Write as 0.
LFIFO_COUNT	Read only view of the current count in Latency buffer (LFIFO).

18.6.29 eLCDIF Threshold Register (LCDIF_THRES)

This register is used to activate control signals when the number of pixels reaches the programmed threshold. These control signals, in turn, can be used to manipulate access priority or dynamically change the input clock frequency to meet the required pixel throughput.

Memory request priority threshold register.

Address: 20F_8000h base + 200h offset = 20F_8200h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								FASTCLOCK								Reserved								PANIC							
W	Reserved								FASTCLOCK								Reserved								PANIC							
Reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1

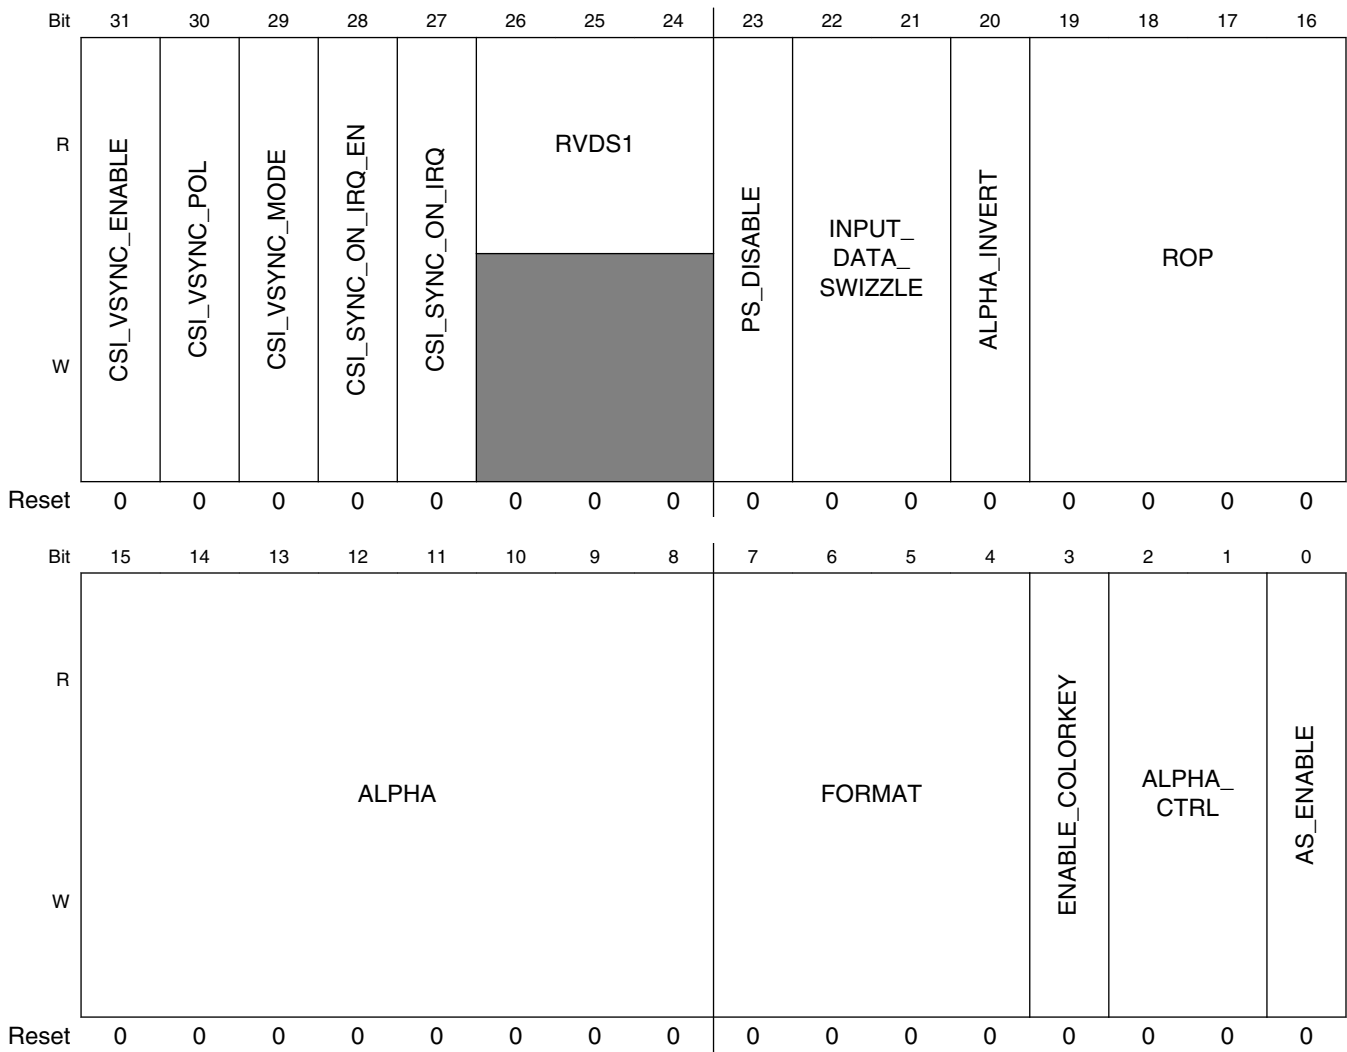

LCDIF_THRES field descriptions

Field	Description
31–25 RSRVD2	This field is reserved. Reserved bits. Write as 0.
24–16 FASTCLOCK	This value should be set to a value of pixels, from 0 to 511. When the number of pixels in the input pixel FIFO is LESS than this value, the fast clock control output will be raised. This signal can be used to reduce the system bus clock frequency to save power during horizontal or vertical blanking intervals. This value should also be programmed to a value that is greater than the "PANIC" threshold value. This will allow a faster clock to recover the number of pixels in the FIFO before a "panic" level is encountered.
15–9 RSRVD1	This field is reserved. Reserved bits. Write as 0.
PANIC	This value should be set to a value of pixels from 0 to 511. When the number of pixels in the input pixel FIFO is less than this value, the internal panic control output will be raised. This signal can be used to raise the access eLCDIF's access priority.

18.6.30 eLCDIF AS Buffer Control Register (LCDIF_AS_CTRL)

The Alpha Surface Parameter register provides additional controls for AS.

Address: 20F_8000h base + 210h offset = 20F_8210h

LCDIF_AS_CTRL field descriptions

Field	Description
31 CSI_VSYNC_ENABLE	When this bit is set by software, the LCDIF work as sync mode with CSI input.
30 CSI_VSYNC_POL	Default 0 active low during VSYNC_PULSE_WIDTH time and will be high during the rest of the VSYNC period. Set it to 1 to invert the polarity.

Table continues on the next page...

LCDIF_AS_CTRL field descriptions (continued)

Field	Description
29 CSI_VSYNC_MODE	this bit is set by software to decide which vsync generate mode. LCDIF vsync generate by internal counter when set to 0, LCDIF vsync delayed by each csi_vsync_in when set to 1; INT_SYNC_MODE = 0x0 LCDIF vsync generate by internal counter. EXT_SYNC_MODE = 0x1 LCDIF vsync delayed by each csi_vsync_in.
28 CSI_SYNC_ON_IRQ_EN	This bit is set to enable an interrupt when LCDIF lock with CSI vsync input.
27 CSI_SYNC_ON_IRQ	this bit is set by software to decide which vsync generate mode. LCDIF vsync generate by internal counter when set to 0, LCDIF vsync delayed by each csi_vsync_in when set to 1; INT_SYNC_MODE = 0x0 LCDIF vsync generate by internal counter. EXT_SYNC_MODE = 0x1 LCDIF vsync delayed by each csi_vsync_in.
26–24 RVDS1	Reserved, always set to zero.
23 PS_DISABLE	When this bit is set by software, the LCDIF will disable PS buffer data.
22–21 INPUT_DATA_SWIZZLE	This field specifies how to swap the bytes either in the HW_LCDIF_DATA register or those fetched by the AXI master part of LCDIF. The swizzle function is independent of the WORD_LENGTH bit. See the explanation of the HW_LCDIF_DATA below for names and definitions of data register fields. The supported swizzle configurations are: NO_SWAP = 0x0 No byte swapping.(Little endian) LITTLE_ENDIAN = 0x0 Little Endian byte ordering (same as NO_SWAP). BIG_ENDIAN_SWAP = 0x1 Big Endian swap (swap bytes 0, 3 and 1, 2). SWAP_ALL_BYTES = 0x1 Swizzle all bytes, swap bytes 0, 3 and 1, 2 (aka Big Endian). HWD_SWAP = 0x2 Swap half-words. HWD_BYTE_SWAP = 0x3 Swap bytes within each half-word.
20 ALPHA_INVERT	Setting this bit to logic 0 will not alter the alpha value. A logic 1 will invert the alpha value and apply (1-alpha) for image composition.
19–16 ROP	Indicates a raster operation to perform when enabled. Raster operations are enabled through the ALPHA_CTRL field. MASKAS = 0x0 AS AND PS MASKNOTAS = 0x1 nAS AND PS MASKASNOT = 0x2 AS AND nPS MERGEAS = 0x3 AS OR PS MERGENOTAS = 0x4 nAS OR PS MERGEASNOT = 0x5 AS OR nPS NOTCOPYAS = 0x6 nAS NOT = 0x7 nPS NOTMASKAS = 0x8 AS NAND PS NOTMERGEAS = 0x9 AS NOR PS XORAS = 0xA AS XOR PS NOTXORAS = 0xB AS XNOR PS

Table continues on the next page...

LCDIF_AS_CTRL field descriptions (continued)

Field	Description
15–8 ALPHA	Alpha modifier used when the ALPHA_MULTIPLY or ALPHA_OVERRIDE values are programmed in REG_AS_CTRL[ALPHA_CTRL]. The output alpha value will either be replaced (ALPHA_OVERRIDE) or scaled (ALPHA_MULTIPLY) when selected.
7–4 FORMAT	Indicates the input buffer format for AS. ARGB8888 = 0x0 32-bit pixels with alpha RGB888 = 0x4 32-bit pixels without alpha (unpacked 24-bit format) ARGB1555 = 0x8 16-bit pixels with alpha ARGB4444 = 0x9 16-bit pixels with alpha RGB555 = 0xC 16-bit pixels without alpha RGB444 = 0xD 16-bit pixels without alpha RGB565 = 0xE 16-bit pixels without alpha
3 ENABLE_ COLORKEY	Indicates that colorkey functionality is enabled for this alpha surface. Pixels found in the alpha surface colorkey range will be displayed as transparent (the PS pixel will be used).
2–1 ALPHA_CTRL	Determines how the alpha value is constructed for this alpha surface. Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. Embedded = 0x0 Indicates that the AS pixel alpha value will be used to blend the AS with PS. The ALPHA field is ignored. Override = 0x1 Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. Multiply = 0x2 Indicates that the value in the ALPHA field should be used to scale all pixel alpha values. Each pixel alpha is multiplied by the value in the ALPHA field. ROPs = 0x3 Enable ROPs. The ROP field indicates an operation to be performed on the alpha surface and PS pixels.
0 AS_ENABLE	When this bit is set by software, the LCDIF will start fetching AS buffer data in bus master mode and combine it with another buffer.

18.6.31 Alpha Surface Buffer Pointer (LCDIF_AS_BUF)

This register is used to indicate the base address of the AS buffer.

Address: 20F_8000h base + 220h offset = 20F_8220h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_AS_BUF field descriptions

Field	Description
ADDR	Address pointer for the alpha surface 0 buffer.

18.6.32 LCDIF_AS_NEXT_BUF

When the LCDIF is behaving as a master, this address points to the address of the next frame of data that will be sent out via the LCDIF. It is upto the software to make sure that this register is programmed before the end of the current frame, otherwise it might result in old data going out the LCDIF. This address must always be double-word aligned.

Address: 20F_8000h base + 230h offset = 20F_8230h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_SYNC_DELAY field descriptions

Field	Description
31–16 V_COUNT_DELAY	LCDIF VSYNC delayed counter for CSI_VSYNC.
H_COUNT_DELAY	LCDIF VSYNC delayed counter for CSI_VSYNC.

Chapter 19

Electrophoretic Display Controller (EPDC)

19.1 Overview

This chapter describes the architecture of the EPDC. It provides a detailed description of the block for digital design and software driver development.

The EPDC is a feature-rich, low power and high performance direct drive active matrix EPD controller. It is specifically designed to drive E•INK™ EPD panels supporting a wide variety of TFT backplanes. The goal of the EPDC is to provide an efficient SoC integration of this functionality for e-paper applications, allowing a significant BOM cost saving over an external solution, while reaching much higher levels of performance at lower power. The EPDC module is defined in the context of an optimized HW/SW partitioning and works in conjunction with the PXP IP module to form a complete display processing solution.

The key features of the EPDC are as follows:

- TFT resolutions up to 4096 x 4096 pixels with 20 Hz refresh (programmable up to 8191 x 8191)
- TFT resolutions up to 1650 x 2332 pixels at 106 Hz refresh
- Industry standard bus interfaces (AMBA AXI and APB)
- Up to 5-bit pixel representation for up to 32 greyscale levels
- Up to 64 concurrent updates with partial update support, except for 32(5-bit) grey level panel for which only 16 concurrent updates can be used
- Automatic collision handling when used in conjunction with the i.MX device driver
- Flexible direct drive TFT interface supporting next generation source driver, gate driver and panel architectures, including LVDS, DDR and multi-level source drivers
- Unified generic configurable timing mode (Pigeon Mode) available on most panel timing control signals
- High performance pixel pipeline architecture to guarantee refresh performance at high pixel rates without the need for high internal clocking

- Ability to process multiple updates asynchronously to refresh/update operations with ability to intercept each frame scan with multiple update requests
- Performance tuning capabilities which can interface with SoC level memory arbitration mechanisms further guaranteeing frame refresh operation
- Decoupled clocking architecture allowing for independent and asynchronous clock sources for memory bus, peripheral bus and pixel clock domains
- Full and partial update mode support
- Support for up to 256 waveform modes, also support optimal waveform auto-selection based on grey level of the pixels being updated
- Low power mode operation via architectural clock gating
- Update buffer analysis functions to get information like collision rectangle, grey level

19.1.1 EPDC Block Diagram

The top-level view of the EPDC is shown in the following figure.

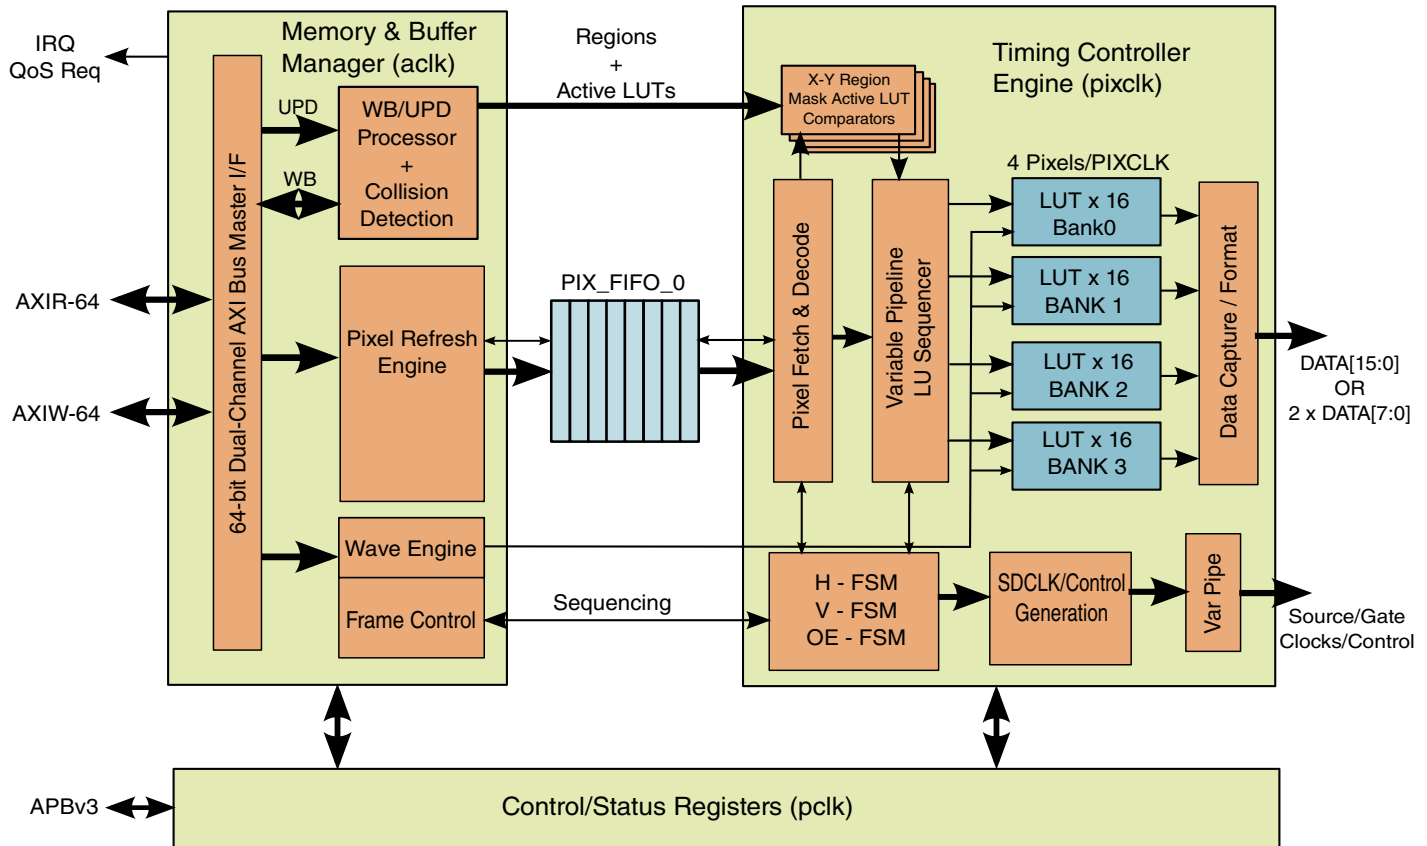

Figure 19-1. EPDC Top-Level Block Diagram

The EPD function can be separated into two major asynchronous processes. The first is the front end portion which is responsible for processing display updates. The second is the function of driving waveforms to the TFT panel in order to update the screen contents (the refresh operation). The EPDC is comprised of two major submodules (MBM and TCE) which mirror the architectural split in the EPD algorithm. These submodules communicate through a number of control/sequencing signals and data (through the pixel FIFOs and LUT memories):

- **Memory and Buffer Manager (MBM):** This submodule is responsible for all memory-related operations and LUT life cycle control, which involves the frame count management for all updates. This module is clocked by both *aclk* and *pixclk*. It also encapsulates the APB register interface which is clocked by *aclk* too.
- **Timing Control Engine (TCE):** This submodule is responsible for performing TFT scan frame refreshes. It is clocked by *pixclk*. It also houses the LUT memory system.

19.2 External Signals

The following table describes the external signals of EPDC:

Table 19-1. EPDC External Signals

Signal	Description	Pad	Mode	Direction
EPDC_BDR0	Panel-Border Control (SW controlled)	ECSPI1_MISO	ALT3	O
		EPDC_BDR0	ALT0	
EPDC_BDR1	Panel-Border Control (SW controlled)	ECSPI1_SS0	ALT3	O

EPDC_VCOM1	Panel-VCOM	ECSPI1_MOSI	ALT3	O
		EPDC_VCOM1	ALT0	

19.3 Programming Model

From an application perspective, the EPDC HW/SW solution aims to abstract much of the details of driving an EPD display from the user space.

This is achieved through a blend of HW features and the kernel-level SW driver implementation of the EPD frame buffer. The scope of this chapter mostly pertains to EPDC HW but in order to correctly define the context of the programming model, certain assumptions about the driver architecture (including use of the ePXP IP) are described below.

19.3.1 Assumptions

The scope of the EPDC does not include certain functions performed by the driver and application layer.

These features are as follows:

- Maintenance of update and collision lists. This includes, but is not limited to, responsibility for managing update order. Updates are processed in the order they are received by the EPDC. Actual start times of multiple updates can occur on the same frame scan. All pixels contained within an update will always begin on the same frame scan.
- Border control. This function is assumed to be performed by a GPIO functionality.
- EPD Panel Power Management. It is assumed that the driver and application layers will control the panel PMIC functions including relevant interfaces such as I²C and 4-wire power sequencing signals.
- Reading and decompression of the waveform file. This is assumed to be unpacked, reformatted and written to system memory into a form that is easily accessed by the EPDC.
- Waveform mode selection. The EPDC provides a mechanism through its histogram analysis feature (which can be run as part of any frame/region processing operations) to allow the SW driver to characterize the region/buffer in terms of gray-map content. For example, EPDC can determine if the update region (considering only those pixels undergoing a transition) contains only 2, 4, 8 or 16 gray levels, HW can automatically select waveform mode according to a programmed LUT holding mapping between grey level and waveform mode. SW driver can also manually choose the appropriate waveform update mode (e.g., when doing an update to repair ghosting artifacts).

19.3.2 Register Space (Write/Set/Clear/Toggle)

The EPDC registers utilize four word address locations per 32-bit register.

For control registers (especially interrupts), this provides for a unique address for the following operations:

- Write (0x0). The base address of the register allows full writes to the 32-bit register.
- Set (0x4). This address allows a set operation on the register or its fields; writing a 1 to a register bit/field with the set address will set that bit. Writing a 0 to the set address has no effect.
- Clear (0x8). This address allows a clear operation on the register or its fields; writing a 1 to a register bit/field with the clear address will clear that bit or field.

NOTE

Interrupt status bits (such as those contained in EPDC_IRQ) must be cleared with the clear address only. Writing to the EPDC_IRQ register with a 0 will not clear the interrupt status/source. Writing a 0 to the clear address has no effect.

- Toggle (0xc). This address allows a toggle operation on the register or its fields; writing a 1 to a register bit/field with the toggle address will invert the state of that bit/field. This address is especially useful because it provides the ability to perform a read-modify-write operation with a single write operation. Writing a 0 to the toggle address has no effect.

19.3.3 Interrupts

19.3.3.1 Interrupt Sources

The EPDC contains 72 (64 of LUT completes IRQs and 8 of common IRQs) unique interrupt sources. Each interrupt source has an interrupt status bit captured in EPDC_IRQ /EPDC_IRQ1/EPDC_IRQ2 .

When an interrupt event occurs, the appropriate bit within the EPDC_IRQ* register is set by the EPDC. Each of the bits in EPDC_IRQ is first AND'ed with its enable bit (in EPDC_IRQ_MASK*), and then the masked bits are logically OR'ed together to generate the final output.

19.3.3.2 Enabling/Masking Interrupts

Each of the EPDC interrupt sources can be individually enabled through the bits in the EPDC_IRQ_MASK* register.

Even if an interrupt source is masked out (IRQ_EN bit set to 0), its status will still be available in the EPDC_IRQ* register. The difference is that it does not result in the interrupt line being asserted.

19.3.3.3 Handling/Clearing Interrupts

When the software driver is entered as a result of an EPDC interrupt it should read the EPDC_IRQ* interrupt status register.

Because multiple interrupts may have fired, in the case of a collision for example, both WB_CMPLT_IRQ and LUT_COL_IRQ fields of EPDC_IRQ will be set. Once the interrupt has been handled, the driver should clear the interrupt source by writing to the CLEAR address (see [Register Space \(Write/Set/Clear/Toggle\)](#) for details).

When collision has occurred and the LUT_COL_IRQ bit is set, SW will handle the collision and clear LUT_COL_IRQ. Please note HW will also clear the entire EPDC_STATUS_COL* register at the sametime on LUT_COL_IRQ clearing by SW.

19.3.4 Controller Setup

Before screen update operations can be performed, the EPDC should be configured appropriately.

These rudimentary setup operations include:

- Waveform data must be present in memory (in a format that is consistent with the method in which the EPDC accesses it). Because the format of the waveform data is supplier proprietary information, it is not discussed in this chapter.
- Configuring the panel architecture parameters (source and gate-driver configuration)
- Configuring line and frame timing parameters
- Initializing the working buffer and panel

19.3.4.1 Memory Requirements

EPDC requires continuous access to the unpacked waveform data, the update region buffer, and its working buffer.

These are all expected to reside in system memory (typically external DRAM). As such, each has particular requirements:

- The Working Buffer (WB), which is pointed to by EPDC_WB_ADDR, must have EPDC_RES[HORIZONTAL] x EPDC_RES[VERTICAL] x 2 bytes allocated. This buffer is used by the EPDC to process updates and perform TFT refresh operations.
 - EPDC_RES[HORIZONTAL] mod 4 must equal to 0 for memory allocation calculations because the EPDC constructs each line of the working buffer at a 64-bit boundary.
- The Update Buffer, which is pointed to by EPDC_UPD_ADDR (and can be redefined with a different address for each update), must have the following allocation in memory:
 - a. when stride feature not enabled
 - EPDC_UPD_SIZE[HEIGHT] x EPDC_UPD_SIZE[WIDTH] bytes
 - Note that EPDC_UPD_SIZE[WIDTH] mod 8 must equal to 0 for memory allocation purposes. This means that for the address size allocation, the WIDTH field must be rounded up to the nearest number so that it can be divided by 8. This is because the EPDC reads each line of the update buffer at a 64-bit boundary (it should be noted that this is consistent with the ePXP IP output). The actual value programmed for the update can be at the pixel granularity.
 - b. when stride feature enabled
 - EPDC_UPD_SIZE[HEIGHT] x EPDC_UPD_STRIDE bytes
 - EPDC_UPD_SIZE[WIDTH] is used to reflect valid bytes in a line with EPDC_UPD_STRIDE pixels, STRIDE >= WIDTH
 - no alignment requirement on line start or end, no padding necessary unless STRIDE > WIDTH
- The waveform data set size is a function of mode count, number of temperature tables and number of frames required for each temperature-compensated mode.

In summary, the memory requirements are as follows (in bytes):

- WB-roundup4(EPDC_RES[HORIZONTAL]) x EPDC_RES[VERTICAL] x 2
- when stride feature not enabled: UPD-N x roundup8(EPDC_UPD_SIZE[WIDTH]) x EPDC_UPD_SIZE[HEIGHT]
 - N = the number of update requests currently being managed by the i.MX EPD driver (that is, the driver may maintain a list of updates in memory which it uses to feed the EPDC).
- when stride feature enabled: UPD-N x EPDC_UPD_STRIDE x EPDC_UPD_SIZE[HEIGHT]

19.3.4.2 Panel Architecture Configuration

The EPDC is designed to directly drive EPD panels which typically expose the source and gate driver IC interfaces (these are often abstracted in traditional displays such as TFT-LCD).

The source and gate driver ICs are responsible for driving the TFT matrix. There are variations in both the panel architectures and the underlying source and gate driver IC functionality.

All the key configuration parameters are defined in the EPDC_RES, EPDC_FORMAT, EPDC_TCE_CTRL, EPDC_TCE_SDCFG and EPDC_TCE_GDCFG registers as follows.

- **EPDC_RES:**
 - **HORIZONTAL:** The panel horizontal resolution (in pixels). The horizontal resolution must be an integer multiple of the source driver PIXELS_PER_SDCLK value. It also must be an integer multiple of the PIXELS_PER_CE value.
 - **VERTICAL:** The panel vertical resolution (in pixels). This can be any integer value.
- **EPDC_FORMAT:**
 - **DEFAULT_TFT_PIXEL:** This field should almost always be left at 0x00. This register field is used as the value for the TFT pixel during a frame scan when a pixel is not being updated. This condition is commonplace especially when using partial updates or updates which do not encompass the entire screen resolution. This value must always correspond to the state the source driver should see when no voltage change is needed. Incorrectly setting this value will damage the EPD material.
 - **TFT_PIXEL_FORMAT:** This enumerated field defines the width of the TFT pixel. The TFT pixel is defined as the per-pixel voltage control value. The most common pixel format is 2B (2 bits per pixel). Panels which support source driver voltage modulation (multi-level voltage control) should use the 4B format. For source drivers that support 7 levels, the 4B format can be used and the unused DATA output pins should be left floating at the board level connection (specifically DATA3, 7, 11, 15). The 2BV and 4BV are variations which require the waveform data to supply a 2-bit VCOM value for each pixel.
- **EPDC_TCE_CTRL:**
 - **SDDO_WIDTH:** This selects 8- or 16-bit DATA operation using enumerations 8-bit and 16-bit. This field is used to describe useful data for panels that support LVDS. DATA[15:8] would be used to drive differential data. In these modes, SDDO_WIDTH would be set to 8-bit.

- **VCOM_MODE, VCOM_VAL:** This VCOM_MODE bit allows the EPDC to either use the VCOM value supplied in the waveform or a software programmable value defined in the VCOM_VAL field, for panels which support VCOM modulation.
- **DDR_MODE:** This mode-bit should be set for panels which expect source-driver data to be available on both edges of the SDCLK. This is common place for panels that support differential signaling, but the feature is not limited to LVDS panels. For example, the EPDC supports DDR modes which make full use of DATA[15:0]. In these modes, DDR_MODE = 1 and LVDS_MODE = 0.
- **LVDS_MODE:** This mode always requires DDR_MODE to be set. When this mode bit is set, differential signaling is enabled such that DATA[15:8] always drives the inverse of the pixel data which is presented on DATA[7:0]. Because LVDS source-drivers use 2 pins per data-bit, they are typically configured to work in DDR mode. Differential signaling is also supported on the SDCE pins (as an option selected by LVDS_MODE_CE). In this mode SDCE[9:5] are used to drive the inverse differential signals for SDCE[4:0].
- **LVDS_MODE_CE:** When LVDS_MODE is set, this bit can also be set to allow SDCE[9:5] to act as differential pairs for each SDCE[4:0].
- **PIXELS_PER_SDCLK:** This is a key configuration and timing parameter. Each source driver latches a number of TFT pixels per shift clock period (SDCLK). This register defines how many pixels are driven per SDCLK period. When DDR_MODE = 1, pixels are driven on both edges of the clock, so this value must be adjusted accordingly. See for the required values per mode.
- **EPDC_TCE_SDCFG:**
 - **SDCLK_HOLD:** Holds the SDCLK low during the LINE_BEGIN time. The purpose of this field is to allow the user to set a LINE_BEGIN time which is not an integer multiple of SDCLKs (for fine tuning the line-time).
 - **SDSHR:** Defines the value of the SDSHR output signal which determines the source driver output order mapping.
 - **NUM_CE:** Defines the total number of source driver chip-enables (must be 1-10). This number doesn't always correspond to the number of source drivers in the panel. Many panels require only a single chip-enable signal which is active during the entire line data time. This signal is often called SPH (Horizontal Start Pulse) in such cases.
 - **PIXELS_PER_CE:** This register defines the span of each chip-enable expressed in pixels. For panels that utilize a single global CE, this value should be set to the horizontal resolution of the panel.

- **SDDO_REFORMAT**: This enumerated field allows for TFT-pixel level reordering within DATA. For most panels it is recommended to set SDDO_REFORMAT to the REVERSE_PIXELS enumeration.
- **SDDO_INVERT**: When this field is set, the values on DATA are inverted relative to the values extracted from the waveform LUT operations.
- **EPDC_TCE_GDCFG**:
 - **GDRL**: Defines the value of the GDRL output signal which determines the gate driver pulse shift direction.
 - **GDOE_MODE**: This field selects between two possible methods for driving the GDOE signal. When GDOE_MODE = 0, the GDOE output is always driven during the frame scan time, except during FRAME_SYNC when it is driven low. When GDOE_MODE = 1, the GDOE signal mimics the GDCLK signal but is only active during the frame-data time (FD). For most panels the recommended setting is 0.
 - **GDSP_MODE**: This field selects between two possible methods for driving the GDSP signal. When GDSP_MODE = 0, the GDSP signal is driven on the first line clock time of the FRAME_BEGIN time. The signal is driven for one GDCLK period (same as line time), and can be shifted using the GDSP_OFFSET control. When GDSP_MODE = 1, GDSP is active during the entire FRAME_SYNC time, and GDSP_OFFSET has not effect in this mode.

19.3.4.3 TFT Panel Timing Configuration

The EPDC provides a simple primary set of registers to define TFT line and frame (refresh) timing.

In addition to these, there are also low-level timing and polarity registers to provide additional flexibility in dealing with future TFT architectures.

The following figure shows how the horizontal and vertical timing is defined in terms of the various timing parameters. When configuring the TFT timing, the following goals should be met:

- Arrive at a refresh rate that matches the waveform requirement (for example, 50 Hz for 50 Hz waveform). The refresh rate is defined as the time between each frame sync event and can be expressed as a multiple of the line timing and the total number of vertical lines.
- Meet the various timing requirements of the gate and source driver clock and control signals (the blanking period provide an infrastructure for controlling these).
- Stay below the maximum source-driver clock (usually referred to as CL) frequency.

- Arrive at a source driver clock frequency which in turn defines the exact pixel clock frequency. In most cases, E-INK™ provides the expected SDCLK frequency.
- Meet the line-timing (LT) requirements of the E-INK panels and their associated waveforms.

For proper waveform performance, it is critical to match the refresh frequency to that required by the waveform and associated panel. Deviation from this frequency results in short term inaccuracy of color and in the long term, complete loss of coherency between the EPDC's internal representation of color and the physical representation on the screen.

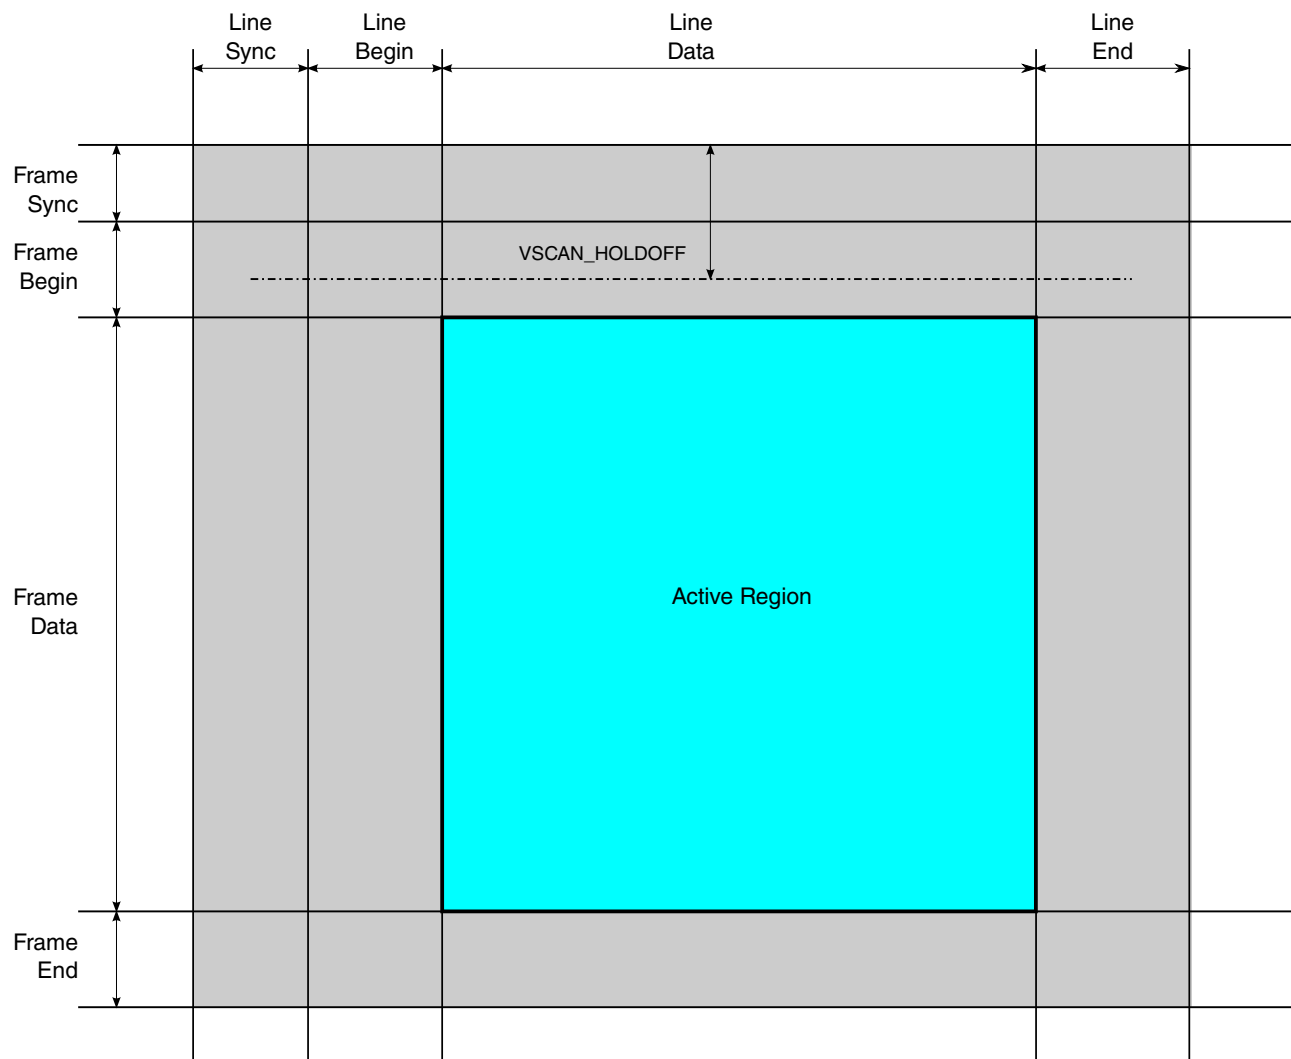

Figure 19-2. Frame Timing

The following equations define the timing of the panel scan frame (where LT = line-timing and FT = frame-timing):

$$LT = TPIXCLK (LS + LB + (HRES \times \left(\frac{\text{Ratio}}{\text{PIXELSPERSDCLK}} \right) + LE)$$

$$FT = LT \times (FS + FB + VRES + LE)$$

Ratio is defined between the internal PIXCLK and the external source driver clock SDCLK. The ratio is automatically determined by the EPDC according to . A simple method to determine the ratio is as follows:

- When $\text{DDR_MODE} = 1$, $\text{RATIO} = 4$
- When $\text{DDR_MODE} = 0$
 - If $\text{PIXELS_PER_SDCLK} = 8$, $\text{RATIO} = 4$
 - Else, $\text{RATIO} = 2$

Typically it is recommended to seed these equations with an estimated (or provided) SDCLK frequency and adjust the various timings until the desired refresh rate is attained.

The following figure shows line timing for cases, where $\text{DDR_MODE} = 0$ (those cases where data is only sampled by the source driver on the rising edge of SDCLK).

Depending on the mode (see), the ratio is a function of TFT pixel width and PIXELS_PER_SDCLK , so the timings are shown generically. For the purposes of this diagram, RATIO can either be 2 or 4.

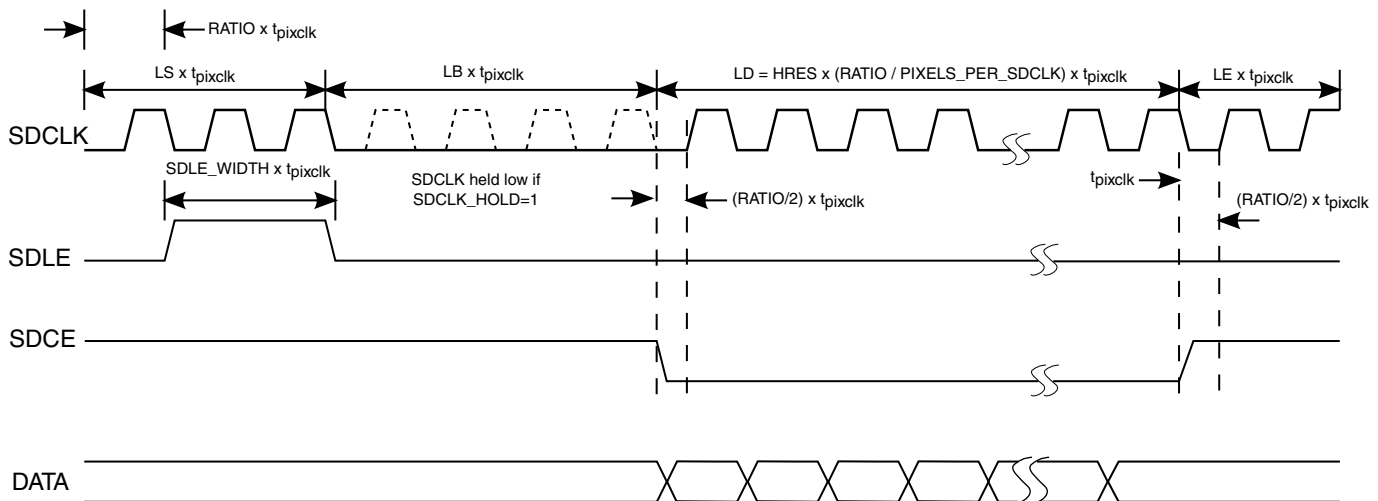

Figure 19-3. Line Timing ($\text{DDR_MODE} = 0$)

As per , when $\text{DDR_MODE}=1$ (for example, for source drivers that require data to be driven on each edge of SDCLK), the RATIO is always set to 4. The timing for such cases is shown in the figure below.

Programming Model

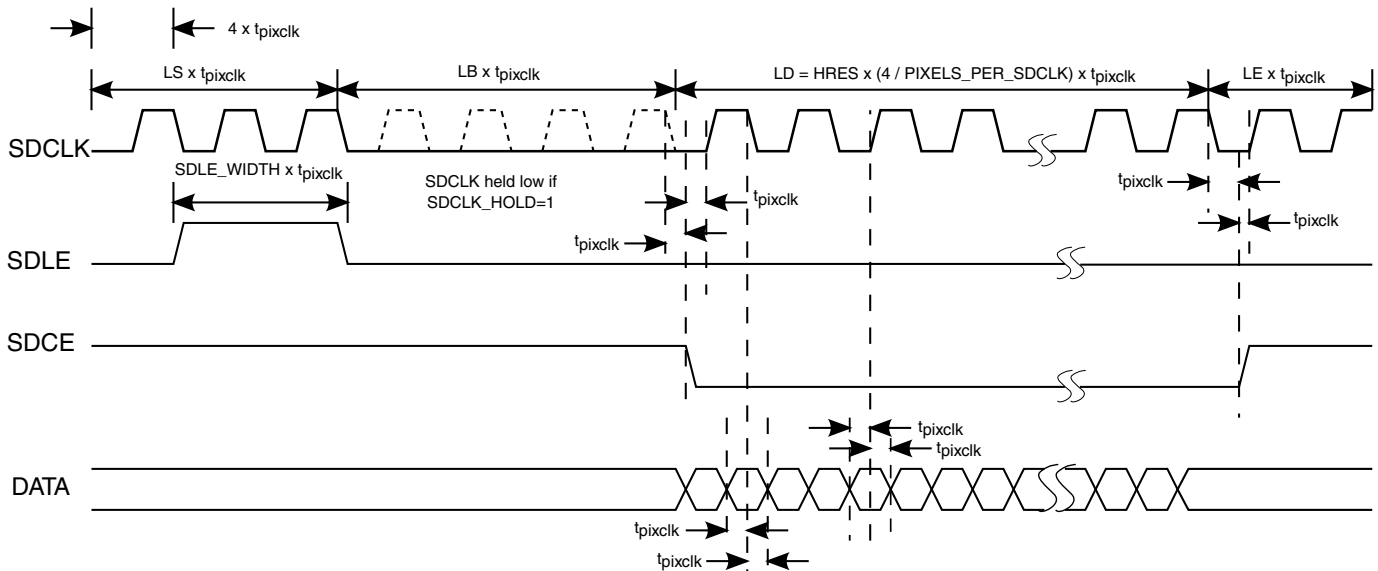

Figure 19-4. Line Timing (DDR_MODE = 1) - RATIO = 4

Vertical timing or frame timing (FT) is always expressed in terms of line timing (LT). This is shown in the following figure, followed by a detailed view of the GDCLK timing (which has programmable duty cycle to allow programming of gate-on/gate-off time) in [Figure 19-6](#). The following important points should be noted in regard to gate driver timing:

- All gate driver timing signals are independently referenced to the LINE_SYNC leading edge (this includes GDCLK_OFFSET, GDSP_OFFSET, and GDOE_OFFSET).
- GDSP_OFFSET is only supported for GDSP_MODE = 1
- For GDOE_MODE = 1, if GDOE is expected to be delayed relative to GDCLK, the GDOE_OFFSET value should be set at a value appropriately greater than GDCLK_OFFSET.
- All offset settings are programmed in terms of PIXCLK cycles.
- By default, if all offset values are set to 0, the gate driver signals are always one PIXCLK cycle delayed from the LINE_SYNC leading edge.
- The LINE_SYNC leading edge doesn't depend on the LINE_SYNC_WIDTH value. In cases where LINE_SYNC_WIDTH is set to some value that is less than LINE_SYNC, a virtual leading edge which determines the line start time still exists.

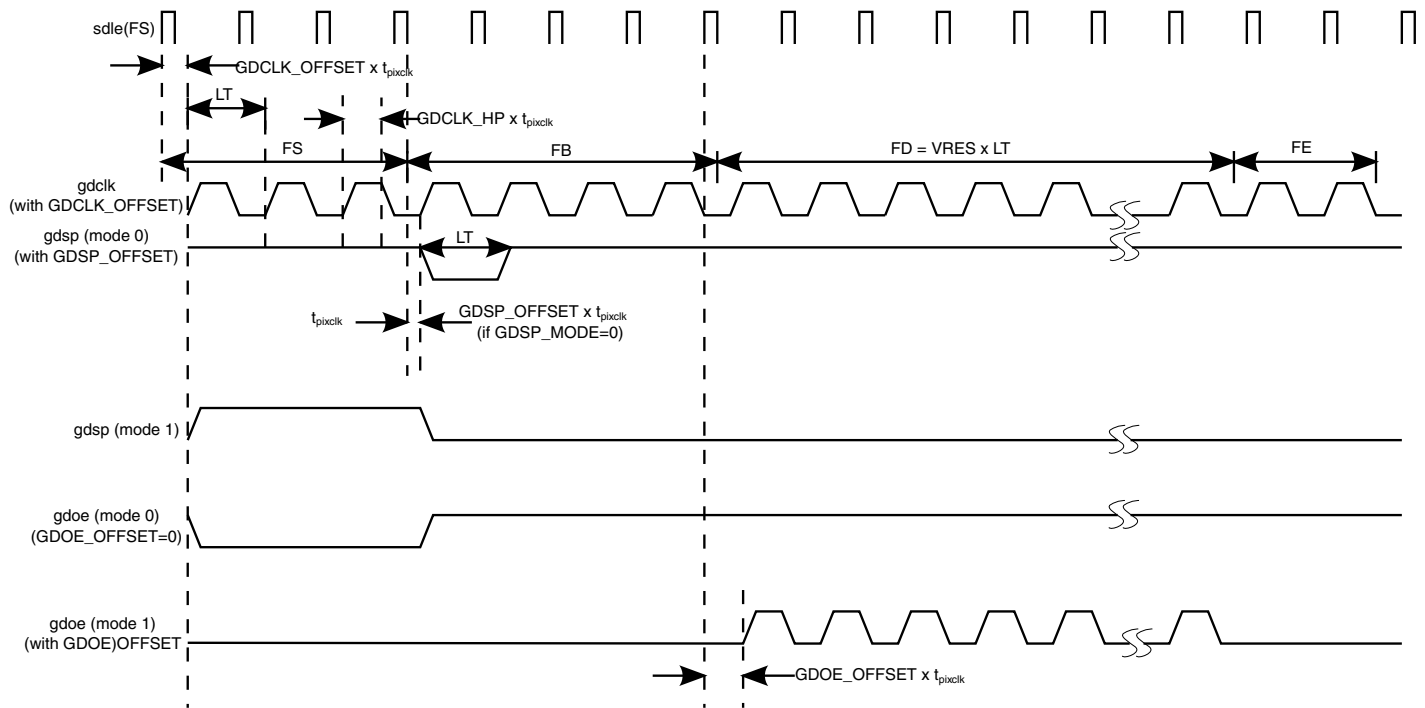

Figure 19-5. Frame Timing (Vertical)

Figure 19-6. GDCLK Duty Cycle

An example calculation based on the 800 x 600 E-INK 6" panel with 50 Hz waveforms is shown be:

- $\text{PIXELS_PER_SDCLK} = 4$
- Ratio = 2 (2 bpp, 8-bit single-ended, SDR per)
- $t_{\text{PIXCLK}} = 17.64 \text{ MHz}$ (assuming available chip clock frequency)
- $\text{LS} = 20 \times t_{\text{PIXCLK}}$
- $\text{LB} = 8 \times t_{\text{PIXCLK}}$
- $\text{LD} = 800 \times (2/4) \times t_{\text{PIXCLK}} = 400 \times t_{\text{PIXCLK}}$
- $\text{LE} = 142 \times t_{\text{PIXCLK}}$
- $\text{LT} = (20 + 8 + 400 + 142) \times t_{\text{PIXCLK}} = 32.31293 \text{ uS}$

LINE_SYNC_WIDTH does not affect line timing. It should be set to the same value as LINE_SYNC, unless LB and LE are short and it is used to shorten the width of SDLE whilst still maintaining the same line-timing.

It is important to meet the target line time of the panel which was 32.312 uS. Then the frame-rate can be calculated and given the vertical timings:

- $FS = 4 \times LT$
- $FB = 4 \times LT$
- $FD = 600 \times LT$
- $FE = 10 \times LT$
- $FT = (4 + 4 + 600 + 10) \times LT = 50.07665 \text{ Hz}$

In addition to this, E-INK panels require a particular duty cycle for the GDCLK signal which is specified as gate-on-time and gate-off-time. The sum of gate-off and gate-on should equal LT and the value of gate-on can be programmed through HW_EPDC_TCE_TIMING2[GDCLK_HP], or GDCLK High-Pulse time.

19.3.4.4 Source Driver and Pixel Clock Configuration

The EPDC supports a number of source driver architectures. Each architecture forces a particular shift clock pixel rate.

In addition to this, the selection of the architecture requires a particular clock ratio between the internal pixel clock (pixclk) and external shift clock EPDC_SDCLK. The table below outlines the various configurations and clock ratios. It also lists the relevant register settings for this configuration.

Table 19-2. Interface Modes

High-Level Mode	EPDC_DATA pins used	HW_EPDC_FORMAT [TFT_PIXEL_FORMAT]	HW_EPDC_TCE_CTRL [PIXELS_PER_SDCLK]	HW_EPDC_TCE_CTRL [LVDS_MODE]	HW_EPDC_TCE_CTRL [DDR_MODE]	HW_EPDC_TCE_CTRL [SDDO_WIDTH]	Required PIXCLK (RATIO)
2bpp, 8-bit single-ended, SDR	[7:0]	2B[V]	FOUR	0	0	8BIT	SDCLK x 2
2bpp, 16-bit single-ended, SDR	[15:0]	2B[V]	EIGHT	0	0	16BIT	SDCLK x 4
2bpp, 8-bit, DDR (LVDS option)	[7:0],[15:8]	2B[V]	EIGHT	1 0	1	8BIT	SDCLK x 4
4bpp, 8-bit single-ended, SDR	[7:0]	4B[V]	TWO	0	0	8BIT	SDCLK x 2
4bpp, 16-bit, single-ended SDR	[15:0]	4B[V]	FOUR	0	0	16BIT	SDCLK x 2

Table continues on the next page...

Table 19-2. Interface Modes (continued)

High-Level Mode	EPDC_DATA pins used	HW_EPDC_FORMAT [TFT_PIXEL_FORMAT]	HW_EPDC_TCE_CTRL [PIXELS_PER_SDCLK]	HW_EPDC_TCE_CTRL [LVDS_MODE]	HW_EPDC_TCE_CTRL [DDR_MODE]	HW_EPDC_TCE_CTRL [SDDO_WIDTH]	Required PIXCLK (RATIO)
4bpp, 8-bit, DDR (LVDS option)	[7:0],[15:8]	4B[V]	FOUR	1 0	1	8BIT	SDCLK x 4
4bpp, 16-bit, single-ended, DDR	[15:0]	4B[V]	EIGHT	0	1	16BIT	SDCLK x 4

19.3.4.5 Initializing the Display

Because of the nature of the EPD technology, a typical scenario would involve the EPDC's working buffer (WB) being maintained in system memory. In such power states (where memory is maintained), it is not required to initialize the display (even if the EPD panel had been powered off for example).

In low-power modes where system memory is not maintained, there are two possible methods to initialize the display.

The first method includes initialization from an unknown state and the second mode simply requires software to load the last state of the WB into memory and configure the EPDC to point to it.

19.3.4.5.1 Reset/Clocks and Buffer Preparation

In cases in which the user wants to initialize the screen to a new known state, the following sequence should be followed. Assume that all relevant display power supplies are active.

First, the user must complete a soft reset sequence which includes enabling the main EPDC block-level clock gate. This sequence is described in the example code below. Setting SFTRST enables the CLKGATE. In order to correctly cycle reset values through pipeline registers, the CLKGATE bit stays asserted for some finite amount of time before it sets. After this time, it is safe to clear both the SFTRST and CLKGATE. The example below shows a typical use of these registers.

```
EPDC_CTRL_SET(BM_EPDC_CTRL_SFTRST);
while (!EPDC_CTRL.B.CLKGATE);
EPDC_CTRL_CLR(BM_EPDC_CTRL_SFTRST | BM_EPDC_CTRL_CLKGATE);
while (EPDC_CTRL_RD() & (BM_EPDC_CTRL_SFTRST | BM_EPDC_CTRL_CLKGATE));
```

Before any display update is performed, the waveform address and working buffer (WB) pointers must be set (both must be aligned to a 64-bit double long word address):

- EPDC_WVADDR: Must point to the base address of the waveform data (managed by the i.MX driver)
- EPDC_WB_ADDR: An area of memory must be assigned for the EPDC's working buffer (WB). Once assigned, this memory space should be reserved purely for the use of the EPDC. The requirements for the memory allocation are described in [Memory Requirements](#).

After this, the various panel configuration parameters must be set including resolutions, source and gate driver formats, TFT and buffer pixel formats.

19.3.4.5.2 Performing an Initialization Display Update

Once all the panel timing and format parameters are defined, a command sequence must be sent to the EPDC with the properties found here.

- Update size must be full screen resolution
- HW_EPDC_UPD_CTRL[UPDATE_MODE] must be set to FULL
- HW_EPDC_UPD_CTRL[WAVEFORM_MODE] must be set to the INIT waveform (typically 0x00)
- HW_EPDC_UPD_CTRL[USE_FIXED] must be set
- HW_EPDC_UPD_FIXED[FIXNP_EN], FIXCP_EN must be set to 1, and FIXNP and FIXCP must be set to 0xFF

The use of HW_EPDC_UPD_FIXED allows the EPDC working buffer to be primed to a state that matches the result of the initialization waveform.

If the application loads the previous WB of the EPDC, these steps are not necessary.

19.3.5 Update Buffer Analysis Functions

EPDC can perform several analyses on the update buffer.

The information collected during processing will be reported to the register after update buffer processing is complete.

• Collision Rectangle Detection

For a collided update buffer, this function will report a minimal rectangle that can cover all collided pixels.

When a collision occurs, it's possible that not all, but only part of that update buffer generate a collision, so only the pixels inside a minimal collision rectangle need to be re-submitted.

Details of minimal collision rectangle reported in UPD_COL_CORD/
UPD_COL_SIZE.

- **Grey Level Detection (histogram)**

This function reports the minimal grey level that covers all pixels and which must be updated. This histogram differs from that of PXP; here we ignore those pixels which need no update, while the PXP histogram is calculated on the whole update buffer. The histogram feature is capable of reporting a histogram for 1, 2, 4, 8, or 16 grey levels. The valid grey levels value should be programmed into the HIST(1/2/4/8/16)_PARAM registers before using this functionality.

- **Dry-Run Mode**

Dry-Run mode allows the user to run an update for the purpose of obtaining information without performing any real action. This mode is enabled by setting UPD_CTRL[DRY_RUN] = 1 when writing UPD_CTRL register .

In this mode, Update Buffer will be read and checked against the current Working Buffer. As with a normal update, an interrupt will be generated when the Working Buffer processing completes.

Several pieces of information about the update can then be acquired from the EPDC registers: whether a collision occurred, the minimal collision area, and histogram data.. However, the result (Next Pixel, LUT info) will not be written back into the Working Buffer for further panel scan operation, nor will the LUT waveform be loaded.

The LUT resource specified by UPD_CTRL[LUT_SEL] is not used here; the user can start this dry-run update when no LUTs are available.

19.3.6 Waveform Mode Selection (AUTOWV)

This function is provided to support waveform selection based on the grey level (histogram) information collected during the update buffer processing stage.

Then AUTOWV LUT is provided to hold a mapping between the grey level of NP(pixel value from update buffer) and optimal waveform mode. This LUT mapping should be programmed before using this function by writing into the AUTOWV_LUT register with AUTOWV_LUT[ADDR]="grey level", AUTOWV_LUT[DATA]="waveform mode" for each possible grey level reported by the EPDC histogram.

After AUTOWV_LUT is programmed, AUTOWV mode can be enabled by setting UPD_CTRL[AUTOWV]=1. When enabling AUTOWV, the waveform mode written into UPD_CTRL[WAVEFORM_MODE] will be ignored and the loading waveform will initially be put on hold.

After the Update Buffer processing completes, EPDC reports the minimal grey level, retrieves the mapped waveform mode from AUTOWV LUT, and writes it back into UPD_CTRL[WAVEFORM_MODE].

If the user also sets UPD_CTRL[DRY_RUN], EPDC will be finished at this point.

Otherwise, EPDC continues with the following, depending upon the UPD_CTRL[AUTOWV_PAUSE] setting:

1. UPD_CTRL[AUTOWV_PAUSE] = 0, AUTO MODE)

EPDC will begin waveform loading immediately without any software interaction

2. UPD_CTRL[AUTOWV_PAUSE] = 1, MANUAL MODE)

EPDC waits for software to decide whether the selected waveform is ok, then if necessary software can use some other criteria to select a waveform mode. After software selects the waveform mode, it writes again into UPD_CTRL with final waveform mode, and waveform loading then panel scan will start.

NOTE

AUTOWV_PAUSE is extended for general use so that it can be used independent of AUTOWV feature. Regardless of whether AUTOWV is enabled or not, the user can send updates with AUTOWV_PAUSE=1. EPDC will stop after WB processing and pause before LUT loading and panel scan. Software can explicitly do that latter by writing to UPD_CTRL with AUTOWV_PAUSE=0. EPDC will ignore the Update Buffer for this time, and kick off the LUT loading and panel scanning. This feature allows SW modification to the working buffer after EPDC hardware has finished processing it.

19.3.7 Panel Interface Generator (Pigeon Mode)

There are seventeen panel interface signal outputs (DATA/SDCLK not included), each of them with dedicated timing purpose as default. This is called "Legacy Mode".

Pigeon Mode is a timing mode which can be independently enabled on any of the seventeen timing signals, with a unified flexible configuration. Signals within pigeon mode can be programmed into any supported signals, and are interchangeable.

The following are the legacy timing signals which support pigeon mode:

- PIGEON[00] - SDCE0
- PIGEON[01] - SDCE1
- PIGEON[02] - SDCE2
- PIGEON[03] - SDCE3
- PIGEON[04] - SDCE4
- PIGEON[05] - SDCE5
- PIGEON[06] - SDCE6
- PIGEON[07] - SDCE7
- PIGEON[08] - SDCE8
- PIGEON[09] - SDCE9
- PIGEON[10] - SDOE
- PIGEON[11] - SDL3
- PIGEON[12] - SDOEZ
- PIGEON[13] - SDOED
- PIGEON[14] - GDSP
- PIGEON[15] - GDOE

Working Theory

Each pigeon signal has one local counter with a configurable start point and incremental condition. It will be compared to configuration register value for signal assertion/de-assertion control, plus delta offset for data alignment and other options like polarity/logic operation. A detailed running scenario is as follows:

1. Start local counter on the MASK rising edge (reference point/start point)
2. Increment on event selected through INC_SEL
3. Count and match SET_CNT: assert signal, reset counter
(SET_CNT==0 means assert immediately on MASK's rising edge)
4. Count and match CLR_CNT: de-assert signal, stop counter
(CLR_CNT==0 means de-assert on MASK's falling edge)

NOTE

When local counter is running, further changes to MASK are not cared unless CLR_CNT==0

MASK - start point for local counter

Created using any combination of below options (ANDed)

1. STATE_MASK = (FS|FB|FD|FE) AND (LS|LB|LD|LE)

8 bits to select in which vertical/horizontal state your counter starts ticking. This is the most common use-case because timing signals generally relate to scan states.

For example, for a line timing signal start on Line Begin phase during Frame Begin/Frame Data lines, use the configuration below:

Table 19-3. STATE_MASK combinations

STATE_MASK	LS	LB =1	LD	LE
FS				
FB =1		X		
FD =1		X		
FE				

2. MASK_CNT/MASK_CNT_SEL(global counter)

Sometimes a more accurate reference point is required, such as "line 20 in a frame", or "line 12 in Frame Begin state" or "pixel 23 in LD phase". For such use-cases, several Global Counters shared by all pigeons are provided. Global counter type (line counter/frame counter/state counter, etc.) is selected using MASK_CNT_SEL, when global counter matches the MASK_CNT value. The pigeon local counter will start ticking.

3. Use another pigeon signal as mask (SIG_LOGIC=MASK)

For some tightly coupled signals it is possible to use one as a reference to generate another.

INC_SEL- select local counter tick event

1. pclk - pixel clk
2. line - line start pulse
3. frame - frame start pulse
4. another - another pigeon signal

OFFSET- offset on pclk basis

Some signals need to come out slightly earlier or later than programmed. For example, the CE type signal usually aligns with the Line Data phase, but some panels need it as one cycle pulse before Line Data. The user can set OFFSET to a negative value to achieve this.

Global Counters (selectable through MASK_CNT_SEL)

- HCNT / VCNT

normal pclk counter / line counter

- HSTATE_CNT / VSTATE_CNT

similar to above, but reset when state changes

- HSTATE_CYCLE / VSTATE_CYCLE

(see figure below for definition of CYCLE/PERIOD/CNT)

Some panels have multiple Gate Drivers/Source Drivers, so Frame Data / Line Data state may be further split to match each driver, and signals such as CE[n] are only valid during part n of Line Data. For such signals, use

HW_EPDC_PIGEON_CTRL.*_PERIOD to specify PERIOD where CNT is reset and CYCLE is included. Then the user can select CYCLE as MASK_CNT to generate mask for CE[n].

- FRAME_CNT / FRAME_CYCLE (only for frame-crossing signals)

frame cycle counter doesn't have a reset condition; use

HW_EPDC_PIGEON_CTRL1.FRAME_CNT_CYCLES to reset it.

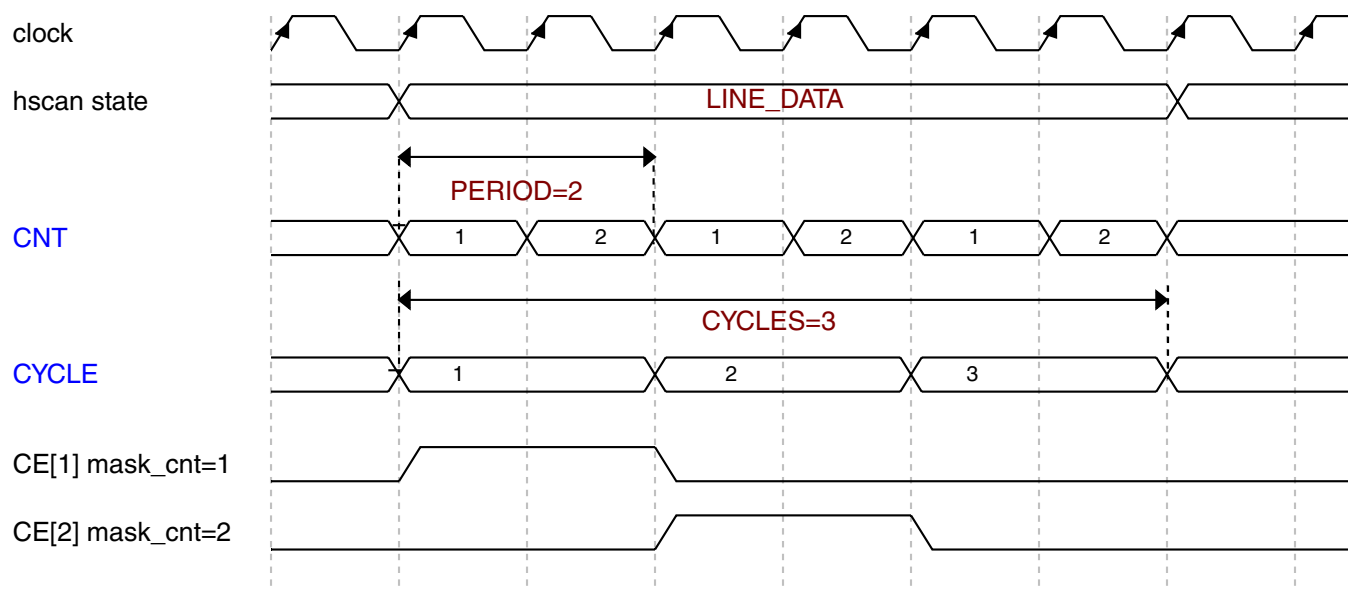

Figure 19-7. Definition of CNT, CYCLE, PERIOD

The following are register settings for the figure above:

- `HW_EPDC_PIGEON_CTRL0.LD_PERIOD=2`
- `MASK_CNT_SEL = 1 // HSTATE_CYCLE`

19.3.8 Display Update Programming

The EPDC is designed to communicate with the kernel driver through the interrupts and status registers.

The driver entry is always assumed to occur as a result of an interrupt.

19.3.8.1 Initiating a Display Update

The typical flow for performing a display update involves the following:

- `EPDC_STATUS[WB_BUSY]` must be 0. The EPDC cannot process new updates if it is currently processing an update.
- `EPDC_STATUS[LUTS_BUSY]` must be 0. The EPDC cannot accept new updates if all LUT resources are currently active.

Assuming both conditions above are met, an update request is programmed in the following manner (it is important to note that the last step must be writing to EPDC_UPD_CTRL which initiates the display update).

The following steps can be performed before WB_BUSY and LUTS_BUSY are clear:

- At this time it is assumed that the correct temperature is selected and written to EPDC_TEMP.
- EPDC_UPD_ADDR must be set to the 8-bit buffer for the update **if stride feature not enabled (when enabled stride feature, no requirement on align)**. This buffer must be aligned to a 64-bit word address. In addition, each line address must begin at a 64-bit word address. Both criteria can be met by utilizing the PXP pixel processing engine which always aligns lines at a 64-bit raster (see [Memory Requirements](#) for details).
- EPDC_UPD_CORD defines the insertion co-ordinate into the panel resolution.
- EPDC_UPD_SIZE defines the dimension of the update (pixels).
- EPDC_UPD_FIXED is used for panel initialization or rectangular fill operations.

Writing the EPDC_UPD_CTRL register initiates a display update:

- USE_FIXED-This field is set when EPDC_UPD_FIXED is used.
- LUT_SEL-The driver should read EPDC_STATUS_NEXLUT[NEXT_LUT] (qualified by NEXT_LUT_VALID) to select an available LUT to assign this update.
- WAVEFORM_MODE selects the E-INK waveform mode (for example, INIT, DU, GC16 and so on). The number corresponds to the waveform number in the waveform specification document.
- UPDATE_MODE selects one of two enumerated updated modes.
 - FULL-In this mode, all pixels defined in the update rectangle have the waveform applied.
 - PARTIAL-In this mode, the EPDC shall only apply the waveform to pixels which are changing, otherwise the EPDC_FORMAT[DEFAULT_TFT_PIXEL] is applied to the pixels which are not changing.

19.3.8.2 Update Processing and Collisions

After the update is initiated (by writing EPDC_UPD_CTRL), the EPDC performs update-buffer processing. This involves processing this update region into its working buffer (WB).

During this time, the EPDC also performs collision detection. At the end of the WB processing, the EPDC asserts the WB_CMPLT_IRQ interrupt. If a collision is detected, the LUT_COL_IRQ interrupt status bit will also be asserted.

The EPDC performs image updates to the EPD by applying waveforms to individual pixels. Waveforms are applied to groups of pixels (ranging from a single pixel to the entire display). Each individual update request is bound to a rectangle. Each pixel within this rectangle has a waveform applied to it using the waveform and update mode specified in EPDC_UPD_CTRL. After this process is initiated, a waveform takes an amount of time to complete which is usually determined by the specifications of the waveform mode. For proper display operation and optimum performance, a waveform must not be interrupted once it has begun.

A collision is defined simply as the interruption of the application of waveform to a pixel or group of pixels. As such, it must be avoided. Because the waveforms take a finite amount of time to complete, the EPDC provides a mechanism to automatically manage collisions, which allows the application to perform multiple updates resulting in a richer user experience without having to be cognizant of the panel and waveform characteristics.

Depending on the update mode (FULL or PARTIAL) a collision is defined as follows:

- For a full-update mode, a collision is defined as the temporal and spatial union of rectangles pertaining to active unique update requests. An active update is one which is still in the process of being updated (that is, a waveform is being applied).
- For a partial-update mode, a collision is defined as the temporal, spatial and differential union of pixels pertaining to unique update requests which are active. The difference between a full-updated and a partial-updated collision is that in the latter case, the collision state occurs only if the next-pixel states differ between the updates. Thus, two partial-update rectangles may intersect, but if all of the pixels in the intersecting update regions are being updated to the same gray-state, the original update and associated LUT/waveform are not disturbed and the intersection does not constitute a collision.
- It should be noted that collisions may be a one-to-many effect. In the case of partial updates, there may be a spatial and temporal union of rectangles with no differential pixel-level union. A subsequent update however might form such a pixel-level differential union to all active updates. Since each update pertains to an active LUT, these many collided updates are referred to as victim LUTs. The update/LUT that caused the collision is referred to as the aggressor LUT.

An example of a partial-update mode collision is shown in the following figure. Each update encompasses the outer rectangle which meets the criteria of the spatial union. The red areas show the pixels which are currently transitioning to gray (from update 1) but need to transition to white (in update 2). These pixels meet the criteria of the differential union and lastly in the temporal domain, the period of time where LUT0 and LUT1 overlap is the temporal union. The pixels that did not change (grey and green areas in the LUT assignment box) are not part of the collision area. In the case of the gray

overlapping pixels, LUT0 can continue to update. In the case of the white pixels (which were previously inactive) a new LUT (if available) can be assigned) and forms the green region. Note that a subsequent update could potentially collide with the green pixels in update 2.

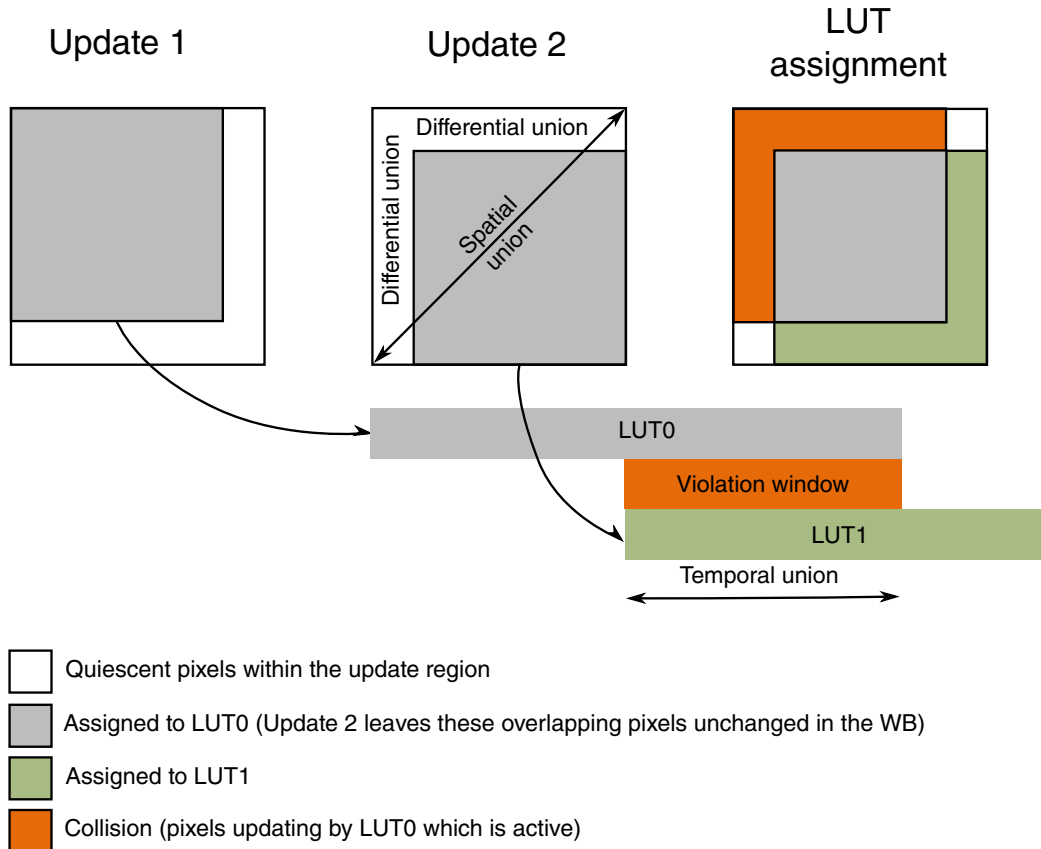

Figure 19-8. Partial Update Collision Handling

NOTE

For FULL update modes, a collision occurs at any intersection of active rectangles/LUTs because in FULL update mode, all pixels within the update rectangle have the waveform applied (even if pixel values are not changing).

It can be seen that when collision is detected (during the WB update process), the EPDC will "block" the collided pixels being updated, and any pixels which are not collided will be assigned to the requested LUT process. When a collision occurs, the EPDC will raise the LUT_COL_IRQ interrupt status bit (this will always happen in conjunction with WB_CMPLT_IRQ).

Because the driver is always entered via an interrupt, when the EPDC interrupt fires, driver should not only check for WB_CMPLT_IRQ but also for the LUT_COL_IRQ status bit within the EPDC_IRQ register. If LUT_COL_IRQ is set, this means that a

collision has occurred. If this is the case the driver should check the value of the EPDC_STATUS_COL register. This register contains one bit for each LUT that has been collided with, that is, it holds the vector of the victim LUTs as a result of the last update LUT. Since the driver knows the value of the LUT of the last update, it can store this update LUT value along with this associated victim LUT vector in a collision list.

Because the EPDC can drive up to 16 concurrent updates (which can be overlapping when using PARTIAL mode updates), a unique interrupt status bit is provided per LUT so that when an update completes (physically completes the waveform), the SW driver can know which LUT completed. In addition to the LUT completion interrupts (which are mapped into the EPDC_IRQ[LUTn_CMPLT_IRQ] interrupt status bits), the current state of each LUT can also be read from the EPDC_STATUS_LUTS status register.

The driver can use the LUT status interrupts in conjunction with EPDC_STATUS_LUTS to perform regular checks on the completion of victim LUTs against the vectors stored for each colliding LUT in the collision list. The driver may also choose to serialize updates such that it might wait until all victim LUTs have completed before re-issuing the colliding update.

The figure below shows a more extended sequence of a collision. In this case there are a series of updates coming from the application layer. They are A, B, C and D. Updates A, B, and C are set without any collision. When update D is requested a collision is detected. Using the interrupt status collision registers, the SW-driver stores D in a collision-list. For that list entry it also store B which is the victim LUT. It uses this information to check when a LUT completes to see if the victim LUTs for any update in the collision list have completed. If they have completed (through a LUT completion interrupt), the SW-driver then sends this update (D in this case) again to the EPDC. It should be noted that from the application perspective it appears that all updates A, B, C and D have been accepted, that is, the collision handling is completely hidden from user-space. Using the collision detection and LUT status interrupts, the application (in conjunction with the driver) could also choose to completely serialize the requests (such that between the first and second D update, no other update is accepted).

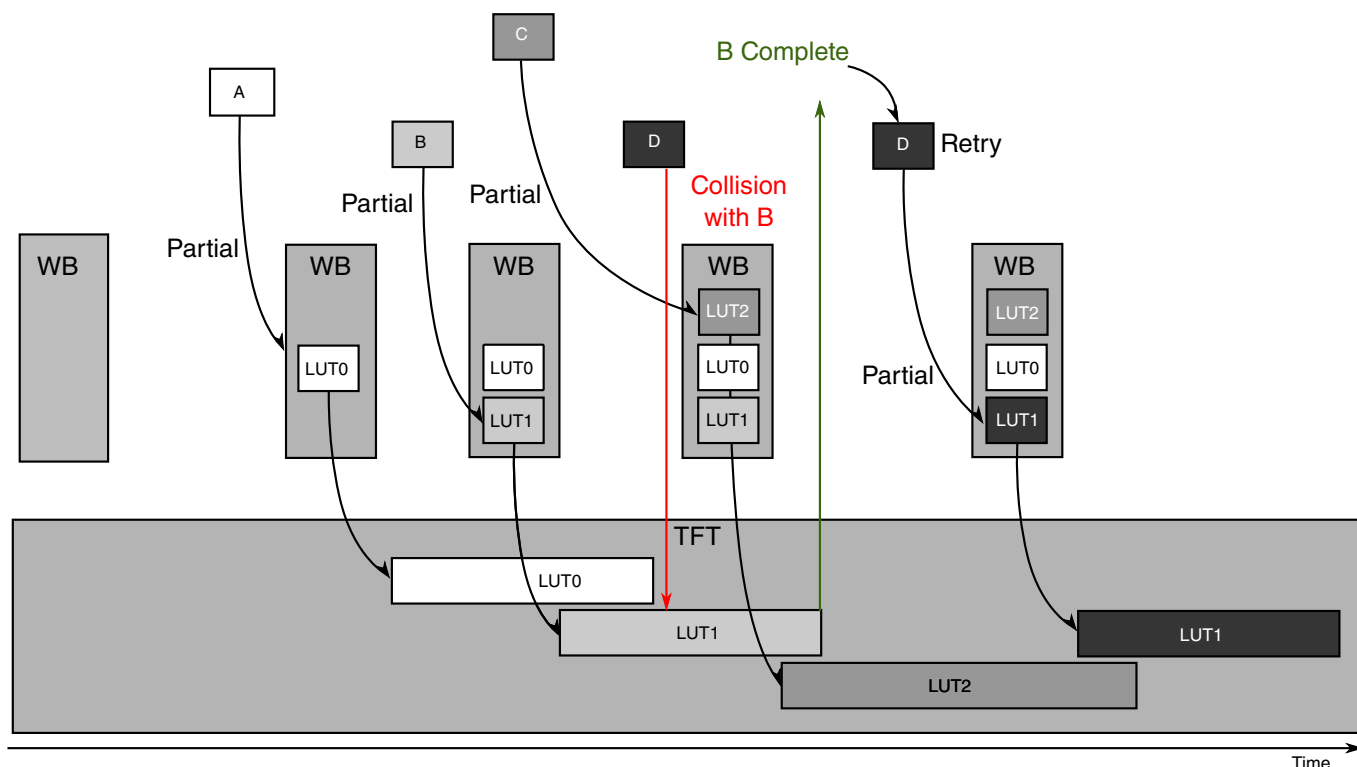

Figure 19-9. Collision Sequence

19.3.8.3 Multiple Update Flow

In most applications, such as e-book readers, besides full-screen page turns, user interfaces require multiple updates to be performed.

Examples of this include cursors, pen input, drop-down menus (with highlighting) and other movable graphical objects. Each update takes such a limited amount of time to complete (up to 1 second depending on the waveform mode) that it would be too prohibitive to only process updates serially.

As described in [Initiating a Display Update](#), there are two conditions that must be met before the SW driver can issue a new update request:

- The Working buffer (WB) update process must be complete.
- There must be an available LUT.

Assuming a free LUT is available, the EPDC is designed to have the capability to start new updates at each TFT frame scan (even being able to commence multiple updates within a frame scan blanking period). The general flow for sequential updates (concurrent or serialized) is shown in the following figure.

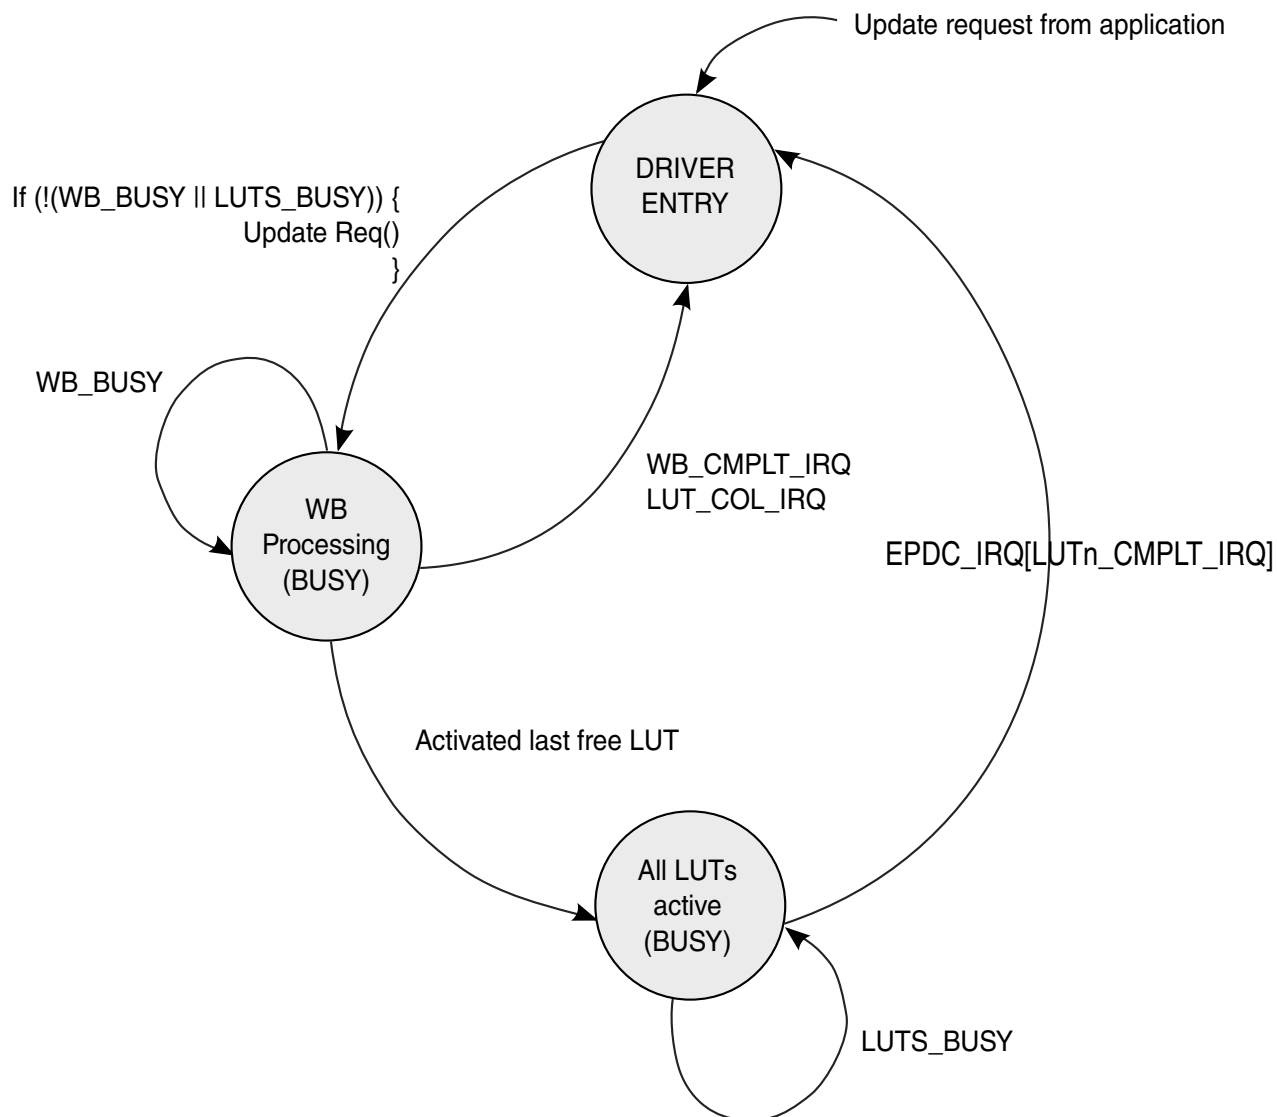

Figure 19-10. Driver Update Flow

This flow assumes that the driver is entered via interrupts. The two busy states are shown to illustrate the conditions under which the driver will not issue new updates. In general, the driver should be throttled by the WB_CMPLT_IRQ interrupt. Because the EPDC can support up to 64 concurrent updates, it is possible to re-enter the update-request (show as Update_Req() in the figure above) any-time that the WB is not busy (even though LUTs are active and the display is being updated). It is possible that when there are 63 LUTs currently active and a new update is sent, there will be a WB_CMPLT_IRQ interrupt issued, but the driver at that time would be in a busy state (because LUTS_BUSY is signaled). The driver will be re-entered on the next LUTn_CMPLT_IRQ interrupt during which time it can issue a new update (since WB_BUSY and LUTS_BUSY status bits are low).

The update-processing process (which is controlled by the MBM module) is asynchronous to the actual TFT refresh operations (which carry out the physical screen updates), so there is no particular relationship between the WB_BUSY status and the state of the screen update. In contrast, the LUTn_CMPLT_IRQ interrupt status and EPDC_STATUS_LUTS provide the status of the physical waveform update. This means that when LUTn_CMPLT_IRQ interrupt fires, it means that the last physical TFT frame scan just completed for that update/LUT.

The EPDC implements proprietary methods to efficiently process the WB such that the WB processing time (the time from the SW driver writing EPDC_UPD_CTRL to EPDC_IRQ[WB_CMPLT_IRQ] fires), is dependent on the size of the update rectangle. This allows smaller updates to be processed faster. In most EPD applications, this is ideal because it's typically smaller sprites that require the fastest performance. In addition, the EPDC implements methods to allow store pending updates and activate them on the next available frame-scan. For example, if the TFT scanning is currently in the active region and during this time a series of small update requests are sent, the EPDC can begin all of those updates on the next available blanking period.

The figure below shows an example of two larger update requests, one to LUT4 and one to LUT5. These update requests are shown in the context of active LUTs and thus active frame scan times. The time when both WB_BUSY and LUT_BUSY is high are defined as "blocking" because no new updates can be accepted. It should also be noted that new updates are physically commenced by the EPDC on blanking periods. From a SW programming model perspective, the EPDC_STATUS_LUTS[LUTn_STATUS] is activated immediately upon the update request being written to the EPDC. The physical frame-scanning for this particular update does not being commenced until the next available frame scan.

It should be noted that updates and WB processing can actually occur during the blanking period (or can begin in the active scan time and continue into the blanking period). For this reason, the EPDC provides some tuning controls via EPDC_TCE_CTRL[VSCAN_HOLDOFF] such that more time can be given to finish processing update request and less time "locking down" the set of LUTs that will be activated for the upcoming active scan. The EPDC will start to pre-fill its refresh pixel FIFOs after the VSCAN_HOLDOFF period. Its possible to tune this value to allow the minimum time for the pixel FIFO pre-fill operation (making sure that refresh under-runs do not occur). If a pixel-FIFO under-run occurs, EPDC_IRQ[TCE_UNDERRUN_IRQ] will fire.

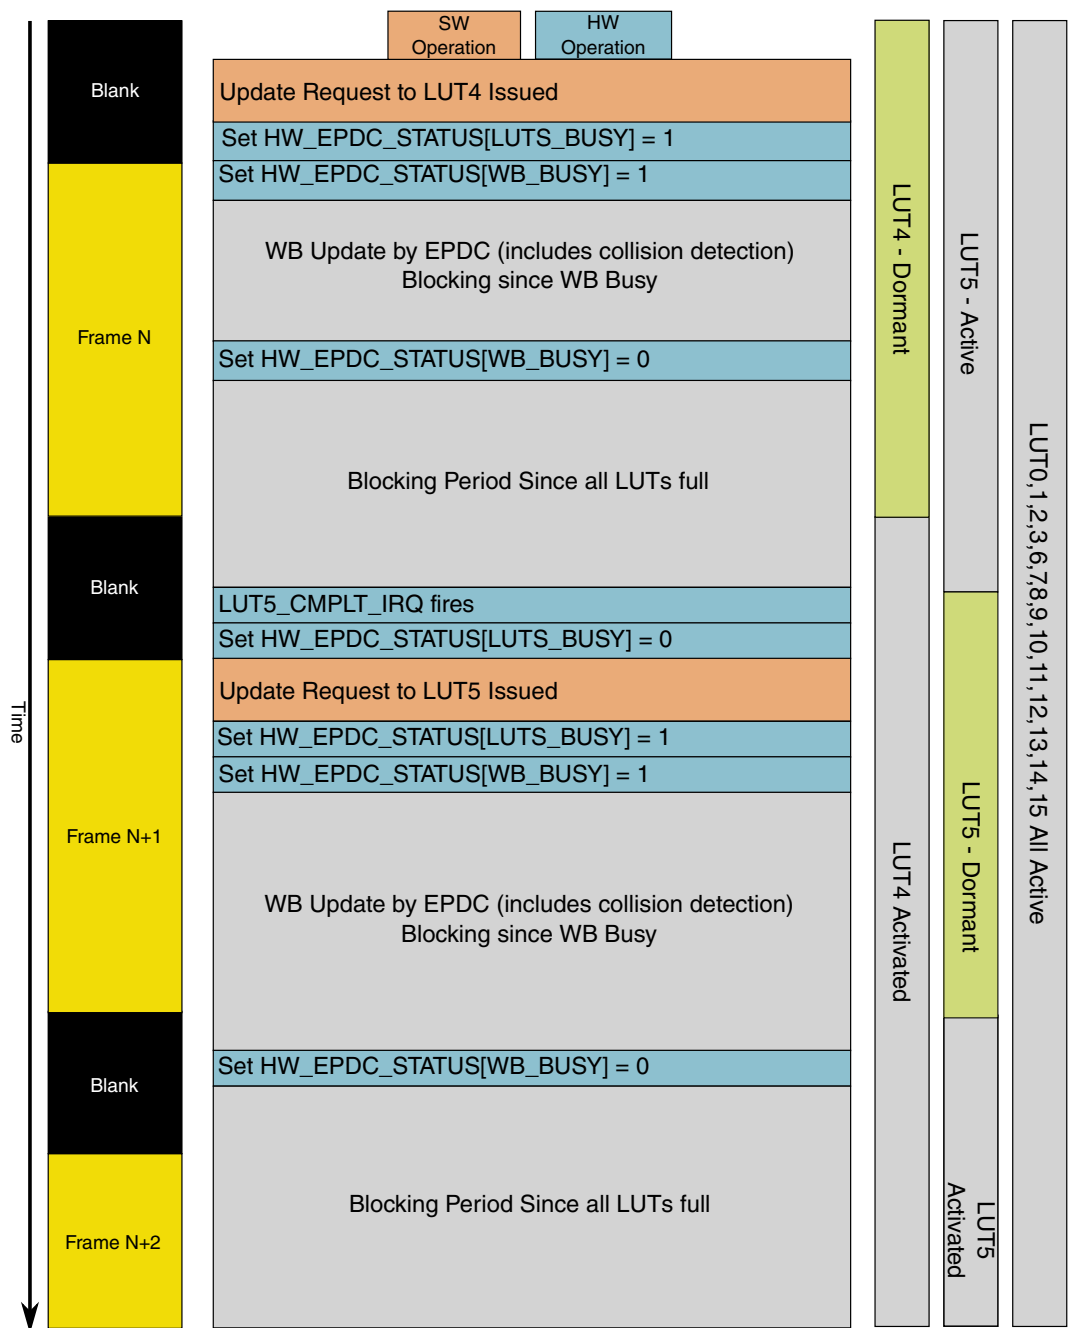

Figure 19-11. Temporal Flow of Update Processing

19.3.9 Architectural Clock Gating (Low Power Mode)

As with most modern IP, the EPDC contains low-level hardware controlled automatic clock gating throughout the design.

These clock gating elements typically gate clocks locally for individual or groups of sequential elements (flip flops) when these registers are not currently active.

This tier of clock gating is useful for reducing power during active operation of the EPDC.

Most e-paper applications utilizing EPDs involve the processor and display controller to be a low-power inactive state in most of the time. This is because EPDs only require refresh operations when the display content is being updated. As such, in between update operations, the EPDC provides a module level clock-gating feature that can be controlled by the SW driver as part of a higher-level power management solution.

The EPDC module can have all its clocks completely gated-off by the setting of `EPDC_CTRL[CLKGATE]`. There are a couple of considerations that the SW driver must adhere to before placing the EPDC into this low power state:

- All active LUTs (updates) must complete
- Any TFT operations must be complete (including any final blanking operations)

In order to maximize display update frequency (the ability accept new updates during each frame scan), the LUT completion interrupts fire on the end of the last frame's active scan period for that update. This means that the TCE still must complete the final `FRAME_END` blanking time to guarantee coherency of its state machines with the panel state (receiving the final LUT completion IRQ is not enough to determine that the EPDC can have all of its clocks shut down). Based on this, the EPDC provides the necessary interrupt and status bits to allow the driver to correctly perform the clock-gating operation by using the following method:

- Once the final `EPDC_IRQ[LUTn_CMPLT_IRQ]` is reached, the driver should enable the `TCE_IDLE` interrupt mask bit via `EPDC_IRQ_MASK[TCE_IDLE_IRQ_EN]`, unmask other interrupts and return.
- Once the final blanking time of the last LUT (`FRAME_END` time) is completed and the TCE reaches its idle state, the EPDC will assert the `EPDC_IRQ[TCE_IDLE_IRQ]` interrupt which will cause the driver to re-enter. At this point, the SW knows that the EPDC is in a completely idle state and can perform a set on `EPDC_CTRL[CLKGATE]`.

Alternative implementations of the driver could simply involve polling for the `EPDC_IRQ[TCE_IDLE_IRQ]` interrupt status bit (which operates regardless of the interrupt being masked or not) before setting the clock gate (this prevents two iterations of interrupt based driver-entry, but requires a wait loop in the interrupt handler which might be undesirable).

It should be noted that the time interval between the last LUTs `LUTn_CMPLT_IRQ` time and `TCE_IDLE_IRQ` interrupt is equal to the `FRAME_END` time.

When the application is ready to send more updates, the driver can immediately re-enable the EPDC by un-gating the module-level clock by clearing the EPDC_CTRL[CLKGATE] field. This un-gating of the clock is instant and the driver is free to immediately send update requests.

19.3.10 Performance Tuning and Considerations

The EPDC is designed to meet the performance requirements of the most demanding e-paper applications. These performance targets must be met in the context of highly integrated SoCs.

In such a context, system memory is typically shared across multiple masters including the ARM platform. Because of this, there is no guarantee of latency from system memory. EPDC provides a number of mechanisms to deal with this as well as some ability to tune various parameters allowing the user to trade-off between update processing performance and refresh functionality.

19.3.10.1 Memory and Bus Bandwidth Requirements

The EPDC MBM module contains up to 6 internal AXI requesting functions (5 read and 1 write). These are arbitrated internally before being sent to the SoC memory system.

The EPDC interfaces to the SoC bus system via a dual-channel 64-bit AXI bus master port. The following table shows the various internal requesters and their properties. Note that there are two round-robin (RR) loops. Because there is only one write source, and the EPDC supports dual-channel AXI, there is no arbitration on the WB write operations.

Table 19-4. EPDC Bus Requestor Profiles

Operation	Priority	Burst Length (x8 Bytes)	Maximum Outstanding Transactions	FIFO size
Waveform LUT read	0	8	2	16x68
WB pixel read FIFO0 (refresh)	RR 1	8 or 16	8	256x64
WB pixel read FIFO1 (refresh)	RR 1	8 or 16	8	256x64
WB read for update processing	RR 2	8	2	16x64
WB write for update processing	N/A	8	2	16x64
UPD read for update processing	RR 2	8	2	16x64

As described in [Memory Requirements](#), it can be seen that all lines in a buffer are padded to the nearest 8 byte boundary. This is important to be noted for the bandwidth calculations. The maximum bandwidth scenario involves processing a full-screen update

while performing refresh operations, but refresh operations always have the highest priority. Based on this, the memory bandwidth required by the EPDC is a function of the refresh pixel rate which in turn is a function of resolution, frame-rate and blanking/active time.

The refresh bandwidth can be calculated as follows:

Active Time = Active time of the frame-scan time as a fraction (for example, 0.8)

Frame Rate = TFT frame refresh rate (Hz) (for example, 106 Hz)

Bandwidth (MB/s) = $\text{roundup4}(\text{EPDC_RES}[\text{HORIZONTAL}]) \times \text{EPDC_RES}[\text{VERTICAL}] \times \text{Frame Rate} \times (1/\text{Active Time}) \times 2 \times (1/1024^2)$

For example, a panel with resolution 2048 x 1536 with 106 Hz refresh and estimated 80% active time, 20% blanking time, the refresh bandwidth is:

$\text{BW (MB/S)} = 2048 \times 1536 \times 106 \times (1/0.8) \times 2 \times (1/1024^2) = 795 \text{ MB/s}$

(Note that $2048 \bmod 4 = 0$.)

The WB requires 2 bytes per pixel.

Remaining bandwidth is used for other operations. Because update processing operations are not real-time (they do not necessarily have to occur at the refresh frame-rate), the time required to perform the update can be calculated as a function of the available bandwidth (actual bandwidth minus refresh bandwidth) and the update size.

19.3.10.2 Pixel Latency FIFO

The EPDC contains one working buffer latency FIFO which is used to load working buffer pixel data which is used by the TCE to perform the panel refresh operations.

The FIFO is sized at 1024 pixels each in order to provide significant system memory latency tolerance. The pixel FIFO is dedicated for the main screen.

Under no circumstance should the EPDC pixel FIFO reach an under-run condition. The EPDC provides an interrupt status bit to flag such a condition (TCE_UNDERRUN_IRQ). During development, this interrupt must be enabled. The pixel values stored in the FIFO are using by the TCE to perform look-up operations (from the LUTs) to generate TFT voltage control pixels. If an under-run occurs, the result will be unknown data being used as the source for the look-ups, which can damage the panel.

19.3.10.3 Basic Watermarking Control

The EPDC provides a basic pixel pre-fetching control mechanism that is applied to the beginning of a new update (from an idle state). This control is provided by `EPDC_FIFOCTRL[FIFO_INIT_LEVEL]`.

The control allows the value to be set between 0-255, with a reset value of 128. Because the internal width of the FIFO holds 4-pixels per entry, the actual number of pixels is $(\text{FIFO_INIT_LEVEL}+1) \times 4$.

The EPDC uses this value to pre-fill the pixel latency FIFO(s) to this level before the TCE commences the refresh operations which drive the update to the panel. This control has no effect on the FIFO(s) when the EPDC is performing sequential frame-scans.

It must be noted that this value must be set less than $(\text{EPDC_RES}[\text{VERTICAL}] \times \text{EPDC_RE}[\text{HORIZONTAL}]) / 4$.

19.3.10.4 Update/Refresh Tuning (VSCAN_HOLDOFF)

During active frame-scan time, the EPDC provides the ability to process and display new update requests, because all pixels in the WB pertaining to a particular update are bound to a single LUT.

Until all pixels pertaining to that update have been processed in the WB, its LUT cannot be activated. As shown in [Figure 19-11](#), the blanking period provides time to pre-load the pixel FIFOs and for completing WB processing updates and loading the associated frame of waveform data into LUT memories.

The `EPDC_TCE_CTRL[VSCAN_HOLDOFF]` control field allows control over the vertical blanking period allotment for working buffer processing and pre-loading of the pixel FIFO. The time window defined by `VSCAN_HOLDOFF` is allotted for working-buffer processing and LUT loading (of newly processed updates). The remainder of the time is allotted for pre-filling the pixel FIFO.

Note that aggressive use of `VSCAN_HOLDOFF` can result in pixel FIFO under-run as the FIFO pre-fill time is compromised.

19.3.10.5 System-Level Arbitration Control

As previously mentioned, the TCE refresh operation is time critical.

Because the EPDC is designed to be integrated into a multimaster SoC, system memory is shared between multiple requesters in the system.

The EPDC provides a dynamic Quality of Service (QoS) priority elevation mechanism that can be leveraged at the SoC level.

The EPDC_FIFOCTRL registers can be used to drive the `epdc_panic` output signal during times when the EPDC requests require priority elevation. As long as `epdc_panic` is asserted, transaction requests from the EPDC will have their priority elevated at the SoC-level bus arbitration control points.

The registers and associated functionality are as follows:

- EPDC_FIFOCTRL[ENABLE_PRIORITY] must be set to enable `epdc_panic` functionality.
- EPDC_FIFOCTRL[FIFO_L_LEVEL] determines FIFO threshold which causes `epdc_panic` to assert when crossed.
- EPDC_FIFOCTRL[FIFO_H_LEVEL] once `epdc_panic` has been asserted due to the pixel FIFO(s) crossing FIFO_L_LEVEL, this value, which must be set higher than FIFO_L_LEVEL, determines the point at which `epdc_panic` will de-assert as the FIFO(s) fills.

Note that the delta between FIFO_H_LEVEL and FIFO_L_LEVEL is intended as a de-bounce mechanism. The purpose is to avoid a constant panic situation, which would cause thrashing of the `epdc_panic` signal.

Figure 19-12. FIFO Priority Elevation

19.4 EPDC Memory Map/Register Definition

EPDC Register Format Summary

EPDC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

19.4.1 EPDC Control Register (EPDC_CTRLn)

EPDC Main control register

This register controls various high-level functions of the EPDC

EXAMPLE

```
/* Reset */
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_SET);
while (!(__raw_readl(EPDC_CTRL) & EPDC_CTRL_CLKGATE))
    ;
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_CLEAR);

/* Enable clock gating (clear to enable) */
__raw_writel(EPDC_CTRL_CLKGATE, EPDC_CTRL_CLEAR);
while (__raw_readl(EPDC_CTRL) & (EPDC_CTRL_SFTRST | EPDC_CTRL_CLKGATE))
    ;

/* EPDC_CTRL */
reg_val = __raw_readl(EPDC_CTRL);
reg_val &= ~EPDC_CTRL_UPD_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_UPD_DATA_SWIZZLE_NO_SWAP;
reg_val &= ~EPDC_CTRL_LUT_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_LUT_DATA_SWIZZLE_NO_SWAP;
__raw_writel(reg_val, EPDC_CTRL_SET);
```

Address: 20F_4000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	SFTRST	CLKGATE	Reserved													
Reset	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								UPD_DATA_SWIZZLE		LUT_DATA_SWIZZLE		Reserved			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_CTRLn field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal EPDC operation. Set this bit to one (default) to disable clocking with the EPDC and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the EPDC block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29–8 -	This field is reserved. Reserved.
7–6 UPD_DATA_SWIZZLE	Specifies how to swap the bytes for the UPD data before the WB construction. Plesae note this swizzle operate right after data fetch from bus, no matter it's aligned access or not. Supported configurations: 0x0 NO_SWAP — No byte swapping.(Little endian) 0x1 ALL_BYTES_SWAP — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 HWD_SWAP — Swap half-words. 0x3 HWD_BYTE_SWAP — Swap bytes within each half-word.

Table continues on the next page...

EPDC_CTRLn field descriptions (continued)

Field	Description
5-4 LUT_DATA_SWIZZLE	Specifies how to swap the bytes for the LUT data before store to LUTRAM. Supported configurations: 0x0 NO_SWAP — No byte swapping.(Little endian) 0x1 ALL_BYTES_SWAP — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 HWD_SWAP — Swap half-words. 0x3 HWD_BYTE_SWAP — Swap bytes within each half-word.
-	This field is reserved. Reserved.

19.4.2 EPDC Working Buffer Address for TCE (EPDC_WB_ADDR_TCE)

EPDC Working Buffer Address for TCE

Address: 20F_4000h base + 10h offset = 20F_4010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	<div>ADDR</div>																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_WB_ADDR_TCE field descriptions

Field	Description
ADDR	Address for EPDC working buffer. This address must be aligned to a 64-bit double-word boundary.

19.4.3 EPDC Waveform Address Pointer (EPDC_WVADDR)

EPDC Waveform Address Pointer

EXAMPLE

```

/* Reset */
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_SET);
while (!(__raw_readl(EPDC_CTRL) & EPDC_CTRL_CLKGATE))
;
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_CLEAR);

/* Enable clock gating (clear to enable) */
__raw_writel(EPDC_CTRL_CLKGATE, EPDC_CTRL_CLEAR);
while (__raw_readl(EPDC_CTRL) & (EPDC_CTRL_SFTRST | EPDC_CTRL_CLKGATE))
;

/* EPDC_CTRL */
reg_val = __raw_readl(EPDC_CTRL);
reg_val &= ~EPDC_CTRL_UPD_DATA_SWIZZLE_MASK;

```

EPDC Memory Map/Register Definition

```
reg_val |= EPDC_CTRL_UPD_DATA_SWIZZLE_NO_SWAP;
reg_val &= ~EPDC_CTRL_LUT_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_LUT_DATA_SWIZZLE_NO_SWAP;
__raw_writel(reg_val, EPDC_CTRL_SET);
```

Address: 20F_4000h base + 20h offset = 20F_4020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

EPDC_WVADDR field descriptions

Field	Description
ADDR	Start address of waveform tables. This address needs to be aligned to a 64-bit word boundary.

19.4.4 EPDC Working Buffer Address (EPDC_WB_ADDR)

EPDC Working Buffer Address

This register points to the address of current working buffer.

Address: 20F_4000h base + 30h offset = 20F_4030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	<div>ADDR</div>																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_WB_ADDR field descriptions

Field	Description
ADDR	Address for EPDC working buffer. This address must be aligned to a 64-bit double-word boundary.

19.4.5 EPDC Screen Resolution (EPDC_RES)

EPDC Screen Resolution.

This register defines the horizontal and vertical resolution of the target display panel

Address: 20F_4000h base + 40h offset = 20F_4040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved			VERTICAL													Reserved			HORIZONTAL												
W	Reserved			VERTICAL													Reserved			HORIZONTAL												
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

EPDC_RES field descriptions

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 VERTICAL	Vertical Resolution (in pixels)
15–13 -	This field is reserved. Reserved.
HORIZONTAL	Horizontal Resolution (in pixels)

19.4.6 EPDC Format Control Register (EPDC_FORMATn)

EPDC Pixel format control register. Defines formats for buffer and TFT pixels.

This register controls various functions throughout the digital portion of the chip.

EXAMPLE

```
/* EPDC_FORMAT - 2bit TFT and 4bit Buf pixel format */
reg_val = EPDC_FORMAT_TFT_PIXEL_FORMAT_2BIT
| EPDC_FORMAT_BUF_PIXEL_FORMAT_P4N
| ((0x0 << EPDC_FORMAT_DEFAULT_TFT_PIXEL_OFFSET) &
EPDC_FORMAT_DEFAULT_TFT_PIXEL_MASK);
__raw_writel(reg_val, EPDC_FORMAT);
```

Address: 20F_4000h base + 50h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	Reserved								BUF_PIXEL_SCALE	DEFAULT_TFT_PIXEL							
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved	WB_ADDR_NO_COPY	WB_TYPE		WB_COMPRESS	BUF_PIXEL_FORMAT			Reserved						TFT_PIXEL_FORMAT	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_FORMATn field descriptions

Field	Description
31–25 -	This field is reserved. Reserved.
24 BUF_PIXEL_ SCALE	Selects method of conversion from 8-bit input 0x0 TRUNCATE — Use Truncate method (LSB) 0x1 ROUND — Use rounding method (with saturation)
23–16 DEFAULT_TFT_ PIXEL	Default TFT pixel value. This value is used as the source-driver voltage value (TFT-pixel) for either partial-updates where a pixel has not changed or for any part of the screen which is not being updated during active frame scans.
15 -	This field is reserved. Reserved.
14 WB_ADDR_NO_ COPY	1 means do not automatically copy WB_ADDR to WB_ADDR_TCE before starting every frame
13–12 WB_TYPE	00 WB_INTERNAL — internal Working Buffer written by EPDC itself 01 WB_WAVEFORM — working buffer is actually holding waveform 10 WB_EXTERNAL16 — 16bit working buffer written by PXP or CPU 11 WB_EXTERNAL32 — 32bit working buffer written by PXP or CPU
11 WB_COMPRESS	whether the working buffer is compressed, only available on WB_FORMAT=EXTERNAL16/32 mode
10–8 BUF_PIXEL_ FORMAT	this field is deprecated in EPDCv3, replaced by WB_FIELDx where we can specify width for each field EPDC Input Buffer Pixel format. All update buffers are expected to have 8-bit grayscale pixels. This register defines which MSB's of those pixels are used. It must be noted that this format must match the waveform (e.g. P4N is not compatible with 3-bit waveforms) 0x2 P2N — 2-bit pixel 0x3 P3N — 3-bit pixel 0x4 P4N — 4-bit pixel 0x5 P5N — 5-bit pixel
7–2 -	This field is reserved. Reserved.
TFT_PIXEL_ FORMAT	EPDC TFT Pixel Format. This defines how many bits of the SDDO bus are required per pixel. This field must be consistent with the waveform and panel architecture. 0x0 2B — 2-bit 0x1 2BV — 2-bit and VCOM 0x2 4B — 4-bit 0x3 4BV — 4-bit and VCOM

19.4.7 Working Buffer Field Setting (EPDC_WB_FIELD0)

specify the pixel fields mapping from working buffer to lut index : WB[FROM+LEN:FROM] => LUT [TO+LEN:TO]

Address: 20F_4000h base + 60h offset = 20F_4060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	FIXED								Reserved						USE_FIXED	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	USAGE			FROM					TO				LEN			
W																
Reset	1	0	0	0	1	0	1	0	1	0	1	0	0	1	0	1

EPDC_WB_FIELD0 field descriptions

Field	Description
31–24 FIXED	used to either force field into a fixed value, or compare to wb field to mask off the pixel
23–18 -	This field is reserved. Reserved
17–16 USE_FIXED	usage of the FIXED value 00 NO_FIXED — not using FIXED field 01 USE_FIXED — set this field to a FIXED value which specified by FIXED[31:24] 10 NE_FIXED — mask off this pixel if this field is non equal to FIXED[31:24] 11 EQ_FIXED — mask off this pixel if this field is equal to FIXED[31:24]
15–13 USAGE	000 NOT_USED — NOT USED 011 PARTIAL — PARTIAL (won't contribute to lut lookup index) 100 LUT — LUT 101 CP — CP 110 NP — NP 111 PTS — PTS
12–8 FROM	Source Field's LSB
7–4 TO	Target Field's LSB
LEN	Field length minus 1 (0x0 means length=1, 0xf means length=16)

19.4.8 Working Buffer Field Setting (EPDC_WB_FIELD1)

specify the pixel fields mapping from working buffer to lut index : WB[FROM+LEN:FROM] => LUT [TO+LEN:TO]

Address: 20F_4000h base + 70h offset = 20F_4070h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	FIXED								Reserved								USE_FIXED
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_WB_FIELD2 field descriptions

Field	Description
31–24 FIXED	used to either force field into a fixed value, or compare to wb field to mask off the pixel
23–18 -	This field is reserved. Reserved
17–16 USE_FIXED	usage of the FIXED value 00 NO_FIXED — not using FIXED field 01 USE_FIXED — set this field to a FIXED value which specified by FIXED[31:24] 10 NE_FIXED — mask off this pixel if this field is non equal to FIXED[31:24] 11 EQ_FIXED — mask off this pixel if this field is equal to FIXED[31:24]
15–13 USAGE	000 NOT_USED — NOT USED 011 PARTIAL — PARTIAL 100 LUT — LUT 101 CP — CP 110 NP — NP 111 PTS — PTS
12–8 FROM	Source Field's LSB
7–4 TO	Target Field's LSB
LEN	Field length minus 1 (0x0 means length=1, 0xf means length=16)

19.4.10 Working Buffer Field Setting (EPDC_WB_FIELD3)

specify the pixel fields mapping from working buffer to lut index : WB[FROM +LEN:FROM] =>LUT [TO+LEN:TO]

Address: 20F_4000h base + 90h offset = 20F_4090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	FIXED								Reserved								USE_FIXED
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	USAGE			FROM					TO				LEN			
W																
Reset	0	1	1	0	1	0	0	0	1	0	0	0	0	0	0	0

EPDC_WB_FIELD3 field descriptions

Field	Description
31–24 FIXED	used to either force field into a fixed value, or compare to wb field to mask off the pixel
23–18 -	This field is reserved. Reserved
17–16 USE_FIXED	usage of the FIXED value 00 NO_FIXED — not using FIXED field 01 USE_FIXED — set this field to a FIXED value which specified by FIXED[31:24] 10 NE_FIXED — mask off this pixel if this field is non equal to FIXED[31:24] 11 EQ_FIXED — mask off this pixel if this field is equal to FIXED[31:24]
15–13 USAGE	000 NOT_USED — NOT USED 011 PARTIAL — PARTIAL 100 LUT — LUT 101 CP — CP 110 NP — NP 111 PTS — PTS
12–8 FROM	Source Field's LSB
7–4 TO	Target Field's LSB
LEN	Field length minus 1 (0x0 means length=1, 0xf means length=16)

19.4.11 EPDC FIFO control register (EPDC_FIFOCTRLn)

Allows for programmability of pixel FIFO watermarks used in conjunction with system arbitration hardware

This register houses FIFO control bits

EXAMPLE

```

/* EPDC_FIFOCTRL (disabled) */
reg_val =
    ((100 << EPDC_FIFOCTRL_FIFO_INIT_LEVEL_OFFSET) &
     EPDC_FIFOCTRL_FIFO_INIT_LEVEL_MASK)
    | ((200 << EPDC_FIFOCTRL_FIFO_H_LEVEL_OFFSET) &
       EPDC_FIFOCTRL_FIFO_H_LEVEL_MASK)
    | ((100 << EPDC_FIFOCTRL_FIFO_L_LEVEL_OFFSET) &
       EPDC_FIFOCTRL_FIFO_L_LEVEL_MASK);
__raw_writel(reg_val, EPDC_FIFOCTRL);

```

Address: 20F_4000h base + A0h offset + (4d × i), where i=0d to 3d

**EPDC_FIFOCTRL_n field descriptions**

Field	Description
31 ENABLE_PRIORITY	Enable watermark-based priority elevation mechanism. 1=Enabled, 0=Disabled. (Only applies to FIFO_H_LEVEL and FIFO_L_LEVEL)
30–24 -	This field is reserved. Reserved.
23–16 FIFO_INIT_LEVEL	This register sets the watermark for the pixel-fifo.
15–8 FIFO_H_LEVEL	Upper level value of FIFO watermark. Must be greater than FIFO_L_LEVEL. When the pixel FIFO reaches this level or above, the priority elevation request is negated
FIFO_L_LEVEL	Lower level value of FIFO watermark. When the pixel FIFO reaches this level or below, the priority elevation request is asserted.

19.4.12 EPDC Update Region Address (EPDC_UPD_ADDR)**EPDC Update Region Address**

The address alignment depends on whether the update region stride register (EPDC_UPD_STRIDE) is set or not.

If EPDC_UPD_STRIDE is zero, the update region address must start and end on the 8-byte aligned addresses.

If EPDC_UPD_STRIDE is non-zero, the update region address can start and/or end on any byte addressing. But aligned address still recommended to get best bus performance.

EXAMPLE1

```
/* no update stride case */
u32 stride = 0;
u32 addr = 0x100; /* 8-byte aligned */
__raw_writel(stride, EPDC_UPD_STRIDE);
__raw_writel(addr, EPDC_UPD_ADDR);
```

EXAMPLE2

```
/* update stride = 345 */
u32 stride = 345;
u32 addr = 0x123; /* 8-byte unaligned is OK */
__raw_writel(stride, EPDC_UPD_STRIDE);
__raw_writel(addr, EPDC_UPD_ADDR);
```

Address: 20F_4000h base + 100h offset = 20F_4100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_UPD_ADDR field descriptions

Field	Description
ADDR	Address for incoming region update. This address points to update region which will be processed into the working buffer.

19.4.13 EPDC Update Region Stride (EPDC_UPD_STRIDE)

EPDC Update Region Stride

When UPD_STRIDE==0 (stride feature disabled), UPD buffer line must start from 64-bit boundary and end on 64-bit boundary(padding if not). When UPD_STRIDE!=0 (stride feature enabled), UPD buffer line can start or end on any byte address, UPD_WIDTH should be set to real line bytes count as normal, while UPD_STRIDE set to byte distance between two lines' start.

EXAMPLE

see details on stride feature introduction

Address: 20F_4000h base + 110h offset = 20F_4110h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_UPD_STRIDE field descriptions

Field	Description
STRIDE	line stride for incoming region update

19.4.14 EPDC Update Command Co-ordinate (EPDC_UPD_CORD)

EPDC Update Command Co-ordinate

This register is used for setting up the coordinate of a new update region.

Address: 20F_4000h base + 120h offset = 20F_4120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_UPD_CORD field descriptions

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 YCORD	Y co-ordinate for incoming region update
15–13 -	This field is reserved. Reserved.
XCORD	X co-ordinate for incoming region update

19.4.15 EPDC Update Command Size (EPDC_UPD_SIZE)

EPDC Update Command Size

This register sets up the size of an update region.

Address: 20F_4000h base + 140h offset = 20F_4140h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_UPD_SIZE field descriptions

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 HEIGHT	Height (in pixels)
15–13 -	This field is reserved. Reserved.
WIDTH	Width (in pixels)

19.4.16 EPDC Update Command Control (EPDC_UPD_CTRLn)

EPDC Update Command Control.

Writing to this registers triggers and update request operation.

Address: 20F_4000h base + 160h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	USE_FIXED	Reserved												LUT_SEL		
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_UPD_CTRLn field descriptions

Field	Description
31 USE_FIXED	Use fixed pixel values (requires programming of EPDC_UPD_FIXED)
30–22 -	This field is reserved. Reserved.
21–16 LUT_SEL	LUT select 0-63
15–8 WAVEFORM_MODE	Waveform Mode 0-255

Table continues on the next page...

EPDC_UPD_CTRL_n field descriptions (continued)

Field	Description
7–6 -	This field is reserved. Reserved.
5 STANDBY	
4 NO_LUT_ CANCEL	EPDC will cancel LUT loading for void update (no real update needed because of partial or collision), set this bit to 1 to disable this feature
3 PAUSE	0x0 AUTO — epdc will analyze update buffer, report histogram, then update waveform mode using the programmed mode mapping in AUTOWV_LUT and start LUT loading 0x1 MANUAL — epdc will analyze update buffer, report histogram, then pause and waiting software to write again with selected waveform mode to start lut loading
2 AUTOWV	enable automatical waveform mode selection
1 DRY_RUN	Enable Dry Run mode(set to 1). WB won't be updated in this mode, and lut_sel will be ignored, so actually you don't need to wait for LUT available to use this feature
0 UPDATE_MODE	Update Mode 0x0 PARTIAL — Partial Update : only process changed pixels in region 0x1 FULL — Full Update : process all pixels in region

19.4.17 EPDC Update Fixed Pixel Control (EPDC_UPD_FIXED_n)

EPDC Update Control register for fixed-pixel updates (enabled via EPDC_UPD_CTRL[USE_FIXED])

Address: 20F_4000h base + 180h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

EPDC_TEMP field descriptions

Field	Description
TEMPERATURE	Temperature Value. This value is simply an index (not a temperature value). The index is used by the EPDC to access the correct temperature compensated waveform.

19.4.19 Waveform Mode Lookup Table Control Register. (EPDC_AUTOWV_LUT)

This register is used to access the waveform mode lookup table.

DATA -> AUTOWV_LUT[ADDR] : Writing this reg with 'ADDR' and 'DATA' info will get 'DATA' written to AUTOWV_LUT mem indexed with 'ADDR'

Address: 20F_4000h base + 1C0h offset = 20F_41C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R	Reserved				VCOM_VAL		VCOM_MODE	DDR_MODE	LVDS_MODE_CE	LVDS_MODE	SCAN_DIR_1	SCAN_DIR_0	Reserved	SDDO_WIDTH	PIXELS_PER_SDCLK	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

EPDC_TCE_CTRLn field descriptions

Field	Description
31–25 -	This field is reserved. Reserved.
24–16 VSCAN_HOLDOFF	This period (expressed in vertical lines), sets the portion of the vertical blanking available for new LUTs to be activated. The remainder of the blanking period is reserved for pre-filling the TCE pixel FIFOs. Increasing this value allows for multiple smaller updates to be intercepted by the current frame scan. This number should not exceed FRAME_END+FRAME_SYNC+FRAME_BEGIN. Increasing this value can improve the ability for any given update to intercept the next available frame-scan. Excessive values can result in TCE FIFO under-runs.
15–12 -	This field is reserved. Reserved.
11–10 VCOM_VAL	When VCOM_MODE = MANUAL, this value is used to manually set the VCOM value for the VCOM[1:0] pins
9 VCOM_MODE	This field determines the method used to drive the VCOM signal. 0x0 MANUAL — VCOM Value is set manually using VCOM_VAL field 0x1 AUTO — VCOM Value is used from waveform
8 DDR_MODE	If set, SDDO data is driven on both positive and negative edges of SDCLK. Note that this mode is not supported when SDDO_BUS_FORMAT=16BIT and LVDS is not used. This must always be set when LVDS_MODE is set.

Table continues on the next page...

EPDC_TCE_CTRLn field descriptions (continued)

Field	Description
7 LVDS_MODE_CE	If set (together with LVDS_MODE=1), SDCE[9:5] shall be driven as the differential inverse of SDCE[4:0]. In this mode the EPDC only supports 5 CE lines.
6 LVDS_MODE	If set, the upper 8-bit of the SDDO bus are used for LVDS differential signalling. Note that this can only be used when SDDO_BUS_FORMAT is set to 16BIT, i.e. LVDS signaling is not supported with an 8-bit SDDO interface. Note that for LVDS_MODE, DDR_MODE must also be set.
5 SCAN_DIR_1	Determines scan direction for each half of the TFT panel 0x1 UP — Scan this region from bottom to top 0x0 DOWN — Scan this region from top to bottom
4 SCAN_DIR_0	Determines scan direction for each half of the TFT panel 0x1 UP — Scan this region from bottom to top 0x0 DOWN — Scan this region from top to bottom
3 -	This field is reserved. Reserved
2 SDDO_WIDTH	Selects either 8 or 16 bit SDDO bus format 0x0 8BIT — Connect to 8-bit source driver 0x1 16BIT — Connect to 16-bit source driver
PIXELS_PER_SDCLK	Number of TFT pixels per SDCLK period. Note that this value forms the division of the PIXCLK to generate the SDCLK such that $SDCLK = PIXCLK / PIXELS_PER_SDCLK$. 0x0 RESERVED — Reserved 0x1 TWO — Two TFT-pixels per SDCLK 0x2 FOUR — Four TFT-pixels per SDCLK 0x3 EIGHT — Eight TFT-pixels per SDCLK

19.4.23 EPDC Timing Control Engine Source-Driver Config Register (EPDC_TCE_SDCFGn)

Source-driver configuration register

Address: 20F_4000h base + 220h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved										SDCLK_HOLD	SDSHR	NUM_CE			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	SDDO_REFORMAT		SDDO_INVERT	PIXELS_PER_CE												
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_TCE_SDCFGn field descriptions

Field	Description
31–22 -	This field is reserved. Reserved.
21 SDCLK_HOLD	Setting this bit to 1 holds the SDCLK low during LINE_BEGIN
20 SDSHR	Value for source-driver shift direction output port
19–16 NUM_CE	Number of source driver IC chip-enables. Must be 1-10
15–14 SDDO_REFORMAT	This register defines the various re-formatting options to enable more flexibility in the source-driver interface: 0x0 STANDARD — No change. 0x1 FLIP_PIXELS — Reverses the order of the pixels on SDDO. This register setting is sensitive to the TFT pixel width (TFT_PIXEL_FORMAT), e.g. for TFT_PIXEL_FORMAT=2B on an 8-bit bus P3,P2,P1,P0 becomes P0,P1,P2,P3, whereas with TFT_PIXEL_FORMAT=4B, on an 8-bit bus, P1,P0 becomes P0,P1
13 SDDO_INVERT	Setting this bit to 1 reverses the polarity of each SDDO bit so 0xAAAA in 16-bit mode for example becomes 0x5555. This setting can be made in addition to the SDDO_REFORMAT register setting.
PIXELS_PER_CE	Number of pixels (outputs) per source-driver IC. Please note that EPDC_RES[HORIZONTAL] must be an integer multiple of PINS_PER_CE.

19.4.24 EPDC Timing Control Engine Gate-Driver Config Register (EPDC_TCE_GDCFGn)

This register houses gate-driver configuration.

Address: 20F_4000h base + 240h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	PERIOD_VSCAN															
W

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_TCE_GDCFGn field descriptions

Field	Description
31–16 PERIOD_VSCAN	when vscan state is splited, this reg defines the counter period
15–5 -	This field is reserved. Reserved.
4 GDRL	Value for gate-driver right/left shift output port
3–2 -	This field is reserved. Reserved.
1 GDOE_MODE	Selects method for driving GDOE signal. When set to 0, GDOE is driven at all times during the frame-scan except FRAME_SYNC. When set to 1, GDOE is driven as a delayed version of GDCLK delayed by EPDC_TCE_TIMING3[GDOE_OFFSET].
0 GDSP_MODE	Selects method for driving GDSP pulse. When set to 0, GDSP is always fixed to have a pulse width of one line-time. When set to 1, GDSP has a pulse-width determined by the FRAME_SYNC setting. Note that GDSP_MODE=1 is not compatible with the GDSP_OFFSET function

19.4.25 EPDC Timing Control Engine Horizontal Timing Register 1 (EPDC_TCE_HSCAN1n)

Horizontal scan timing registers. Note that all timing values are expressed in terms of the EPDC's internal PIXCLK, which depending on the PIXELS_PER_SDCLK register setting is either 2:1 or 4:1

This register houses Horizontal scan timing. Note that line data length is derived from EPDC_RES.

Address: 20F_4000h base + 260h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_TCE_HSCAN1n field descriptions

Field	Description
31–28 -	This field is reserved. Reserved.
27–16 LINE_SYNC_WIDTH	Number of PIXCLK cycles for the SDLE active time. Note that this value cannot be larger than LINE_SYNC and must be greater than 0. Typically it is recommended to set this value to be the same as LINE_SYNC
15–12 -	This field is reserved. Reserved.
LINE_SYNC	Number of PIXCLK cycles for line sync duration. Note that this value encompasses the LINE_SYNC_WIDTH duration. This value must be programmed to a multiple of SDCLK cycles

19.4.26 EPDC Timing Control Engine Horizontal Timing Register 2 (EPDC_TCE_HSCAN2n)

Horizontal scan timing registers. Note that all timing values are expressed in terms of the EPDC's internal PIXCLK, which depending on the PIXELS_PER_SDCLK register setting is either 2:1 or 4:1

This register houses Horizontal scan timing. Note that line data length is derived from EPDC_RES.

Address: 20F_4000h base + 280h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_TCE_HSCAN2n field descriptions

Field	Description
31–28 -	This field is reserved. Reserved.
27–16 LINE_END	Number of PIXCLK cycles for line end duration. This defines the duration from the de-assertion of SDCE and assertion of the next SDLE.
15–12 -	This field is reserved. Reserved.
LINE_BEGIN	Number of PIXCLK cycles for line begin duration. This defines the interval between de-assertion of SDLE and assertion of the SDCE signals. This value must be programmed to a multiple of SDCLK cycles

19.4.27 EPDC Timing Control Engine Vertical Timing Register (EPDC_TCE_VSCANn)

Vertical scan timing registers

This register houses vertical scan timing. Note that frame data length is derived from EPDC_RES.

Address: 20F_4000h base + 2A0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_TCE_VSCANn field descriptions

Field	Description
31–24 -	This field is reserved. Reserved.
23–16 FRAME_END	Number of lines for frame end duration.
15–8 FRAME_BEGIN	Number of lines for frame begin duration.
FRAME_SYNC	Number of lines for frame sync duration.

19.4.28 EPDC Timing Control Engine OE timing control Register (EPDC_TCE_OEn)

This register contain delay programming values for the SDOEZ and SDOED source driver control signals

This register contain delay programming values for the SDOZ and SDOE source driver control signals

EPDC Memory Map/Register Definition

Address: 20F_4000h base + 2C0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_TCE_TIMING2n field descriptions

Field	Description
31–16 GDCLK_HP	This register controls the GDCLK high-pulse width. It is expressed by N PIXCLKs where N=1 to 65535. Note that GDCLK will always have a period equal to the line-clock timing. A value of 0 is not supported. It is recommended that this value be set to at least a half line-clock time. For panels which use GDCLK to drive GDOE, this high-pulse width should be set to cover the majority of the line timing
GDSP_OFFSET	This register allows the user to shift the GDSP pulse by N PIXCLKs where N=1 to 65535. Note that GDSP will always have a pulse width equivalent to the line-clock timing. A value of 0 is not supported.

19.4.32 EPDC Timing Control Engine Timing Register 3 (EPDC_TCE_TIMING3n)

This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

Address: 20F_4000h base + 320h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NEXT_LUT	Next available LUT value

19.4.44 EPDC LUT Collision Status (EPDC_STATUS_COL1n)

EPDC LUT Collision Status Register and works in conjunction with EPDC_IRQ[LUT_COL_IRQ]. When a collision occurs the interrupt is set and all status bits are set for LUTs which were touched by the collision. It does not set the bit for the LUT which caused the collision. There is a single interrupt mask which is used to control all the IRQ bits in this register (in EPDC_IRQ_MASK). Note that a collision caused by a LUT which was set-up for no collision detection will not trigger any collision LUT IRQ or status update. Note that clearing the interrupt bit EPDC_IRQ[LUT_COL_IRQ] clears this register

Address: 20F_4000h base + 480h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_STATUS_COL2n field descriptions

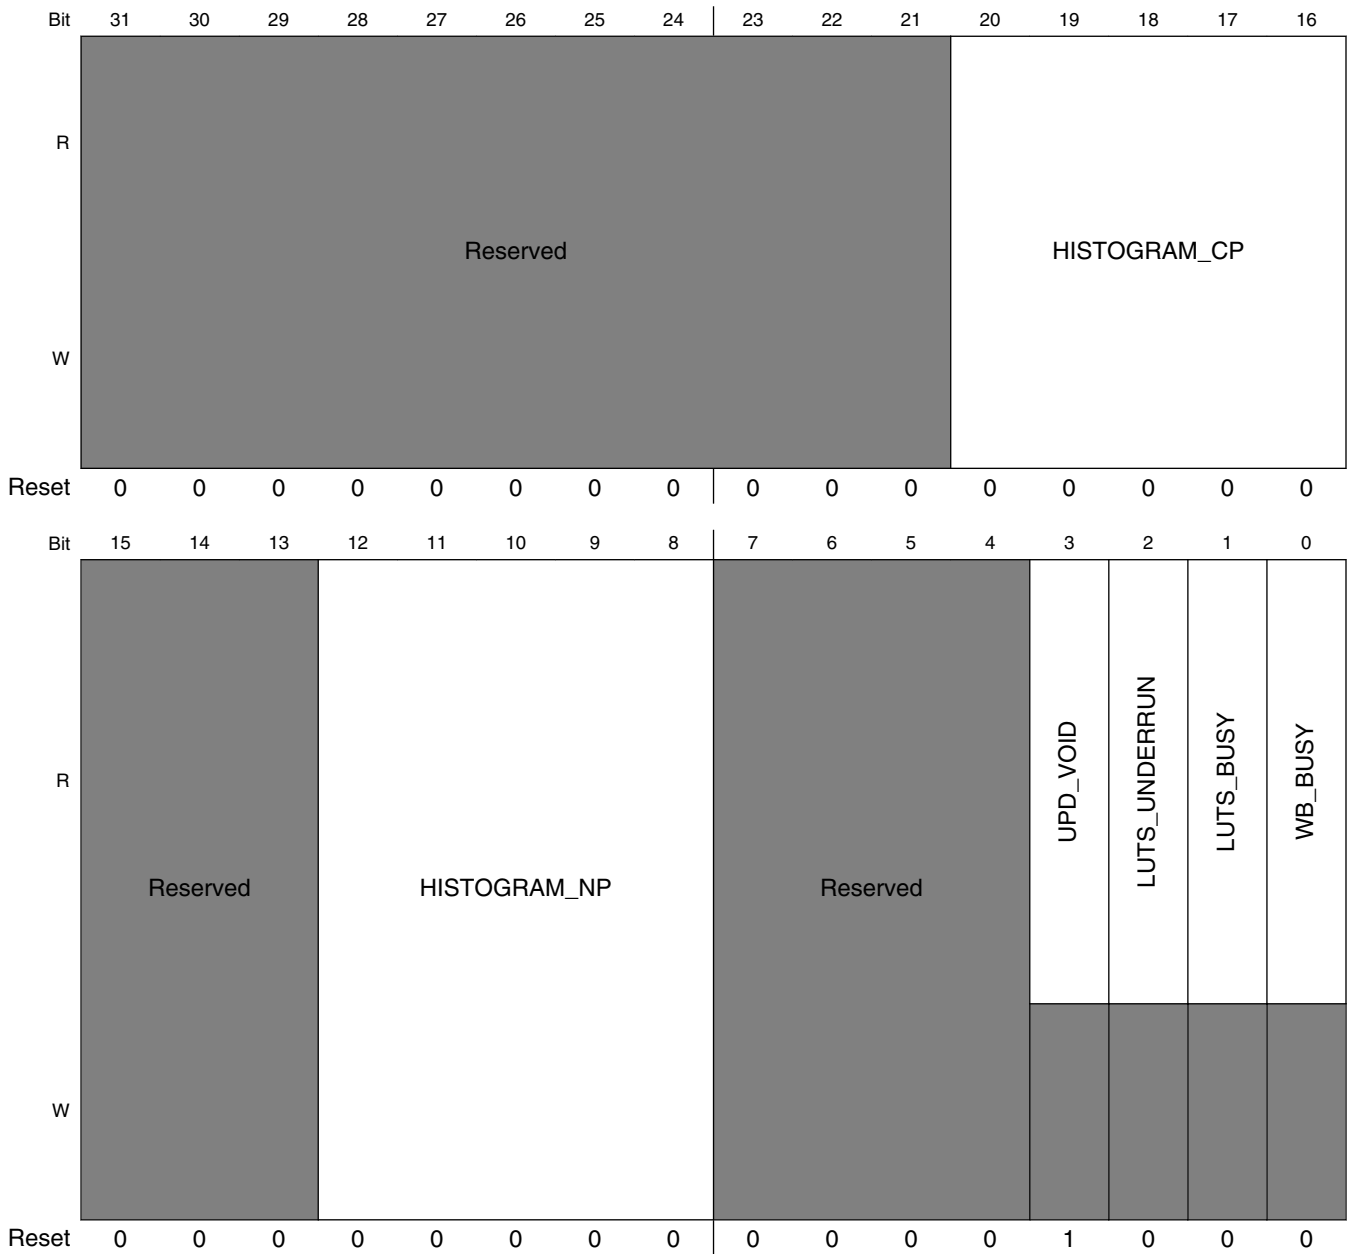

Field	Description
LUTN_COL_STS	LUTn Collision Status

19.4.46 EPDC General Status Register (EPDC_STATUSn)

Register to house non LUT specific status bits

This register houses general status bits

Address: 20F_4000h base + 4A0h offset + (4d × i), where i=0d to 3d

EPDC_STATUS_n field descriptions

Field	Description
31–21 -	This field is reserved. Reserved.
20–16 HISTOGRAM_ CP	Indicates which histogram matched the existing bitmap(CP). Bit[0] indicates that the bitmap pixels were fully contained within the HIST1 (single color) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST2 (black / white) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.
15–13 -	This field is reserved. Reserved.
12–8 HISTOGRAM_ NP	Indicates which histogram matched the processed bitmap(NP). Bit[0] indicates that the bitmap pixels were fully contained within the HIST1 (single color) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST2 (black / white) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.
7–4 -	This field is reserved. Reserved.
3 UPD_VOID	Indicates that the update buffer is void. This means either no pixels need updating or all pixels requiring updating were collided.
2 LUTS_ UNDERRUN	Provides a summary status of LUT fill. 1= not enough time for active luts read during blanking period before vscan_holdoff. 0=complete all active luts fill during blanking period before VSCAN_HOLD OFF.
1 LUTS_BUSY	Provides a summary status of LUTs. 1= All LUTs are busy, 0= LUTs are available
0 WB_BUSY	Working buffer process is busy cannot accept new update requests. When WB_BUSY is 1, software should wait for the WB_CMPLT_IRQ interrupt. When this interrupt occurs WB_BUSY is cleared immediately. This is a real-time status of the process.

19.4.47 EPDC Collision Region Co-ordinate (EPDC_UPD_COL_CORD)

EPDC Collision Region Co-ordinate, cleared when new update issued

This register only valid after WB completion and collision happens.

Address: 20F_4000h base + 4C0h offset = 20F_44C0h

WIDTH	Width (in pixels)

**19.4.49 1-level Histogram Parameter Register.
(EPDC_HIST1_PARAM)**

This register specifies the valid values for a 1-level(single color) histogram. If all pixels in a bitmap is only one color, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT_PIXEL_FORMAT control field.

Address: 20F_4000h base + 600h offset = 20F_4600h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Chapter 20

Enhanced Periodic Interrupt Timer (EPIT)

20.1 Overview

EPIT is a 32-bit set-and-forget timer that is capable of providing precise interrupts at regular intervals with minimal processor intervention. EPIT begins counting after it is enabled by software.

The following figure shows the EPIT block diagram.

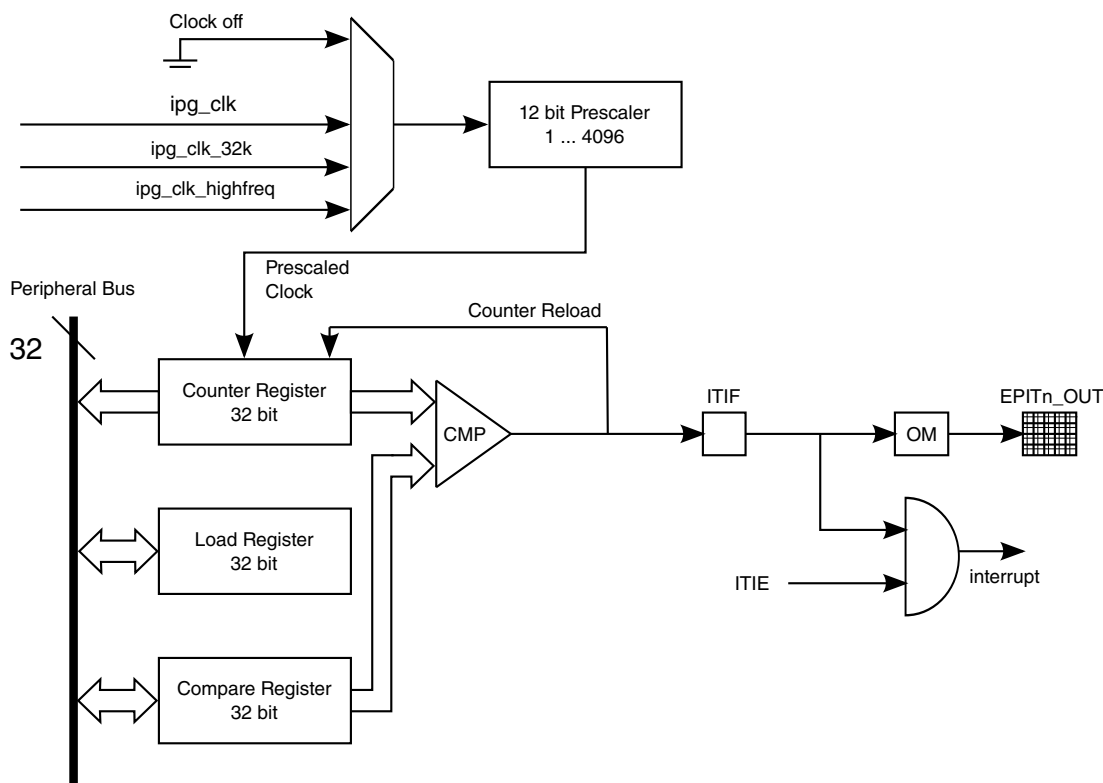

Figure 20-1. EPIT block diagram

20.1.1 EPIT features

EPIT has the following key features:

- 32-bit down counter with clock source selection
- 12-bit prescaler for division of input clock frequency
- Counter value that can be programmed on the fly
- Can be programmed to be active during low-power and debug modes
- Interrupt generation when counter reaches the compare value

20.1.2 EPIT modes and operations

EPIT supports the following modes: set-and-forget and free running. See the following sections for more information.

- [Operating in set-and-forget mode](#)
- [Operating in free-running mode](#)

See [Operations](#) for a description of the operations that EPIT supports.

20.2 External signals

The following table describes EPIT's I/O signals.

Table 20-1. EPIT External Signals

Signal	Description	Pad	Mode	Direction
EPIT1_OUT	Output 1 pin at chip boundary for indicating the occurrence of an output compare event through a specified transition.	PWM1	ALT6	O
		SD2_CMD	ALF4	
		SD3_CMD	ALT4	
EPIT2_OUT	Output 2 pin at chip boundary for indicating the occurrence of an output compare event through a specified transition.	LCD_DAT2	ALT2	O
		SD3_DAT3	ALT4	

20.3 Clocks

The table found here describes the clock sources for EPIT.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 20-2. EPIT Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32 kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

The clock that feeds the prescaler can be selected from among the following sources:

- **High-frequency reference clock (ipg_clk_highfreq)**

This clock is provided by the Clock Control Module (CCM). This clock remains on during low-power mode when the peripheral clock is turned off, allowing EPIT to use this clock in low-power mode. In normal mode, the CCM synchronizes this clock to ahb_clk; in low-power mode, CCM switches to an unsynchronized version.

- **Low-frequency reference clock (ipg_clk_32k)**

This 32 kHz reference clock is provided by the CCM. This clock remains on in low-power mode when the peripheral clock is turned off, so EPIT can use this clock during low-power mode. In normal mode, the CCM synchronizes this clock to ahb_clk; in low-power mode, CCM switches to an unsynchronized version. This clock is derived from the external 32 kHz crystal.

- **Peripheral clock (ipg_clk)**

This is the peripheral clock (PER Clock) which is provided (and optionally gated) by the CCM. This clock is typically used in normal operations. In low-power modes, if the EPIT is programmed to be disabled (via STOPEN or WAITEN), then the peripheral clock can be switched off.

The clock input source is determined by the CLKSRC field in the control register. The clock input to the prescaler can also be disabled by setting CLKSRC to 0b00. **This field value should only be changed after first disabling the EPIT by clearing the EN bit in the EPIT_EPITCR.** For other programming requirements that apply while changing clock source, refer section [Change of Clock Source](#).

The PRESCALER field in the control register is used to select the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value between 1 and 4096. A change in the value of the PRESCALER field is immediately reflected on its output clock frequency. The following figure shows the timing for a change in the prescaler value.

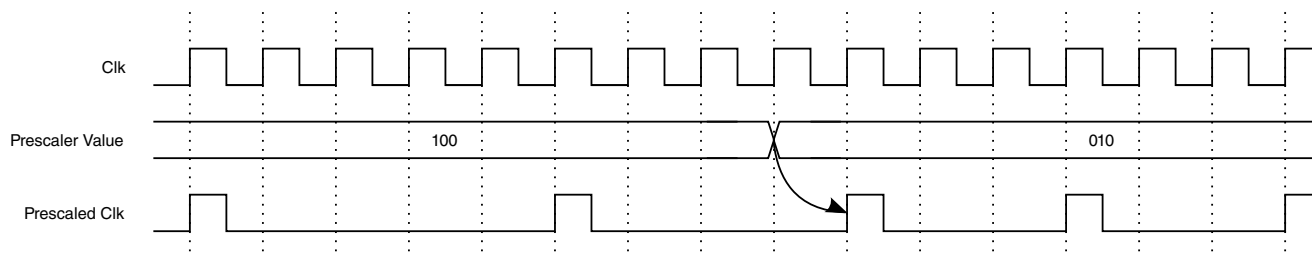

Figure 20-2. Prescaler Value Change Diagram

20.4 Functional Description

This section provides a complete functional description of the block.

20.4.1 Operating modes

EPIT can operate in either set-and-forget or free-running mode. Use EPIT_CR[RLD] to select the desired mode.

20.4.1.1 Operating in set-and-forget mode

To select this mode of operation, set the RLD bit in the control register (EPIT_CR).

In this mode, the counter obtains its data from the load register (EPIT_LR); it cannot be written to directly from the block data bus. Whenever the counter reaches zero, the value in EPIT_LR is loaded into the counter. This value is then decremented to zero.

To directly initialize the counter instead of waiting for the count to reach zero, set the EPIT counter overwrite enable bit (EPIT_CR[IOVW]) and write to EPIT_LR with the required initialization value.

20.4.1.2 Operating in free-running mode

To select this mode of operation, clear the RLD bit.

In this mode, the counter rolls over from 0000 0000h to FFFF FFFFh without reloading from the modulus register. After rolling over, the counter continues counting down.

To directly initialize the counter, set the EPIT counter overwrite enable bit (EPIT_EPITCL[IOVW]) and write to EPIT_EPITLR with the required initialization value.

20.4.2 Operations

EPIT has a single 32-bit down counter, which starts counting when the block is enabled by software.

The start value of the counter is loaded from the EPIT load register, which can be written to at any time by the processor. The value in the compare register determines the time that the interrupt occurs.

When EPIT is disabled (EN = 0), both the main counter and the prescaler counter freeze their count at their current count values. When EPIT is re-enabled (EN = 1), the ENMOD bit, which is a RW bit, decides the counter value:

- If ENMOD is set, the main counter is loaded with the load value (If RLD = 1)/ FFFF FFFFh (If RLD = 0) and the prescaler counter is reset (000h).
- If ENMOD is cleared, both main counter and prescaler counter restart counting from their frozen values.

If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both the main counter and the prescaler counter start counting from their frozen values regardless of the ENMOD bit.

A hardware reset resets all EPIT registers to their respective reset values. There is a software reset which has the same effect on all registers except for the EN, ENMOD, STOPEN and WAITEN bits in the control register. The state of these bits are not affected by software reset. A software reset can be asserted even when the EPIT is disabled.

20.4.3 Compare Event

When the programmed value of EPIT_EPITCMPR matches the value in EPIT_EPITCNR a compare status flag is set, and an interrupt is generated if the OCIEN bit is set in the control register.

The compare output pin is set, cleared, toggled, or not affected at all depending on the setting of the output mode (OM) bits in the control register. If an interrupt is required at rollover (when the counter value reaches 0x0000_0000 and the new value is loaded) then the compare register value should be set equal to the load register value in set-and-forget mode, or equal to 0xFFFF_FFFF in free-running mode.

The following figure shows the timing for a compare event and interrupt.

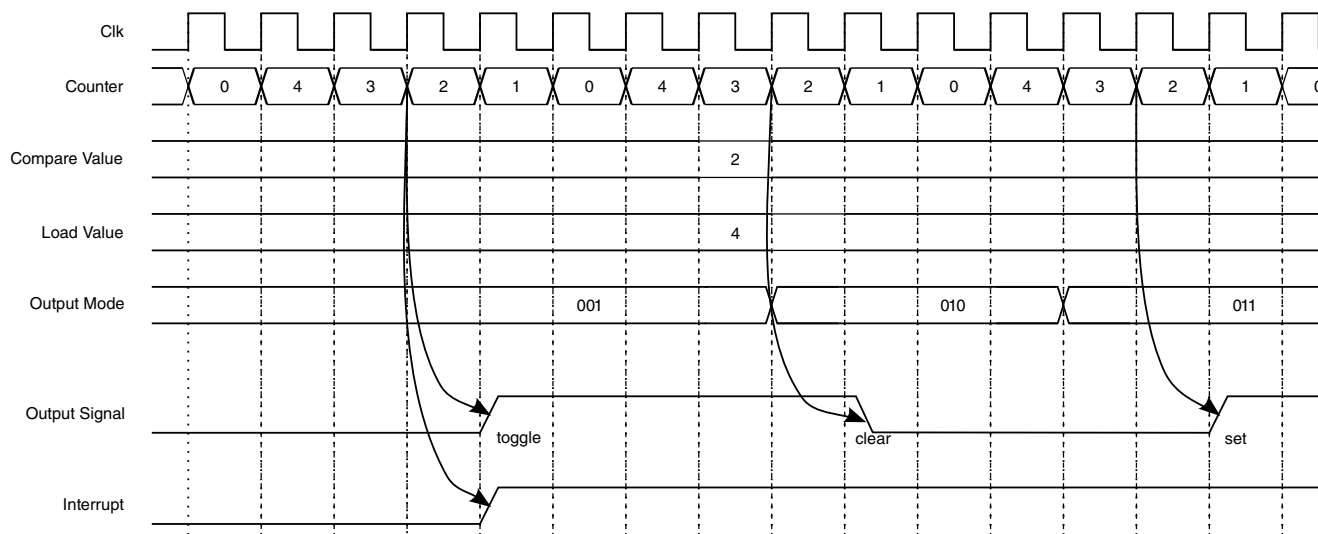

Figure 20-3. Compare Event and Interrupt Timing Diagram

EPIT will generate a compare event in the next count if the EPITx_CNR from the previous count equals the new EPITx_CMPR configured before re-enabling the EPIT in the next count. Even in case a new start counter value was updated in EPITx_LR before re-enabling the EPIT for the next round. To avoid this, configure the EPITx_CMPR to previous EPITx_CNR+1. Or, in set and forget mode, configure EPITx_LR with IOVW=1, before disabling EPIT. Also can do an extra disable/enable iteration to clear OCIF and update EPITx_CNR.

20.4.3.1 Counter Value Overwrite

The EPIT counter value can be overwritten to acquire a desired value at any point of time. The procedure for this is to set the IOVW bit in the control register and then write the desired value into the load register.

This results in the load register acquiring that value and also the counter being overwritten with it. If the EPIT is running the counter resumes counting from the overwritten value.

20.4.3.2 Low-Power Mode Behavior

The EPIT timer's behavior in low-power modes depends on which clock source is being used.

If the selected clock source is available and the corresponding low-power enable bit is set, then the EPIT continues to function in the low-power mode. If the EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), then main counter and the prescaler counter freeze at the current count values when the EPIT enters low-power mode. When the EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit.

20.4.3.3 Debug Mode Behavior

In debug mode, the user has the option to run or halt the EPIT timers. If the DBGGEN bit is reset in the EPIT Control Register, the timer is halted.

When debug mode is exited, the timer operation reverts to what it was prior to entering debug mode.

20.5 Initialization/ Application Information

20.5.1 Change of Clock Source

The CLKSRC field in EPIT_EPITCR determines the clock source. This field value should be changed only after disabling the EPIT (EN = 0).

Below is the software sequence which must be followed while changing clock source.

1. Disable the EPIT - set EN=0 in EPIT_EPITCR.
2. Disable EPIT output - program OM=00 in the EPIT_EPITCR.
3. Disable EPIT interrupts.
4. Program CLKSRC to desired clock source in EPIT_EPITCR.
5. Clear the EPIT status register (EPIT_EPITSR), that is, write "1" to clear (w1c).
6. Set ENMOD= 1 in the EPIT_EPITCR, to bring the EPIT Counter to defined state (EPIT_EPITLR value or 0xFFFF_FFFF).
7. Enable EPIT - set (EN=1) in the EPIT_EPITCR
8. Enable the EPIT interrupts.

20.6 EPIT Memory Map/Register Definition

The EPIT includes five user-accessible 32-bit registers. The following table summarizes these registers and their addresses.

Peripheral bus write access to the EPIT control register (EPITCR) and the EPIT load register (EPITLR) results in one cycle of wait state, while other valid peripheral bus accesses are with 0 wait state.

EPIT memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20D_0000	Control register (EPIT1_CR)	32	R/W	0000_0000h	20.6.1/870
20D_0004	Status register (EPIT1_SR)	32	R/W	0000_0000h	20.6.2/873
20D_0008	Load register (EPIT1_LR)	32	R/W	FFFF_FFFFh	20.6.3/873
20D_000C	Compare register (EPIT1_CMPR)	32	R/W	0000_0000h	20.6.4/874
20D_0010	Counter register (EPIT1_CNR)	32	R	FFFF_FFFFh	20.6.5/874
20D_4000	Control register (EPIT2_CR)	32	R/W	0000_0000h	20.6.1/870
20D_4004	Status register (EPIT2_SR)	32	R/W	0000_0000h	20.6.2/873
20D_4008	Load register (EPIT2_LR)	32	R/W	FFFF_FFFFh	20.6.3/873
20D_400C	Compare register (EPIT2_CMPR)	32	R/W	0000_0000h	20.6.4/874
20D_4010	Counter register (EPIT2_CNR)	32	R	FFFF_FFFFh	20.6.5/874

20.6.1 Control register (EPITx_CR)

The EPIT control register (EPIT_CR) is used to configure the operating settings of the EPIT. It contains the clock division prescaler value and also the interrupt enable bit. Additionally, it contains other control bits which are described below.

Peripheral Bus Write access to EPIT Control Register (EPIT_CR) results in one cycle of the wait state, while other valid peripheral bus accesses are with 0 wait state.

Address: Base address + 0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0						CLKSRC		OM		STOPEN	0	WAITEN	DBGEN	IOW	SWR
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPITx_CR field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 CLKSRC	<p>Select clock source</p> <p>These bits determine which clock input is to be selected for running the counter. This field value should only be changed when the EPIT is disabled by clearing the EN bit in this register. For other programming requirements while changing clock source, refer to Change of Clock Source.</p> <p>00 Clock is off 01 Peripheral clock 10 High-frequency reference clock 11 Low-frequency reference clock</p>
23–22 OM	<p>EPIT output mode. This bit field determines the mode of EPIT output on the output pin.</p> <p>00 EPIT output is disconnected from pad 01 Toggle output pin 10 Clear output pin 11 Set output pin</p>
21 STOPEN	<p>EPIT stop mode enable. This read/write control bit enables the operation of the EPIT during stop mode. This bit is reset by a hardware reset and unaffected by software reset.</p> <p>0 EPIT is disabled in stop mode 1 EPIT is enabled in stop mode</p>
20 Reserved	This read-only field is reserved and always has the value 0.
19 WAITEN	<p>This read/write control bit enables the operation of the EPIT during wait mode. This bit is reset by a hardware reset. A software reset does not affect this bit.</p> <p>0 EPIT is disabled in wait mode 1 EPIT is enabled in wait mode</p>
18 DBGEN	<p>This bit is used to keep the EPIT functional in debug mode. When this bit is cleared, the input clock is gated off in debug mode. This bit is reset by hardware reset. A software reset does not affect this bit.</p> <p>0 Inactive in debug mode 1 Active in debug mode</p>
17 IOVW	<p>EPIT counter overwrite enable. This bit controls the counter data when the modulus register is written. When this bit is set, all writes to the load register overwrites the counter contents and the counter starts subsequently counting down from the programmed value.</p> <p>0 Write to load register does not result in counter value being overwritten. 1 Write to load register results in immediate overwriting of counter value.</p>

Table continues on the next page...

EPITx_CR field descriptions (continued)

Field	Description
16 SWR	<p>Software reset. The EPIT is reset when this bit is set to 1. It is a self clearing bit. This bit is set when the block is in reset state and is cleared when the reset procedure is over. Setting this bit resets all the registers to their reset values, except for the EN, ENMOD, STOPEN, WAITEN and DBGEN bits in this control register</p> <p>0 EPIT is out of reset 1 EPIT is undergoing reset</p>
15–4 PRESCALAR	<p>Counter clock prescaler value. This bit field determines the prescaler value by which the clock is divided before it goes to the counter</p> <p>0x000 Divide by 1 0x001 Divide by 2... 0xFFFF Divide by 4096</p>
3 RLD	<p>Counter reload control.</p> <p>This bit is cleared by hardware reset. It decides the counter functionality, whether to run in free-running mode or set-and-forget mode.</p> <p>0 When the counter reaches zero it rolls over to 0xFFFF_FFFF (free-running mode) 1 When the counter reaches zero it reloads from the modulus register (set-and-forget mode)</p>
2 OCIEN	<p>Output compare interrupt enable.</p> <p>This bit enables the generation of interrupt on occurrence of compare event.</p> <p>0 Compare interrupt disabled 1 Compare interrupt enabled</p>
1 ENMOD	<p>EPIT enable mode.</p> <p>When EPIT is disabled (EN=0), both main counter and prescaler counter freeze their count at current count values. ENMOD bit is a r/w bit that determines the counter value when the EPIT is enabled again by setting EN bit. If ENMOD bit is set, then main counter is loaded with the load value (If RLD=1)/ 0xFFFF_FFFF (If RLD=0) and prescaler counter is reset, when EPIT is enabled (EN=1). If ENMOD is programmed to 0 then both main counter and prescaler counter restart counting from their frozen values when EPIT is enabled (EN=1). If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT/DEBUG), then both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit. This bit is reset by a hardware reset. A software reset does not affect this bit.</p> <p>0 Counter starts counting from the value it had when it was disabled. 1 Counter starts count from load value (RLD=1) or 0xFFFF_FFFF (If RLD=0)</p>
0 EN	<p>This bit enables the EPIT. EPIT counter and prescaler value when EPIT is enabled (EN = 1), is dependent upon ENMOD and RLD bit as described for ENMOD bit. It is recommended that all registers be properly programmed before setting this bit. This bit is reset by a hardware reset. A software reset does not affect this bit.</p> <p>0 EPIT is disabled 1 EPIT is enabled</p>

20.6.2 Status register (EPITx_SR)

The EPIT status register (EPIT_SR) has a single status bit for the output compare event. The bit is a write 1 to clear bit.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0															OCIF
W																w1c
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPITx_SR field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 OCIF	Output compare interrupt flag. This bit is the interrupt flag that is set when the content of counter equals the content of the compare register (EPIT_CMPR). The bit is a write 1 to clear bit. 0 Compare event has not occurred 1 Compare event occurred

20.6.3 Load register (EPITx_LR)

The EPIT load register (EPIT_LR) contains the value that is to be loaded into the counter when EPIT counter reaches zero if the RLD bit in EPIT_CR is set. If the IOVW bit in the EPIT_CR is set then a write to this register overwrites the value of the EPIT counter register in addition to updating this registers value. This overwrite feature is active even if the RLD bit is not set.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPITx_LR field descriptions

Field	Description
LOAD	Load value. Value that is loaded into the counter at the start of each count cycle.

20.6.4 Compare register (EPITx_CMPR)

The EPIT compare register (EPIT_CMPR) holds the value that determines when a compare event is generated.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPITx_CMPR field descriptions

Field	Description
COMPARE	Compare Value. When the counter value equals this bit field value a compare event is generated.

20.6.5 Counter register (EPITx_CNR)

The EPIT counter register (EPIT_CNR) contains the current count value and can be read at any time without disturbing the counter. This is a read-only register and any attempt to write into it generates a transfer error. But if the IOVW bit in EPIT_CR is set, the value of this register can be overwritten with a write to EPIT_LR. This change is reflected when this register is subsequently read.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
COUNT	Counter value. This contains the current value of the counter.

Chapter 21

General Power Controller (GPC)

21.1 Overview

The General Power Control (GPC) block includes the sub-blocks listed here.

- CPU [Power Gating Control \(PGC\)](#)
- GPU and Display power gating controller

Each sub-block has its own IP registers.

GPC determines wake-up irq for exiting STOP mode (with or without CPU power gating).

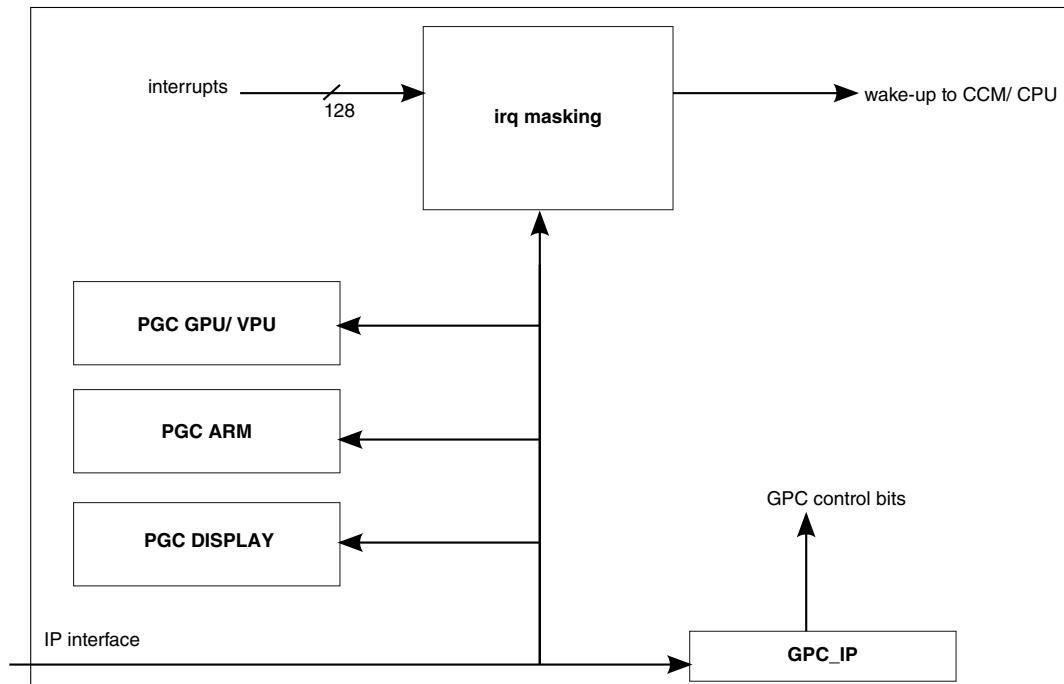

Figure 21-1. GPC Block Diagram

21.2 Clocks

The table found here describes the clock sources for GPC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 21-1. GPC Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
pgc_clk	ipg_clk_root	PGC peripheral clock
sys_clk	ipg_clk_root	Module clock

21.3 Power Gating Control (PGC)

Power Gating (PGC) is applied to the ARM CPU only in STOP low power mode, after all essential CPU registers data are saved by ARM dormant procedure.

If any of the unmasked interrupts appears, CPU is powered up and clock restore request (exit from STOP mode) is sent to CCM.

PGC power down sequence:

- CCM sends power down request when the chip is about to enter stop mode. The user should define which modules will be powered down (PGCR registers of corresponding PGC module, bit 0).

PGC power up sequence:

- One of the power up irq is asserted.
- Power up request is asserted in GPC and in CCM.
- The Power Gated modules are powered up, according to PGC settings of appropriate module.

The Power Gated modules require reset after powering up. The next figure describes GPC-SRC handshake procedure for reset after power gating.

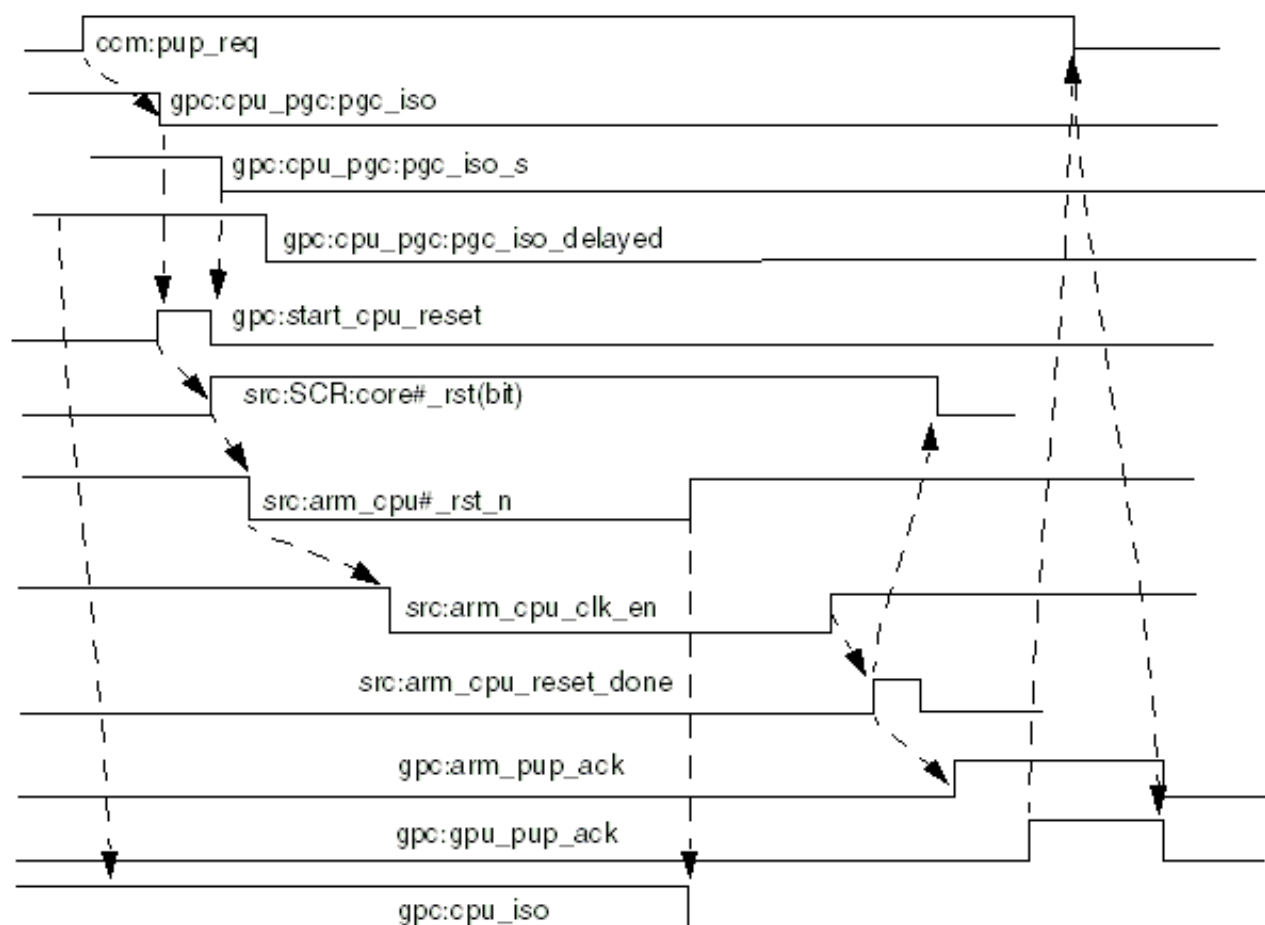

Figure 21-2. GPC-SRC handshake for reset after power gating

21.3.1 Overview

The Power Gating Controller (PGC) is a power management component that controls the power-down and power-up sequencing of individual subsystems.

The sequence timing is programmable using the PGC control registers. [Figure 21-3](#) shows PGC as part of the SoC's overall power management scheme.

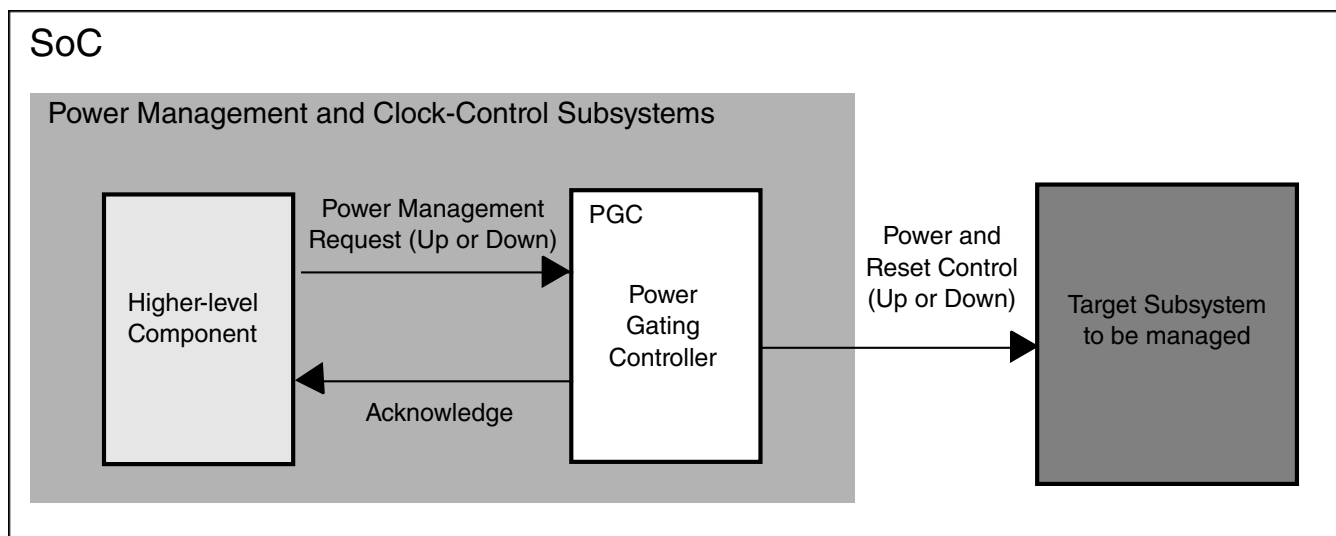

Figure 21-3. PGC Block Diagram

21.3.1.1 Features

Key features of the PGC include:

- Provides the ability to switch off power to a target subsystem.
- Generates power-up and power-down control sequences.
- Provides programmable registers to adjust the timing of the power control signals.

21.4 GPC Interrupt Controller (INTC)

The INTC (Interrupt Controller) detects an interrupt and generates the wakeup signal. It supports up to 128 interrupts.

21.4.1 Interrupt Controller features

The features of the GPC INTC are listed below.

Features:

- Supports up to 128 interrupts
- Provides an option to mask/unmask each interrupt
- Detects interrupts and generates the wake up signal
- 32-bits IP bus interface
- All registers are byte-accessible

21.5 GPC Memory Map/Register Definition

Detailed descriptions of each register can be found below.

GPC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

ISR2 Register - status of irq [95:64].

Address: 20D_C000h base + 1Ch offset = 20D_C01Ch

GPC_ISR2 field descriptions

Field	Description
ISR2	IRQ[95:64] status, read only

21.5.9 IRQ status resister 3 (GPC_ISR3)

ISR3 Register - status of irq [127:96].

Address: 20D_C000h base + 20h offset = 20D_C020h

GPC_ISR3 field descriptions

Field	Description
ISR3	IRQ[127:96] status, read only

21.5.10 IRQ status resister 4 (GPC_ISR4)

ISR4 Register - status of irq [159:128].

Address: 20D_C000h base + 24h offset = 20D_C024h

GPC_ISR4 field descriptions

Field	Description
ISR4	IRQ[159:128] status, read only

21.6 PGC Memory Map/Register Definition

The PGC registers can be accessed only in supervisor mode.

Attempts to access registers when not in supervisor mode or attempts to access an unimplemented address location might trigger a bus transfer error. (The hardware asserts the signal `ips_xfr_err` if the PGC has been integrated with `resp_sel` tied low.) In this case, software should take appropriate action (such as ignore the error, log the error, or initiate a soft reset).

All PGC registers are byte-accessible.

NOTE

The base address of each PGC module instantiation is specified in the GPC module. Absolute address values will be calculated by [GPC base address] + [PGC CPU/GPU/DISPLAY Offset].

PGC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20D_C220	PGC Mega Control Register (PGC_MEGA_CTRL)	32	R/W	0000_0000h	21.6.1/887

Table continues on the next page...

PGC_CPU_PUPSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SW2ISO	After asserting , the PGC waits a number of 32k clocks equal to the value of SW2ISO before negating isolation. NOTE: SW2ISO must not be programmed to zero. The SW2ISO value should be chosen such that the delay before negating isolation is greater than the LDO ramp-up time.
7–6 Reserved	This read-only field is reserved and always has the value 0.
SW	After a power-up request (pup_req assertion), the PGC waits a number of 32k clocks equal to the value of SW before asserting. NOTE: SW must not be programmed to zero.

21.6.15 PGC CPU Pull Down Sequence Control Register (PGC_CPU_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: 20D_C000h base + 2A8h offset = 20D_C2A8h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PGC_CPU_SR field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 PSR	<p>Power status. When in functional (or software-controlled debug) mode, PGC hardware sets PSR as soon as any of the power control output changes its state to one. Write one to clear this bit. Software should clear this bit after power up; otherwise, PSR continues to reflect the power status of the initial power down.</p> <p>0 The target subsystem was not powered down for the previous power-down request. 1 The target subsystem was powered down for the previous power-down request.</p>

Chapter 22

General Purpose Input/Output (GPIO)

22.1 Overview

The GPIO general-purpose input/output peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs.

When configured as an output, it is possible to write to an internal register to control the state driven on the output pin. When configured as an input, it is possible to detect the state of the input by reading the state of an internal register. In addition, the GPIO peripheral can produce CORE interrupts.

The GPIO is one of the blocks controlling the IOMUX of the chip.

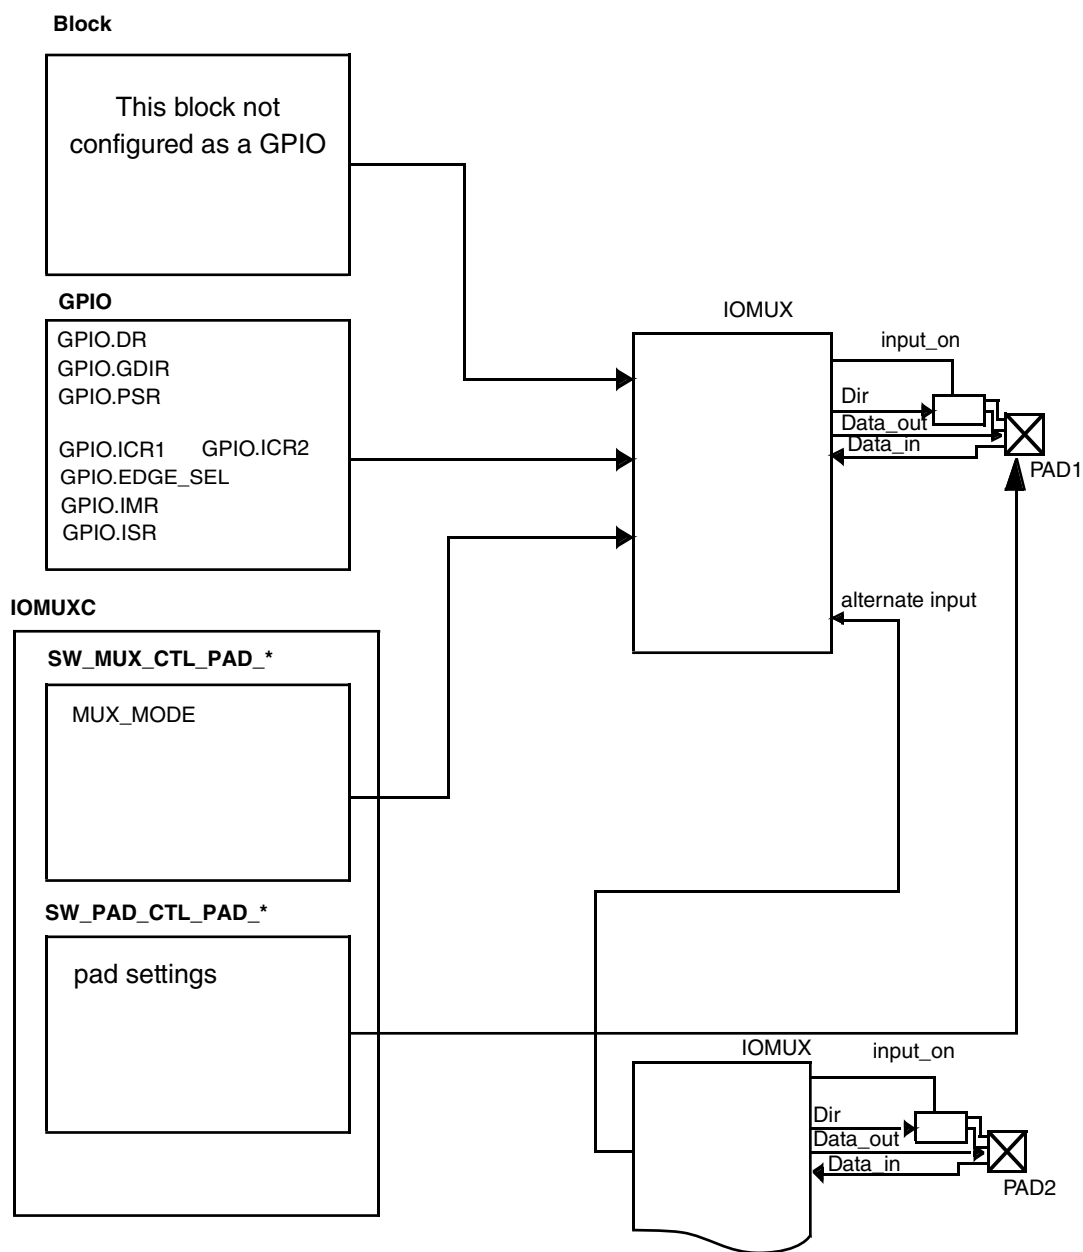

Figure 22-1. Chip IOMUX Scheme

The GPIO functionality is provided through eight registers, an edge-detect circuit, and interrupt generation logic.

The eight registers are:

- Data register (GPIO_DR)
- GPIO direction register (GPIO_GDIR)
- Pad sample register (GPIO_PSR)
- Interrupt control registers (GPIO_ICR1, GPIO_ICR2)

- Edge select register (GPIO_EDGE_SEL)
- Interrupt mask register (GPIO_IMR)
- Interrupt status register (GPIO_ISR)

These registers are described in detail in [GPIO Memory Map/Register Definition](#).

Each GPIO input has a dedicated edge-detect circuit which can be configured through software to detect rising edges, falling edges, logic low-levels or logic high-levels on the input signals. The outputs of the edge detect circuits are optionally masked by setting the corresponding bit in the interrupt mask register (GPIO_IMR). These qualified outputs are OR'ed together to generate two one-bit interrupt lines:

- Combined interrupt indication for GPIOx signals 0 - 15
- Combined interrupt indication for GPIOx signals 16 - 31

In addition, GPIO1 provides visibility to each of its 8 low order interrupt sources (i.e. GPIO1 interrupt n, for $n = 0 - 7$). However, individual interrupt indications from other GPIOx are not available.

The GPIO edge detection is described further in [Interrupt Control Unit](#).

The GPIO's overall functionality is described further in [GPIO Functional Description](#).

22.1.1 Block Diagram

The GPIO subsystem contains multiple GPIO blocks, which can generate and control up to 32 signals for general purpose.

A block diagram of the GPIO is shown in [Figure 22-2](#)

Figure 22-2. GPIO Block Diagram

22.1.2 Features

The GPIO includes the following features:

- General purpose input/output logic capabilities:
 - Drives specific data to output using the data register (GPIO_DR)
 - Controls the direction of the signal using the GPIO direction register (GPIO_GDIR)
 - Enables the core to sample the status of the corresponding inputs by reading the pad sample register (GPIO_PSR).
- GPIO interrupt capabilities:
 - Supports up to 32 interrupts
 - Identifies interrupt edges
 - Generates three active-high interrupts to the SoC interrupt controller

22.2 External Signals

The tables found here describe the external signals of GPIO.

Table 22-1. GPIO1 External Signals

22.3 Clocks

The table found here describes the clock sources for GPIO.

Please see the clock controller Module for clock setting, configuration and gating information.

Table 22-6. GPIO Clocks

Clock name	Clock Root	Description
ipg_clk_s	ipg_clk_root	Peripheral access clock

22.4 GPIO Functional Description

This section provides a complete functional description of the block.

22.4.1 GPIO Function

A GPIO signal can operate as a general-purpose input/output when the IOMUX is set to GPIO mode. Each GPIO signal may be independently configured as either an input or an output using the GPIO direction register (GPIO_GDIR).

When configured as an output (GPIO_GDIR bit = 1), the value in the data bit in the GPIO data register (GPIO_DR) is driven on the corresponding GPIO line. When a signal is configured as an input (GPIO_GDIR bit = 0), the state of the input can be read from the corresponding GPIO_PSR bit.

22.4.2 GPIO pad structure

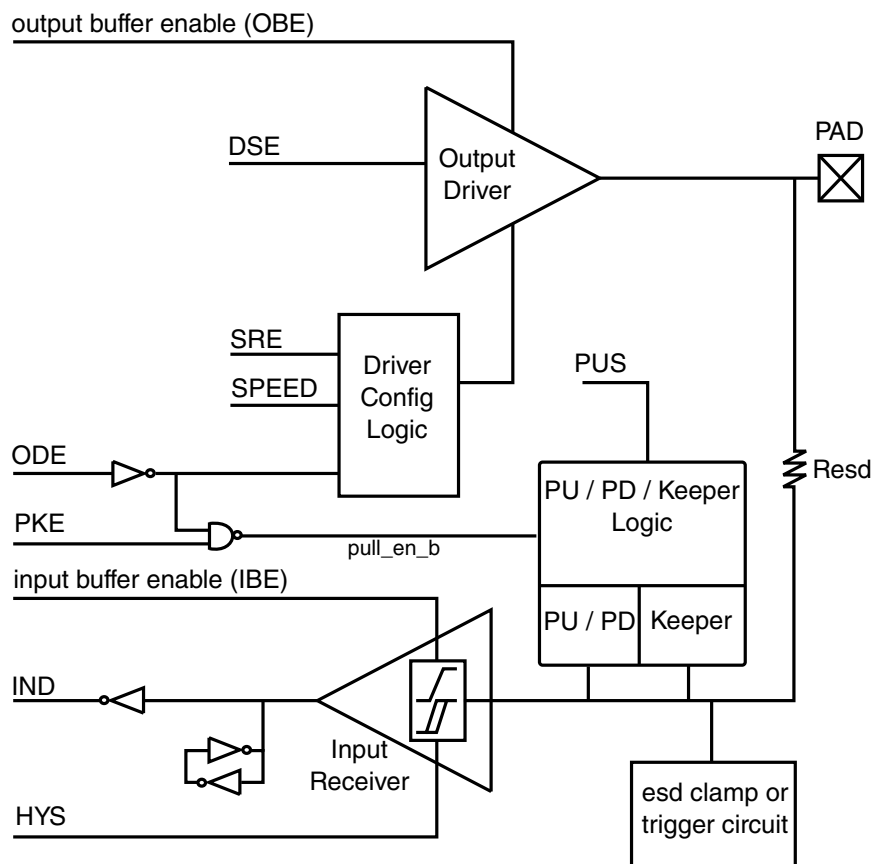

Figure 22-3. GPIO pad functional diagram

22.4.2.1 Input Driver

Input driver characteristics

- Selectable Schmitt trigger or CMOS input mode
- Keeper structure with buffer at the input receiver output to Core
- Receiver is tri-stated when I/O supply (OVDD) is powered down. (Keeper at receiver output keeps its previous state).

22.4.2.1.1 Schmitt trigger

The anti-jamming functionality of the Schmitt trigger is illustrated below.

Figure 22-4. Schmitt trigger transfer characteristic

Figure 22-5. Receiver output in CMOS and hysteresis

22.4.2.1.2 Input keeper

A simple latch to hold the input value when OVDD is powered down, or the first inverter is tri-stated. Input buffer's keeper is always enabled for all the pads.

22.4.2.2 Output Driver

Output driver characteristics

- Selectable CMOS or open-drain output type
- Selectable pull-keeper enable signal to enable/disable the pull-up/down and output keeper
- Selectable pull-up resistors of 22K, 47K, 100K and a pull-down resistor of 100KOhm. Unsilicided P+ poly resistor is used to limit resistance variation to within +/- 20%.
- Pull-up, pull-down, and pad keeper are disabled in output mode.
- Seven drive strengths in each operating mode
- Additional 2-bit slew rate control to select between 50, 100, and 200 MHz IO cell operation range with reduced switching noise

Figure 22-6. Output Driver Functional Diagram

22.4.2.2.1 Drive strength

Drive strength selection can be use to make the impedance matched and get better signal integrity.

22.4.2.2.2 Output keeper

A simple latch to hold the input value.

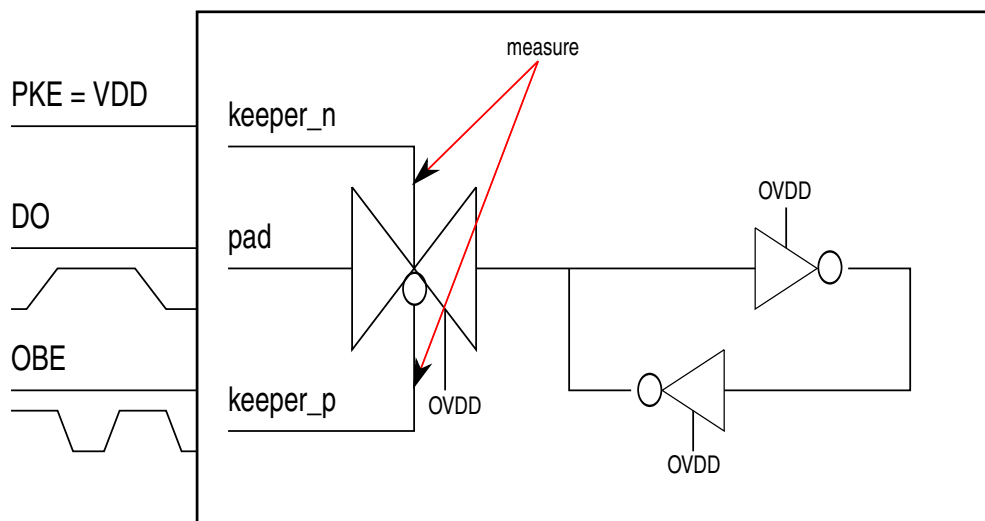

Figure 22-7. Keeper functional diagram

22.4.2.2.3 PU / PD / Keeper Logic

When Keeper is enabled, the pull-up and pull-down are disabled, and the output value of the pad depends on the Keeper. The output keeper is powered by OVDD. When the core VDD is powered down or the first inverter is tri-stated, the pad's state can be kept. Keeper and Pull can't be enabled together.

22.4.2.2.4 Open drain

Open drain is a circuit technique which allows multiple devices to communication over a single wire bi-directionally. Open drain drivers usually operate with an external or internal pull-up resistor that holds the signal line high until a device sinks enough current to pull the line low, usually used for a bus with multiple devices.

Figure 22-8. Output buffer in open drain mode

22.4.3 GPIO Programming

22.4.3.1 GPIO Read Mode

The programming sequence for reading input signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUX Controller (IOMUXC)).
2. Configure GPIO direction register to input (GPIO_GDIR[GDIR] set to 0b).
3. Read value from data register/pad status register.

A pseudocode description to read [input3:input0] values is as follows:

```
// SET INPUTS TO GPIO MODE.
write sw_mux_ctl_<input0>_<input1>_<input2>_<input3>, 32'h00000000
// SET GDIR TO INPUT.
write GDIR[31:4,input3_bit, input2_bit, input1_bit, input0_bit,] 32'hxxxxxxx0
// READ INPUT VALUE FROM DR.
read DR
// READ INPUT VALUE FROM PSR.
read PSR
```

NOTE

While the GPIO direction is set to input (GPIO_GDIR = 0), a read access to GPIO_DR does not return GPIO_DR data. Instead, it returns the GPIO_PSR data, which is the corresponding input signal value.

22.4.3.2 GPIO Write Mode

The programming sequence for driving output signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUXC), also enable SION if need to read loopback pad value through PSR
2. Configure GPIO direction register to output (GPIO_GDIR[GDIR] set to 1b).
3. Write value to data register (GPIO_DR).

A pseudocode description to drive 4'b0101 on [output3:output0] is as follows:

```
// SET PADS TO GPIO MODE VIA IOMUX.
write sw_mux_ctl_pad_<output[0-3]>.mux_mode, <GPIO_MUX_MODE>
// Enable loopback so we can capture pad value into PSR in output mode
write sw_mux_ctl_pad_<output[0-3]>.sion, 1
// SET GDIR=1 TO OUTPUT BITS.
write GDIR[31:4,output3_bit,output2_bit, output1_bit, output0_bit,] 32'hxxxxxxxF
// WRITE OUTPUT VALUE=4'b0101 TO DR.
write DR, 32'hxxxxxxx5
// READ OUTPUT VALUE FROM PSR ONLY.
read_cmp PSR, 32'hxxxxxxx5
```

22.4.4 Interrupt Control Unit

In addition to the general-purpose input/output function, the edge-detect logic in the GPIO peripheral reflects whether a transition has occurred on a given GPIO signal that is configured as an input (GDIR bit = 0). The interrupt control registers (GPIO_ICR1 and GPIO_ICR2) may be used to independently configure the interrupt condition of each input signal (low-to-high transition, high-to-low transition, low, or high). For information about GPIO_ICR1 and GPIO_ICR2 settings, see [GPIO Memory Map/Register Definition](#).

The interrupt control unit is built of 32 interrupt control subunits, where each subunit handles a single interrupt line.

22.5 GPIO Memory Map/Register Definition

There are eight 32-bit GPIO registers. All registers are accessible from the IP interface. Only 32-bit access is supported.

The GPIO memory map is shown in the following table.

GPIO memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
209_C000	GPIO data register (GPIO1_DR)	32	R/W	0000_0000h	22.5.1/915

22.5.1 GPIO data register (GPIOx_DR)

The 32-bit GPIO_DR register stores data that is ready to be driven to the output lines. If the IOMUXC is in GPIO mode and a given GPIO direction bit is set, then the corresponding DR bit is driven to the output. If a given GPIO direction bit is cleared, then a read of GPIO_DR reflects the value of the corresponding signal. Two wait states are required in read access for synchronization.

The results of a read of a DR bit depends on the IOMUXC input mode settings and the corresponding GDIR bit as follows:

- If GDIR[n] is set and IOMUXC input mode is GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is GPIO, then reading DR[n] returns the corresponding input signal's value.
- If GDIR[n] is set and IOMUXC input mode is not GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is not GPIO, then reading DR[n] always returns zero.

Address: Base address + 0h offset

GPIOx_DR field descriptions

Field	Description
DR	<p>Data bits. This register defines the value of the GPIO output when the signal is configured as an output (GDIR[n]=1). Writes to this register are stored in a register. Reading GPIO_DR returns the value stored in the register if the signal is configured as an output (GDIR[n]=1), or the input signal's value if configured as an input (GDIR[n]=0).</p> <p>NOTE: The I/O multiplexer must be configured to GPIO mode for the GPIO_DR value to connect with the signal. Reading the data register with the input path disabled always returns a zero value.</p>

22.5.2 GPIO direction register (GPIOx_GDIR)

GPIO_GDIR functions as direction control when the IOMUXC is in GPIO mode. Each bit specifies the direction of a one-bit signal. The mapping of each DIR bit to a corresponding SoC signal is determined by the SoC's pin assignment and the IOMUX table. For more details consult the IOMUXC chapter.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPIOx_GDIR field descriptions

Field	Description
GDIR	<p>GPIO direction bits. Bit n of this register defines the direction of the GPIO[n] signal.</p> <p>NOTE: GPIO_GDIR affects only the direction of the I/O signal when the corresponding bit in the I/O MUX is configured for GPIO.</p> <p>0 INPUT — GPIO is configured as input.</p> <p>1 OUTPUT — GPIO is configured as output.</p>

22.5.3 GPIO pad status register (GPIOx_PSR)

GPIO_PSR is a read-only register. Each bit stores the value of the corresponding input signal (as configured in the IOMUX). This register is clocked with the `ipg_clk_s` clock, meaning that the input signal is sampled only when accessing this location. Two wait states are required any time this register is accessed for synchronization.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPIOx_PSR field descriptions

Field	Description
PSR	GPIO pad status bits (status bits). Reading GPIO_PSR returns the state of the corresponding input signal. Settings: NOTE: The IOMUXC must be configured to GPIO mode for GPIO_PSR to reflect the state of the corresponding signal.

22.5.4 GPIO interrupt configuration register1 (GPIOx_ICR1)

GPIO_ICR1 contains 16 two-bit fields, where each field specifies the interrupt configuration for a different input signal.

Address: Base address + Ch offset

GPIOx_IMR field descriptions

Field	Description
IMR	<p>Interrupt Mask bits. This register is used to enable or disable the interrupt function on each of the 32 GPIO signals.</p> <p>Settings:</p> <p>Bit IMR[n] (n=0...31) controls interrupt n as follows:</p> <p>0 UNMASKED — Interrupt n is disabled.</p> <p>1 MASKED — Interrupt n is enabled.</p>

22.5.7 GPIO interrupt status register (GPIOx_ISR)

The GPIO_ISR functions as an interrupt status indicator. Each bit indicates whether an interrupt condition has been met for the corresponding input signal. When an interrupt condition is met (as determined by the corresponding interrupt condition register field), the corresponding bit in this register is set. Two wait states are required in read access for synchronization. One wait state is required for reset.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

GPIOx_ISR field descriptions

Field	Description
ISR	<p>Interrupt status bits - Bit n of this register is asserted (active high) when the active condition (as determined by the corresponding ICR bit) is detected on the GPIO input and is waiting for service. The value of this register is independent of the value in GPIO_IMR.</p> <p>When the active condition has been detected, the corresponding bit remains set until cleared by software. Status flags are cleared by writing a 1 to the corresponding bit position.</p>

22.5.8 GPIO edge select register (GPIOx_EDGE_SEL)

GPIO_EDGE_SEL may be used to override the ICR registers' configuration. If the GPIO_EDGE_SEL bit is set, then a rising edge or falling edge in the corresponding signal generates an interrupt. This register provides backward compatibility. On reset all bits are cleared (ICR is not overridden).

Address: Base address + 1Ch offset

GPIOx_EDGE_SEL field descriptions

Field	Description
GPIO_EDGE_SEL	Edge select. When GPIO_EDGE_SEL[n] is set, the GPIO disregards the ICR[n] setting, and detects any edge on the corresponding input signal.

Chapter 23

General Purpose Timer (GPT)

23.1 Overview

This chapter describes the General Purpose Timer (GPT) module interface. It is also a reference for software driver programming. The GPT has a 32-bit up-counter. The timer counter value can be captured in a register using an event on an external pin. The capture trigger can be programmed to be a rising or/and falling edge. The GPT can also generate an event on the output compare pins and an interrupt when the timer reaches a programmed value. The GPT has a 12-bit prescaler, which provides a programmable clock frequency derived from multiple clock sources.

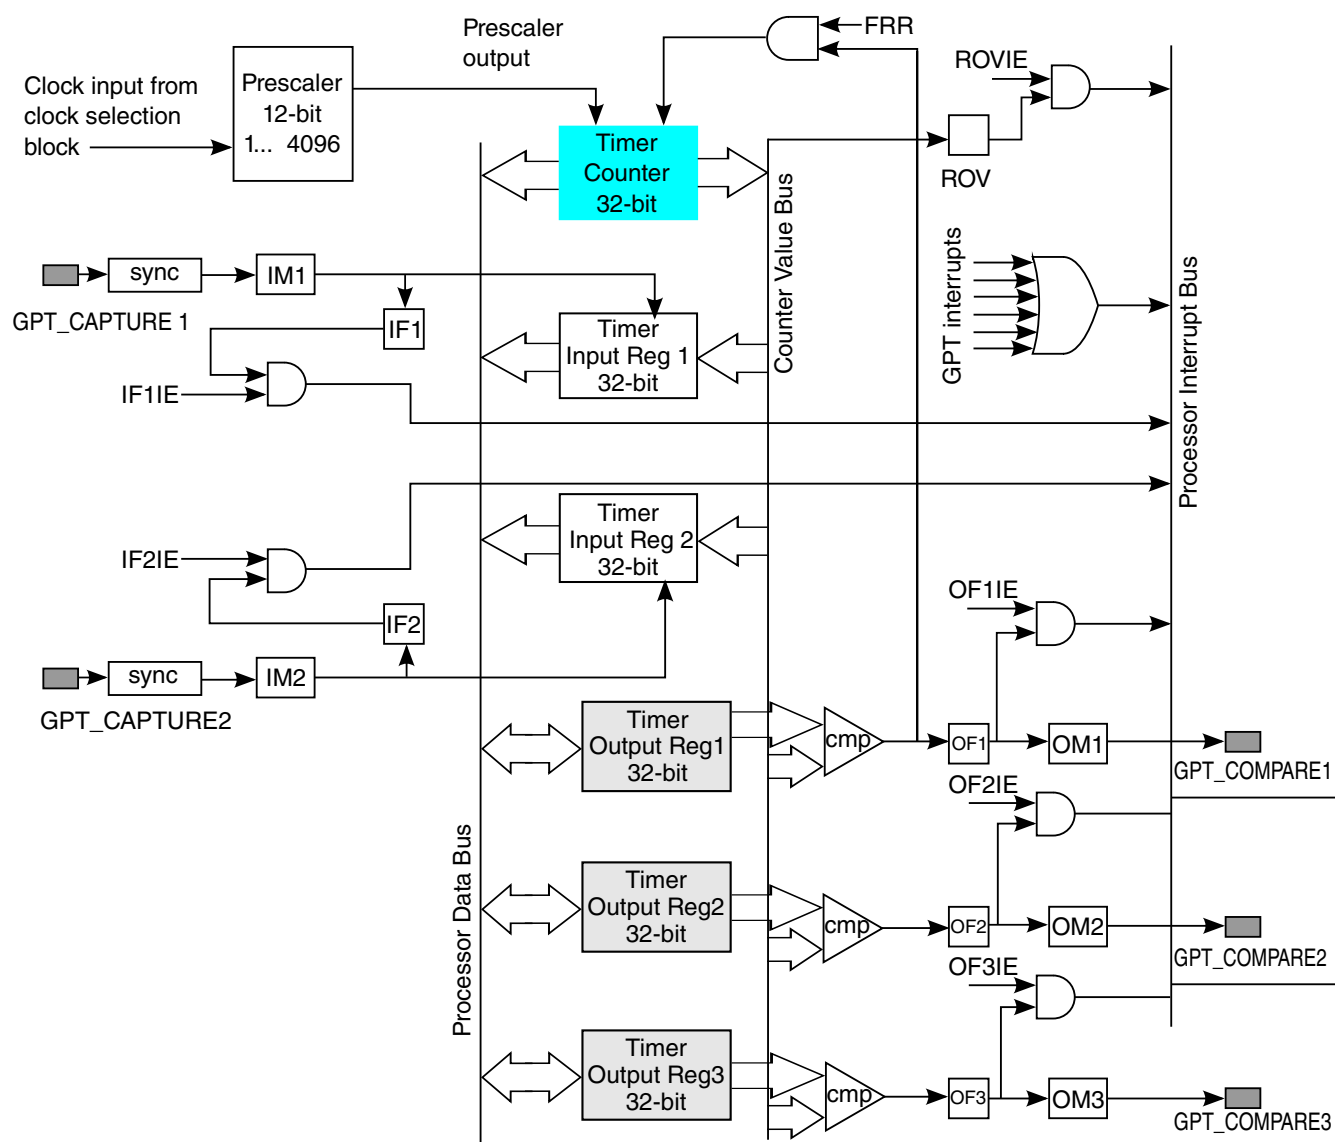

Figure 23-1. GPT Block Diagram

Figure 23-2. GPT Counter Clocks Diagram

23.1.1 Features

- One 32-bit up-counter with clock source selection, including external clock.
- Two input capture channels with a programmable trigger edge.
- Three output compare channels with a programmable output mode. A "forced compare" feature is also available.
- Can be programmed to be *active* in low power and debug modes.
- Interrupt generation at capture, compare, and rollover events.
- Restart or free-run modes for counter operations.

23.1.2 Modes and Operation

The GPT supports the modes described in the indicated sections:

- [Operating Modes](#)
 - [Restart Mode](#)
 - [Free-Run Mode](#)

23.2 External Signals

The GPT follows the IP Bus protocol for interfacing with the processor core. The GPT does not have *any interface signals with any other module inside the chip*, except for the clock and reset inputs (from the clock and reset controller module) and for the interrupt signals *to* the processor interrupt handler. There are functional and clock inputs, and functional output signals going outside the chip boundary.

The following table describes all block signals that connect off-chip.

Table 23-1. GPT External Signals

Signal	Description	Pad	Mode	Direction
GPT_CAPTURE1	Input pin for a capture event for Input Capture Channel 1.	GPIO4_IO20	ALT4	I
		LCD_DATA18	ALT4	
GPT_CAPTURE2	Input pin for a capture event for Input Capture Channel 2.	GPIO4_IO21	ALT4	I
		LCD_DATA19	ALT4	
GPT_CLK	Input pin for an external clock that the counter can be operated at.	GPIO4_IO24	ALT4	I
		LCD_DATA23	ALT4	
GPT_COMPARE1	Output pin that indicates a "compare event" occurrence in Output Compare Channel 1.	GPIO4_IO19	ALT4	O
		LCD_DATA20	ALT4	
GPT_COMPARE2	Output pin that indicates a "compare event" occurrence in Output Compare Channel 2.	GPIO4_IO25	ALT4	O
		LCD_DATA21	ALT4	
GPT_COMPARE3	Output pin that indicates a "compare event" occurrence in Output Compare Channel 3.	GPIO4_IO25	ALT4	O
		LCD_DATA22	ALT4	

There are six signals (three input, three output) in the GPT module that *can be* connected to the chip pads.

23.2.1 External Clock Input

The GPT counter can be operated using an external clock from outside the device, and this is the input pin used for that purpose. The external clock input (GPT_CLK) is treated as asynchronous to the peripheral clock (ipg_clk). To ensure proper operations of GPT, the external clock input frequency should be less than 1/4 of frequency of the peripheral clock (ipg_clk). Hysteresis characteristics on this pad will be required because this is a clock input.

23.2.2 Input Capture Trigger Signals

The GPT counter value can be stored in a register, triggered by an event from *outside the device*. A positive or/and negative edge on these signals GPT_CAPTURE1 , GPT_CAPTURE2 can trigger this capture event. These signals are treated as asynchronous to the peripheral clock (ipg_clk). Only those transitions which occur *at least a single clock cycle* (the clock selected to run the counter) *after the previous recorded transition* are guaranteed to trigger a capture event.

23.2.3 Output Compare Signals

The output compare signals: GPT_COMPARE1, GPT_COMPARE2, GPT_COMPARE3, indicate that output compare events have gone through a specified transition.

23.3 Clocks

The clock that is input to the prescaler can be selected from 4 clock sources. The following table describes the clock sources for GPT. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 23-2. GPT Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32 kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

- High-Frequency Clock (ipg_clk_highfreq)

Provided by the Clock Controller Module (CCM), the High Frequency Clock is intended to be ON in Normal Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the High Frequency Clock *in Normal Power mode*. The CCM is expected to provide this clock *after* synchronizing it to the System Bus Clock (ahb_clk) in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the High Frequency Clock in a Low Power mode.

- Low-Reference Clock (ipg_clk_32k)

This 32 kHz Low Reference Clock (provided by the CCM) is intended to be ON in Low Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the Low Reference Clock in Low Power mode. The CCM is expected to provide the Low Reference Clock *after* synchronizing it to the System Bus Clock (ahb_clk) in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the Low Reference Clock in a Low Power mode.

- Peripheral Clock (ipg_clk)

If the Peripheral Clock (ipg_clk) or the External Clock (GPT_CLK) is selected (CLKSRC=001 or 011) as Clock Source, then the Peripheral Clock will be ON in normal GPT operations. In Low Power modes, if the GPT is programmed to be disabled (STOPEN or WAITEN or DOZEN=0), then the Peripheral Clock (ipg_clk) can be switched OFF.

- External Clock (GPT_CLK)

The External Clock comes from *outside the device* and can be selected to run the GPT counter. The External Clock is treated as *asynchronous to the Peripheral Clock*, (ipg_clk) and is synchronized to the Peripheral Clock (ipg_clk), *inside* the module. Therefore, the External Clock frequency is limited to $< 1/4$ frequency of the Peripheral Clock (ipg_clk), for proper GPT operations. Note that in Low Power modes, *if* the Peripheral Clock (ipg_clk) is not available, then the External Clock *cannot be used* to run the counter.

- Crystal Oscillator Clock (ipg_clk_24M)

This 24 MHz Crystal Oscillator Clock (provided by the CCM) is intended to be used against frequency change of Peripheral Clock (ipg_clk) changes to provide a more accurate timer clock for operation system. The CCM is expected to provide the 24 MHz Crystal Oscillator Clock *without* synchronizing it to the System Bus Clock (ahb_clk) in Normal functional mode. Synchronization is done in GPT module. Before synchronization, the 24 MHz Crystal Oscillator Clock is divided by a 24 MHz clock prescaler, to make sure the clock frequency less than half of System Bus Clock (ahb_clk).

The clock input source is configured using the clock source field (CLKSRC, in the GPT_CR control register). The clock input to the prescaler can be disabled by programming the CLKSRC bits (of the GPT_CR control register) to 000. **The CLKSRC field value should be changed only after disabling the GPT** (by setting the EN bit in the GPT_CR to 0).

The PRESCALER field selects the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value (from 1 to 4096) and can be changed *at any time*. A change in the value of the PRESCALER field *immediately affects* the output clock frequency.

Figure 23-3. Prescaler Value Change Timing Diagram

23.4 Functional Description

This section provides a complete functional description of the GPT.

23.4.1 Operating Modes

The GPT counter can be programmed to work in either of two modes: Restart mode or Free-Run mode.

23.4.1.1 Restart Mode

In Restart mode (selectable through the GPT Control Register GPT_CR), when the counter reaches the compared value, the counter resets and starts again from 0x00000000. The Restart feature is associated only with Compare Channel 1.

Any write access to the Compare register of Channel 1 will reset the GPT counter. This is done to avoid possibly missing a compare event when compare value is changed from a higher value to lower value while counting is proceeding.

For the other two compare channels, when the compare event occurs the counter is *not reset*.

23.4.1.2 Free-Run Mode

In Free-Run mode, when compare events occur for all 3 channels, the counter is *not reset*; instead the counter continues to count until 0xffffffff, and then rolls over (to 0x00000000).

23.4.2 Operation

The General Purpose Timer (GPT) has a single counter (GPT_CNT) that is a 32-bit free-running *up-counter*, which starts counting *after it is enabled by software* (EN=1). The counter's clock source is the output of the prescaler labelled "Prescaler output" in [Figure 23-1](#).

- If the GPT timer is disabled (EN=0), then the Main Counter *and* Prescaler Counter freeze their current count values. The ENMOD bit determines the value of the GPT counter when the EN bit is set and the Counter is enabled again.
 - If the ENMOD bit is set (=1), then the Main Counter and Prescaler Counter values are reset to 0, when GPT is enabled (EN=1).
 - If ENMOD bit is programmed to 0, then the Main Counter and Prescaler Counter restart counting from their frozen values, when GPT is enabled again (EN=1).
- If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter freeze at their current count values *when* GPT enters low power mode. When GPT exits a low power mode, the Main Counter and Prescaler Counter start counting from their frozen values *regardless* of the ENMOD bit value. Note that the GPT_CNT can be read *at any time* by the processor, and that *both* Input Capture Channels use the *same* counter (GPT_CNT).
- A hardware reset resets all the GPT registers to their respective reset values. All registers except the Output Compare Registers (OCR1, OCR2, OCR3) obtain a value of 0x0. The Compare registers are reset to 0xFFFF_FFFF.
- The software reset (SWR bit in the GPT_CR control register) resets *all* of the register bits *except* the EN, ENMOD, STOPEN, WAITEN, and DBGEN bits. The state of these bits is not affected by a software reset. Note that a software reset can be given *while the GPT is disabled*.

23.4.2.1 Input Capture

There are two Input Capture Channels, and each Input Capture Channel has a dedicated capture pin, capture register and input edge detection/selection logic. Each input capture function has an associated status flag, and can cause the processor to make an interrupt service request.

When a selected edge transition occurs on an Input Capture pin, the contents of the GPT_CNT is captured on the corresponding capture register and the appropriate interrupt status flag is set. An interrupt request can be generated when the transition is detected *if* its corresponding enable bit is set (in the Interrupt Register). The capture can be programmed to occur on the input pin's rising edge, falling edge, on both rising and falling edges, or the capture can be disabled. The events are synchronized with the clock that was selected to run the counter. Only those transitions that occur at least one clock cycle *after* the previous recorded transition will be guaranteed to trigger a capture event. There can be up to one clock cycle of uncertainty in the latching of the input transition. The Input Capture registers can be read *at any time* without affecting their values.

Figure 23-4. Input Capture Event Timing

23.4.2.2 Output Compare

The three Output Compare Channels *use the same counter* (GPT_CNT) as the Input Capture Channels. When the programmed content of an Output Compare register matches the value in GPT_CNT, an output compare status flag is set and an interrupt is generated (if the corresponding bit is set in the interrupt register). Consequently, the Output Compare timer pin will be set, cleared, toggled, not affected at all or provide an active-low pulse for one input clock period (subject to the restriction on the maximum frequency allowed on the pad) according to the mode bits (that were programmed).

There is also a "forced-compare" feature that allows the software to generate a compare event when required, *without the condition of the counter value that is equal to the compare value*. The action taken as a result of a forced compare is the same as when an output compare match occurs, *except that the status flags are not set and no interrupt can be generated*. Forced channels take programmed action immediately after the write to the force-compare bits. These bits are self-negating and always read as zeros.

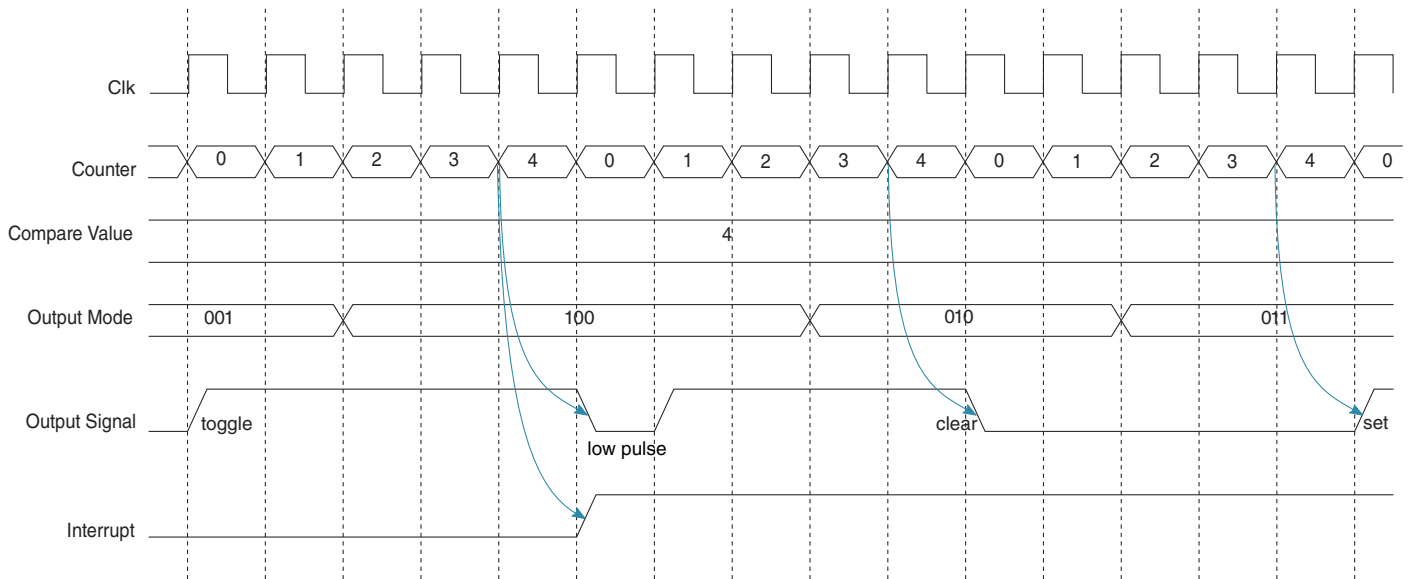

Figure 23-5. Output Compare and Interrupt Timing

23.4.2.3 Interrupts

There are 6 different interrupts that are generated by the GPT. If the selected clock for running the counter is available, then *all interrupts can be generated in Low Power and Debug modes*.

- Rollover Interrupt

The Rollover Interrupt is generated when the GPT counter reaches 0xffffffff, then resets to 0x00000000 and continues counting. The Rollover Interrupt is enabled by the ROVIE bit in the GPT_IR register; the associated status bit is the ROV bit in the GPT_SR register.

- Input Capture Interrupt 1, 2

After a capture event occurs, the associated Input Capture Channel generates an interrupt. The "capture event" interrupts are enabled by the IF2IE and IF1IE bits (in the GPT_IR register); the associated status bits are IF2 and IF1 (in the GPT_SR register). The capture of the counter value because of a capture event is *not affected by a pending capture interrupt*. The Capture register is updated with a new counter value when a capture event occurs, regardless of whether that Capture Channels' interrupt has been serviced or not.

- Output Compare Interrupt 1, 2, 3

After a compare event occurs, the associated Output Compare Channel generates an interrupt. The "compare event" interrupts are enabled by the OF3IE, OF2IE, and OF1IE bits (in the GPT_IR register); the associated status bits are OF3, OF2, and OF1 (in the GPT_SR register). A "forced compare" does not generate an interrupt.

A *cumulative* interrupt line is also present, which is asserted whenever any of the above interrupts are posted. The cumulative interrupt line has *no* associated enables or status bits.

23.4.2.4 Low Power Mode Behavior

In Low Power modes, if the clock from the selected clock source is available (except for the External Clock (GPT_CLK), which can be used *only if* the Peripheral Clock (ipg_clk) is available), the counter will continue to run depending on whether the control bit for that mode is set. If the clock is not present or if the corresponding low power bit in the GPT_CR control register is 0, the Main Counter and the Prescaler Counter freeze at their current values and resume counting (from their frozen values) when the Low Power mode is exited.

23.4.2.5 Debug Mode Behavior

In Debug mode, the modules in the device have the option of continuing to run or be halted.

- If the DBGGEN bit is set, then the GPT timer will continue to run in Debug mode.
- If the DBGGEN bit is not set (in the GPT_CR control register), then the GPT timer is halted.

23.5 Initialization/ Application Information

23.5.1 Selecting the Clock Source

The CLKSRC field in the GPT_CR register selects the clock source. The CLKSRC field value should be changed only after disabling the GPT (EN=0).

The software sequence to be followed while changing clock source is:

1. Disable GPT by setting EN=0 in GPT_CR register.
2. Disable GPT interrupt register (GPT_IR).

3. Configure Output Mode to unconnected/ disconnected—Write zeros in OM3, OM2, and OM1 in GPT_CR
4. Disable Input Capture Modes—Write zeros in IM1 and IM2 in GPT_CR
5. Change clock source CLKSRC to the desired value in GPT_CR register.
6. Assert the SWR bit in GPT_CR register.
7. Clear GPT status register (GPT_SR) (i.e., w1c).
8. Set ENMOD=1 in GPT_CR register, to bring GPT counter to 0x00000000.
9. Enable GPT (EN=1) in GPT_CR register.
10. Enable GPT interrupt register (GPT_IR).

23.6 GPT Memory Map/Register Definition

The GPT has 10 user-accessible 32-bit registers, which are used to configure, operate, and monitor the state of the GPT.

An IP bus write access to the GPT Control Register (GPT_CR) and the GPT Output Compare Register1 (GPT_OCR1) results in *one cycle of wait state*, while other valid IP bus accesses incur 0 wait states.

Irrespective of the Response Select signal value, a Write access to the GPT Status Registers (Read-only registers GPT_ICR1, GPT_ICR2, GPT_CNT) will generate a bus exception.

- If the Response Select signal is driven Low, then the Read/Write access to the *unimplemented* address space of GPT (*ips_addr* is greater than or equal to \$BASE + \$028) will generate a bus exception.
- If the Response Select is driven High, then the Read/Write access to the unimplemented address space of GPT will *not* generate any error response (like a bus exception).

GPT memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
209_8000	GPT Control Register (GPT_CR)	32	R/W	0000_0000h	23.6.1/939

A software reset <i>does not affect</i> the DBGEN bit. 0 GPT is disabled in debug mode. 1 GPT is enabled in debug mode.
1 ENMOD	GPT Enable mode. When the GPT is disabled (EN=0), then both the Main Counter and Prescaler Counter <i>freeze their current count values</i> . The ENMOD bit determines the value of the GPT counter when Counter is enabled again (if the EN bit is set). <ul style="list-style-type: none"> If the ENMOD bit is 1, then the Main Counter and Prescaler Counter values are reset to 0 after GPT is enabled (EN=1). If the ENMOD bit is 0, then the Main Counter and Prescaler Counter restart counting <i>from their frozen values</i> after GPT is enabled (EN=1). If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter <i>freeze at their current count values</i> when the GPT enters low power mode. When GPT exits low power mode, the Main Counter and Prescaler Counter start counting from their frozen values, regardless of the ENMOD bit value. Setting the SWR bit will clear the Main Counter and Prescaler Counter values, regardless of the value of EN or ENMOD bits. A hardware reset resets the ENMOD bit. A software reset <i>does not affect</i> the ENMOD bit. 0 GPT counter will retain its value when it is disabled. 1 GPT counter value is reset to 0 when it is disabled.
0 EN	GPT Enable. The EN bit is the GPT module enable bit. Before setting the EN bit , we recommend that <i>all registers be properly programmed</i> . <ul style="list-style-type: none"> A hardware reset resets the EN bit. A software reset <i>does not affect</i> the EN bit. 0 GPT is disabled. 1 GPT is enabled.

23.6.2 GPT Prescaler Register (GPT_PR)

The GPT Prescaler Register (GPT_PR) contains bits that determine the *divide value* of the clock that runs the counter.

Address: 209_8000h base + 4h offset = 209_8004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

See Figure 23-3 for the timing diagram. <p>0x000 Divide by 1 0x001 Divide by 2 ... 0xFFFF Divide by 4096</p>

23.6.3 GPT Status Register (GPT_SR)

The GPT Status Register (GPT_SR) contains bits that indicate that a counter has rolled over, and if any event has occurred on the Input Capture and Output Compare channels. The bits are cleared by writing a 1 to them.

Address: 209_8000h base + 8h offset = 209_8008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0 OF1IE	See OF3IE

23.6.5 GPT Output Compare Register 1 (GPT_OCR1)

The GPT Compare Register 1 (GPT_OCR1) holds the value that determines when a compare event will be generated on Output Compare Channel 1. Any write access to the Compare register of Channel 1 while in Restart mode (FRR=0) will reset the GPT counter.

An IP Bus Write access to the GPT Output Compare Register1 (GPT_OCR1) occurs *after* one cycle of wait state; an IP Bus Read access occurs *immediately* (0 wait states).

Address: 209_8000h base + 10h offset = 209_8010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPT_OCR3 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 3.

23.6.8 GPT Input Capture Register 1 (GPT_ICR1)

The GPT Input Capture Register 1 (GPT_ICR1) is a read-only register that holds the value *that was in the counter during the last capture event* on Input Capture Channel 1.

Address: 209_8000h base + 1Ch offset = 209_801Ch

GPT_ICR1 field descriptions

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 1 occurs, the current value of the counter is loaded into GPT Input Capture Register 1.

23.6.9 GPT Input Capture Register 2 (GPT_ICR2)

The GPT Input capture Register 2 (GPT_ICR2) is a read-only register which holds the value that was in the counter during the last capture event on input capture channel 2.

Address: 209_8000h base + 20h offset = 209_8020h

GPT_ICR2 field descriptions

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 2 occurs, the current value of the counter is loaded into GPT Input Capture Register 2.

23.6.10 GPT Counter Register (GPT_CNT)

The GPT Counter Register (GPT_CNT) is the main counter's register. GPT_CNT is a read-only register and can be read *without affecting the counting process* of the GPT.

Address: 209_8000h base + 24h offset = 209_8024h

GPT_CNT field descriptions

Field	Description
COUNT	Counter Value. The COUNT bits show the current count value of the GPT counter.

Chapter 24

I2C Controller (I2C)

24.1 Overview

This chapter describes block-level operation and programming of I2C. The chapter is intended for a block-driver software developer. To understand how the block is integrated at the SoC level, a system software developer should see discussions of the block in the appropriate SoC-level chapter(s).

References: This document assumes an understanding of the following document:

- *The I2C Bus Specification*, Version 2.1, by Philips Semiconductor

The Inter IC (I2C) provides functionality of a standard I2C slave and master. The I2C is designed to be compatible with the standard NXP I2C bus protocol.

NOTE

Three independent I2C channels are available.

I2C is a two-wire, bidirectional serial bus that provides a simple, efficient method of data exchange, minimizing the interconnection between devices. This bus is suitable for applications requiring occasional communications over a short distance between many devices. The flexible I2C standard allows additional devices to be connected to the bus for expansion and system development. See the connection diagram in the figure below.

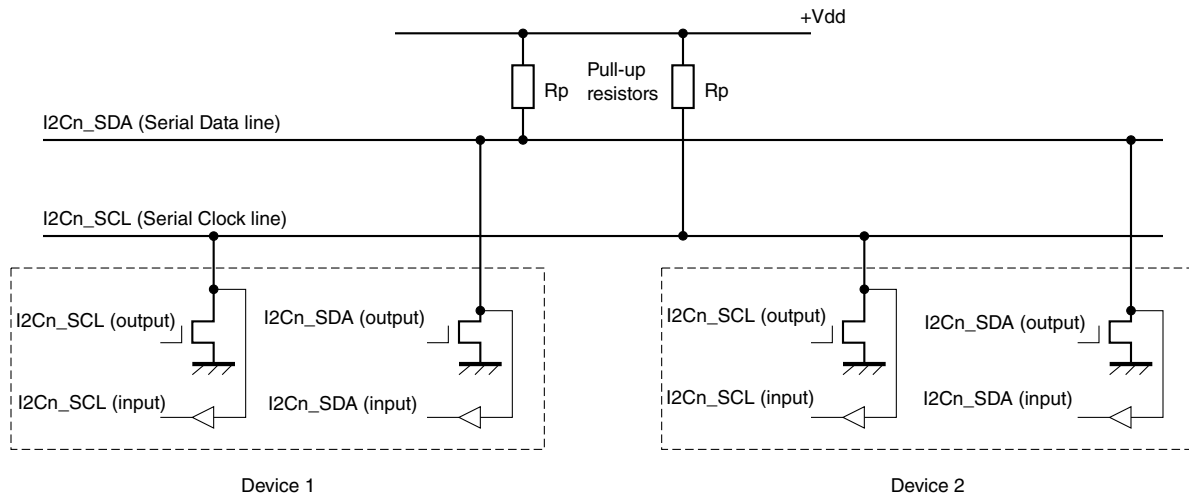

Figure 24-1. Connection of devices to I2C bus

The I2C interface speed is dependent on the I2C bus loading and timing characteristics. For pin requirement details, see *The I2C Bus Specification*. The I2C system is a true multimaster bus including arbitration and collision detection that prevents data corruption if multiple devices attempt to control the bus simultaneously. This feature supports complex applications with multiprocessor control and can be used for rapid testing and alignment of end products through external connections to an assembly-line computer. The figure below shows the block diagram of I2C.

Figure 24-2. I2C block diagram

24.1.1 Features

The I2C has the following key features:

- Compatibility with I2C bus standard
- Multimaster operation
- Software programmability for one of 64 different serial clock frequencies
- Software-selectable acknowledge bit
- Interrupt-driven, byte-by-byte data transfer
- Arbitration-lost interrupt with automatic mode switching from master to slave

- Calling address identification interrupt
- Start and stop signal generation/detection
- Repeated Start signal generation
- Acknowledge bit generation/detection
- Bus-busy detection

24.1.2 Modes and operations

The I2C operates primarily in two functional modes: Standard mode and Fast mode.

- In Standard mode, I2C supports the data transfer rates up to 100 kbits/s.
- In Fast mode, data transfer rates up to 400 kbits/s can be achieved. Per block operation, there is no special configuration required for Fast or Standard mode. It is the data transfer rate that distinguishes Standard and Fast mode.

24.2 External Signals

This section discusses I2C signals that connect off-chip.

For I2C compliance, all devices connected to the I2Cn_SCL and I2Cn_SDA signals must have open-drain or open-collector outputs. The logic AND function is implemented on both lines with external pull-up resistors.

Inputs of I2Cn_SCL and I2Cn_SDA also need to be manually enabled by setting the SION bit in the IOMUX after the corresponding PADs are selected as I2C function.

The table below describes all I2C signals that connect off-chip.

Table 24-1. I2C External Signals

Signal	Description	Pad	Mode	Direction
I2C1_SCL	Serial Clock	AUD_RXFS	ALT1	IO
		I2C1_SCL	ALT0	
I2C1_SDA	Serial Data	AUD_RXC	ALT1	IO
		I2C1_SDA	ALT0	
I2C2_SCL	Serial Clock	EPDC_SDCLK	ALT2	IO
		I2C2_SCL	ALT0	
		KEY_COL0	ALT1	
		LCD_DATA16	ALT4	
I2C2_SDA	Serial Data	EPDC_SDLE	ALT2	IO
		I2C2_SDA	ALT0	

Table continues on the next page...

Table 24-1. I2C External Signals (continued)

Signal	Description	Pad	Mode	Direction
		KEY_ROW0	ALT1	
		LCD_DATA17	ALT4	
I2C3_SCL	Serial Clock	AUD_RXFS	ALT4	IO
		EPDC_SDCE2	ALT1	
		REF_CLK_24M	ALT1	
I2C3_SDA	Serial Data	AUD_RXC	ALT4	IO
		EPDC_SDCE3	ALT1	
		REF_CLK_32K	ALT1	

24.3 Clocks

There are two input clocks for I2C.

The following table describes the clock sources for I2C. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 24-2. I2C Clocks

Clock name	Clock Root	Description
ipg_clk_patref	perclk_clk_root	Module clock
ipg_clk_s	perclk_clk_root	Peripheral access clock

- Peripheral clock: This clock is used for peripheral bus register read/writes.
- Module clock: This is the functional clock of the I2C. The serial bit clock frequency is derived from the module clock. The module clock and peripheral clocks are synchronous with each other. The minimum frequency of the module clock should be 12.8 MHz for Fast mode to achieve 400-kbps operation.

24.4 Functional description

This section provides a complete functional description of the block.

24.4.1 I2C system configuration

After a reset, the I2C defaults to Slave Receive operations. Thus, when not operating as a master or responding to a slave transmit address, the I2C defaults to the Slave Receive state.

For exceptions, see [Initialization sequence](#).

NOTE

The I2C is designed to be compatible with the Philips™ I2C bus protocol. For information on system configuration, protocol, and restrictions, see the *I2C Bus Specification*, version 2.1, by Philips Semiconductors. The I2C supports Standard and Fast modes only.

24.4.2 Arbitration procedure

If multiple devices simultaneously request the bus, the bus clock is determined by a synchronization procedure in which the low period equals the longest clock-low period among the devices, and the high period equals the shortest. A data arbitration procedure determines the relative priority of competing devices.

A device loses arbitration if it sends logic high while another sends logic low; it immediately switches to Slave Receive mode and stops driving I2Cn_SDA. In this case, the transition from master to Slave mode does not generate a Stop condition. Meanwhile, hardware sets the arbitration lost bit in the I2C Status register (I2C_I2SR[IAL] to indicate loss of arbitration).

24.4.3 Clock synchronization

Because wire-AND logic is used, a high-to-low transition on SCL affects devices connected to the bus. Devices start counting their low period when the master drives SCL low. When a device clock goes low, it holds SCL low until the Clock High state is reached. However, the low-to-high change in this device clock may not change the state of SCL if another device clock is still in its low period. Therefore, the device with the longest low period holds the synchronized clock SCL low.

Devices with shorter low periods enter a High Wait state during this time (see [Figure 24-3](#)). When all devices involved have counted off their low periods, the synchronized clock SCL is released and pulled high. There is then no difference between device clocks and the state of SCL, so all of the devices start counting their high periods. The first device to complete its high period pulls SCL low again.

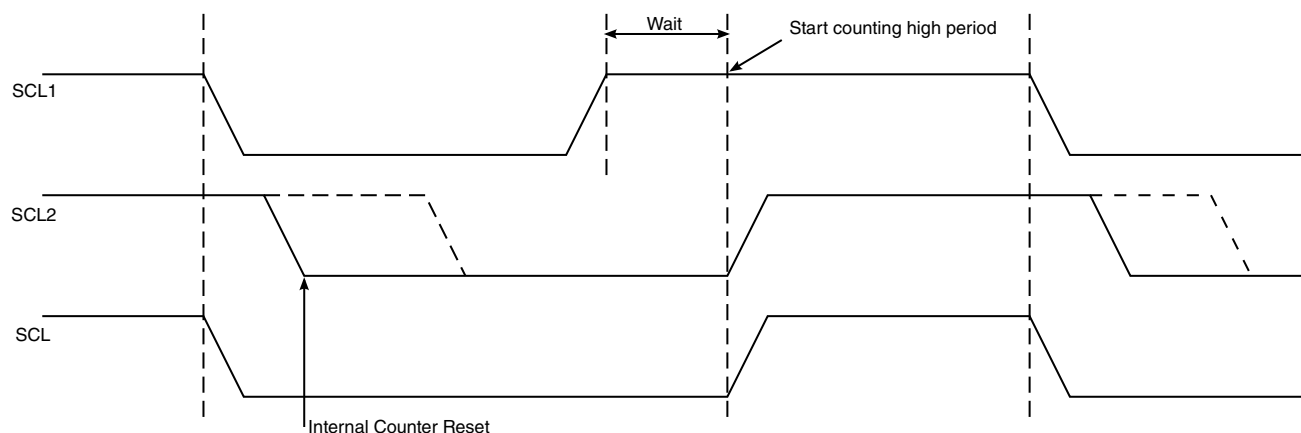

Figure 24-3. Synchronized clock SCL

24.4.4 Handshaking

The clock synchronization mechanism can be used as a handshake in data transfers. Slave devices can hold SCL low after completing one byte transfer (9 bits). In such a case, the clock mechanism halts the bus clock and forces the master clock into a Wait state until the slave releases SCL.

24.4.5 Clock stretching

Slaves can use the clock synchronization mechanism to slow down the transfer bit rate. After the master has driven SCL low, the slave can drive SCL low for the required period and then release it. If the slave SCL low period is longer than the master SCL low period, the resulting SCL bus signal low period is stretched.

24.4.6 Peripheral bus accesses

I2C is a 16-bit block. Only half-word accesses should be performed to the block.

24.4.7 Generation of transfer error on IP bus

If an address is received on the peripheral slave bus interface but it is not implemented, an access error is generated.

24.4.8 Reset

The I2C can be reset in the following ways:

- Global reset: A hard asynchronous reset of the whole I2C
- Software reset: An internal reset for the whole I2C (except for I2C_IADR and I2C_IFDR registers) initiated by deasserting the I2C_I2CR[IEN] bit

24.4.9 Interrupts

There is only one interrupt from the block, which is enabled by setting the I2C_I2CR[IIEN] bit.

The interrupt is generated in any one of the following conditions:

- One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).
- An address is received that matches its own specific address in Slave Receive mode.
- Arbitration is lost.

24.4.10 Byte order

The block only supports the Little-Endian mode.

24.5 Initialization

NOTE

Ensure the input select pins for IOMUXC are configured correctly for I2C.

24.5.1 Initialization sequence

Before the interface can transfer serial data, registers must be initialized, as listed here.

1. Set the data sampling rate (I2C_IFDR[IC] to obtain SCL frequency from the system bus clock.
2. Update the address in the (I2C_IADR) to define its slave address (address can range from 0 to 0x7f).
3. Set the I2C enable bit (I2C_I2CR[IEN]) to enable the I2C bus interface system.
4. Modify the bits in the I2C_I2CR to select Master/Slave mode, Transmit/Receive mode, and Interrupt-Enable or not.

24.5.2 Generation of Start

After completion of the initialization procedure, serial data can be transmitted by selecting the Master Transmit mode. On a multimaster bus system, the busy bus (I2C_I2SR[IBB]) must be tested to determine whether the serial bus is free. If the bus is free (IBB = 0), the Start signal and the first byte (the slave address) can be sent. The data written to the data register comprises the address of the desired slave and the LSB indicates the transfer direction.

The free time between a Stop and the next Start condition is built into the hardware that generates the Start cycle. Depending on the relative frequencies of the system clock and the SCL period, it may be necessary to wait until the I2C is not busy after writing the calling address to the data register (I2C_I2DR), before proceeding to load data into the data register (I2C_I2DR).

24.5.3 Post-transfer software response

Sending or receiving a byte sets the data transferring bit (I2C_I2SR[ICF]), which indicates one byte of communication is finished. Upon completion, the interrupt status (I2C_I2SR[IIF]) is also set. An external interrupt is generated if the interrupt enable (I2C_I2CR[IIEN]) is set. The software must first clear the interrupt status (I2C_I2SR[IIF]) in the interrupt routine.

See the flow chart in [Figure 24-5](#).

The data transferring bit (I2C_I2SR[ICF]) is cleared either by reading from I2C_I2DR in Receive mode or by writing to this register in Transmit mode.

The software can service the I2C I/O in the main program by monitoring the interrupt status (I2C_I2SR[IIF]) if the interrupt enable is deasserted. In this case, the interrupt status should be polled in the data transferring bit (I2C_I2SR[ICF]) because the operation is different when arbitration is lost.

When an interrupt occurs at the end of the address cycle, the master is always in Transmit mode; that is, the address is sent. If Master Receive mode is required, then I2C_I2CR[MTX] should be toggled and a dummy read of the I2C_I2DR register must be executed to trigger receive data.

During Slave-mode address cycles (I2C_I2SR[IAAS] = 1), the slave read/write bit I2C_I2SR[SRW] is read to determine the direction of the next transfer. The transmit/receive bit (I2C_I2CR[MTX]) should also be programmed accordingly. For Slave-mode data cycles (IAAS = 0), SRW is invalid. MTX should be read to determine the current transfer direction.

24.5.4 Generation of Stop

A data transfer ends when the master signals a Stop, which can occur after all data is sent.

For a master receiver to terminate a data transfer, it must inform the slave transmitter by not acknowledging the last data byte. This is done by setting the transmit acknowledge bit (I2C_I2CR[TXAK]) before reading the next-to-last byte. Before the last byte is read, a Stop signal must be generated.

24.5.5 Generation of Repeated Start

After the data transfer, if the master still requires the bus, it can signal another Start followed by another slave address without signaling a Stop.

24.5.6 Slave mode

In the slave interrupt service routine (see [Figure 24-5](#)), the block addressed as slave bit (IAAS) should be tested to check if a calling of its own address has just been received. If IAAS is set, software should set the Transmit/Receive mode select bit (I2C_I2CR[MTX]) according to the I2C_I2SR[SRW]. Writing to the I2C_I2CR clears the IAAS automatically. The only time IAAS is read as set is from the interrupt at the end of the address cycle where an address match occurred; interrupts resulting from subsequent data transfers will have IAAS cleared. A data transfer can now be initiated by writing information to I2C_I2DR for slave transmits, or read from I2C_I2DR in Slave Receive mode. A dummy read of I2C_I2DR in Slave Receive mode releases SCL, allowing the master to send data.

In the slave transmitter routine, the receive acknowledge bit (I2C_I2SR[RXAK]) must be tested before sending the next byte of data. Setting RXAK means an end-of-data signal from the master receiver, after which the software must switch it from Transmit to Receiver mode. Reading the data register (I2C_I2DR) then releases SCL so the master can generate a Stop signal.

24.5.7 Arbitration lost

If several devices try to engage the bus at the same time, one becomes master. Hardware immediately switches devices that lose arbitration to Slave Receive mode. Data output to 12Cn_SDA stops, but 12Cn_SCL is still generated until the end of the byte during which arbitration is lost. An interrupt occurs at the falling edge of the ninth clock of this transfer if the arbitration is lost (I2C_I2SR[IAL] = 1), and the Slave mode is selected (I2C_I2CR[MSTA] = 0).

See the flow chart in [Figure 24-5](#).

If a device that is not a master tries to transmit or do a Start, hardware inhibits the transmission, clears MSTA without signaling a Stop, generates an interrupt to the ARM platform, and sets I2C_I2SR[IAL] to indicate a failed attempt to engage the bus. When considering these cases, the slave service routine should first test I2C_I2SR[IAL], and the software should clear it if it is set.

For Multimaster mode, when an I2C is enabled when the bus is busy and asserts Start, the I2C_I2SR[IAL] bit gets set only for 12Cn_SDA=0, 12Cn_SCL=0/1, 12Cn_SDA=1, and 12Cn_SCL=0; but not for 12Cn_SDA=1 and I2Cn_SCL=1, which is the equivalent of Bus Idle state.

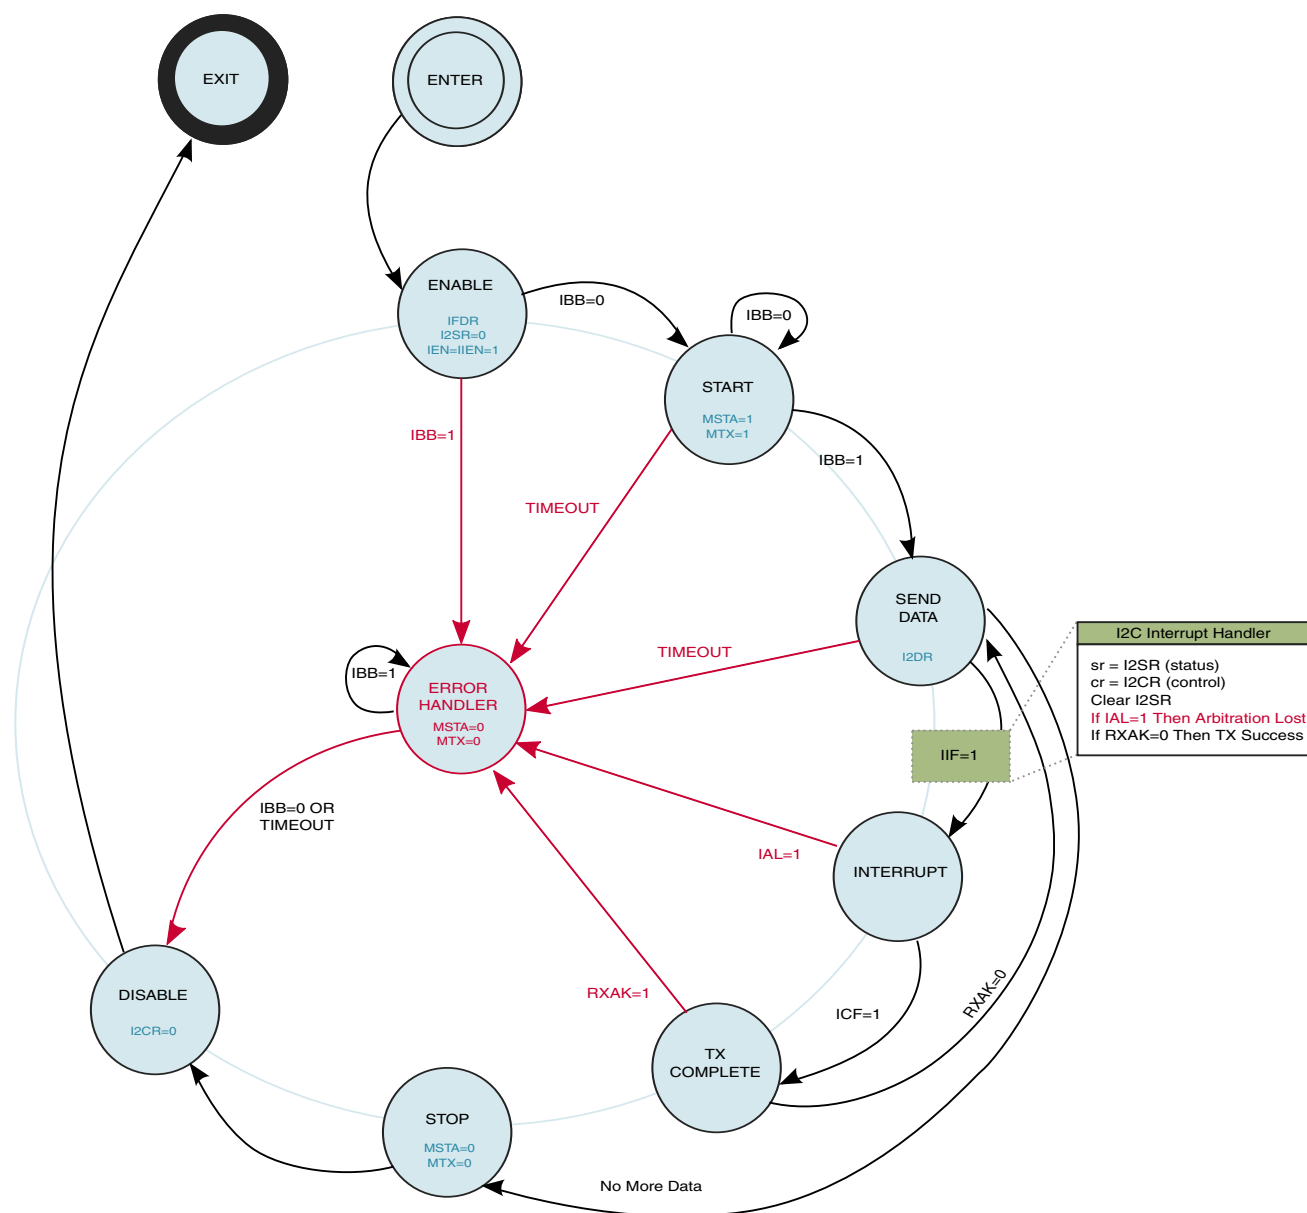

Figure 24-4. I2C Programming state diagram

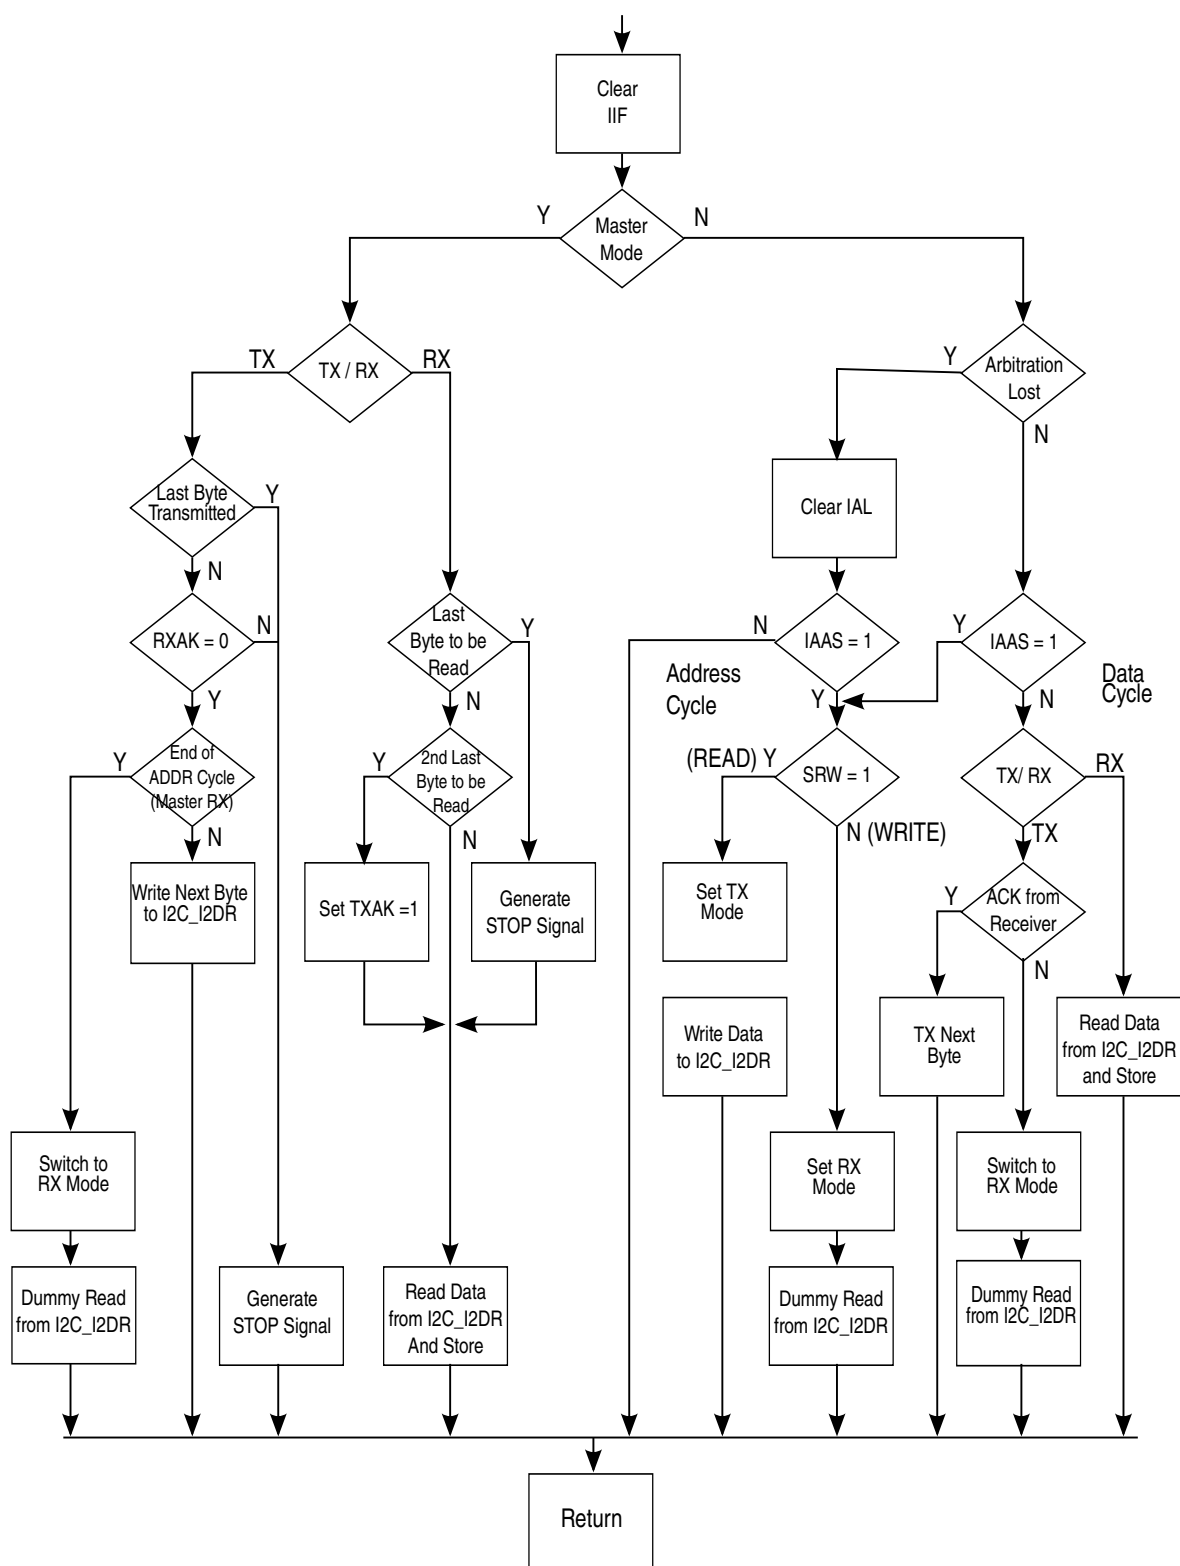

Figure 24-5. Flowchart of typical I2C interrupt routine

NOTE

For a Repeated Start only, the Stop-generation stage does not occur in Master mode. A loop repeats itself without stopping for the next start.

For Master Receive mode, I2C is programmed as Master Transmit during Address mode and after slave address transfer; the MTX bit should be cleared and a dummy read on the I2C_I2DR register should be performed so I2C can read the next receive data.

Figure 24-6. Flowchart for typical I2C polling routine

NOTE

The timeout value depends on the bus frequency at which I2C is operating. The minimum timeout for polling the IIF bit at a maximum I2C bus frequency of 400 kHz is $T_{\min} = 25 \mu\text{s}$ ($=2.5 \times 10 \mu\text{s}$). This value can be calculated for any bus frequency. The formula is $T_{\min} = 10/F_{\text{SCL}}$, where F_{SCL} is the frequency of the I2C clock (SCL).

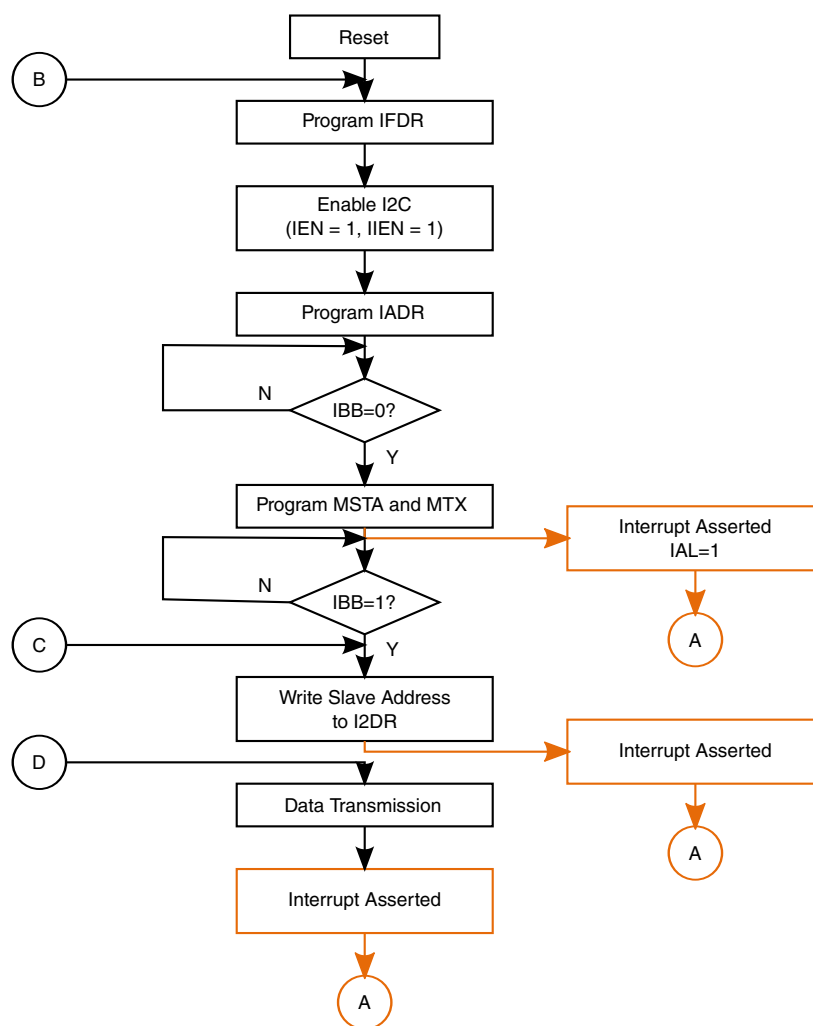

Figure 24-7. Detailed flowchart of a typical I2C Master Transmit mode, part 1

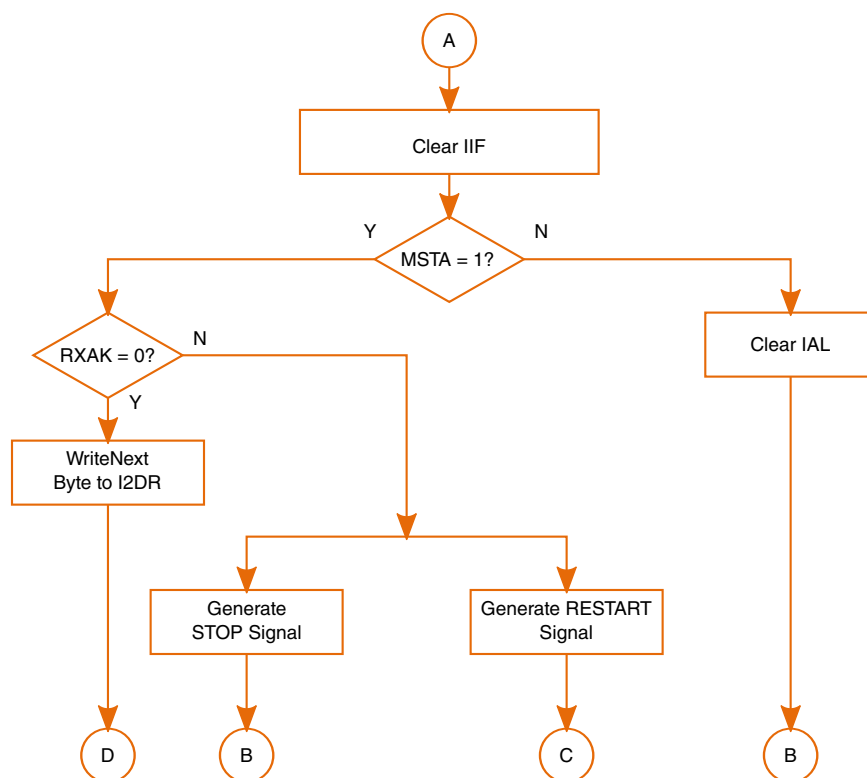

Figure 24-8. Detailed flowchart of a typical I2C Master Transmit mode, part 2

Figure 24-7 and Figure 24-8 show the Master Transmit mode operation with interrupt subroutine. If an interrupt is generated and the MSTA bit is 0, then bus arbitration is lost and IAL is set. Software can clear the IAL bit and reprogram I2C. If the MSTA bit is 1, then it is a transfer-generated interrupt. In this case, software can check the RXAK bit for a data receive acknowledgement by the slave and, accordingly, decide to do one of the following:

- Generate a STOP
- Generate a REPEATED START by writing to the I2C_I2CR register
- Perform the next data transfer by writing to the I2C_I2DR register

NOTE

The IBB bit is asserted by a Start condition on the bus, and it is deasserted by a Stop condition on the bus. Therefore, if arbitration is lost due to an unexpected Stop condition during transfer, then IBB is cleared. If arbitration is lost due to a data mismatch, then it is not cleared. Software should always clear the IEN bit and then set it if arbitration is lost.

24.6 Software restriction

Software should ensure that there is a delay of at least two module clock cycles after it sets the I2C_I2CR[RSTA] bit and before writing to the I2C_I2DR register. The maximum possible clock period of the module clock is 78 ns.

24.7 I2C Memory Map/Register Definition

The I2C contains five 16-bit registers.

NOTE

Registers at offsets 0x0002, 0x0006, 0x000A, and 0x000E are reserved for future additions.

I2C memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

24.7.1 I2C Address Register (I2Cx_IADR)

Address: Base address + 0h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0								ADR							0
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Cx_IADR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7–1 ADR	Slave address. Contains the specific slave address to be used by the I2C. Slave mode is the default I2C mode for an address match on the bus. NOTE: The I2C_IADR holds the address to which the I2C responds when addressed as a slave. The slave address is not the address sent on the bus during the address transfer. The register is not reset by a software reset.
0 Reserved	This read-only field is reserved and always has the value 0.

24.7.2 I2C Frequency Divider Register (I2Cx_IFDR)

The I2C_IFDR provides a programmable prescaler to configure the clock for bit-rate selection. The register does not get reset by a software reset.

I2C clock is sourced from PERCLK_ROOT which is routed from IPG_CLK_ROOT. I2C clock frequency can easily be obtained by using the following formula:

I2C clock Frequency = (PERCLK_ROOT frequency)/(division factor corresponding to IFDR)

By default, IPG_CLK_ROOT and PERCLK_ROOT frequencies are set to 49.5 MHz, where the root clock is sourced from PLL2's PFD2. Obtaining the frequencies can be accomplished by:

PLL2 = 528 MHz

PLL2_PFD2 = 528 MHz * 18 / 24 = 396 MHz

IPG_CLK_ROOT = (PLL2_PFD2 / ahb_podf) / ipg_podf = (396 MHz/4)/2 = 49.5 MHz

PER_CLK_ROOT = IPG_CLK_ROOT/perclk_podf = 49.5 MHz/1 = 49.5 MHz

NOTE

The above calculation assumes that the default CCM register settings, routing, and division factors are used. If different routing, PFD values, and/or division factors are used, the user must adjust the parameters accordingly to calculate the correct clock frequency.

The following table describes the divider and register values for the register field "IC."

Table 24-3. I2C_IFDR Register Field Values

I2Cx_IFDR field descriptions

Field	Description
15–6 Reserved	This read-only field is reserved and always has the value 0.
IC	<p>I2C clock rate. Prescales the clock for bit-rate selection. Due to potentially slow I2Cn_SCL and I2Cn_SDA rise and fall times, bus signals are sampled at the prescaler frequency. The serial bit clock frequency may be lower than IPG_CLK_ROOT divided by the divider shown in the I2C Data I/O Register.</p> <p>NOTE: The IC value should not be changed during the data transfer, however, it can be changed before a Repeat Start or Start programming sequence in I2C. The I2C protocol supports bit rates of up to 400 kbps. The IC bits need to be programmed in accordance with this constraint.</p>

24.7.3 I2C Control Register (I2Cx_I2CR)

The I2C_I2CR is used to enable the I2C and the I2C interrupt. It also contains bits that govern operation as a slave or a master.

Address: Base address + 8h offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	IEN	IEN	MSTA	MTX	TXAK	0	0	
Write						RSTA		
Reset	0	0	0	0	0	0	0	0

I2Cx_I2CR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 IEN	<p>I2C enable. Also controls the software reset of the entire I2C. Resetting the bit generates an internal reset to the block. If the block is enabled in the middle of a byte transfer, Slave mode ignores the current bus transfer and starts operating when the next Start condition is detected. Master mode is not aware that the bus is busy, so initiating a start cycle may corrupt the current bus cycle, ultimately causing either the current master or the I2C to lose arbitration. Subsequently, bus operation returns to normal.</p> <p>0 The block is disabled, but registers can still be accessed. 1 The I2C is enabled. This bit must be set before any other I2C_I2CR bits have an effect.</p>
6 I2EN	<p>I2C interrupt enable.</p> <p>NOTE: If data is written during the Start condition, that is, just after setting the I2C_I2CR[MSTA] and I2C_I2CR[MTX] bits, then the ICF bit is cleared at the falling edge of SCLK after Start. If data is written after the Start condition and falling edge of SCLK, then the ICF bit is cleared as soon as data is written.</p> <p>0 I2C interrupts are disabled, but the status flag I2C_I2SR[IIF] continues to be set when an Interrupt condition occurs. 1 I2C interrupts are enabled. An I2C interrupt occurs if I2C_I2SR[IIF] is also set.</p>
5 MSTA	<p>Master/Slave mode select bit. If the master loses arbitration, MSTa is cleared without generating a Stop signal.</p> <p>NOTE: The module clock should be on for writing to the MSTa bit.</p> <p>NOTE: The MSTa bit is cleared by software to generate a Stop condition; it can also be cleared by hardware when the I2C loses the bus arbitration.</p>

Table continues on the next page...

I2Cx_I2CR field descriptions (continued)

Field	Description
	0 Slave mode. Changing MSTA from 1 to 0 generates a Stop and selects Slave mode. 1 Master mode. Changing MSTA from 0 to 1 signals a Start on the bus and selects Master mode.
4 MTX	Transmit/Receive mode select bit. Selects the direction of master and slave transfers. 0 Receive. When a slave is addressed, the software should set MTX according to the slave read/write bit in the I2C status register (I2C_I2SR[SRW]). 1 Transmit. In Master mode, MTX should be set according to the type of transfer required. Therefore, for address cycles, MTX is always 1.
3 TXAK	Transmit acknowledge enable. Specifies the value driven onto I2Cn_SDA during acknowledge cycles for both master and slave receivers. NOTE: Writing TXAK applies only when the I2C bus is a receiver. 0 An acknowledge signal is sent to the bus at the ninth clock bit after receiving one byte of data. 1 No acknowledge signal response is sent (that is, the acknowledge bit = 1).
2 RSTA	Repeat start. Always reads as 0. Attempting a repeat start without bus mastership causes loss of arbitration. 0 No repeat start 1 Generates a Repeated Start condition
Reserved	This read-only field is reserved and always has the value 0.

24.7.4 I2C Status Register (I2Cx_I2SR)

The I2C_I2SR contains bits that indicate transaction direction and status.

Address: Base address + Ch offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	ICF	IAAS	IBB	IAL	0	SRW	IIF	RXAK
Write								
Reset	1	0	0	0	0	0	0	1

I2Cx_I2SR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 ICF	Data transferring bit. While one byte of data is transferred, ICF is cleared. 0 Transfer is in progress. 1 Transfer is complete. This bit is set by the falling edge of the ninth clock of the last byte transfer.
6 IAAS	I2C addressed as a slave bit. The ARM platform is interrupted if the interrupt enable (I2C_I2CR[IEN]) is set. The ARM platform must check the slave read/write bit (SRW) and set its Transfer/Receive mode accordingly. Writing to I2C_I2CR clears this bit. 0 Not addressed 1 Addressed as a slave. Set when its own address (I2C_IADR) matches the calling address.
5 IBB	I2C bus busy bit. Indicates the status of the bus. NOTE: When I2C is enabled (I2C_I2CR[IEN] = 1), it continuously polls the bus data (SDA) and clock (SCL) signals to determine a Start or Stop condition. 0 Bus is idle. If a Stop signal is detected, IBB is cleared. 1 Bus is busy. When Start is detected, IBB is set.
4 IAL	Arbitration lost. Set by hardware in the following circumstances (IAL must be cleared by software by writing a "0" to it at the start of the interrupt service routine): <ul style="list-style-type: none"> I2Cn_SDA input samples low when the master drives high during an address or data-transmit cycle. I2Cn_SDA input samples low when the master drives high during the acknowledge bit of a data-receive cycle. <p>For the above two cases, the bit is set at the falling edge of the ninth I2Cn_SCL clock during the ACK cycle.</p> <ul style="list-style-type: none"> A Start cycle is attempted when the bus is busy. A Repeated Start cycle is requested in Slave mode. A Stop condition is detected when the master did not request it. <p>NOTE: Software cannot set the bit.</p> 0 No arbitration lost. 1 Arbitration is lost.
3 Reserved	This read-only field is reserved and always has the value 0.
2 SRW	Slave read/write. When the I2C is addressed as a slave, IAAS is set, and the slave read/write bit (SRW) indicates the value of the R/W command bit of the calling address sent from the master. SRW is valid only when a complete transfer has occurred, no other transfers have been initiated, and the I2C is a slave and has an address match. 0 Slave receive, master writing to slave 1 Slave transmit, master reading from slave
1 IIF	I2C interrupt. Must be cleared by the software by writing a "0" to it in the interrupt routine. NOTE: The software cannot set the bit. 0 No I2C interrupt pending. 1 An interrupt is pending.

Table continues on the next page...

I2Cx_I2SR field descriptions (continued)

Field	Description
	<p>This causes a processor interrupt request (if the interrupt enable is asserted [IEN = 1]). The interrupt is set when one of the following occurs:</p> <ul style="list-style-type: none"> • One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock). • An address is received that matches its own specific address in Slave Receive mode. • Arbitration is lost.
0 RXAK	<p>Received acknowledge. This is the value received from the I2Cn_SDA input for the acknowledge bit during a bus cycle.</p> <p>0 An "acknowledge" signal was received after the completion of an 8-bit data transmission on the bus. 1 A "No acknowledge" signal was detected at the ninth clock.</p>

24.7.5 I2C Data I/O Register (I2Cx_I2DR)

In Master Receive mode, reading the data register allows a read to occur and initiates the next byte to be received. In Slave mode, the same function is available after it is addressed.

Address: Base address + 10h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0								DATA							
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Cx_I2DR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
DATA	<p>Data Byte. Holds the last data byte received or the next data byte to be transferred. Software writes the next data byte to be transmitted or reads the data byte received.</p> <p>NOTE: The core-written value in I2C_I2DR cannot be read back by the core. Only data written by the I2C bus side can be read.</p>

24.7.6 I2C Clock Duty-cycle Adjust Register (I2Cx_DCA)

The I2C_DCA is used to adjust duty cycle of SCL output when I2C works in Master mode.

Address: Base address + 14h offset

I2Cx_DCA field descriptions

Field	Description
15–5 Reserved	This read-only field is reserved and always has the value 0.
DCA	DCA[4]==1'b1 Represent how many pre-divider clock cycle that the SCL high period hold. Valid range [2, Post-divider>>1]. Where the pre-divider clock frequency = PER_CLK_ROOT frequency / (2 ^ IFDR_IC[4:2]); Post-divider = Divider / (2 ^ IFDR_IC[4:2]) and Divider can be found in the Table 24-3 . DCA[4]==1'b0 Represents how many pre-divider clock cycles that the SCL high period extent compares to 50 percent duty cycle scenario. DCA[3:0]==4'h0 The reshaping function is disabled.

Chapter 25

IOMUX Controller (IOMUXC)

25.1 Overview

The IOMUX Controller (IOMUXC), together with the IOMUX, enables the IC to share one pad to several functional blocks. This sharing is done by multiplexing the pad's input and output signals.

Every module requires a specific pad setting (such as pull up or keeper), and for each pad, there are up to 8 muxing options (called ALT modes). The pad settings parameters are controlled by the IOMUXC.

The IOMUX consists only of combinatorial logic combined from several basic IOMUX cells. Each basic IOMUX cell handles only one pad signal's muxing.

[Figure 25-1](#) illustrates the IOMUX/IOMUXC connectivity in the system.

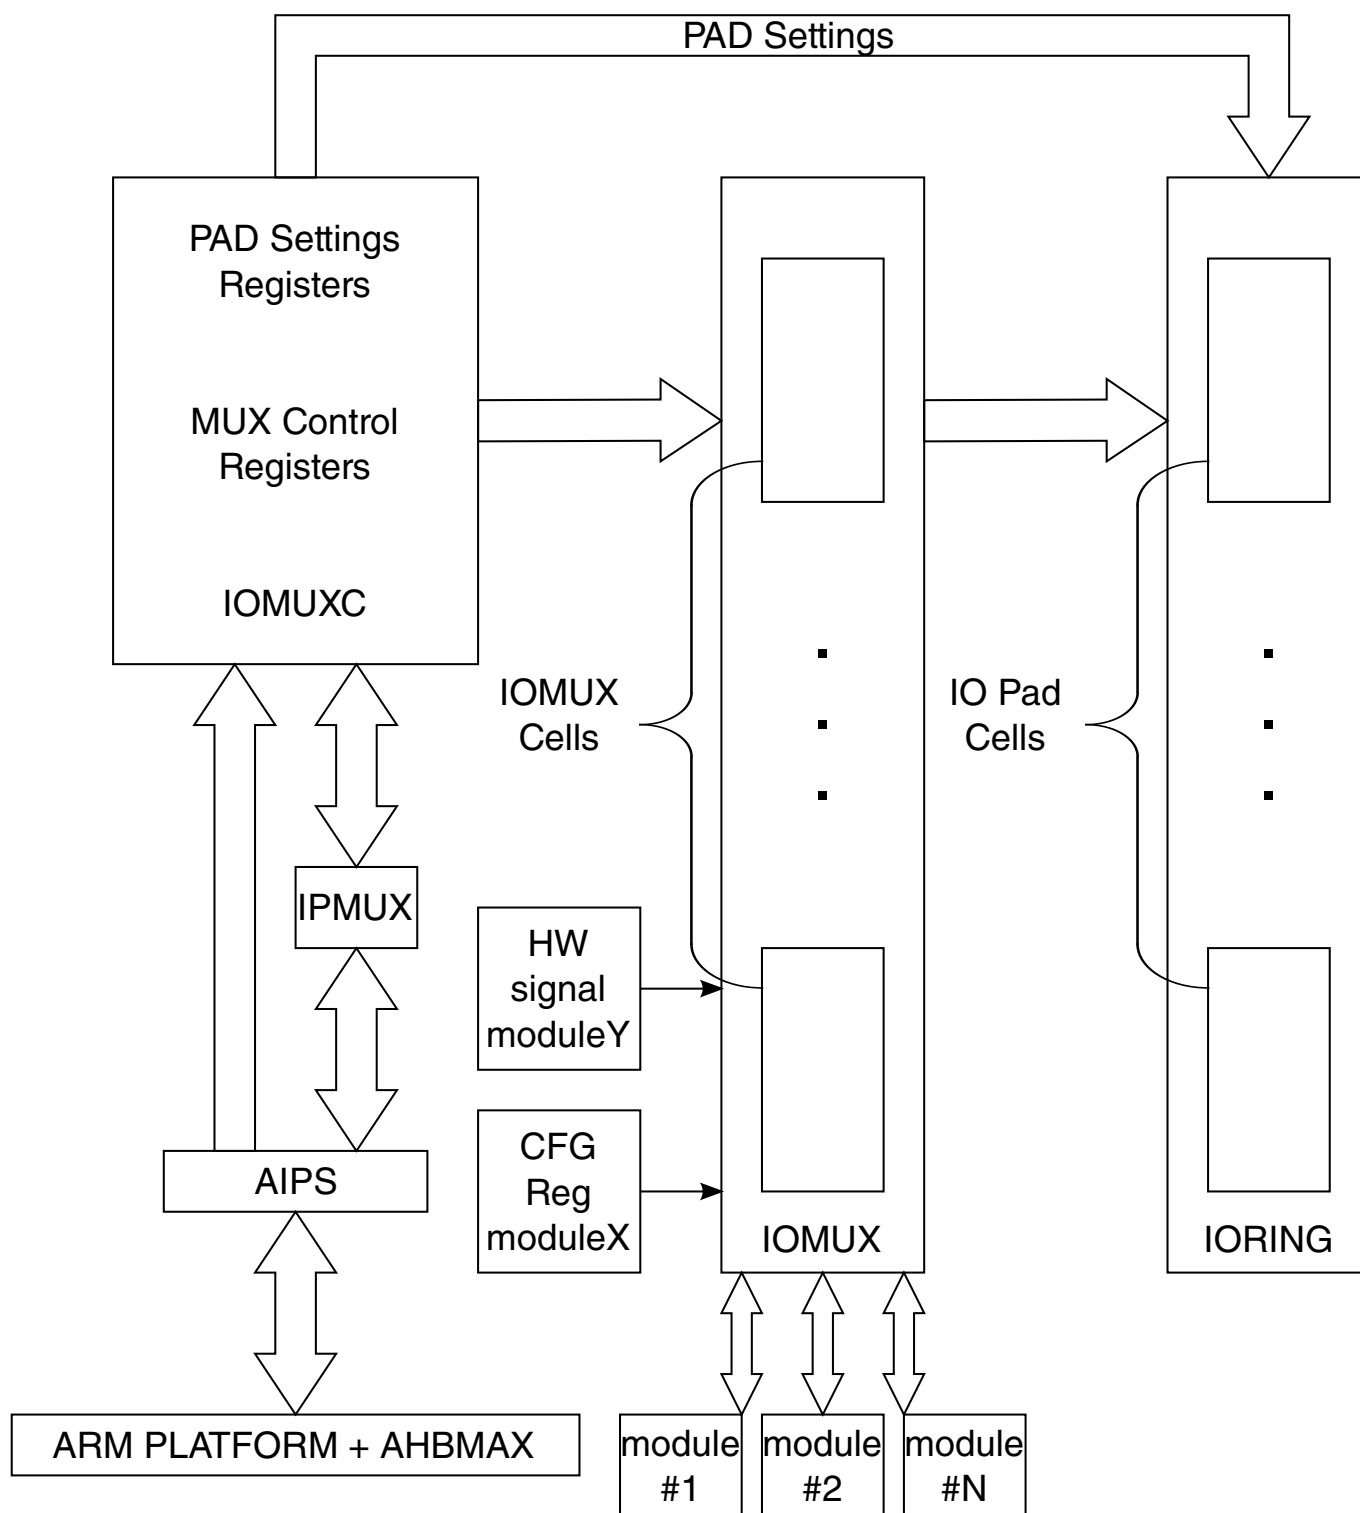

Figure 25-1. IOMUX SoC Level Block Diagram

25.1.1 Features

The IOMUXC features are:

- 32-bit software mux control registers (IOMUXC_SW_MUX_CTL_PAD_<PAD NAME> or IOMUXC_SW_MUX_CTL_GRP_<GROUP NAME>) to configure 1 of 8 alternate (ALT) MUX_MODE fields of each pad or a predefined group of pads and to enable the forcing of an input path of the pad(s) (SION bit).
- 32-bit software pad control registers (IOMUXC_SW_PAD_CTL_PAD_<PAD NAME> or IOMUXC_SW_PAD_CTL_GRP_<GROUP NAME>) to configure specific pad settings of each pad, or a predefined group of pads.
- 32-bit general purpose registers - 14 (GPR0 to GPR13) 32-bit registers according to SoC requirements for any usage.
- 32-bit input select control registers to control the input path to a module when more than one pad drives this module input.

Each SW MUX/PAD CTL IOMUXC register handles only one pad or one pad's group.

Only the minimum number of registers required by software are implemented by hardware. For example, if only ALT0 and ALT1 modes are used on Pad x then only one bit register will be generated as the MUX_MODE control field in the software mux control register of Pad x.

The software mux control registers may allow the forcing of pads to become input (input path enabled) regardless of the functional direction driven. This may be useful for loopback and GPIO data capture.

25.2 Clocks

The table found here describes the clock sources for IOMUXC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 25-1. IOMUXC Clocks

Clock name	Clock Root	Description
ipt_clk_io	lcdif_pix_clk_root	IO clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

25.3 Functional description

This section provides a complete functional description of the block.

The IOMUXC consists of two sub-blocks:

- IOMUXC_REGISTERS includes all of the IOMUXC registers (see [Features](#)).
- IOMUXC_LOGIC includes all of the IOMUXC combinatorial logic (IP interface controls, address decoder, observability muxes).

The IOMUX consists of a number (about the number of pads in the SoC) of basic iomux_cell units. If only one functional mode is required for a specific pad, there is no need for IOMUX and the signals can be connected directly from the module to the I/O. The IOMUX cell is required whenever two or more functional modes are required for a specific pad or when one functional mode and the one test mode are required.

The basic iomux_cell design, which allows two levels of HW signal control (in ALT6 and ALT7 modes - ALT7 gets highest priority) is shown in [Figure 25-2](#).

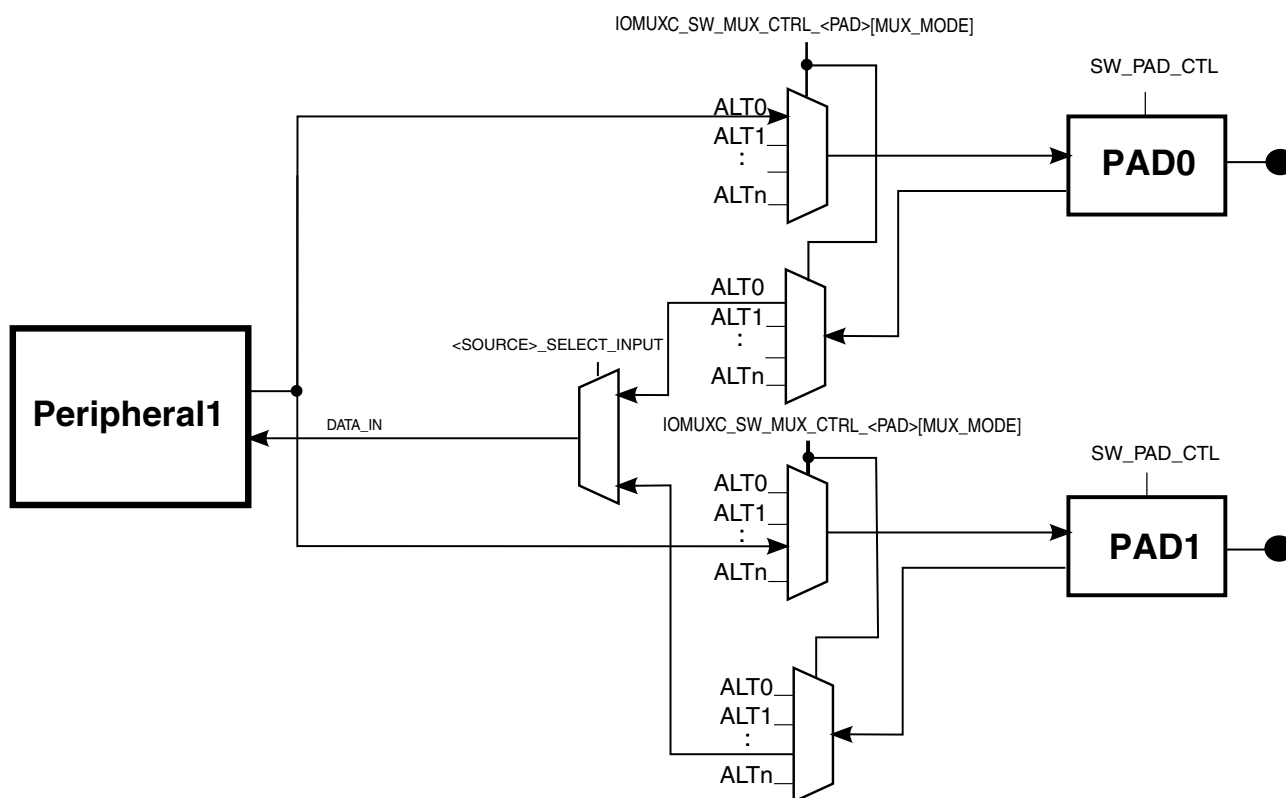

Figure 25-2. IOMUX Cell Block Diagram

25.3.1 ALT6 and ALT7 extended muxing modes

The ALT7 and ALT6 extended muxing modes allow any signal in the system (such as fuse, pad input, JTAG, or software register) to override any software configuration and to force the ALT6/ALT7 muxing mode.

It also allows an IOMUX software register to control a group of pads.

25.3.2 SW Loopback through SION bit

A limited option exists to override the default pad functionality and force the input path to be active (`ipp_ibe==1'b1`) regardless of the value driven by the corresponding module. This can be done by setting the SION (Software Input On) bit in the IOMUXC_SW_MUX_CTL register (when available) to "1".

Uses include:

- LoopBack - Module x drives the pad and also receives pad value as an input.
- GPIO Capture - Module x drives the pad and the value is captured by GPIO.

25.3.3 Daisy chain - multi pads driving same module input pin

In some cases, more than one pad may drive a single module input pin. Such cases require the addition of one more level of IOMUXing; all of these input signals are muxed, and a dedicated software controlled register controls the mux in order to select the required input path.

A module port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC_SW_MUX_CTL_<PAD> registers) and one for defining it as the input path (via the daisy chain registers).

This means that a module port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC_SW_MUX_CTL_<PAD> registers) and one for defining it as the input path (via the daisy chain registers). The daisy chain is illustrated in the figure below.

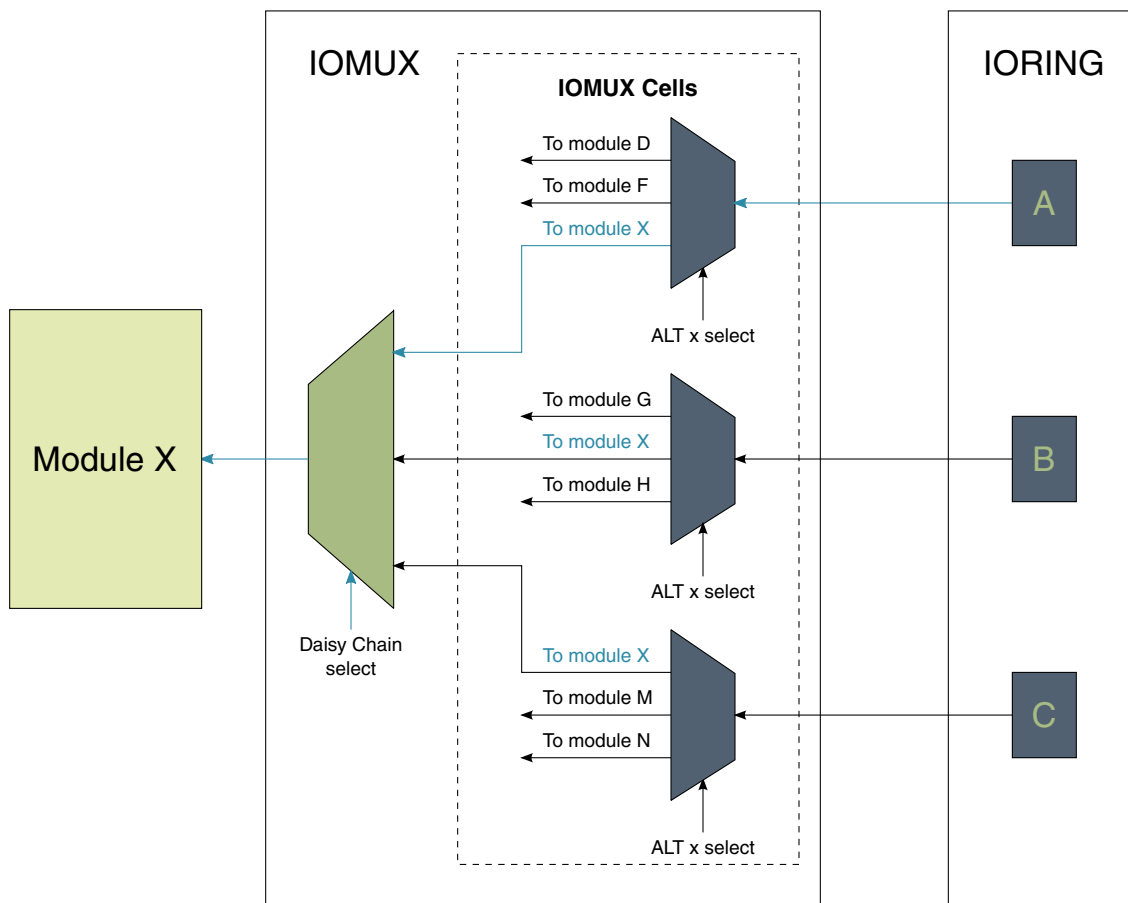

Figure 25-3. Daisy chain illustration

Field	Description
31–27 -	This field is reserved. Reserved
26 uSDHCx_WR_CACHE_CTL	Control uSDHCx [1-3] blocks cacheable attribute of AXI write transactions 0 Cacheable attribute is off for write transactions. 1 Cacheable attribute is on for write transactions.
25 uSDHCx_RD_CACHE_CTL	Control uSDHCx [1-3] blocks cacheable attribute of AXI read transactions 0 Cacheable attribute is off for read transactions. 1 Cacheable attribute is on for read transactions.
24–21 OCRAM_CTL	<p>OCRAM_CTL[3] write address pipeline control bit.</p> <p>When this feature is enabled, the write address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid setup time issue for the write access on the memory cell at high frequency. Enable this feature would cost at most 1 more clock cycle for each AXI write transaction, i.e., at most 1 more clock cycle for each write burst with multiple beats of data. When this feature is disabled, the write address from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write data is also ready at this cycle).</p> <p>0 write address pipeline is disabled 1 write address pipeline is enabled</p> <p>OCRAM_CTL[2] - write data pipeline control bit</p> <p>When this feature is enabled, the write data from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid setup time issue for the write access on the memory cell at high frequency. Enabling this feature would cost at most 1 more clock cycle for each AXI write transaction, i.e., at most 1 more clock cycle for each write burst with multiple beats of data.</p> <p>When this feature is disabled, the write data from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write address is also ready at this cycle).</p> <p>0 write data pipeline is disabled 1 write data pipeline is enabled</p> <p>OCRAM_CTL[1] read address pipeline control bit.</p> <p>When this feature is enabled, the read address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid setup time issue for the read access on the memory cell at high frequency. Enable this feature would cost at most 1 more clock cycle for each AXI read transaction, i.e., at most 1 more clock cycle for each read burst with multiple beats of data. When this feature is disabled, the read address from the AXI master can be accepted by the on-chip RAM without delay, and data can become ready for master at next clock cycle (if no other access and no read data wait).</p> <p>0 read address pipeline is disabled 1 read address pipeline is enabled</p> <p>OCRAM_CTL[0] - read data wait state control bit</p> <p>When thread data wait state is enabled, it will cost 2 cycles for each read access, (each beat of a read burst). This can avoid the potential timing problem caused by the relatively longer memory access time at higher frequency. When this feature is disabled, it only costs 1 clock cycle to finish a read transaction, i.e., get read data back in the next cycle of read request becomes valid on the bus.</p>

Table continues on the next page...

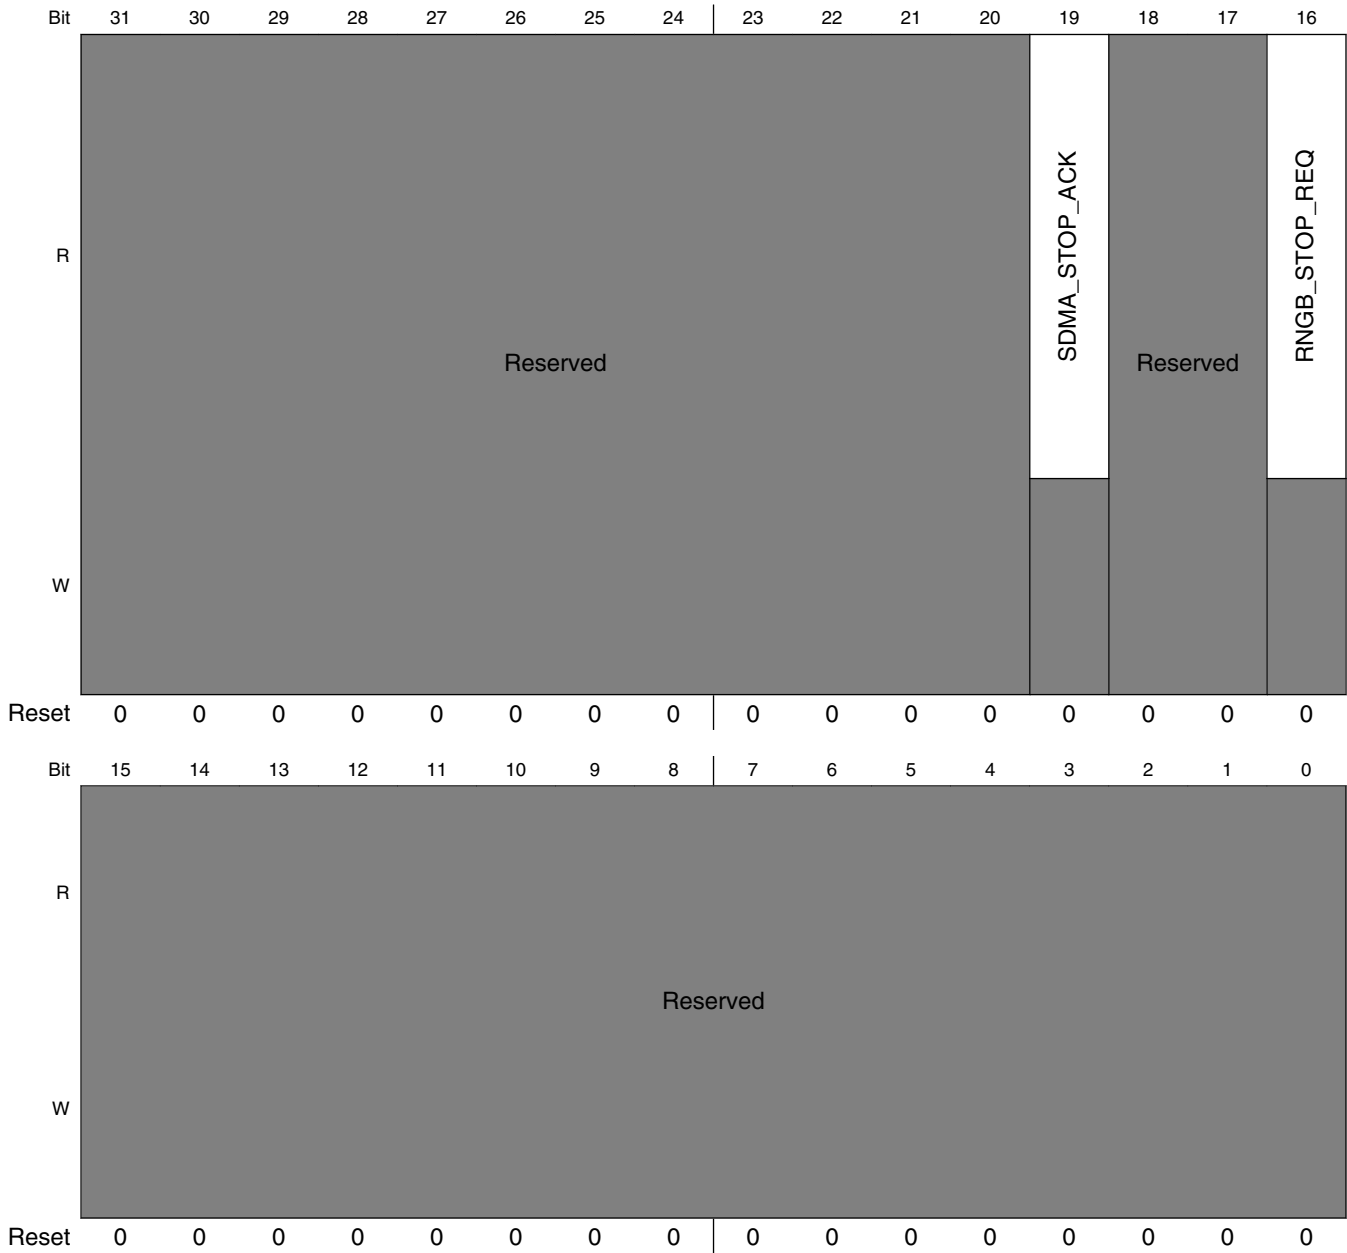

IOMUXC_GPR_GPR3 field descriptions (continued)

Field	Description
	0 read data pipeline is disabled 1 read data pipeline is enabled
20–17 OCRAM_ STATUS	<p>This field shows the OCRM pipeline settings status, controlled by OCRM_CTL[24:21] bits respectively. When the control bit is changed, the corresponding status bit goes high and keeps high until this new configuration is applied the internal logic. This provides a way for software to detect that the configuration has become valid. The suggested flow for changing the configuration in software is:</p> <ul style="list-style-type: none"> • set/clear the control bit • poll the status bit until it goes to 0 <p>OCRAM_STATUS[19] shows the write address pipeline status. This bit value reflects the propagation of the respective control bit to OCRM memory.</p> <p>OCRAM_STATUS[18] shows the write data pipeline status. This bit value reflects the propagation of the respective control bit to OCRM memory.</p> <p>OCRAM_STATUS[17] shows the read address pipeline status. This bit value reflects the propagation of the respective control bit to OCRM memory.</p> <p>OCRAM_STATUS[16] shows the read data pipeline status. This bit value reflects the propagation of the respective control bit to OCRM memory.</p> <p>0 read data pipeline configuration valid 1 read data pipeline control bit changed</p>
16–14 -	This field is reserved. Reserved

17 LOCK_DBG_CLK_EN	Lock DBG_CLK_EN field for changes. This is a sticky field, once set it can't be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
16 LOCK_DBG_EN	Lock DBG_EN field for changes. This is a sticky field, once set it can't be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
15–11 OCRAM_TZ_ADDR	OCRAM TrustZone (TZ) start address. This is the start address of the secure memory region within the OCRAM memory space is 4KB granularity. The start address affects the OCRAM transactions only if OCRAM_TZ_EN bit is set. The OCRAM TZ ENDADDR is not configurable and is set to the end of OCRAM memory space.
10 OCRAM_TZ_EN	OCRAM TrustZone (TZ) enable. 0 The TrustZone feature is disabled. Entire OCRAM space is available for all access types (secure/non-secure/user/supervisor). 1 The TrustZone feature is enabled. Access to address in the range specified by [ENDADDR:STARTADDR] follows the execution mode access policy described in CSU chapter.
9–4 OCRAM_L2_TZ_ADDR	OCRAM_L2 TrustZone (TZ) start address. This is the start address of the secure memory region within the OCRAM_L2 memory space is 4KB granularity. The start address affects the OCRAM_L2 transactions only if OCRAM_L2_TZ_EN bit is set. The OCRAM_L2 TZ ENDADDR is not configurable and is set to the end of OCRAM_L2 memory space.
3 OCRAM_L2_TZ_EN	OCRAM_L2 TrustZone (TZ) enable. 0 The TrustZone feature is disabled. Entire OCRAM_L2 space is available for all access types (secure/non-secure/user/supervisor). 1 The TrustZone feature is enabled. Access to address in the range specified by [ENDADDR:STARTADDR] follows the execution mode access policy described in CSU chapter.
2 SEC_ERR_RESP	Security error response enable for all security gaskets (on both AHB and AXI busses) 0 OKEY response 1 SLVError (default)
1 DBG_CLK_EN	ARM Debug clock enable 0 Debug turned off. 1 Debug enabled (default).
0 DBG_EN	ARM non secure (non-invasive) debug enable 0 Debug turned off. 1 Debug enabled (default).

IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA01 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 ENABLED — Force input path of pad EPDC_D1. 0 DISABLED — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 5 iomux modes to be used for pad: EPDC_D1. NOTE: Pad EPDC_D1 is involved in Daisy Chain. 000 ALT0 — Select signal EPDC_DATA01. 001 ALT1 — Select signal ECSPI4_MISO. - Configure register IOMUXC_ECSPI4_MISO_SELECT_INPUT for mode ALT1. 010 ALT2 — Select signal LCD_DATA25. 011 ALT3 — Select signal CSI_DATA01. - Configure register IOMUXC_CSI_CSI_DATA01_SELECT_INPUT for mode ALT3. 101 ALT5 — Select signal GPIO1_IO08.

25.7.23 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA02)

Address: 20E_0000h base + 6Ch offset = 20E_006Ch

IOMUXC_SW_MUX_CTL_PAD_EPDC_BDR0 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 ENABLED — Force input path of pad EPDC_BDR0. 0 DISABLED — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 4 iomux modes to be used for pad: EPDC_BDR0. NOTE: Pad EPDC_BDR0 is involved in Daisy Chain. 000 ALT0 — Select signal EPDC_BDR0. 010 ALT2 — Select signal UART3_RTS_B. - Configure register IOMUXC_UART3_UART_RTS_B_SELECT_INPUT for mode ALT2. 101 ALT5 — Select signal GPIO2_IO05. 110 ALT6 — Select signal EPDC_SDCE7.

25.7.52 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_BDR1)

Address: 20E_0000h base + E0h offset = 20E_00E0h

IOMUXC_SW_MUX_CTL_PAD_LCD_DATA00 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 ENABLED — Force input path of pad LCD_DATA00. 0 DISABLED — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 8 iomux modes to be used for pad: LCD_DATA00. NOTE: Pad LCD_DATA00 is involved in Daisy Chain. 000 ALT0 — Select signal LCD_DATA00. - Configure register IOMUXC_LCD_DATA00_SELECT_INPUT for mode ALT0. 001 ALT1 — Select signal ECSPI1_MOSI. - Configure register IOMUXC_ECSPI1_MOSI_SELECT_INPUT for mode ALT1. 010 ALT2 — Select signal USB_OTG2_ID. - Configure register IOMUXC_ANALOG_USB_H1_ID_SELECT_INPUT for mode ALT2. 011 ALT3 — Select signal PWM1_OUT. 100 ALT4 — Select signal UART5_DTR_B. 101 ALT5 — Select signal GPIO2_IO20. 110 ALT6 — Select signal ARM_TRACE00. 111 ALT7 — Select signal SRC_BOOT_CFG00.

25.7.67 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA01)

IOMUXC_SW_MUX_CTL_PAD_ECSP1_MISO field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 ENABLED — Force input path of pad ECSP1_MISO. 0 DISABLED — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 6 iomux modes to be used for pad: ECSP1_MISO. NOTE: Pad ECSP1_MISO is involved in Daisy Chain. 000 ALT0 — Select signal ECSP1_MISO. - Configure register IOMUXC_ECSP1_MISO_SELECT_INPUT for mode ALT0. 001 ALT1 — Select signal AUD4_TXFS. - Configure register IOMUXC_AUD4_INPUT_TXFS_AMX_SELECT_INPUT for mode ALT1. 010 ALT2 — Select signal UART5_RTS_B. - Configure register IOMUXC_UART5_UART_RTS_B_SELECT_INPUT for mode ALT2. 011 ALT3 — Select signal EPDC_BDR0. 100 ALT4 — Select signal SD2_WP. - Configure register IOMUXC_USDHC2_WP_ON_SELECT_INPUT for mode ALT4. 101 ALT5 — Select signal GPIO4_IO10.

25.7.106 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ECSP1_SS0)

Address: 20E_0000h base + 1B8h offset = 20E_01B8h

IOMUXC_SW_MUX_CTL_PAD_SD1_DATA6 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 ENABLED — Force input path of pad SD1_DAT6. 0 DISABLED — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 5 iomux modes to be used for pad: SD1_DAT6. NOTE: Pad SD1_DAT6 is involved in Daisy Chain. 000 ALT0 — Select signal SD1_DATA6. 010 ALT2 — Select signal KEY_COL4. - Configure register IOMUXC_KEY_COL4_SELECT_INPUT for mode ALT2. 011 ALT3 — Select signal EPDC_SDOEZ. 100 ALT4 — Select signal UART4_RTS_B. - Configure register IOMUXC_UART4_UART_RTS_B_SELECT_INPUT for mode ALT4. 101 ALT5 — Select signal GPIO5_IO07.

25.7.120 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_SD1_DATA7)

Address: 20E_0000h base + 1F0h offset = 20E_01F0h

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 ENABLED — Force input path of pad GPIO4_IO22. 0 DISABLED — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 4 iomux modes to be used for pad: GPIO4_IO22. NOTE: Pad GPIO4_IO22 is involved in Daisy Chain. 010 ALT2 — Select signal SPDIF_IN. - Configure register IOMUXC_SPDIF_SPDIF_IN1_SELECT_INPUT for mode ALT2. 011 ALT3 — Select signal SD1_WP. - Configure register IOMUXC_USDHC1_WP_ON_SELECT_INPUT for mode ALT3. 100 ALT4 — Select signal SD3_WP. - Configure register IOMUXC_USDHC3_WP_ON_SELECT_INPUT for mode ALT4. 101 ALT5 — Select signal GPIO4_IO22.

25.7.147 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO4_IO16)

Address: 20E_0000h base + 25Ch offset = 20E_025Ch

IOMUXC_SW_PAD_CTL_PAD_KEY_COL0 field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 IPD	IPD Field Select one of next values for pad: KEY_COL0. 0 ENABLED — PAD ENABLED 1 DISABLED — PAD DISABLED
26–23 Reserved	This read-only field is reserved and always has the value 0.
22 LVE	Low Voltage Enable Field Select one of next values for pad: KEY_COL0.

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_KEY_COL0 field descriptions (continued)

Field	Description
	0 DISABLED — High Voltage 1 ENABLED — Low Voltage
21–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: KEY_COL0. 0 DISABLED — CMOS input 1 ENABLED — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: KEY_COL0. 00 100K_OHM_PD — 100K Ohm Pull Down 01 47K_OHM_PU — 47K Ohm Pull Up 10 100K_OHM_PU — 100K Ohm Pull Up 11 22K_OHM_PU — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: KEY_COL0. 0 KEEP — Keeper Enabled 1 PULL — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: KEY_COL0. 0 DISABLED — Pull/Keeper Disabled 1 ENABLED — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 DISABLED — Output is CMOS. 1 ENABLED — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field Select one of next values for pad: KEY_COL0. 00 50MHZ — Low (50 MHz) 01 100MHZ — Medium (100 MHz) 10 100MHZ — Medium (100 MHz) 11 200MHZ — Maximum (200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: KEY_COL0. 000 HIZ — HI-Z 001 260_OHM — 260 Ohm @ 3.3V, 150 Ohm @ 1.8V

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_EPDC_DATA10 field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 IPD	IPD Field Select one of next values for pad: EPDC_D10. 0 ENABLED — PAD ENABLED 1 DISABLED — PAD DISABLED
26–23 Reserved	This read-only field is reserved and always has the value 0.
22 LVE	Low Voltage Enable Field Select one of next values for pad: EPDC_D10.

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_EPDC_DATA10 field descriptions (continued)

Field	Description
	0 DISABLED — High Voltage 1 ENABLED — Low Voltage
21–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: EPDC_D10. 0 DISABLED — CMOS input 1 ENABLED — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: EPDC_D10. 00 100K_OHM_PD — 100K Ohm Pull Down 01 47K_OHM_PU — 47K Ohm Pull Up 10 100K_OHM_PU — 100K Ohm Pull Up 11 22K_OHM_PU — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: EPDC_D10. 0 KEEP — Keeper Enabled 1 PULL — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: EPDC_D10. 0 DISABLED — Pull/Keeper Disabled 1 ENABLED — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 DISABLED — Output is CMOS. 1 ENABLED — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field Select one of next values for pad: EPDC_D10. 00 50MHZ — Low (50 MHz) 01 100MHZ — Medium (100 MHz) 10 100MHZ — Medium (100 MHz) 11 200MHZ — Maximum (200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: EPDC_D10. 000 HIZ — HI-Z 001 260_OHM — 260 Ohm @ 3.3V, 150 Ohm @ 1.8V

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_EPDC_VCOM1 field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 IPD	IPD Field Select one of next values for pad: EPDC_VCOM1. 0 ENABLED — PAD ENABLED 1 DISABLED — PAD DISABLED
26–23 Reserved	This read-only field is reserved and always has the value 0.
22 LVE	Low Voltage Enable Field Select one of next values for pad: EPDC_VCOM1.

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_EPDC_VCOM1 field descriptions (continued)

Field	Description
	0 DISABLED — High Voltage 1 ENABLED — Low Voltage
21–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: EPDC_VCOM1. 0 DISABLED — CMOS input 1 ENABLED — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: EPDC_VCOM1. 00 100K_OHM_PD — 100K Ohm Pull Down 01 47K_OHM_PU — 47K Ohm Pull Up 10 100K_OHM_PU — 100K Ohm Pull Up 11 22K_OHM_PU — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: EPDC_VCOM1. 0 KEEP — Keeper Enabled 1 PULL — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: EPDC_VCOM1. 0 DISABLED — Pull/Keeper Disabled 1 ENABLED — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 DISABLED — Output is CMOS. 1 ENABLED — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field Select one of next values for pad: EPDC_VCOM1. 00 50MHZ — Low (50 MHz) 01 100MHZ — Medium (100 MHz) 10 100MHZ — Medium (100 MHz) 11 200MHZ — Maximum (200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: EPDC_VCOM1. 000 HIZ — HI-Z 001 260_OHM — 260 Ohm @ 3.3V, 150 Ohm @ 1.8V

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_EPDC_VCOM1 field descriptions (continued)

Field	Description
010 130_OHM — 130 Ohm @ 3.3V, 75 Ohm @ 1.8V 011 86_OHM — 86 Ohm @ 3.3V, 50 Ohm @ 1.8V 100 65_OHM — 65 Ohm @ 3.3V, 37 Ohm @ 1.8V 101 52_OHM — 52 Ohm @ 3.3V, 30 Ohm @ 1.8V 110 43_OHM — 43 Ohm @ 3.3V, 25 Ohm @ 1.8V 111 37_OHM — 37 Ohm @ 3.3V, 21 Ohm @ 1.8V	
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. 0 SLOW — Slow Slew Rate 1 FAST — Fast Slew Rate
