About This	Document	20
About This Ma	anual	20
	ments	
Documentatio	on Conventions	20
1	Architectural Overview	23
1.1	Product Features	23
1.2	Target Applications	29
1.3	High-Level Block Diagram	
1.4	Functional Overview	
1.4.1	ARM Cortex™-M3	
1.4.2	Motor Control Peripherals	
1.4.3	Analog Peripherals	
1.4.4	Serial Communications Peripherals	
1.4.5	System Peripherals	
1.4.6	Memory Peripherals	
1.4.7	Additional Features	
1.4.8	Hardware Details	37
2	ARM Cortex-M3 Processor Core	38
2.1	Block Diagram	39
2.2	Functional Description	39
2.2.1	Serial Wire and JTAG Debug	39
2.2.2	Embedded Trace Macrocell (ETM)	40
2.2.3	Trace Port Interface Unit (TPIU)	40
2.2.4	ROM Table	
2.2.5	Memory Protection Unit (MPU)	
2.2.6	Nested Vectored Interrupt Controller (NVIC)	40
3	Memory Map	44
4	Interrupts	46
5	JTAG Interface	49
5.1	Block Diagram	50
5.2	Functional Description	50
5.2.1	JTAG Interface Pins	50
5.2.2	JTAG TAP Controller	52
5.2.3	Shift Registers	53
5.2.4	Operational Considerations	53
5.3	Initialization and Configuration	56
5.4	Register Descriptions	
5.4.1	Instruction Register (IR)	
5.4.2	Data Registers	58
6	System Control	61
6.1	Functional Description	
6.1.1	Device Identification	61

6.1.2	Reset Control	61
6.1.3	Power Control	64
6.1.4	Clock Control	65
6.1.5	System Control	69
6.2	Initialization and Configuration	70
6.3	Register Map	
6.4	Register Descriptions	
7	Hibernation Module	
<b>7</b> .1	Block Diagram	
7.2	Functional Description	
7.2.1	Register Access Timing	
7.2.2	Clock Source	
7.2.3	Battery Management	
7.2.4	Real-Time Clock	
7.2.5	Non-Volatile Memory	
7.2.6	Power Control	
7.2.7	Initiating Hibernate	
7.2.7	Interrupts and Status	
7.2.6	Initialization and Configuration	
7.3.1	Initialization and Configuration	
7.3.1	RTC Match Functionality (No Hibernation)	
7.3.2	RTC Match/Wake-Up from Hibernation	
7.3.4	External Wake-Up from Hibernation	
7.3.4	RTC/External Wake-Up from Hibernation	
7.3.5 7.4	Register Map	
7.5	Register Descriptions	
8	Internal Memory	
8.1	Block Diagram	
8.2	Functional Description	
8.2.1	SRAM Memory	
8.2.2	Flash Memory	
8.3	Flash Memory Initialization and Configuration	
8.3.1	Flash Programming	
8.3.2	Nonvolatile Register Programming	
8.4	Register Map	
8.5	Flash Register Descriptions (Flash Control Offset)	
8.6	Flash Register Descriptions (System Control Offset)	
9	General-Purpose Input/Outputs (GPIOs)	
9.1	Functional Description	
9.1.1	Data Control	
9.1.2	Interrupt Control	167
9.1.3	Mode Control	
9.1.4	Commit Control	
9.1.5	Pad Control	
9.1.6	Identification	168

# **List of Registers**

System Cor	ntrol	
Register 1:	Device Identification 0 (DID0), offset 0x000	72
Register 2:	Brown-Out Reset Control (PBORCTL), offset 0x030	74
Register 3:	LDO Power Control (LDOPCTL), offset 0x034	75
Register 4:	Raw Interrupt Status (RIS), offset 0x050	76
Register 5:	Interrupt Mask Control (IMC), offset 0x054	77
Register 6:	Masked Interrupt Status and Clear (MISC), offset 0x058	
Register 7:	Reset Cause (RESC), offset 0x05C	
Register 8:	Run-Mode Clock Configuration (RCC), offset 0x060	80
Register 9:	XTAL to PLL Translation (PLLCFG), offset 0x064	84
Register 10:	Run-Mode Clock Configuration 2 (RCC2), offset 0x070	
Register 11:	Deep Sleep Clock Configuration (DSLPCLKCFG), offset 0x144	87
Register 12:	Device Identification 1 (DID1), offset 0x004	88
Register 13:	Device Capabilities 0 (DC0), offset 0x008	90
Register 14:	Device Capabilities 1 (DC1), offset 0x010	91
Register 15:	Device Capabilities 2 (DC2), offset 0x014	93
Register 16:	Device Capabilities 3 (DC3), offset 0x018	95
Register 17:	Device Capabilities 4 (DC4), offset 0x01C	97
Register 18:	Run Mode Clock Gating Control Register 0 (RCGC0), offset 0x100	99
Register 19:	Sleep Mode Clock Gating Control Register 0 (SCGC0), offset 0x110	100
Register 20:	Deep Sleep Mode Clock Gating Control Register 0 (DCGC0), offset 0x120	101
Register 21:	Run Mode Clock Gating Control Register 1 (RCGC1), offset 0x104	102
Register 22:	Sleep Mode Clock Gating Control Register 1 (SCGC1), offset 0x114	105
Register 23:	Deep Sleep Mode Clock Gating Control Register 1 (DCGC1), offset 0x124	108
Register 24:	Run Mode Clock Gating Control Register 2 (RCGC2), offset 0x108	
Register 25:	Sleep Mode Clock Gating Control Register 2 (SCGC2), offset 0x118	113
Register 26:	Deep Sleep Mode Clock Gating Control Register 2 (DCGC2), offset 0x128	115
Register 27:	Software Reset Control 0 (SRCR0), offset 0x040	117
Register 28:	Software Reset Control 1 (SRCR1), offset 0x044	
Register 29:	Software Reset Control 2 (SRCR2), offset 0x048	120
Hibernation	Module	121
Register 1:	Hibernation RTC Counter (HIBRTCC), offset 0x000	129
Register 2:	Hibernation RTC Match 0 (HIBRTCM0), offset 0x004	130
Register 3:	Hibernation RTC Match 1 (HIBRTCM1), offset 0x008	131
Register 4:	Hibernation RTC Load (HIBRTCLD), offset 0x00C	132
Register 5:	Hibernation Control (HIBCTL), offset 0x010	133
Register 6:	Hibernation Interrupt Mask (HIBIM), offset 0x014	135
Register 7:	Hibernation Raw Interrupt Status (HIBRIS), offset 0x018	136
Register 8:	Hibernation Masked Interrupt Status (HIBMIS), offset 0x01C	137
Register 9:	Hibernation Interrupt Clear (HIBIC), offset 0x020	138
Register 10:	Hibernation RTC Trim (HIBRTCT), offset 0x024	139
Register 11:	Hibernation Data (HIBDATA), offset 0x030-0x12C	140
Internal Mer	nory	141
Register 1:	Flash Memory Address (FMA), offset 0x000	
Register 2:	Flash Memory Data (FMD), offset 0x004	

Register 3:	Flash Memory Control (FMC), offset 0x008	148
Register 4:	Flash Controller Raw Interrupt Status (FCRIS), offset 0x00C	150
Register 5:	Flash Controller Interrupt Mask (FCIM), offset 0x010	
Register 6:	Flash Controller Masked Interrupt Status and Clear (FCMISC), offset 0x014	152
Register 7:	USec Reload (USECRL), offset 0x140	
Register 8:	Flash Memory Protection Read Enable 0 (FMPRE0), offset 0x130 and 0x200	154
Register 9:	Flash Memory Protection Program Enable 0 (FMPPE0), offset 0x134 and 0x400	155
Register 10:	User Debug (USER_DBG), offset 0x1D0	156
Register 11:	User Register 0 (USER_REG0), offset 0x1E0	157
Register 12:	User Register 1 (USER_REG1), offset 0x1E4	158
Register 13:	Flash Memory Protection Read Enable 1 (FMPRE1), offset 0x204	159
Register 14:	Flash Memory Protection Read Enable 2 (FMPRE2), offset 0x208	160
Register 15:	Flash Memory Protection Read Enable 3 (FMPRE3), offset 0x20C	161
Register 16:	Flash Memory Protection Program Enable 1 (FMPPE1), offset 0x404	
Register 17:	Flash Memory Protection Program Enable 2 (FMPPE2), offset 0x408	
Register 18:	Flash Memory Protection Program Enable 3 (FMPPE3), offset 0x40C	164
General-Pu	rpose Input/Outputs (GPIOs)	165
Register 1:	GPIO Data (GPIODATA), offset 0x000	
Register 2:	GPIO Direction (GPIODIR), offset 0x400	
Register 3:	GPIO Interrupt Sense (GPIOIS), offset 0x404	
Register 4:	GPIO Interrupt Both Edges (GPIOIBE), offset 0x408	
Register 5:	GPIO Interrupt Event (GPIOIEV), offset 0x40C	
Register 6:	GPIO Interrupt Mask (GPIOIM), offset 0x410	
Register 7:	GPIO Raw Interrupt Status (GPIORIS), offset 0x414	
Register 8:	GPIO Masked Interrupt Status (GPIOMIS), offset 0x418	
Register 9:	GPIO Interrupt Clear (GPIOICR), offset 0x41C	
Register 10:	GPIO Alternate Function Select (GPIOAFSEL), offset 0x420	181
Register 11:	GPIO 2-mA Drive Select (GPIODR2R), offset 0x500	
Register 12:	GPIO 4-mA Drive Select (GPIODR4R), offset 0x504	
Register 13:	GPIO 8-mA Drive Select (GPIODR8R), offset 0x508	185
Register 14:	GPIO Open Drain Select (GPIOODR), offset 0x50C	186
Register 15:	GPIO Pull-Up Select (GPIOPUR), offset 0x510	
Register 16:	GPIO Pull-Down Select (GPIOPDR), offset 0x514	188
Register 17:	GPIO Slew Rate Control Select (GPIOSLR), offset 0x518	189
Register 18:	GPIO Digital Enable (GPIODEN), offset 0x51C	190
Register 19:	GPIO Lock (GPIOLOCK), offset 0x520	191
Register 20:	GPIO Commit (GPIOCR), offset 0x524	192

# **Revision History**

The revision history table notes changes made between the indicated revisions of the LM3S1911 data sheet.

**Table 1. Revision History** 

Date	Revision	Description
March 2008	2550	Started tracking revision history.
April 2008	2881	■ The Θ <sub>JA</sub> value was changed from 55.3 to 34 in the "Thermal Characteristics" table in the Operating Characteristics chapter.
		■ Bit 31 of the <b>DC3</b> register was incorrectly described in prior versions of the data sheet. A reset of 1 indicates that an even CCP pin is present and can be used as a 32-KHz input clock.
		■ Values for I <sub>DD_HIBERNATE</sub> were added to the "Detailed Power Specifications" table in the "Electrical Characteristics" chapter.
		■ The "Hibernation Module DC Electricals" table was added to the "Electrical Characteristics" chapter.
		■ The T <sub>VDDRISE</sub> parameter in the "Reset Characteristics" table in the "Electrical Characteristics" chapter was changed from a max of 100 to 250.
		■ The maximum value on Core supply voltage (V <sub>DD25</sub> ) in the "Maximum Ratings" table in the "Electrica Characteristics" chapter was changed from 4 to 3.
		■ The operational frequency of the internal 30-kHz oscillator clock source is 30 kHz ± 50% (prior data sheets incorrectly noted it as 30 kHz ± 30%).
		A value of 0x3 in bits 5:4 of the MISC register (OSCSRC) indicates the 30-KHz internal oscillator is the input source for the oscillator. Prior data sheets incorrectly noted 0x3 as a reserved value.
		■ The reset for bits 6:4 of the RCC2 register (OSCSRC2) is 0x1 (IOSC). Prior data sheets incorrectly noted the reset was 0x0 (MOSC).
		■ Two figures on clock source were added to the "Hibernation Module":
		Clock Source Using Crystal
		Clock Source Using Dedicated Oscillator
		■ The following notes on battery management were added to the "Hibernation Module" chapter:
		<ul> <li>Battery voltage is not measured while in Hibernate mode.</li> </ul>
		<ul> <li>System level factors may affect the accuracy of the low battery detect circuit. The designer should consider battery type, discharge characteristics, and a test load during battery voltage measurements.</li> </ul>
		■ A note on high-current applications was added to the GPIO chapter:
		For special high-current applications, the GPIO output buffers may be used with the following restrictions. With the GPIO pins configured as 8-mA output drivers, a total of four GPIO outputs ma be used to sink current loads up to 18 mA each. At 18-mA sink current loading, the VOL value is specified as 1.2 V. The high-current GPIO package pins must be selected such that there are onl a maximum of two per side of the physical package or BGA pin group with the total number of high-current GPIO outputs not exceeding four for the entire package.
		■ A note on Schmitt inputs was added to the GPIO chapter:
		Pins configured as digital inputs are Schmitt-triggered.
		■ The Buffer type on the WAKE pin changed from OD to - in the Signal Tables.

Table 1. Revision History (continued)

Date	Revision	Description
		■ The "Differential Sampling Range" figures in the ADC chapter were clarified.
		■ The last revision of the data sheet (revision 2550) introduced two errors that have now been corrected:
		<ul> <li>The LQFP pin diagrams and pin tables were missing the comparator positive and negative input pins.</li> </ul>
		The base address was listed incorrectly in the FMPRE0 and FMPPE0 register bit diagrams.
		■ Additional minor data sheet clarifications and corrections.
May 2008	2972	■ As noted in the PCN, the option to provide VDD25 power from external sources was removed. Use the LDO output as the source of VDD25 input.
		Additional minor data sheet clarifications and corrections.
July 2008	3108	Additional minor data sheet clarifications and corrections.
August 2008	3447	■ Added note on clearing interrupts to Interrupts chapter.
		■ Added Power Architecture diagram to System Control chapter.
		■ Additional minor data sheet clarifications and corrections.
October 2008	4149	■ Corrected values for DSOSCSRC bit field in Deep Sleep Clock Configuration (DSLPCLKCFG) register.
		■ The FMA value for the <b>FMPRE3</b> register was incorrect in the Flash Resident Registers table in the Internal Memory chapter. The correct value is 0x0000.0006.
		■ Incorrect Comparator Operating Modes tables were removed from the Analog Comparators chapter.
November 2008	4283	Revised High-Level Block Diagram.
		■ Additional minor data sheet clarifications and corrections were made.
January 2009	4660	■ Corrected bit type for RELOAD bit field in SysTick Reload Value register; changed to R/W.
		■ Clarification added as to what happens when the SSI in slave mode is required to transmit but there is no data in the TX FIFO.
		■ Additional minor data sheet clarifications and corrections.
April 2009	5367	■ Added JTAG/SWD clarification (see "Communication with JTAG/SWD" on page 55).
		Added clarification that the PLL operates at 400 MHz, but is divided by two prior to the application of the output divisor.
		■ Added "GPIO Module DC Characteristics" table (see Table 19-4 on page 420).
		■ Additional minor data sheet clarifications and corrections.

Table 1. Revision History (continued)

Date	Revision	Description
July 2009	5902	■ Clarified Power-on reset and RST pin operation; added new diagrams.
		<ul> <li>Corrected the reset value of the Hibernation Data (HIBDATA) and Hibernation Control (HIBCTL) registers.</li> </ul>
		Clarified explanation of nonvolatile register programming in Internal Memory chapter.
		■ Added explanation of reset value to FMPRE0/1/2/3, FMPPE0/1/2/3, USER_DBG, and USER_REG0/1 registers.
		■ Changed buffer type for WAKE pin to TTL and HIB pin to OD.
		■ In ADC characteristics table, changed Max value for GAIN parameter from ±1 to ±3 and added E <sub>IR</sub> (Internal voltage reference error) parameter.
		Additional minor data sheet clarifications and corrections.
July 2009	5920	Corrected ordering numbers.
October 2009	6462	■ Removed erroneous reference to the WRC bit in the Hibernation chapter.
		■ Deleted reset value for 16-bit mode from <b>GPTMTAILR</b> , <b>GPTMTAMATCHR</b> , and <b>GPTMTAR</b> registers because the module resets in 32-bit mode.
		■ Made these changes to the Electrical Characteristics chapter:
		$-$ Removed $\rm V_{SIH}$ and $\rm V_{SIL}$ parameters from Operating Conditions table.
		Added table showing actual PLL frequency depending on input crystal.
		Changed the name of the t <sub>HIB_REG_WRITE</sub> parameter to t <sub>HIB_REG_ACCESS</sub> .
		Changed SSI set up and hold times to be expressed in system clocks, not ns.

#### **About This Document**

This data sheet provides reference information for the LM3S1911 microcontroller, describing the functional blocks of the system-on-chip (SoC) device designed around the ARM® Cortex™-M3 core.

#### **Audience**

This manual is intended for system software developers, hardware designers, and application developers.

#### **About This Manual**

This document is organized into sections that correspond to each major feature.

#### **Related Documents**

The following documents are referenced by the data sheet, and available on the documentation CD or from the Stellaris<sup>®</sup> web site at www.luminarymicro.com:

- ARM® Cortex™-M3 Technical Reference Manual
- ARM® CoreSight Technical Reference Manual
- ARM® v7-M Architecture Application Level Reference Manual
- Stellaris® Peripheral Driver Library User's Guide
- Stellaris® ROM User's Guide

The following related documents are also referenced:

■ IEEE Standard 1149.1-Test Access Port and Boundary-Scan Architecture

This documentation list was current as of publication date. Please check the web site for additional documentation, including application notes and white papers.

#### **Documentation Conventions**

This document uses the conventions shown in Table 2 on page 20.

**Table 2. Documentation Conventions** 

Notation	Meaning	
General Register Notation		
REGISTER	APB registers are indicated in uppercase bold. For example, <b>PBORCTL</b> is the Power-On and Brown-Out Reset Control register. If a register name contains a lowercase n, it represents more than one register. For example, <b>SRCRn</b> represents any (or all) of the three Software Reset Control registers: <b>SRCR0</b> , <b>SRCR1</b> , and <b>SRCR2</b> .	
bit	A single bit in a register.	
bit field	Two or more consecutive and related bits.	
offset 0xnnn	A hexadecimal increment to a register's address, relative to that module's base address as specified in "Memory Map" on page 44.	

Table 2. Documentation Conventions (continued)

Notation	Meaning
Register N	Registers are numbered consecutively throughout the document to aid in referencing them. The register number has no meaning to software.
reserved	Register bits marked <i>reserved</i> are reserved for future use. In most cases, reserved bits are set to 0; however, user software should not rely on the value of a reserved bit. To provide software compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
уу:хх	The range of register bits inclusive from xx to yy. For example, 31:15 means bits 15 through 31 in that register.
Register Bit/Field Types	This value in the register bit diagram indicates whether software running on the controller can change the value of the bit field.
RC	Software can read this field. The bit or field is cleared by hardware after reading the bit/field.
RO	Software can read this field. Always write the chip reset value.
R/W	Software can read or write this field.
R/W1C	Software can read or write this field. A write of a 0 to a W1C bit does not affect the bit value in the register. A write of a 1 clears the value of the bit in the register; the remaining bits remain unchanged.
	This register type is primarily used for clearing interrupt status bits where the read operation provides the interrupt status and the write of the read value clears only the interrupts being reported at the time the register was read.
R/W1S	Software can read or write a 1 to this field. A write of a 0 to a R/W1S bit does not affect the bit value in the register.
W1C	Software can write this field. A write of a 0 to a W1C bit does not affect the bit value in the register. A write of a 1 clears the value of the bit in the register; the remaining bits remain unchanged. A read of the register returns no meaningful data.
	This register is typically used to clear the corresponding bit in an interrupt register.
WO	Only a write by software is valid; a read of the register returns no meaningful data.
Register Bit/Field Reset Value	This value in the register bit diagram shows the bit/field value after any reset, unless noted.
0	Bit cleared to 0 on chip reset.
1	Bit set to 1 on chip reset.
-	Nondeterministic.
Pin/Signal Notation	
[]	Pin alternate function; a pin defaults to the signal without the brackets.
pin	Refers to the physical connection on the package.
signal	Refers to the electrical signal encoding of a pin.
assert a signal	Change the value of the signal from the logically False state to the logically True state. For active High signals, the asserted signal value is 1 (High); for active Low signals, the asserted signal value is 0 (Low). The active polarity (High or Low) is defined by the signal name (see SIGNAL and SIGNAL below).
deassert a signal	Change the value of the signal from the logically True state to the logically False state.
SIGNAL	Signal names are in uppercase and in the Courier font. An overbar on a signal name indicates that it is active Low. To assert SIGNAL is to drive it Low; to deassert SIGNAL is to drive it High.
SIGNAL	Signal names are in uppercase and in the Courier font. An active High signal has no overbar. To assert Signal is to drive it High; to deassert Signal is to drive it Low.
Numbers	
x	An uppercase X indicates any of several values is allowed, where X can be any legal pattern. For example, a binary value of 0X00 can be either 0100 or 0000, a hex value of 0xX is 0x0 or 0x1, and so on.
L	L

#### Table 2. Documentation Conventions (continued)

Notation	Meaning
0x	Hexadecimal numbers have a prefix of 0x. For example, 0x00FF is the hexadecimal number FF.
	All other numbers within register tables are assumed to be binary. Within conceptual information, binary numbers are indicated with a b suffix, for example, 1011b, and decimal numbers are written without a prefix or suffix.

## 1 Architectural Overview

The Stellaris<sup>®</sup> family of microcontrollers—the first ARM® Cortex<sup>™</sup>-M3 based controllers—brings high-performance 32-bit computing to cost-sensitive embedded microcontroller applications. These pioneering parts deliver customers 32-bit performance at a cost equivalent to legacy 8- and 16-bit devices, all in a package with a small footprint.

The Stellaris<sup>®</sup> family offers efficient performance and extensive integration, favorably positioning the device into cost-conscious applications requiring significant control-processing and connectivity capabilities. The Stellaris<sup>®</sup> LM3S1000 series extends the Stellaris<sup>®</sup> family with larger on-chip memories, enhanced power management, and expanded I/O and control capabilities.

The LM3S1911 microcontroller is targeted for industrial applications, including remote monitoring, electronic point-of-sale machines, test and measurement equipment, network appliances and switches, factory automation, HVAC and building control, gaming equipment, motion control, medical instrumentation, and fire and security.

For applications requiring extreme conservation of power, the LM3S1911 microcontroller features a battery-backed Hibernation module to efficiently power down the LM3S1911 to a low-power state during extended periods of inactivity. With a power-up/power-down sequencer, a continuous time counter (RTC), a pair of match registers, an APB interface to the system bus, and dedicated non-volatile memory, the Hibernation module positions the LM3S1911 microcontroller perfectly for battery applications.

In addition, the LM3S1911 microcontroller offers the advantages of ARM's widely available development tools, System-on-Chip (SoC) infrastructure IP applications, and a large user community. Additionally, the microcontroller uses ARM's Thumb®-compatible Thumb-2 instruction set to reduce memory requirements and, thereby, cost. Finally, the LM3S1911 microcontroller is code-compatible to all members of the extensive Stellaris® family; providing flexibility to fit our customers' precise needs

Texas Instruments offers a complete solution to get to market quickly, with evaluation and development boards, white papers and application notes, an easy-to-use peripheral driver library, and a strong support, sales, and distributor network. See "Ordering and Contact Information" on page 450 for ordering information for Stellaris<sup>®</sup> family devices.

#### 1.1 Product Features

The LM3S1911 microcontroller includes the following product features:

- 32-Bit RISC Performance
  - 32-bit ARM® Cortex™-M3 v7M architecture optimized for small-footprint embedded applications
  - System timer (SysTick), providing a simple, 24-bit clear-on-write, decrementing, wrap-on-zero counter with a flexible control mechanism
  - Thumb®-compatible Thumb-2-only instruction set processor core for high code density
  - 50-MHz operation
  - Hardware-division and single-cycle-multiplication

- Integrated Nested Vectored Interrupt Controller (NVIC) providing deterministic interrupt handling
- 29 interrupts with eight priority levels
- Memory protection unit (MPU), providing a privileged mode for protected operating system functionality
- Unaligned data access, enabling data to be efficiently packed into memory
- Atomic bit manipulation (bit-banding), delivering maximum memory utilization and streamlined peripheral control
- ARM® Cortex™-M3 Processor Core
  - Compact core.
  - Thumb-2 instruction set, delivering the high-performance expected of an ARM core in the memory size usually associated with 8- and 16-bit devices; typically in the range of a few kilobytes of memory for microcontroller class applications.
  - Rapid application execution through Harvard architecture characterized by separate buses for instruction and data.
  - Exceptional interrupt handling, by implementing the register manipulations required for handling an interrupt in hardware.
  - Deterministic, fast interrupt processing: always 12 cycles, or just 6 cycles with tail-chaining
  - Memory protection unit (MPU) to provide a privileged mode of operation for complex applications.
  - Migration from the ARM7™ processor family for better performance and power efficiency.
  - Full-featured debug solution
    - Serial Wire JTAG Debug Port (SWJ-DP)
    - Flash Patch and Breakpoint (FPB) unit for implementing breakpoints
    - Data Watchpoint and Trigger (DWT) unit for implementing watchpoints, trigger resources, and system profiling
    - Instrumentation Trace Macrocell (ITM) for support of printf style debugging
    - Trace Port Interface Unit (TPIU) for bridging to a Trace Port Analyzer
  - Optimized for single-cycle flash usage
  - Three sleep modes with clock gating for low power
  - Single-cycle multiply instruction and hardware divide
  - Atomic operations
  - ARM Thumb2 mixed 16-/32-bit instruction set

#### - 1.25 DMIPS/MHz

#### ■ JTAG

- IEEE 1149.1-1990 compatible Test Access Port (TAP) controller
- Four-bit Instruction Register (IR) chain for storing JTAG instructions
- IEEE standard instructions: BYPASS, IDCODE, SAMPLE/PRELOAD, EXTEST and INTEST
- ARM additional instructions: APACC, DPACC and ABORT
- Integrated ARM Serial Wire Debug (SWD)

#### Hibernation

- System power control using discrete external regulator
- Dedicated pin for waking from an external signal
- Low-battery detection, signaling, and interrupt generation
- 32-bit real-time counter (RTC)
- Two 32-bit RTC match registers for timed wake-up and interrupt generation
- Clock source from a 32.768-kHz external oscillator or a 4.194304-MHz crystal
- RTC predivider trim for making fine adjustments to the clock rate
- 64 32-bit words of non-volatile memory
- Programmable interrupts for RTC match, external wake, and low battery events

#### Internal Memory

- 256 KB single-cycle flash
  - User-managed flash block protection on a 2-KB block basis
  - · User-managed flash data programming
  - User-defined and managed flash-protection block
- 64 KB single-cycle SRAM

#### ■ GPIOs

- 23-60 GPIOs, depending on configuration
- 5-V-tolerant input/outputs
- Programmable control for GPIO interrupts
  - · Interrupt generation masking
  - · Edge-triggered on rising, falling, or both

- Level-sensitive on High or Low values
- Bit masking in both read and write operations through address lines
- Pins configured as digital inputs are Schmitt-triggered.
- Programmable control for GPIO pad configuration
  - · Weak pull-up or pull-down resistors
  - 2-mA, 4-mA, and 8-mA pad drive for digital communication; up to four pads can be configured with an 18-mA pad drive for high-current applications
  - · Slew rate control for the 8-mA drive
  - · Open drain enables
  - · Digital input enables
- General-Purpose Timers
  - Four General-Purpose Timer Modules (GPTM), each of which provides two 16-bit timers.
     Each GPTM can be configured to operate independently:
    - As a single 32-bit timer
    - As one 32-bit Real-Time Clock (RTC) to event capture
    - For Pulse Width Modulation (PWM)
  - 32-bit Timer modes
    - Programmable one-shot timer
    - · Programmable periodic timer
    - Real-Time Clock when using an external 32.768-KHz clock as the input
    - Software-controlled event stalling (excluding RTC mode)
  - 16-bit Timer modes
    - General-purpose timer function with an 8-bit prescaler (for one-shot and periodic modes only)
    - Programmable one-shot timer
    - Programmable periodic timer
    - User-enabled stalling when the controller asserts CPU Halt flag during debug
  - 16-bit Input Capture modes
    - · Input edge count capture
    - · Input edge time capture

- 16-bit PWM mode
  - Simple PWM mode with software-programmable output inversion of the PWM signal
- ARM FiRM-compliant Watchdog Timer
  - 32-bit down counter with a programmable load register
  - Separate watchdog clock with an enable
  - Programmable interrupt generation logic with interrupt masking
  - Lock register protection from runaway software
  - Reset generation logic with an enable/disable
  - User-enabled stalling when the controller asserts the CPU Halt flag during debug

#### UART

- Three fully programmable 16C550-type UARTs with IrDA support
- Separate 16x8 transmit (TX) and receive (RX) FIFOs to reduce CPU interrupt service loading
- Programmable baud-rate generator allowing speeds up to 3.125 Mbps
- Programmable FIFO length, including 1-byte deep operation providing conventional double-buffered interface
- FIFO trigger levels of 1/8, 1/4, 1/2, 3/4, and 7/8
- Standard asynchronous communication bits for start, stop, and parity
- False-start bit detection
- Line-break generation and detection
- Fully programmable serial interface characteristics
  - 5, 6, 7, or 8 data bits
  - Even, odd, stick, or no-parity bit generation/detection
  - 1 or 2 stop bit generation
- IrDA serial-IR (SIR) encoder/decoder providing
  - Programmable use of IrDA Serial Infrared (SIR) or UART input/output
  - Support of IrDA SIR encoder/decoder functions for data rates up to 115.2 Kbps half-duplex
  - Support of normal 3/16 and low-power (1.41-2.23 µs) bit durations
  - Programmable internal clock generator enabling division of reference clock by 1 to 256 for low-power mode bit duration
- Synchronous Serial Interface (SSI)

- Two SSI modules, each with the following features:
- Master or slave operation
- Programmable clock bit rate and prescale
- Separate transmit and receive FIFOs, 16 bits wide, 8 locations deep
- Programmable interface operation for Freescale SPI, MICROWIRE, or Texas Instruments synchronous serial interfaces
- Programmable data frame size from 4 to 16 bits
- Internal loopback test mode for diagnostic/debug testing

#### ■ I<sup>2</sup>C

- Two I<sup>2</sup>C modules, each with the following features:
- Devices on the I<sup>2</sup>C bus can be designated as either a master or a slave
  - Supports both sending and receiving data as either a master or a slave
  - · Supports simultaneous master and slave operation
- Four I<sup>2</sup>C modes
  - Master transmit
  - Master receive
  - Slave transmit
  - · Slave receive
- Two transmission speeds: Standard (100 Kbps) and Fast (400 Kbps)
- Master and slave interrupt generation
  - Master generates interrupts when a transmit or receive operation completes (or aborts due to an error)
  - Slave generates interrupts when data has been sent or requested by a master
- Master with arbitration and clock synchronization, multimaster support, and 7-bit addressing mode

#### Analog Comparators

- Two independent integrated analog comparators
- Configurable for output to drive an output pin or generate an interrupt
- Compare external pin input to external pin input or to internal programmable voltage reference
- Compare a test voltage against any one of these voltages

- · An individual external reference voltage
- · A shared single external reference voltage
- · A shared internal reference voltage

#### ■ Power

- On-chip Low Drop-Out (LDO) voltage regulator, with programmable output user-adjustable from 2.25 V to 2.75 V
- Hibernation module handles the power-up/down 3.3 V sequencing and control for the core digital logic and analog circuits
- Low-power options on controller: Sleep and Deep-sleep modes
- Low-power options for peripherals: software controls shutdown of individual peripherals
- 3.3-V supply brown-out detection and reporting via interrupt or reset
- Flexible Reset Sources
  - Power-on reset (POR)
  - Reset pin assertion
  - Brown-out (BOR) detector alerts to system power drops
  - Software reset
  - Watchdog timer reset
  - Internal low drop-out (LDO) regulator output goes unregulated
- Industrial and extended temperature 100-pin RoHS-compliant LQFP package
- Industrial-range 108-ball RoHS-compliant BGA package

## 1.2 Target Applications

- Remote monitoring
- Electronic point-of-sale (POS) machines
- Test and measurement equipment
- Network appliances and switches
- Factory automation
- HVAC and building control
- Gaming equipment
- Motion control

- Medical instrumentation
- Fire and security
- Power and energy
- Transportation

## 1.3 High-Level Block Diagram

Figure 1-1 on page 31 depicts the features on the Stellaris<sup>®</sup> LM3S1911 microcontroller.

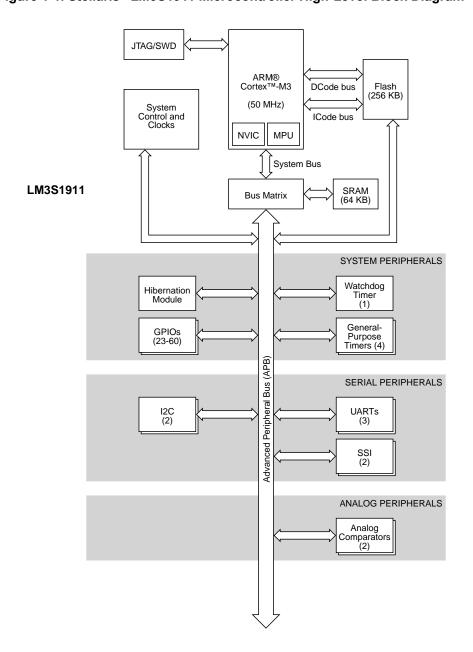

Figure 1-1. Stellaris<sup>®</sup> LM3S1911 Microcontroller High-Level Block Diagram

October 13, 2009 31

#### 1.4 Functional Overview

The following sections provide an overview of the features of the LM3S1911 microcontroller. The page number in parenthesis indicates where that feature is discussed in detail. Ordering and support information can be found in "Ordering and Contact Information" on page 450.

#### 1.4.1 ARM Cortex™-M3

#### 1.4.1.1 Processor Core (see page 38)

All members of the Stellaris<sup>®</sup> product family, including the LM3S1911 microcontroller, are designed around an ARM Cortex<sup>™</sup>-M3 processor core. The ARM Cortex-M3 processor provides the core for a high-performance, low-cost platform that meets the needs of minimal memory implementation, reduced pin count, and low-power consumption, while delivering outstanding computational performance and exceptional system response to interrupts.

"ARM Cortex-M3 Processor Core" on page 38 provides an overview of the ARM core; the core is detailed in the *ARM*® *Cortex*™-*M3 Technical Reference Manual*.

#### 1.4.1.2 System Timer (SysTick) (see page 41)

Cortex-M3 includes an integrated system timer, SysTick. SysTick provides a simple, 24-bit clear-on-write, decrementing, wrap-on-zero counter with a flexible control mechanism. The counter can be used in several different ways, for example:

- An RTOS tick timer which fires at a programmable rate (for example, 100 Hz) and invokes a SysTick routine.
- A high-speed alarm timer using the system clock.
- A variable rate alarm or signal timer—the duration is range-dependent on the reference clock used and the dynamic range of the counter.
- A simple counter. Software can use this to measure time to completion and time used.
- An internal clock source control based on missing/meeting durations. The COUNTFLAG bit-field in the control and status register can be used to determine if an action completed within a set duration, as part of a dynamic clock management control loop.

#### 1.4.1.3 Nested Vectored Interrupt Controller (NVIC) (see page 46)

The LM3S1911 controller includes the ARM Nested Vectored Interrupt Controller (NVIC) on the ARM® Cortex™-M3 core. The NVIC and Cortex-M3 prioritize and handle all exceptions. All exceptions are handled in Handler Mode. The processor state is automatically stored to the stack on an exception, and automatically restored from the stack at the end of the Interrupt Service Routine (ISR). The vector is fetched in parallel to the state saving, which enables efficient interrupt entry. The processor supports tail-chaining, which enables back-to-back interrupts to be performed without the overhead of state saving and restoration. Software can set eight priority levels on 7 exceptions (system handlers) and 29 interrupts.

"Interrupts" on page 46 provides an overview of the NVIC controller and the interrupt map. Exceptions and interrupts are detailed in the *ARM*® *Cortex*™-*M3 Technical Reference Manual*.

#### 1.4.2 Motor Control Peripherals

To enhance motor control, the LM3S1911 controller features Pulse Width Modulation (PWM) outputs.

#### 1.4.2.1 PWM

Pulse width modulation (PWM) is a powerful technique for digitally encoding analog signal levels. High-resolution counters are used to generate a square wave, and the duty cycle of the square wave is modulated to encode an analog signal. Typical applications include switching power supplies and motor control.

On the LM3S1911, PWM motion control functionality can be achieved through:

■ The motion control features of the general-purpose timers using the CCP pins

#### CCP Pins (see page 212)

The General-Purpose Timer Module's CCP (Capture Compare PWM) pins are software programmable to support a simple PWM mode with a software-programmable output inversion of the PWM signal.

#### 1.4.3 Analog Peripherals

For support of analog signals, the LM3S1911 microcontroller offers two analog comparators.

#### 1.4.3.1 Analog Comparators (see page 380)

An analog comparator is a peripheral that compares two analog voltages, and provides a logical output that signals the comparison result.

The LM3S1911 microcontroller provides two independent integrated analog comparators that can be configured to drive an output or generate an interrupt .

A comparator can compare a test voltage against any one of these voltages:

- An individual external reference voltage
- A shared single external reference voltage
- A shared internal reference voltage

The comparator can provide its output to a device pin, acting as a replacement for an analog comparator on the board, or it can be used to signal the application via interrupts to cause it to start capturing a sample sequence.

#### 1.4.4 Serial Communications Peripherals

The LM3S1911 controller supports both asynchronous and synchronous serial communications with:

- Three fully programmable 16C550-type UARTs
- Two SSI modules
- Two I<sup>2</sup>C modules

#### 1.4.4.1 **UART** (see page 266)

A Universal Asynchronous Receiver/Transmitter (UART) is an integrated circuit used for RS-232C serial communications, containing a transmitter (parallel-to-serial converter) and a receiver (serial-to-parallel converter), each clocked separately.

The LM3S1911 controller includes three fully programmable 16C550-type UARTs that support data transfer speeds up to 3.125 Mbps. (Although similar in functionality to a 16C550 UART, it is not register-compatible.) In addition, each UART is capable of supporting IrDA.

Separate 16x8 transmit (TX) and receive (RX) FIFOs reduce CPU interrupt service loading. The UART can generate individually masked interrupts from the RX, TX, modem status, and error conditions. The module provides a single combined interrupt when any of the interrupts are asserted and are unmasked.

#### 1.4.4.2 SSI (see page 307)

Synchronous Serial Interface (SSI) is a four-wire bi-directional full and low-speed communications interface.

The LM3S1911 controller includes two SSI modules that provide the functionality for synchronous serial communications with peripheral devices, and can be configured to use the Freescale SPI, MICROWIRE, or TI synchronous serial interface frame formats. The size of the data frame is also configurable, and can be set between 4 and 16 bits, inclusive.

Each SSI module performs serial-to-parallel conversion on data received from a peripheral device, and parallel-to-serial conversion on data transmitted to a peripheral device. The TX and RX paths are buffered with internal FIFOs, allowing up to eight 16-bit values to be stored independently.

Each SSI module can be configured as either a master or slave device. As a slave device, the SSI module can also be configured to disable its output, which allows a master device to be coupled with multiple slave devices.

Each SSI module also includes a programmable bit rate clock divider and prescaler to generate the output serial clock derived from the SSI module's input clock. Bit rates are generated based on the input clock and the maximum bit rate is determined by the connected peripheral.

#### 1.4.4.3 I<sup>2</sup>C (see page 344)

The Inter-Integrated Circuit (I<sup>2</sup>C) bus provides bi-directional data transfer through a two-wire design (a serial data line SDA and a serial clock line SCL).

The I<sup>2</sup>C bus interfaces to external I<sup>2</sup>C devices such as serial memory (RAMs and ROMs), networking devices, LCDs, tone generators, and so on. The I<sup>2</sup>C bus may also be used for system testing and diagnostic purposes in product development and manufacture.

The LM3S1911 controller includes two I<sup>2</sup>C modules that provide the ability to communicate to other IC devices over an I<sup>2</sup>C bus. The I<sup>2</sup>C bus supports devices that can both transmit and receive (write and read) data.

Devices on the  $I^2C$  bus can be designated as either a master or a slave. Each  $I^2C$  module supports both sending and receiving data as either a master or a slave, and also supports the simultaneous operation as both a master and a slave. The four  $I^2C$  modes are: Master Transmit, Master Receive, Slave Transmit, and Slave Receive.

A Stellaris<sup>®</sup> I<sup>2</sup>C module can operate at two speeds: Standard (100 Kbps) and Fast (400 Kbps).

Both the I<sup>2</sup>C master and slave can generate interrupts. The I<sup>2</sup>C master generates interrupts when a transmit or receive operation completes (or aborts due to an error). The I<sup>2</sup>C slave generates interrupts when data has been sent or requested by a master.

#### 1.4.5 System Peripherals

#### 1.4.5.1 Programmable GPIOs (see page 165)

General-purpose input/output (GPIO) pins offer flexibility for a variety of connections.

The Stellaris<sup>®</sup> GPIO module is comprised of eight physical GPIO blocks, each corresponding to an individual GPIO port. The GPIO module is FiRM-compliant (compliant to the ARM Foundation IP for Real-Time Microcontrollers specification) and supports 23-60 programmable input/output pins. The number of GPIOs available depends on the peripherals being used (see "Signal Tables" on page 393 for the signals available to each GPIO pin).

The GPIO module features programmable interrupt generation as either edge-triggered or level-sensitive on all pins, programmable control for GPIO pad configuration, and bit masking in both read and write operations through address lines. Pins configured as digital inputs are Schmitt-triggered.

#### 1.4.5.2 Four Programmable Timers (see page 206)

Programmable timers can be used to count or time external events that drive the Timer input pins.

The Stellaris<sup>®</sup> General-Purpose Timer Module (GPTM) contains four GPTM blocks. Each GPTM block provides two 16-bit timers/counters that can be configured to operate independently as timers or event counters, or configured to operate as one 32-bit timer or one 32-bit Real-Time Clock (RTC).

When configured in 32-bit mode, a timer can run as a Real-Time Clock (RTC), one-shot timer or periodic timer. When in 16-bit mode, a timer can run as a one-shot timer or periodic timer, and can extend its precision by using an 8-bit prescaler. A 16-bit timer can also be configured for event capture or Pulse Width Modulation (PWM) generation.

#### 1.4.5.3 Watchdog Timer (see page 242)

A watchdog timer can generate nonmaskable interrupts (NMIs) or a reset when a time-out value is reached. The watchdog timer is used to regain control when a system has failed due to a software error or to the failure of an external device to respond in the expected way.

The Stellaris<sup>®</sup> Watchdog Timer module consists of a 32-bit down counter, a programmable load register, interrupt generation logic, and a locking register.

The Watchdog Timer can be configured to generate an interrupt to the controller on its first time-out, and to generate a reset signal on its second time-out. Once the Watchdog Timer has been configured, the lock register can be written to prevent the timer configuration from being inadvertently altered.

#### 1.4.6 Memory Peripherals

The LM3S1911 controller offers both single-cycle SRAM and single-cycle Flash memory.

#### 1.4.6.1 SRAM (see page 141)

The LM3S1911 static random access memory (SRAM) controller supports 64 KB SRAM. The internal SRAM of the Stellaris® devices is located at offset 0x0000.0000 of the device memory map. To reduce the number of time-consuming read-modify-write (RMW) operations, ARM has introduced bit-banding technology in the new Cortex-M3 processor. With a bit-band-enabled processor, certain regions in the memory map (SRAM and peripheral space) can use address aliases to access individual bits in a single, atomic operation.

#### 1.4.6.2 Flash (see page 142)

The LM3S1911 Flash controller supports 256 KB of flash memory. The flash is organized as a set of 1-KB blocks that can be individually erased. Erasing a block causes the entire contents of the block to be reset to all 1s. These blocks are paired into a set of 2-KB blocks that can be individually protected. The blocks can be marked as read-only or execute-only, providing different levels of code protection. Read-only blocks cannot be erased or programmed, protecting the contents of those blocks from being modified. Execute-only blocks cannot be erased or programmed, and can only be read by the controller instruction fetch mechanism, protecting the contents of those blocks from being read by either the controller or by a debugger.

#### 1.4.7 Additional Features

#### 1.4.7.1 Memory Map (see page 44)

A memory map lists the location of instructions and data in memory. The memory map for the LM3S1911 controller can be found in "Memory Map" on page 44. Register addresses are given as a hexadecimal increment, relative to the module's base address as shown in the memory map.

The ARM® Cortex™-M3 Technical Reference Manual provides further information on the memory map.

#### 1.4.7.2 JTAG TAP Controller (see page 49)

The Joint Test Action Group (JTAG) port is an IEEE standard that defines a Test Access Port and Boundary Scan Architecture for digital integrated circuits and provides a standardized serial interface for controlling the associated test logic. The TAP, Instruction Register (IR), and Data Registers (DR) can be used to test the interconnections of assembled printed circuit boards and obtain manufacturing information on the components. The JTAG Port also provides a means of accessing and controlling design-for-test features such as I/O pin observation and control, scan testing, and debugging.

The JTAG port is composed of the standard five pins: TRST, TCK, TMS, TDI, and TDO. Data is transmitted serially into the controller on TDI and out of the controller on TDO. The interpretation of this data is dependent on the current state of the TAP controller. For detailed information on the operation of the JTAG port and TAP controller, please refer to the IEEE Standard 1149.1-Test Access Port and Boundary-Scan Architecture.

The Stellaris<sup>®</sup> JTAG controller works with the ARM JTAG controller built into the Cortex-M3 core. This is implemented by multiplexing the TDO outputs from both JTAG controllers. ARM JTAG instructions select the ARM TDO output while Stellaris<sup>®</sup> JTAG instructions select the Stellaris<sup>®</sup> TDO outputs. The multiplexer is controlled by the Stellaris<sup>®</sup> JTAG controller, which has comprehensive programming for the ARM, Stellaris<sup>®</sup>, and unimplemented JTAG instructions.

#### 1.4.7.3 System Control and Clocks (see page 61)

System control determines the overall operation of the device. It provides information about the device, controls the clocking of the device and individual peripherals, and handles reset detection and reporting.

#### 1.4.7.4 Hibernation Module (see page 121)

The Hibernation module provides logic to switch power off to the main processor and peripherals, and to wake on external or time-based events. The Hibernation module includes power-sequencing logic, a real-time clock with a pair of match registers, low-battery detection circuitry, and interrupt signalling to the processor. It also includes 64 32-bit words of non-volatile memory that can be used for saving state during hibernation.

### 1.4.8 Hardware Details

Details on the pins and package can be found in the following sections:

- "Pin Diagram" on page 391
- "Signal Tables" on page 393
- "Operating Characteristics" on page 418
- "Electrical Characteristics" on page 419
- "Package Information" on page 452

## 2 ARM Cortex-M3 Processor Core

The ARM Cortex-M3 processor provides the core for a high-performance, low-cost platform that meets the needs of minimal memory implementation, reduced pin count, and low power consumption, while delivering outstanding computational performance and exceptional system response to interrupts. Features include:

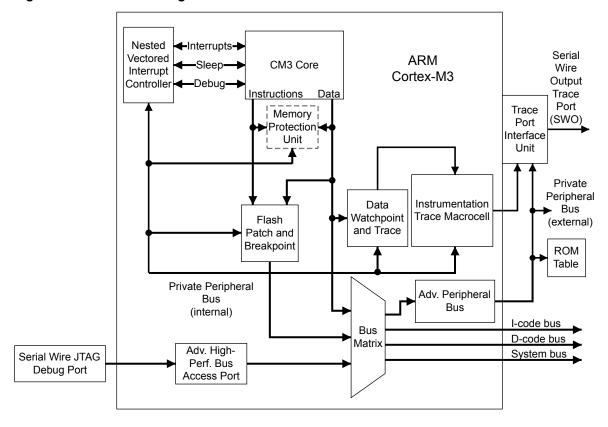

- Compact core.
- Thumb-2 instruction set, delivering the high-performance expected of an ARM core in the memory size usually associated with 8- and 16-bit devices; typically in the range of a few kilobytes of memory for microcontroller class applications.
- Rapid application execution through Harvard architecture characterized by separate buses for instruction and data.
- Exceptional interrupt handling, by implementing the register manipulations required for handling an interrupt in hardware.
- Deterministic, fast interrupt processing: always 12 cycles, or just 6 cycles with tail-chaining
- Memory protection unit (MPU) to provide a privileged mode of operation for complex applications.
- Migration from the ARM7<sup>™</sup> processor family for better performance and power efficiency.
- Full-featured debug solution
  - Serial Wire JTAG Debug Port (SWJ-DP)
  - Flash Patch and Breakpoint (FPB) unit for implementing breakpoints
  - Data Watchpoint and Trigger (DWT) unit for implementing watchpoints, trigger resources, and system profiling
  - Instrumentation Trace Macrocell (ITM) for support of printf style debugging
  - Trace Port Interface Unit (TPIU) for bridging to a Trace Port Analyzer
- Optimized for single-cycle flash usage
- Three sleep modes with clock gating for low power
- Single-cycle multiply instruction and hardware divide
- Atomic operations
- ARM Thumb2 mixed 16-/32-bit instruction set
- 1.25 DMIPS/MHz

The Stellaris<sup>®</sup> family of microcontrollers builds on this core to bring high-performance 32-bit computing to cost-sensitive embedded microcontroller applications, such as factory automation and control, industrial control power devices, building and home automation, and stepper motors.

For more information on the ARM Cortex-M3 processor core, see the *ARM*® *Cortex*™-*M3 Technical Reference Manual*. For information on SWJ-DP, see the *ARM*® *CoreSight Technical Reference Manual*.

## 2.1 Block Diagram

Figure 2-1. CPU Block Diagram

## 2.2 Functional Description

Important: The ARM® Cortex™-M3 Technical Reference Manual describes all the features of an ARM Cortex-M3 in detail. However, these features differ based on the implementation. This section describes the Stellaris® implementation.

Texas Instruments has implemented the ARM Cortex-M3 core as shown in Figure 2-1 on page 39. As noted in the *ARM*® *Cortex*<sup>™</sup>-*M3 Technical Reference Manual*, several Cortex-M3 components are flexible in their implementation: SW/JTAG-DP, ETM, TPIU, the ROM table, the MPU, and the Nested Vectored Interrupt Controller (NVIC). Each of these is addressed in the sections that follow.

## 2.2.1 Serial Wire and JTAG Debug

Texas Instruments has replaced the ARM SW-DP and JTAG-DP with the ARM CoreSight™-compliant Serial Wire JTAG Debug Port (SWJ-DP) interface. This means Chapter 12, "Debug Port," of the *ARM® Cortex™-M3 Technical Reference Manual* does not apply to Stellaris<sup>®</sup> devices.

The SWJ-DP interface combines the SWD and JTAG debug ports into one module. See the CoreSight™ Design Kit Technical Reference Manual for details on SWJ-DP.

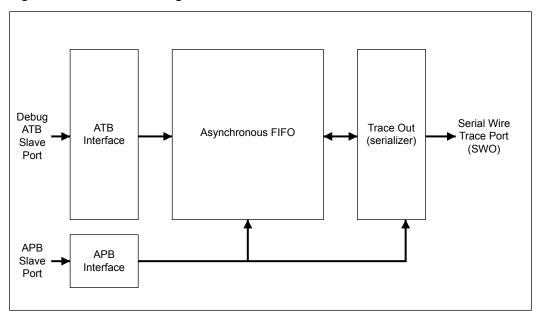

### 2.2.2 Embedded Trace Macrocell (ETM)

ETM was not implemented in the Stellaris<sup>®</sup> devices. This means Chapters 15 and 16 of the *ARM*® *Cortex*™-*M3 Technical Reference Manual* can be ignored.

## 2.2.3 Trace Port Interface Unit (TPIU)

The TPIU acts as a bridge between the Cortex-M3 trace data from the ITM, and an off-chip Trace Port Analyzer. The Stellaris<sup>®</sup> devices have implemented TPIU as shown in Figure 2-2 on page 40. This is similar to the non-ETM version described in the *ARM® Cortex™-M3 Technical Reference Manual*, however, SWJ-DP only provides SWV output for the TPIU.

Figure 2-2. TPIU Block Diagram

#### 2.2.4 ROM Table

The default ROM table was implemented as described in the *ARM*® *Cortex*™-*M3 Technical Reference Manual*.

## 2.2.5 Memory Protection Unit (MPU)

The Memory Protection Unit (MPU) is included on the LM3S1911 controller and supports the standard ARMv7 Protected Memory System Architecture (PMSA) model. The MPU provides full support for protection regions, overlapping protection regions, access permissions, and exporting memory attributes to the system.

## 2.2.6 Nested Vectored Interrupt Controller (NVIC)

The Nested Vectored Interrupt Controller (NVIC):

- Facilitates low-latency exception and interrupt handling
- Controls power management
- Implements system control registers

The NVIC supports up to 240 dynamically reprioritizable interrupts each with up to 256 levels of priority. The NVIC and the processor core interface are closely coupled, which enables low latency interrupt processing and efficient processing of late arriving interrupts. The NVIC maintains knowledge of the stacked (nested) interrupts to enable tail-chaining of interrupts.

You can only fully access the NVIC from privileged mode, but you can pend interrupts in user-mode if you enable the Configuration Control Register (see the ARM® Cortex™-M3 Technical Reference Manual). Any other user-mode access causes a bus fault.

All NVIC registers are accessible using byte, halfword, and word unless otherwise stated.

## 2.2.6.1 Interrupts

The ARM® Cortex™-M3 Technical Reference Manual describes the maximum number of interrupts and interrupt priorities. The LM3S1911 microcontroller supports 29 interrupts with eight priority levels.

## 2.2.6.2 System Timer (SysTick)

Cortex-M3 includes an integrated system timer, SysTick. SysTick provides a simple, 24-bit clear-on-write, decrementing, wrap-on-zero counter with a flexible control mechanism. The counter can be used in several different ways, for example:

- An RTOS tick timer which fires at a programmable rate (for example, 100 Hz) and invokes a SysTick routine.
- A high-speed alarm timer using the system clock.
- A variable rate alarm or signal timer—the duration is range-dependent on the reference clock used and the dynamic range of the counter.
- A simple counter. Software can use this to measure time to completion and time used.
- An internal clock source control based on missing/meeting durations. The COUNTFLAG bit-field in the control and status register can be used to determine if an action completed within a set duration, as part of a dynamic clock management control loop.

#### **Functional Description**

The timer consists of three registers:

- A control and status counter to configure its clock, enable the counter, enable the SysTick interrupt, and determine counter status.
- The reload value for the counter, used to provide the counter's wrap value.
- The current value of the counter.

A fourth register, the SysTick Calibration Value Register, is not implemented in the Stellaris<sup>®</sup> devices.

When enabled, the timer counts down from the reload value to zero, reloads (wraps) to the value in the SysTick Reload Value register on the next clock edge, then decrements on subsequent clocks. Writing a value of zero to the Reload Value register disables the counter on the next wrap. When the counter reaches zero, the COUNTFLAG status bit is set. The COUNTFLAG bit clears on reads.

Writing to the Current Value register clears the register and the COUNTFLAG status bit. The write does not trigger the SysTick exception logic. On a read, the current value is the value of the register at the time the register is accessed.

If the core is in debug state (halted), the counter will not decrement. The timer is clocked with respect to a reference clock. The reference clock can be the core clock or an external clock source.

## SysTick Control and Status Register

Use the SysTick Control and Status Register to enable the SysTick features. The reset is 0x0000.0000.

Bit/Field	Name	Type	Reset	Description
31:17	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
16	COUNTFLAG	R/W	0	Count Flag
				Returns 1 if timer counted to 0 since last time this was read. Clears on read by application. If read by the debugger using the DAP, this bit is cleared on read-only if the MasterType bit in the AHB-AP Control Register is set to 0. Otherwise, the COUNTFLAG bit is not changed by the debugger read.
15:3	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
2	CLKSOURCE	R/W	0	Clock Source
				Value Description
				External reference clock. (Not implemented for Stellaris microcontrollers.)
				1 Core clock
				If no reference clock is provided, it is held at 1 and so gives the same time as the core clock. The core clock must be at least 2.5 times faster than the reference clock. If it is not, the count values are unpredictable.
1	TICKINT	R/W	0	Tick Interrupt
				Value Description
				O Counting down to 0 does not generate the interrupt request to the NVIC. Software can use the COUNTFLAG to determine if ever counted to 0.
				1 Counting down to 0 pends the SysTick handler.
0	ENABLE	R/W	0	Enable
				Value Description
				0 Counter disabled.
				1 Counter operates in a multi-shot way. That is, counter loads with the Reload value and then begins counting down. On reaching 0, it sets the COUNTFLAG to 1 and optionally pends the SysTick handler, based on TICKINT. It then loads the Reload value again, and begins counting.

#### SysTick Reload Value Register

Use the SysTick Reload Value Register to specify the start value to load into the current value register when the counter reaches 0. It can be any value between 1 and 0x00FF.FFFF. A start value of 0 is possible, but has no effect because the SysTick interrupt and COUNTFLAG are activated when counting from 1 to 0.

Therefore, as a multi-shot timer, repeated over and over, it fires every N+1 clock pulse, where N is any value from 1 to 0x00FF.FFFF. So, if the tick interrupt is required every 100 clock pulses, 99 must be written into the RELOAD. If a new value is written on each tick interrupt, so treated as single shot, then the actual count down must be written. For example, if a tick is next required after 400 clock pulses, 400 must be written into the RELOAD.

Bit/Field	Name	Type	Reset	Description
31:24	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
23:0	RELOAD	R/W	-	Reload
				Value to load into the SysTick Current Value Register when the counter reaches 0.

#### SysTick Current Value Register

Use the SysTick Current Value Register to find the current value in the register.

Bit/Field	Name	Type	Reset	Description
31:24	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
23:0	CURRENT	W1C	-	Current Value
				Current value at the time the register is accessed. No read-modify-write protection is provided, so change with care.
				This register is write-clear. Writing to it with any value clears the register to 0. Clearing this register also clears the COUNTFLAG bit of the SysTick Control and Status Register.

#### SysTick Calibration Value Register

The SysTick Calibration Value register is not implemented.

# 3 Memory Map

The memory map for the LM3S1911 controller is provided in Table 3-1 on page 44.

In this manual, register addresses are given as a hexadecimal increment, relative to the module's base address as shown in the memory map. See also Chapter 4, "Memory Map" in the ARM® Cortex<sup>TM</sup>-M3 Technical Reference Manual.

a. All reserved space returns a bus fault when read or written.

b. The unavailable flash will bus fault throughout this range.

c. The unavailable SRAM will bus fault throughout this range.

# 4 Interrupts

The ARM Cortex-M3 processor and the Nested Vectored Interrupt Controller (NVIC) prioritize and handle all exceptions. All exceptions are handled in Handler Mode. The processor state is automatically stored to the stack on an exception, and automatically restored from the stack at the end of the Interrupt Service Routine (ISR). The vector is fetched in parallel to the state saving, which enables efficient interrupt entry. The processor supports tail-chaining, which enables back-to-back interrupts to be performed without the overhead of state saving and restoration.

Table 4-1 on page 46 lists all exception types. Software can set eight priority levels on seven of these exceptions (system handlers) as well as on 29 interrupts (listed in Table 4-2 on page 47).

Priorities on the system handlers are set with the NVIC System Handler Priority registers. Interrupts are enabled through the NVIC Interrupt Set Enable register and prioritized with the NVIC Interrupt Priority registers. You also can group priorities by splitting priority levels into pre-emption priorities and subpriorities. All of the interrupt registers are described in Chapter 8, "Nested Vectored Interrupt Controller" in the *ARM*® *Cortex*™-*M3 Technical Reference Manual*.

Internally, the highest user-settable priority (0) is treated as fourth priority, after a Reset, NMI, and a Hard Fault. Note that 0 is the default priority for all the settable priorities.

If you assign the same priority level to two or more interrupts, their hardware priority (the lower position number) determines the order in which the processor activates them. For example, if both GPIO Port A and GPIO Port B are priority level 1, then GPIO Port A has higher priority.

Important: It may take several processor cycles after a write to clear an interrupt source in order for NVIC to see the interrupt source de-assert. This means if the interrupt clear is done as the last action in an interrupt handler, it is possible for the interrupt handler to complete while NVIC sees the interrupt as still asserted, causing the interrupt handler to be re-entered errantly. This can be avoided by either clearing the interrupt source at the beginning of the interrupt handler or by performing a read or write after the write to clear the interrupt source (and flush the write buffer).

See Chapter 5, "Exceptions" and Chapter 8, "Nested Vectored Interrupt Controller" in the *ARM*® *Cortex*™-*M3 Technical Reference Manual* for more information on exceptions and interrupts.

Table 4-1. Exception Types

Exception Type	Vector Number	Priority <sup>a</sup>	Description
-	0	-	Stack top is loaded from first entry of vector table on reset.
Reset	1	-3 (highest)	Invoked on power up and warm reset. On first instruction, drops to lowest priority (and then is called the base level of activation). This is asynchronous.
Non-Maskable Interrupt (NMI)	2	-2	Cannot be stopped or preempted by any exception but reset. This is asynchronous.  An NMI is only producible by software, using the NVIC Interrupt Control State register.
Hard Fault	3	-1	All classes of Fault, when the fault cannot activate due to priority or the configurable fault handler has been disabled. This is synchronous.
Memory Management	4	settable	MPU mismatch, including access violation and no match. This is synchronous.
			The priority of this exception can be changed.

Table 4-1. Exception Types (continued)

Exception Type	Vector Number	<b>Priority</b> <sup>a</sup>	Description
Bus Fault	5	settable	Pre-fetch fault, memory access fault, and other address/memory related faults. This is synchronous when precise and asynchronous when imprecise.
			You can enable or disable this fault.
Usage Fault	6	settable	Usage fault, such as undefined instruction executed or illegal state transition attempt. This is synchronous.
-	7-10	-	Reserved.
SVCall	11	settable	System service call with SVC instruction. This is synchronous.
Debug Monitor	12	settable	Debug monitor (when not halting). This is synchronous, but only active when enabled. It does not activate if lower priority than the current activation.
-	13	-	Reserved.
PendSV	14	settable	Pendable request for system service. This is asynchronous and only pended by software.
SysTick	15	settable	System tick timer has fired. This is asynchronous.
Interrupts	16 and above	settable	Asserted from outside the ARM Cortex-M3 core and fed through the NVIC (prioritized). These are all asynchronous. Table 4-2 on page 47 lists the interrupts on the LM3S1911 controller.

a. 0 is the default priority for all the settable priorities.

Table 4-2. Interrupts

Vector Number	Interrupt Number (Bit in Interrupt Registers)	Description
0-15	-	Processor exceptions
16	0	GPIO Port A
17	1	GPIO Port B
18	2	GPIO Port C
19	3	GPIO Port D
20	4	GPIO Port E
21	5	UART0
22	6	UART1
23	7	SSI0
24	8	I2C0
25-33	9-17	Reserved
34	18	Watchdog timer
35	19	Timer0 A
36	20	Timer0 B

54-58	38-42	Reserved
59	43	Hibernation Module
60-70	44-54	Reserved

## 5 JTAG Interface

The Joint Test Action Group (JTAG) port is an IEEE standard that defines a Test Access Port and Boundary Scan Architecture for digital integrated circuits and provides a standardized serial interface for controlling the associated test logic. The TAP, Instruction Register (IR), and Data Registers (DR) can be used to test the interconnections of assembled printed circuit boards and obtain manufacturing information on the components. The JTAG Port also provides a means of accessing and controlling design-for-test features such as I/O pin observation and control, scan testing, and debugging.

The JTAG port is comprised of five pins: TRST, TCK, TMS, TDI, and TDO. Data is transmitted serially into the controller on TDI and out of the controller on TDO. The interpretation of this data is dependent on the current state of the TAP controller. For detailed information on the operation of the JTAG port and TAP controller, please refer to the *IEEE Standard 1149.1-Test Access Port and Boundary-Scan Architecture*.

The Stellaris JTAG controller works with the ARM JTAG controller built into the Cortex-M3 core. This is implemented by multiplexing the TDO outputs from both JTAG controllers. ARM JTAG instructions select the ARM TDO output while Stellaris JTAG instructions select the Stellaris TDO outputs. The multiplexer is controlled by the Stellaris JTAG controller, which has comprehensive programming for the ARM, Stellaris, and unimplemented JTAG instructions.

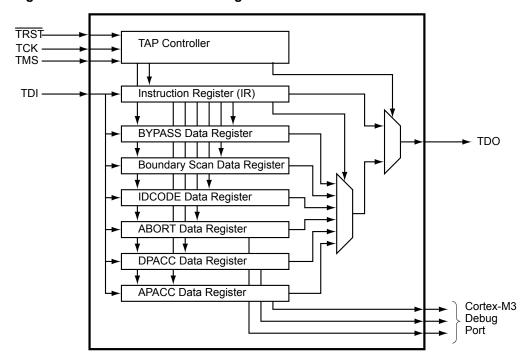

The Stellaris® JTAG module has the following features:

- IEEE 1149.1-1990 compatible Test Access Port (TAP) controller
- Four-bit Instruction Register (IR) chain for storing JTAG instructions
- IEEE standard instructions: BYPASS, IDCODE, SAMPLE/PRELOAD, EXTEST and INTEST
- ARM additional instructions: APACC, DPACC and ABORT
- Integrated ARM Serial Wire Debug (SWD)

See the ARM® Cortex™-M3 Technical Reference Manual for more information on the ARM JTAG controller.

## 5.1 Block Diagram

Figure 5-1. JTAG Module Block Diagram

## 5.2 Functional Description

A high-level conceptual drawing of the JTAG module is shown in Figure 5-1 on page 50. The JTAG module is composed of the Test Access Port (TAP) controller and serial shift chains with parallel update registers. The TAP controller is a simple state machine controlled by the TRST, TCK and TMS inputs. The current state of the TAP controller depends on the current value of TRST and the sequence of values captured on TMS at the rising edge of TCK. The TAP controller determines when the serial shift chains capture new data, shift data from TDI towards TDO, and update the parallel load registers. The current state of the TAP controller also determines whether the Instruction Register (IR) chain or one of the Data Register (DR) chains is being accessed.

The serial shift chains with parallel load registers are comprised of a single Instruction Register (IR) chain and multiple Data Register (DR) chains. The current instruction loaded in the parallel load register determines which DR chain is captured, shifted, or updated during the sequencing of the TAP controller.

Some instructions, like EXTEST and INTEST, operate on data currently in a DR chain and do not capture, shift, or update any of the chains. Instructions that are not implemented decode to the BYPASS instruction to ensure that the serial path between TDI and TDO is always connected (see Table 5-2 on page 56 for a list of implemented instructions).

See "JTAG and Boundary Scan" on page 424 for JTAG timing diagrams.

### 5.2.1 JTAG Interface Pins

The JTAG interface consists of five standard pins: TRST,TCK, TMS, TDI, and TDO. These pins and their associated reset state are given in Table 5-1 on page 51. Detailed information on each pin follows.

Table 5-1. JTAG Port Pins Reset State

Pin Name	Data Direction	Internal Pull-Up	Internal Pull-Down	Drive Strength	Drive Value
TRST	Input	Enabled	Disabled	N/A	N/A
TCK	Input	Enabled	Disabled	N/A	N/A
TMS	Input	Enabled	Disabled	N/A	N/A
TDI	Input	Enabled	Disabled	N/A	N/A
TDO	Output	Enabled	Disabled	2-mA driver	High-Z

### 5.2.1.1 Test Reset Input (TRST)

The TRST pin is an asynchronous active Low input signal for initializing and resetting the JTAG TAP controller and associated JTAG circuitry. When TRST is asserted, the TAP controller resets to the Test-Logic-Reset state and remains there while TRST is asserted. When the TAP controller enters the Test-Logic-Reset state, the JTAG Instruction Register (IR) resets to the default instruction, IDCODE.

By default, the internal pull-up resistor on the TRST pin is enabled after reset. Changes to the pull-up resistor settings on GPIO Port B should ensure that the internal pull-up resistor remains enabled on PB7/TRST; otherwise JTAG communication could be lost.

### 5.2.1.2 Test Clock Input (TCK)

The TCK pin is the clock for the JTAG module. This clock is provided so the test logic can operate independently of any other system clocks. In addition, it ensures that multiple JTAG TAP controllers that are daisy-chained together can synchronously communicate serial test data between components. During normal operation, TCK is driven by a free-running clock with a nominal 50% duty cycle. When necessary, TCK can be stopped at 0 or 1 for extended periods of time. While TCK is stopped at 0 or 1, the state of the TAP controller does not change and data in the JTAG Instruction and Data Registers is not lost.

By default, the internal pull-up resistor on the  ${ t TCK}$  pin is enabled after reset. This assures that no clocking occurs if the pin is not driven from an external source. The internal pull-up and pull-down resistors can be turned off to save internal power as long as the  ${ t TCK}$  pin is constantly being driven by an external source.

#### 5.2.1.3 Test Mode Select (TMS)

The TMS pin selects the next state of the JTAG TAP controller. TMS is sampled on the rising edge of TCK. Depending on the current TAP state and the sampled value of TMS, the next state is entered. Because the TMS pin is sampled on the rising edge of TCK, the *IEEE Standard 1149.1* expects the value on TMS to change on the falling edge of TCK.

Holding TMS high for five consecutive TCK cycles drives the TAP controller state machine to the Test-Logic-Reset state. When the TAP controller enters the Test-Logic-Reset state, the JTAG Instruction Register (IR) resets to the default instruction, IDCODE. Therefore, this sequence can be used as a reset mechanism, similar to asserting TRST. The JTAG Test Access Port state machine can be seen in its entirety in Figure 5-2 on page 53.

By default, the internal pull-up resistor on the TMS pin is enabled after reset. Changes to the pull-up resistor settings on GPIO Port C should ensure that the internal pull-up resistor remains enabled on PC1/TMS; otherwise JTAG communication could be lost.

### 5.2.1.4 Test Data Input (TDI)

The TDI pin provides a stream of serial information to the IR chain and the DR chains. TDI is sampled on the rising edge of TCK and, depending on the current TAP state and the current instruction, presents this data to the proper shift register chain. Because the TDI pin is sampled on the rising edge of TCK, the *IEEE Standard 1149.1* expects the value on TDI to change on the falling edge of TCK.

By default, the internal pull-up resistor on the TDI pin is enabled after reset. Changes to the pull-up resistor settings on GPIO Port C should ensure that the internal pull-up resistor remains enabled on PC2/TDI; otherwise JTAG communication could be lost.

### 5.2.1.5 Test Data Output (TDO)

The TDO pin provides an output stream of serial information from the IR chain or the DR chains. The value of TDO depends on the current TAP state, the current instruction, and the data in the chain being accessed. In order to save power when the JTAG port is not being used, the TDO pin is placed in an inactive drive state when not actively shifting out data. Because TDO can be connected to the TDI of another controller in a daisy-chain configuration, the *IEEE Standard 1149.1* expects the value on TDO to change on the falling edge of TCK.

By default, the internal pull-up resistor on the <code>TDO</code> pin is enabled after reset. This assures that the pin remains at a constant logic level when the JTAG port is not being used. The internal pull-up and pull-down resistors can be turned off to save internal power if a High-Z output value is acceptable during certain TAP controller states.

#### 5.2.2 JTAG TAP Controller

The JTAG TAP controller state machine is shown in Figure 5-2 on page 53. The TAP controller state machine is reset to the Test-Logic-Reset state on the assertion of a Power-On-Reset (POR) or the assertion of TRST. Asserting the correct sequence on the TMS pin allows the JTAG module to shift in new instructions, shift in data, or idle during extended testing sequences. For detailed information on the function of the TAP controller and the operations that occur in each state, please refer to IEEE Standard 1149.1.

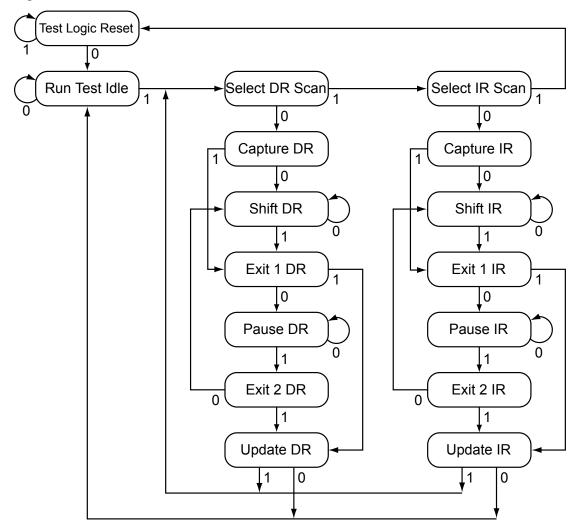

Figure 5-2. Test Access Port State Machine

## 5.2.3 Shift Registers

The Shift Registers consist of a serial shift register chain and a parallel load register. The serial shift register chain samples specific information during the TAP controller's CAPTURE states and allows this information to be shifted out of TDO during the TAP controller's SHIFT states. While the sampled data is being shifted out of the chain on TDO, new data is being shifted into the serial shift register on TDI. This new data is stored in the parallel load register during the TAP controller's UPDATE states. Each of the shift registers is discussed in detail in "Register Descriptions" on page 56.

## 5.2.4 Operational Considerations

There are certain operational considerations when using the JTAG module. Because the JTAG pins can be programmed to be GPIOs, board configuration and reset conditions on these pins must be considered. In addition, because the JTAG module has integrated ARM Serial Wire Debug, the method for switching between these two operational modes is described below.

#### 5.2.4.1 GPIO Functionality

When the controller is reset with either a POR or RST, the JTAG/SWD port pins default to their JTAG/SWD configurations. The default configuration includes enabling digital functionality (setting **GPIODEN** to 1), enabling the pull-up resistors (setting **GPIOPUR** to 1), and enabling the alternate hardware function (setting **GPIOAFSEL** to 1) for the PB7 and PC[3:0] JTAG/SWD pins.

It is possible for software to configure these pins as GPIOs after reset by writing 0s to PB7 and PC[3:0] in the **GPIOAFSEL** register. If the user does not require the JTAG/SWD port for debugging or board-level testing, this provides five more GPIOs for use in the design.

Caution – It is possible to create a software sequence that prevents the debugger from connecting to the Stellaris® microcontroller. If the program code loaded into flash immediately changes the JTAG pins to their GPIO functionality, the debugger may not have enough time to connect and halt the controller before the JTAG pin functionality switches. This may lock the debugger out of the part. This can be avoided with a software routine that restores JTAG functionality based on an external or software trigger.

The GPIO commit control registers provide a layer of protection against accidental programming of critical hardware peripherals. Protection is currently provided for the five JTAG/SWD pins (PB7 and PC[3:0]). Writes to protected bits of the **GPIO Alternate Function Select (GPIOAFSEL)** register (see page 181) are not committed to storage unless the **GPIO Lock (GPIOLOCK)** register (see page 191) has been unlocked and the appropriate bits of the **GPIO Commit (GPIOCR)** register (see page 192) have been set to 1.

#### Recovering a "Locked" Device

**Note:** Performing the sequence below causes the nonvolatile registers discussed in "Nonvolatile Register Programming" on page 144 to be restored to their factory default values. The mass erase of the flash memory caused by the below sequence occurs prior to the nonvolatile registers being restored.

If software configures any of the JTAG/SWD pins as GPIO and loses the ability to communicate with the debugger, there is a debug sequence that can be used to recover the device. Performing a total of ten JTAG-to-SWD and SWD-to-JTAG switch sequences while holding the device in reset mass erases the flash memory. The sequence to recover the device is:

- 1. Assert and hold the RST signal.
- **2.** Perform the JTAG-to-SWD switch sequence.
- **3.** Perform the SWD-to-JTAG switch sequence.
- **4.** Perform the JTAG-to-SWD switch sequence.
- **5.** Perform the SWD-to-JTAG switch sequence.
- **6.** Perform the JTAG-to-SWD switch sequence.
- 7. Perform the SWD-to-JTAG switch sequence.
- 8. Perform the JTAG-to-SWD switch sequence.
- **9.** Perform the SWD-to-JTAG switch sequence.
- **10.** Perform the JTAG-to-SWD switch sequence.

- 11. Perform the SWD-to-JTAG switch sequence.
- **12.** Release the  $\overline{RST}$  signal.
- 13. Wait 400 ms.
- 14. Power-cycle the device.

The JTAG-to-SWD and SWD-to-JTAG switch sequences are described in "ARM Serial Wire Debug (SWD)" on page 55. When performing switch sequences for the purpose of recovering the debug capabilities of the device, only steps 1 and 2 of the switch sequence in the section called "JTAG-to-SWD Switching" on page 55 must be performed.

#### 5.2.4.2 Communication with JTAG/SWD

Because the debug clock and the system clock can be running at different frequencies, care must be taken to maintain reliable communication with the JTAG/SWD interface. In the Capture-DR state, the result of the previous transaction, if any, is returned, together with a 3-bit ACK response. Software should check the ACK response to see if the previous operation has completed before initiating a new transaction. Alternatively, if the system clock is at least 8 times faster than the debug clock (TCK or SWCLK), the previous operation has enough time to complete and the ACK bits do not have to be checked.

## 5.2.4.3 ARM Serial Wire Debug (SWD)

In order to seamlessly integrate the ARM Serial Wire Debug (SWD) functionality, a serial-wire debugger must be able to connect to the Cortex-M3 core without having to perform, or have any knowledge of, JTAG cycles. This is accomplished with a SWD preamble that is issued before the SWD session begins.

The switching preamble used to enable the SWD interface of the SWJ-DP module starts with the TAP controller in the Test-Logic-Reset state. From here, the preamble sequences the TAP controller through the following states: Run Test Idle, Select DR, Select IR, Test Logic Reset, Test Logic Reset, Run Test Idle, Run Test Idle, Select DR, Select IR, Test Logic Reset, Test Logic Reset, Run Test Idle, Select DR, Select IR, and Test Logic Reset states.

Stepping through this sequences of the TAP state machine enables the SWD interface and disables the JTAG interface. For more information on this operation and the SWD interface, see the *ARM*® *Cortex*™-*M3 Technical Reference Manual* and the *ARM*® *CoreSight Technical Reference Manual*.

Because this sequence is a valid series of JTAG operations that could be issued, the ARM JTAG TAP controller is not fully compliant to the *IEEE Standard 1149.1*. This is the only instance where the ARM JTAG TAP controller does not meet full compliance with the specification. Due to the low probability of this sequence occurring during normal operation of the TAP controller, it should not affect normal performance of the JTAG interface.

#### JTAG-to-SWD Switching

To switch the operating mode of the Debug Access Port (DAP) from JTAG to SWD mode, the external debug hardware must send the switching preamble to the device. The 16-bit switch sequence for switching to SWD mode is defined as b1110011110011110, transmitted LSB first. This can also be represented as 16'hE79E when transmitted LSB first. The complete switch sequence should consist of the following transactions on the TCK/SWCLK and TMS/SWDIO signals:

1. Send at least 50 TCK/SWCLK cycles with TMS/SWDIO set to 1. This ensures that both JTAG and SWD are in their reset/idle states.

- 2. Send the 16-bit JTAG-to-SWD switch sequence, 16'hE79E.
- 3. Send at least 50 TCK/SWCLK cycles with TMS/SWDIO set to 1. This ensures that if SWJ-DP was already in SWD mode, before sending the switch sequence, the SWD goes into the line reset state.

#### SWD-to-JTAG Switching

To switch the operating mode of the Debug Access Port (DAP) from SWD to JTAG mode, the external debug hardware must send a switch sequence to the device. The 16-bit switch sequence for switching to JTAG mode is defined as b1110011100111100, transmitted LSB first. This can also be represented as 16'hE73C when transmitted LSB first. The complete switch sequence should consist of the following transactions on the TCK/SWCLK and TMS/SWDIO signals:

- 1. Send at least 50 TCK/SWCLK cycles with TMS/SWDIO set to 1. This ensures that both JTAG and SWD are in their reset/idle states.
- 2. Send the 16-bit SWD-to-JTAG switch sequence, 16'hE73C.
- 3. Send at least 5 TCK/SWCLK cycles with TMS/SWDIO set to 1. This ensures that if SWJ-DP was already in JTAG mode, before sending the switch sequence, the JTAG goes into the Test Logic Reset state.

## 5.3 Initialization and Configuration

After a Power-On-Reset or an external reset ( $\overline{RST}$ ), the JTAG pins are automatically configured for JTAG communication. No user-defined initialization or configuration is needed. However, if the user application changes these pins to their GPIO function, they must be configured back to their JTAG functionality before JTAG communication can be restored. This is done by enabling the five JTAG pins (PB7 and PC[3:0]) for their alternate function using the **GPIOAFSEL** register. In addition to enabling the alternate functions, any other changes to the GPIO pad configurations on the five JTAG pins (PB7 and PC[3:0]) should be reverted to their default settings.

## 5.4 Register Descriptions

There are no APB-accessible registers in the JTAG TAP Controller or Shift Register chains. The registers within the JTAG controller are all accessed serially through the TAP Controller. The registers can be broken down into two main categories: Instruction Registers and Data Registers.

### 5.4.1 Instruction Register (IR)

The JTAG TAP Instruction Register (IR) is a four-bit serial scan chain connected between the JTAG TDI and TDO pins with a parallel load register. When the TAP Controller is placed in the correct states, bits can be shifted into the Instruction Register. Once these bits have been shifted into the chain and updated, they are interpreted as the current instruction. The decode of the Instruction Register bits is shown in Table 5-2 on page 56. A detailed explanation of each instruction, along with its associated Data Register, follows.

**Table 5-2. JTAG Instruction Register Commands** 

IR[3:0]	Instruction	Description
0000		Drives the values preloaded into the Boundary Scan Chain by the SAMPLE/PRELOAD instruction onto the pads.
0001		Drives the values preloaded into the Boundary Scan Chain by the SAMPLE/PRELOAD instruction into the controller.

Table 5-2. JTAG Instruction Register Commands (continued)

IR[3:0]	Instruction	Description
0010	SAMPLE / PRELOAD	Captures the current I/O values and shifts the sampled values out of the Boundary Scan Chain while new preload data is shifted in.
1000	ABORT	Shifts data into the ARM Debug Port Abort Register.
1010	DPACC	Shifts data into and out of the ARM DP Access Register.
1011	APACC	Shifts data into and out of the ARM AC Access Register.
1110	IDCODE	Loads manufacturing information defined by the <i>IEEE Standard 1149.1</i> into the IDCODE chain and shifts it out.
1111	BYPASS	Connects TDI to TDO through a single Shift Register chain.
All Others	Reserved	Defaults to the BYPASS instruction to ensure that $\mathtt{TDI}$ is always connected to $\mathtt{TDO}$ .

#### 5.4.1.1 EXTEST Instruction

The EXTEST instruction is not associated with its own Data Register chain. The EXTEST instruction uses the data that has been preloaded into the Boundary Scan Data Register using the SAMPLE/PRELOAD instruction. When the EXTEST instruction is present in the Instruction Register, the preloaded data in the Boundary Scan Data Register associated with the outputs and output enables are used to drive the GPIO pads rather than the signals coming from the core. This allows tests to be developed that drive known values out of the controller, which can be used to verify connectivity. While the EXTEST instruction is present in the Instruction Register, the Boundary Scan Data Register can be accessed to sample and shift out the current data and load new data into the Boundary Scan Data Register.

#### 5.4.1.2 INTEST Instruction

The INTEST instruction is not associated with its own Data Register chain. The INTEST instruction uses the data that has been preloaded into the Boundary Scan Data Register using the SAMPLE/PRELOAD instruction. When the INTEST instruction is present in the Instruction Register, the preloaded data in the Boundary Scan Data Register associated with the inputs are used to drive the signals going into the core rather than the signals coming from the GPIO pads. This allows tests to be developed that drive known values into the controller, which can be used for testing. It is important to note that although the  $\overline{\text{RST}}$  input pin is on the Boundary Scan Data Register chain, it is only observable. While the INTEXT instruction is present in the Instruction Register, the Boundary Scan Data Register can be accessed to sample and shift out the current data and load new data into the Boundary Scan Data Register.

#### 5.4.1.3 SAMPLE/PRELOAD Instruction

The SAMPLE/PRELOAD instruction connects the Boundary Scan Data Register chain between  $\mathtt{TDI}$  and  $\mathtt{TDO}$ . This instruction samples the current state of the pad pins for observation and preloads new test data. Each GPIO pad has an associated input, output, and output enable signal. When the TAP controller enters the Capture DR state during this instruction, the input, output, and output-enable signals to each of the GPIO pads are captured. These samples are serially shifted out of  $\mathtt{TDO}$  while the TAP controller is in the Shift DR state and can be used for observation or comparison in various tests.

While these samples of the inputs, outputs, and output enables are being shifted out of the Boundary Scan Data Register, new data is being shifted into the Boundary Scan Data Register from TDI. Once the new data has been shifted into the Boundary Scan Data Register, the data is saved in the parallel load registers when the TAP controller enters the Update DR state. This update of the parallel load register preloads data into the Boundary Scan Data Register that is associated with

each input, output, and output enable. This preloaded data can be used with the EXTEST and INTEST instructions to drive data into or out of the controller. Please see "Boundary Scan Data Register" on page 59 for more information.

#### 5.4.1.4 ABORT Instruction

The ABORT instruction connects the associated ABORT Data Register chain between TDI and TDO. This instruction provides read and write access to the ABORT Register of the ARM Debug Access Port (DAP). Shifting the proper data into this Data Register clears various error bits or initiates a DAP abort of a previous request. Please see the "ABORT Data Register" on page 60 for more information.

### 5.4.1.5 DPACC Instruction

The DPACC instruction connects the associated DPACC Data Register chain between TDI and TDO. This instruction provides read and write access to the DPACC Register of the ARM Debug Access Port (DAP). Shifting the proper data into this register and reading the data output from this register allows read and write access to the ARM debug and status registers. Please see "DPACC Data Register" on page 60 for more information.

#### 5.4.1.6 APACC Instruction

The APACC instruction connects the associated APACC Data Register chain between TDI and TDO. This instruction provides read and write access to the APACC Register of the ARM Debug Access Port (DAP). Shifting the proper data into this register and reading the data output from this register allows read and write access to internal components and buses through the Debug Port. Please see "APACC Data Register" on page 60 for more information.

#### 5.4.1.7 IDCODE Instruction

The IDCODE instruction connects the associated IDCODE Data Register chain between TDI and TDO. This instruction provides information on the manufacturer, part number, and version of the ARM core. This information can be used by testing equipment and debuggers to automatically configure their input and output data streams. IDCODE is the default instruction that is loaded into the JTAG Instruction Register when a Power-On-Reset (POR) is asserted, TRST is asserted, or the Test-Logic-Reset state is entered. Please see "IDCODE Data Register" on page 59 for more information.

#### 5.4.1.8 BYPASS Instruction

The BYPASS instruction connects the associated BYPASS Data Register chain between TDI and TDO. This instruction is used to create a minimum length serial path between the TDI and TDO ports. The BYPASS Data Register is a single-bit shift register. This instruction improves test efficiency by allowing components that are not needed for a specific test to be bypassed in the JTAG scan chain by loading them with the BYPASS instruction. Please see "BYPASS Data Register" on page 59 for more information.

## 5.4.2 Data Registers

The JTAG module contains six Data Registers. These include: IDCODE, BYPASS, Boundary Scan, APACC, DPACC, and ABORT serial Data Register chains. Each of these Data Registers is discussed in the following sections.

#### 5.4.2.1 IDCODE Data Register

The format for the 32-bit IDCODE Data Register defined by the *IEEE Standard 1149.1* is shown in Figure 5-3 on page 59. The standard requires that every JTAG-compliant device implement either the IDCODE instruction or the BYPASS instruction as the default instruction. The LSB of the IDCODE Data Register is defined to be a 1 to distinguish it from the BYPASS instruction, which has an LSB of 0. This allows auto configuration test tools to determine which instruction is the default instruction.

The major uses of the JTAG port are for manufacturer testing of component assembly, and program development and debug. To facilitate the use of auto-configuration debug tools, the IDCODE instruction outputs a value of 0x3BA0.0477. This allows the debuggers to automatically configure themselves to work correctly with the Cortex-M3 during debug.

Figure 5-3. IDCODE Register Format

### 5.4.2.2 BYPASS Data Register

The format for the 1-bit BYPASS Data Register defined by the *IEEE Standard 1149.1* is shown in Figure 5-4 on page 59. The standard requires that every JTAG-compliant device implement either the BYPASS instruction or the IDCODE instruction as the default instruction. The LSB of the BYPASS Data Register is defined to be a 0 to distinguish it from the IDCODE instruction, which has an LSB of 1. This allows auto configuration test tools to determine which instruction is the default instruction.

Figure 5-4. BYPASS Register Format

#### 5.4.2.3 Boundary Scan Data Register

The format of the Boundary Scan Data Register is shown in Figure 5-5 on page 60. Each GPIO pin, starting with a GPIO pin next to the JTAG port pins, is included in the Boundary Scan Data Register. Each GPIO pin has three associated digital signals that are included in the chain. These signals are input, output, and output enable, and are arranged in that order as can be seen in the figure.

When the Boundary Scan Data Register is accessed with the SAMPLE/PRELOAD instruction, the input, output, and output enable from each digital pad are sampled and then shifted out of the chain to be verified. The sampling of these values occurs on the rising edge of <code>TCK</code> in the Capture DR state of the TAP controller. While the sampled data is being shifted out of the Boundary Scan chain in the Shift DR state of the TAP controller, new data can be preloaded into the chain for use with the EXTEST and INTEST instructions. These instructions either force data out of the controller, with the EXTEST instruction, or into the controller, with the INTEST instruction.

### Figure 5-5. Boundary Scan Register Format

## 5.4.2.4 APACC Data Register

The format for the 35-bit APACC Data Register defined by ARM is described in the *ARM*® *Cortex*™-*M3 Technical Reference Manual*.

## 5.4.2.5 DPACC Data Register

The format for the 35-bit DPACC Data Register defined by ARM is described in the *ARM*® *Cortex*™-*M3 Technical Reference Manual*.

## 5.4.2.6 ABORT Data Register

The format for the 35-bit ABORT Data Register defined by ARM is described in the *ARM*® *Cortex*™-*M3 Technical Reference Manual*.

# 6 System Control

System control determines the overall operation of the device. It provides information about the device, controls the clocking to the core and individual peripherals, and handles reset detection and reporting.

## 6.1 Functional Description

The System Control module provides the following capabilities:

- Device identification, see "Device Identification" on page 61
- Local control, such as reset (see "Reset Control" on page 61), power (see "Power Control" on page 64) and clock control (see "Clock Control" on page 65)
- System control (Run, Sleep, and Deep-Sleep modes), see "System Control" on page 69

### 6.1.1 Device Identification

Several read-only registers provide software with information on the microcontroller, such as version, part number, SRAM size, flash size, and other features. See the **DID0**, **DID1**, and **DC0-DC4** registers.

#### 6.1.2 Reset Control

This section discusses aspects of hardware functions during reset as well as system software requirements following the reset sequence.

#### 6.1.2.1 CMOD0 and CMOD1 Test-Mode Control Pins

Two pins, CMODO and CMODO, are defined for internal use for testing the microcontroller during manufacture. They have no end-user function and should not be used. The CMOD pins should be connected to ground.

#### 6.1.2.2 Reset Sources

The controller has five sources of reset:

- **1.** External reset input pin  $(\overline{RST})$  assertion, see "External  $\overline{RST}$  Pin" on page 62.
- 2. Power-on reset (POR), see "Power-On Reset (POR)" on page 61.
- 3. Internal brown-out (BOR) detector, see "Brown-Out Reset (BOR)" on page 63.
- 4. Software-initiated reset (with the software reset registers), see "Software Reset" on page 64.
- 5. A watchdog timer reset condition violation, see "Watchdog Timer Reset" on page 64.

After a reset, the **Reset Cause (RESC)** register is set with the reset cause. The bits in this register are sticky and maintain their state across multiple reset sequences, except when an internal POR is the cause, and then all the other bits in the **RESC** register are cleared except for the POR indicator.

#### 6.1.2.3 Power-On Reset (POR)

**Note:** The power-on reset also resets the JTAG controller. An external reset does not.

The internal Power-On Reset (POR) circuit monitors the power supply voltage ( $V_{DD}$ ) and generates a reset signal to all of the internal logic including JTAG when the power supply ramp reaches a threshold value ( $V_{TH}$ ). The microcontroller must be operating within the specified operating parameters when the on-chip power-on reset pulse is complete. The 3.3-V power supply to the microcontroller must reach 3.0 V within 10 msec of  $V_{DD}$  crossing 2.0 V to guarantee proper operation. For applications that require the use of an external reset signal to hold the microcontroller in reset longer than the internal POR, the  $\overline{RST}$  input may be used as discussed in "External  $\overline{RST}$  Pin" on page 62.

The Power-On Reset sequence is as follows:

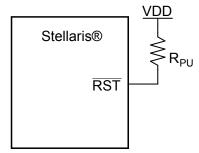

- 1. The microcontroller waits for internal POR to go inactive.
- 2. The internal reset is released and the core loads from memory the initial stack pointer, the initial program counter, and the first instruction designated by the program counter, and then begins execution.

The internal POR is only active on the initial power-up of the microcontroller. The Power-On Reset timing is shown in Figure 19-6 on page 427.

### 6.1.2.4 External RST Pin

If the application only uses the internal POR circuit, the  $\overline{\text{RST}}$  input must be connected to the power supply  $(V_{DD})$  through an optional pull-up resistor (0 to 10K  $\Omega$ ) as shown in Figure 6-1 on page 62.

Figure 6-1. Basic RST Configuration

 $R_{PU}$  = 0 to 100 k $\Omega$ 

The external reset pin  $(\overline{RST})$  resets the microcontroller including the core and all the on-chip peripherals except the JTAG TAP controller (see "JTAG Interface" on page 49). The external reset sequence is as follows:

- 1. The external reset pin ( $\overline{RST}$ ) is asserted for the duration specified by  $T_{MIN}$  and then de-asserted (see "Reset" on page 426).
- 2. The internal reset is released and the core loads from memory the initial stack pointer, the initial program counter, and the first instruction designated by the program counter, and then begins execution.

To improve noise immunity and/or to delay reset at power up, the  $\overline{RST}$  input may be connected to an RC network as shown in Figure 6-2 on page 63.

Figure 6-2. External Circuitry to Extend Power-On Reset

 $R_{PU}$  = 1 k $\Omega$  to 100 k $\Omega$ 

 $C_1 = 1 \text{ nF to } 10 \mu\text{F}$ 

If the application requires the use of an external reset switch, Figure 6-3 on page 63 shows the proper circuitry to use.

Figure 6-3. Reset Circuit Controlled by Switch

Typical  $R_{PU}$  = 10 k $\Omega$ 

Typical  $R_S = 470 \Omega$ 

 $C_1 = 10 \text{ nF}$ 

The  $R_{PU}$  and  $C_1$  components define the power-on delay.

The external reset timing is shown in Figure 19-5 on page 426.

#### 6.1.2.5 Brown-Out Reset (BOR)

A drop in the input voltage resulting in the assertion of the internal brown-out detector can be used to reset the controller. This is initially disabled and may be enabled by software.

The system provides a brown-out detection circuit that triggers if the power supply  $(V_{DD})$  drops below a brown-out threshold voltage  $(V_{BTH})$ . If a brown-out condition is detected, the system may generate a controller interrupt or a system reset.

Brown-out resets are controlled with the **Power-On and Brown-Out Reset Control (PBORCTL)** register. The BORIOR bit in the **PBORCTL** register must be set for a brown-out condition to trigger a reset.

The brown-out reset is equivalent to an assertion of the external  $\overline{\mathtt{RST}}$  input and the reset is held active until the proper  $V_{DD}$  level is restored. The **RESC** register can be examined in the reset interrupt

handler to determine if a Brown-Out condition was the cause of the reset, thus allowing software to determine what actions are required to recover.

The internal Brown-Out Reset timing is shown in Figure 19-7 on page 427.

#### 6.1.2.6 Software Reset

Software can reset a specific peripheral or generate a reset to the entire system.

Peripherals can be individually reset by software via three registers that control reset signals to each peripheral (see the **SRCRn** registers). If the bit position corresponding to a peripheral is set and subsequently cleared, the peripheral is reset. The encoding of the reset registers is consistent with the encoding of the clock gating control for peripherals and on-chip functions (see "System Control" on page 69). Note that all reset signals for all clocks of the specified unit are asserted as a result of a software-initiated reset.

The entire system can be reset by software by setting the SYSRESETREQ bit in the Cortex-M3 Application Interrupt and Reset Control register resets the entire system including the core. The software-initiated system reset sequence is as follows:

- 1. A software system reset is initiated by writing the SYSRESETREQ bit in the ARM Cortex-M3 Application Interrupt and Reset Control register.
- 2. An internal reset is asserted.
- **3.** The internal reset is deasserted and the controller loads from memory the initial stack pointer, the initial program counter, and the first instruction designated by the program counter, and then begins execution.

The software-initiated system reset timing is shown in Figure 19-8 on page 427.

#### 6.1.2.7 Watchdog Timer Reset

The watchdog timer module's function is to prevent system hangs. The watchdog timer can be configured to generate an interrupt to the controller on its first time-out, and to generate a reset signal on its second time-out.

After the first time-out event, the 32-bit counter is reloaded with the value of the **Watchdog Timer Load (WDTLOAD)** register, and the timer resumes counting down from that value. If the timer counts down to its zero state again before the first time-out interrupt is cleared, and the reset signal has been enabled, the watchdog timer asserts its reset signal to the system. The watchdog timer reset sequence is as follows:

- 1. The watchdog timer times out for the second time without being serviced.
- 2. An internal reset is asserted.
- 3. The internal reset is released and the controller loads from memory the initial stack pointer, the initial program counter, the first instruction designated by the program counter, and begins execution.

The watchdog reset timing is shown in Figure 19-9 on page 427.

#### 6.1.3 Power Control

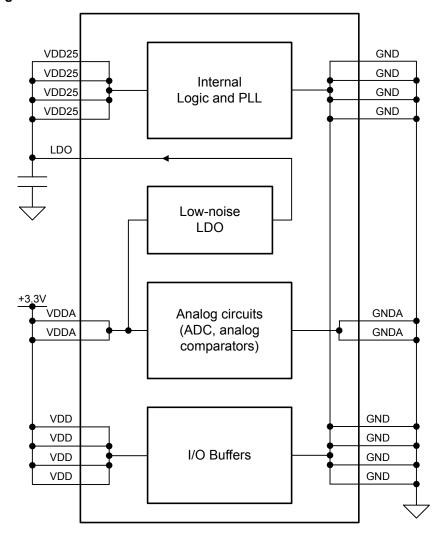

The Stellaris<sup>®</sup> microcontroller provides an integrated LDO regulator that may be used to provide power to the majority of the controller's internal logic. For power reduction, the LDO regulator provides

software a mechanism to adjust the regulated value, in small increments (VSTEP), over the range of 2.25 V to 2.75 V (inclusive)—or 2.5 V  $\pm$  10%. The adjustment is made by changing the value of the VADJ field in the **LDO Power Control (LDOPCTL)** register.

Figure 6-4 on page 65 shows the power architecture.

**Note:** On the printed circuit board, use the LDO output as the source of VDD25 input. In addition, the LDO requires decoupling capacitors. See "On-Chip Low Drop-Out (LDO) Regulator Characteristics" on page 420.

Figure 6-4. Power Architecture

## 6.1.4 Clock Control

System control determines the control of clocks in this part.

#### 6.1.4.1 Fundamental Clock Sources

There are multiple clock sources for use in the device:

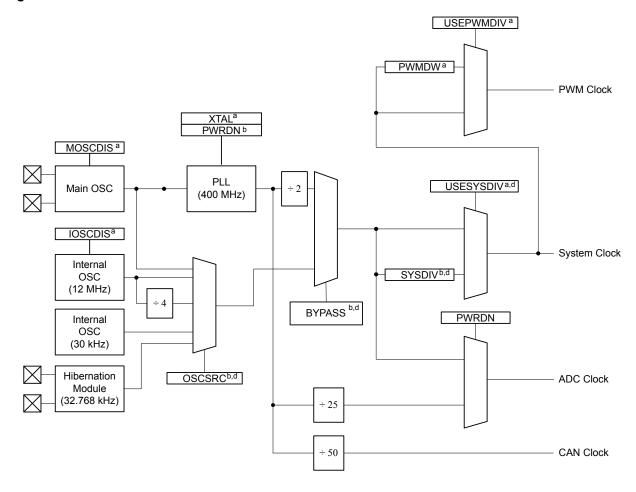

- Internal Oscillator (IOSC). The internal oscillator is an on-chip clock source. It does not require the use of any external components. The frequency of the internal oscillator is 12 MHz ± 30%. Applications that do not depend on accurate clock sources may use this clock source to reduce system cost. The internal oscillator is the clock source the device uses during and following POR. If the main oscillator is required, software must enable the main oscillator following reset and allow the main oscillator to stabilize before changing the clock reference.
- Main Oscillator (MOSC). The main oscillator provides a frequency-accurate clock source by one of two means: an external single-ended clock source is connected to the OSCO input pin, or an external crystal is connected across the OSCO input and OSC1 output pins. If the PLL is being used, the crystal value must be one of the supported frequencies between 3.579545 MHz through 8.192 MHz (inclusive). If the PLL is not being used, the crystal may be any one of the supported frequencies between 1 MHz and 8.192 MHz. The single-ended clock source range is from DC through the specified speed of the device. The supported crystals are listed in the XTAL bit field in the RCC register (see page 80).
- Internal 30-kHz Oscillator. The internal 30-kHz oscillator is similar to the internal oscillator, except that it provides an operational frequency of 30 kHz ± 50%. It is intended for use during Deep-Sleep power-saving modes. This power-savings mode benefits from reduced internal switching and also allows the main oscillator to be powered down.
- External Real-Time Oscillator. The external real-time oscillator provides a low-frequency, accurate clock reference. It is intended to provide the system with a real-time clock source. The real-time oscillator is part of the Hibernation Module (see "Hibernation Module" on page 121) and may also provide an accurate source of Deep-Sleep or Hibernate mode power savings.

The internal system clock (SysClk), is derived from any of the above sources plus two others: the output of the main internal PLL, and the internal oscillator divided by four (3 MHz ± 30%). The frequency of the PLL clock reference must be in the range of 3.579545 MHz to 8.192 MHz (inclusive).

The Run-Mode Clock Configuration (RCC) and Run-Mode Clock Configuration 2 (RCC2) registers provide control for the system clock. The RCC2 register is provided to extend fields that offer additional encodings over the RCC register. When used, the RCC2 register field values are used by the logic over the corresponding field in the RCC register. In particular, RCC2 provides for a larger assortment of clock configuration options.

Figure 6-5 on page 67 shows the logic for the main clock tree. The peripheral blocks are driven by the system clock signal and can be individually enabled/disabled.

Figure 6-5. Main Clock Tree

- a. Control provided by RCC register bit/field.
- b. Control provided by RCC register bit/field or RCC2 register bit/field, if overridden with RCC2 register bit USERCC2.
- c. Control provided by RCC2 register bit/field.
- $\ensuremath{\mathsf{d}}.$  Also may be controlled by DSLPCLKCFG when in deep sleep mode.

**Note:** The figure above shows all features available on all Stellaris® Fury-class devices.

## 6.1.4.2 Crystal Configuration for the Main Oscillator (MOSC)

The main oscillator supports the use of a select number of crystals. If the main oscillator is used by the PLL as a reference clock, the supported range of crystals is 3.579545 to 8.192 MHz, otherwise, the range of supported crystals is 1 to 8.192 MHz.

The  $\mathtt{XTAL}$  bit in the **RCC** register (see page 80) describes the available crystal choices and default programming values.

Software configures the **RCC** register XTAL field with the crystal number. If the PLL is used in the design, the XTAL field value is internally translated to the PLL settings.

## 6.1.4.3 Main PLL Frequency Configuration

The main PLL is disabled by default during power-on reset and is enabled later by software if required. Software specifies the output divisor to set the system clock frequency, and enables the main PLL to drive the output. The PLL operates at 400 MHz, but is divided by two prior to the application of the output divisor.

If the main oscillator provides the clock reference to the main PLL, the translation provided by hardware and used to program the PLL is available for software in the **XTAL** to **PLL Translation** (**PLLCFG**) register (see page 84). The internal translation provides a translation within  $\pm$  1% of the targeted PLL VCO frequency. Table 19-9 on page 423 shows the actual PLL frequency and error for a given crystal choice.

The Crystal Value field (XTAL) on page 80 describes the available crystal choices and default programming of the **PLLCFG** register. The crystal number is written into the XTAL field of the **Run-Mode Clock Configuration (RCC)** register. Any time the XTAL field changes, the new settings are translated and the internal PLL settings are updated.

To configure the external 32-kHz real-time oscillator as the PLL input reference, program the OSCRC2 field in the **Run-Mode Clock Configuration 2 (RCC2)** register to be 0x7.

#### 6.1.4.4 PLL Modes

The PLL has two modes of operation: Normal and Power-Down

- Normal: The PLL multiplies the input clock reference and drives the output.
- Power-Down: Most of the PLL internal circuitry is disabled and the PLL does not drive the output.

The modes are programmed using the RCC/RCC2 register fields (see page 80 and page 85).

#### 6.1.4.5 PLL Operation

If a PLL configuration is changed, the PLL output frequency is unstable until it reconverges (relocks) to the new setting. The time between the configuration change and relock is T<sub>READY</sub> (see Table 19-8 on page 423). During the relock time, the affected PLL is not usable as a clock reference.

The PLL is changed by one of the following:

- Change to the XTAL value in the **RCC** register—writes of the same value do not cause a relock.
- Change in the PLL from Power-Down to Normal mode.

A counter is defined to measure the  $T_{READY}$  requirement. The counter is clocked by the main oscillator. The range of the main oscillator has been taken into account and the down counter is set to 0x1200 (that is, ~600  $\mu$ s at an 8.192 MHz external oscillator clock). Hardware is provided to keep the PLL from being used as a system clock until the  $T_{READY}$  condition is met after one of the two changes above. It is the user's responsibility to have a stable clock source (like the main oscillator) before the **RCC/RCC2** register is switched to use the PLL.

If the main PLL is enabled and the system clock is switched to use the PLL in one step, the system control hardware continues to clock the controller from the oscillator selected by the RCC/RCC2 register until the main PLL is stable (T<sub>READY</sub> time met), after which it changes to the PLL. Software can use many methods to ensure that the system is clocked from the main PLL, including periodically polling the PLLLRIS bit in the Raw Interrupt Status (RIS) register, and enabling the PLL Lock interrupt.

## 6.1.5 System Control

For power-savings purposes, the **RCGCn**, **SCGCn**, and **DCGCn** registers control the clock gating logic for each peripheral or block in the system while the controller is in Run, Sleep, and Deep-Sleep mode, respectively.

There are four levels of operation for the device defined as:

- Run Mode. In Run mode, the controller actively executes code. Run mode provides normal operation of the processor and all of the peripherals that are currently enabled by the RCGCn registers. The system clock can be any of the available clock sources including the PLL.
- Sleep Mode. In Sleep mode, the clock frequency of the active peripherals is unchanged, but the processor and the memory subsystem are not clocked and therefore no longer execute code. Sleep mode is entered by the Cortex-M3 core executing a WFI(Wait for Interrupt) instruction. Any properly configured interrupt event in the system will bring the processor back into Run mode. See the system control NVIC section of the ARM® Cortex™-M3 Technical Reference Manual for more details.
  - Peripherals are clocked that are enabled in the **SCGCn** register when auto-clock gating is enabled (see the **RCC** register) or the **RCGCn** register when the auto-clock gating is disabled. The system clock has the same source and frequency as that during Run mode.
- Deep-Sleep Mode. In Deep-Sleep mode, the clock frequency of the active peripherals may change (depending on the Run mode clock configuration) in addition to the processor clock being stopped. An interrupt returns the device to Run mode from one of the sleep modes; the sleep modes are entered on request from the code. Deep-Sleep mode is entered by first writing the Deep Sleep Enable bit in the ARM Cortex-M3 NVIC system control register and then executing a WFI instruction. Any properly configured interrupt event in the system will bring the processor back into Run mode. See the system control NVIC section of the ARM® Cortex<sup>TM</sup>-M3 Technical Reference Manual for more details.
  - The Cortex-M3 processor core and the memory subsystem are not clocked. Peripherals are clocked that are enabled in the **DCGCn** register when auto-clock gating is enabled (see the **RCC** register) or the **RCGCn** register when auto-clock gating is disabled. The system clock source is the main oscillator by default or the internal oscillator specified in the **DSLPCLKCFG** register if one is enabled. When the **DSLPCLKCFG** register is used, the internal oscillator is powered up, if necessary, and the main oscillator is powered down. If the PLL is running at the time of the WFI instruction, hardware will power the PLL down and override the SYSDIV field of the active **RCC/RCC2** register, to be determined by the DSDIVORIDE setting in the **DSLPCLKCFG** register, up to /16 or /64 respectively. When the Deep-Sleep exit event occurs, hardware brings the system clock back to the source and frequency it had at the onset of Deep-Sleep mode before enabling the clocks that had been stopped during the Deep-Sleep duration.
- **Hibernate Mode.** In this mode, the power supplies are turned off to the main part of the device and only the Hibernation module's circuitry is active. An external wake event or RTC event is required to bring the device back to Run mode. The Cortex-M3 processor and peripherals outside of the Hibernation module see a normal "power on" sequence and the processor starts running code. It can determine that it has been restarted from Hibernate mode by inspecting the Hibernation module registers.

## 6.2 Initialization and Configuration

The PLL is configured using direct register writes to the RCC/RCC2 register. If the RCC2 register is being used, the USERCC2 bit must be set and the appropriate RCC2 bit/field is used. The steps required to successfully change the PLL-based system clock are:

- 1. Bypass the PLL and system clock divider by setting the BYPASS bit and clearing the USESYS bit in the RCC register. This configures the system to run off a "raw" clock source and allows for the new PLL configuration to be validated before switching the system clock to the PLL.
- 2. Select the crystal value (XTAL) and oscillator source (OSCSRC), and clear the PWRDN bit in RCC/RCC2. Setting the XTAL field automatically pulls valid PLL configuration data for the appropriate crystal, and clearing the PWRDN bit powers and enables the PLL and its output.
- 3. Select the desired system divider (SYSDIV) in RCC/RCC2 and set the USESYS bit in RCC. The SYSDIV field determines the system frequency for the microcontroller.
- 4. Wait for the PLL to lock by polling the PLLLRIS bit in the Raw Interrupt Status (RIS) register.
- 5. Enable use of the PLL by clearing the BYPASS bit in RCC/RCC2.

## 6.3 Register Map

Table 6-1 on page 70 lists the System Control registers, grouped by function. The offset listed is a hexadecimal increment to the register's address, relative to the System Control base address of 0x400F.E000.

**Note:** Spaces in the System Control register space that are not used are reserved for future or internal use. Software should not modify any reserved memory address.

Table 6-1. System Control Register Map

# 6.4 Register Descriptions

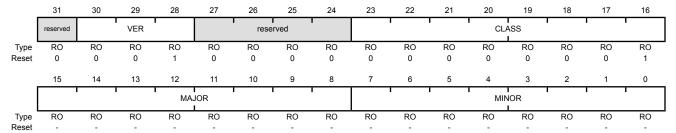

All addresses given are relative to the System Control base address of 0x400F.E000.

## Register 1: Device Identification 0 (DID0), offset 0x000

This register identifies the version of the device.

Device Identification 0 (DID0)

Base 0x400F.E000 Offset 0x000 Type RO, reset -

Bit/Field	Name	Type	Reset	Description
31	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
30:28	VER	RO	0x1	DID0 Version
				This field defines the $\textbf{DID0}$ register format version. The version number is numeric. The value of the $\mathtt{VER}$ field is encoded as follows:
				Value Description
				0x1 Second version of the <b>DID0</b> register format.
27:24	reserved	RO	0x0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
23:16	CLASS	RO	0x1	Device Class

The CLASS field value identifies the internal design from which all mask sets are generated for all devices in a particular product line. The CLASS field value is changed for new product lines, for changes in fab process (for example, a remap or shrink), or any case where the MAJOR OR MINOR fields require differentiation from prior devices. The value of the CLASS field is encoded as follows (all other encodings are reserved):

Value Description

0x1 Stellaris® Fury-class devices.

Bit/Field	Name	Туре	Reset	Description
15:8	MAJOR	RO	-	Major Revision
				This field specifies the major revision number of the device. The major revision reflects changes to base layers of the design. The major revision number is indicated in the part number as a letter (A for first revision, B for second, and so on). This field is encoded as follows:
				Value Description
				0x0 Revision A (initial device)
				0x1 Revision B (first base layer revision)
				0x2 Revision C (second base layer revision)
				and so on.
7:0	MINOR	RO	-	Minor Revision
				This field specifies the minor revision number of the device. The minor revision reflects changes to the metal layers of the design. The ${\tt MINOR}$ field value is reset when the ${\tt MAJOR}$ field is changed. This field is numeric and is encoded as follows:
				Value Description
				0x0 Initial device, or a major revision update.
				0x1 First metal layer change.
				0x2 Second metal layer change.
				and so on.

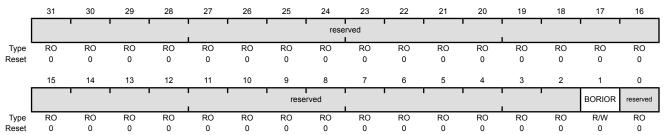

### Register 2: Brown-Out Reset Control (PBORCTL), offset 0x030

This register is responsible for controlling reset conditions after initial power-on reset.

#### Brown-Out Reset Control (PBORCTL)

Base 0x400F.E000

Offset 0x030 Type R/W, reset 0x0000.7FFD

Bit/Field	Name	Type	Reset	Description
31:2	reserved	RO	0x0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	BORIOR	R/W	0	BOR Interrupt or Reset
				This bit controls how a BOR event is signaled to the controller. If set, a reset is signaled. Otherwise, an interrupt is signaled.
0	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

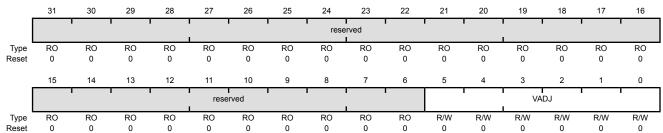

# Register 3: LDO Power Control (LDOPCTL), offset 0x034

The VADJ field in this register adjusts the on-chip output voltage ( $V_{OUT}$ ).

#### LDO Power Control (LDOPCTL)

Base 0x400F.E000 Offset 0x034

Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:6	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
5:0	VADJ	R/W	0x0	LDO Output Voltage

This field sets the on-chip output voltage. The programming values for the  $\mathtt{VADJ}$  field are provided below.

Value	$V_{OUT}\left( V\right)$
0x00	2.50
0x01	2.45
0x02	2.40
0x03	2.35
0x04	2.30
0x05	2.25
0x06-0x3F	Reserved
0x1B	2.75
0x1C	2.70
0x1D	2.65
0x1E	2.60
0x1F	2.55

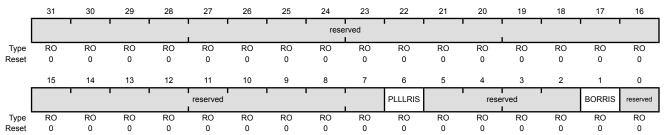

### Register 4: Raw Interrupt Status (RIS), offset 0x050

Central location for system control raw interrupts. These are set and cleared by hardware.

#### Raw Interrupt Status (RIS)

Base 0x400F.E000 Offset 0x050

Type RO, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:7	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
6	PLLLRIS	RO	0	PLL Lock Raw Interrupt Status
				This bit is set when the PLL $T_{READY}$ Timer asserts.
5:2	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	BORRIS	RO	0	Brown-Out Reset Raw Interrupt Status
				This bit is the raw interrupt status for any brown-out conditions. If set, a brown-out condition is currently active. This is an unregistered signal from the brown-out detection circuit. An interrupt is reported if the BORIM bit in the <b>IMC</b> register is set and the BORIOR bit in the <b>PBORCTL</b> register is cleared.
0	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

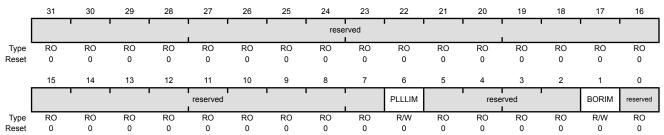

### Register 5: Interrupt Mask Control (IMC), offset 0x054

Central location for system control interrupt masks.

#### Interrupt Mask Control (IMC)

Base 0x400F.E000

Offset 0x054 Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:7	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
6	PLLLIM	R/W	0	PLL Lock Interrupt Mask
				This bit specifies whether a PLL Lock interrupt is promoted to a controller interrupt. If set, an interrupt is generated if PLLLRIS in <b>RIS</b> is set; otherwise, an interrupt is not generated.
5:2	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	BORIM	R/W	0	Brown-Out Reset Interrupt Mask
				This bit specifies whether a brown-out condition is promoted to a controller interrupt. If set, an interrupt is generated if BORRIS is set; otherwise, an interrupt is not generated.
0	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

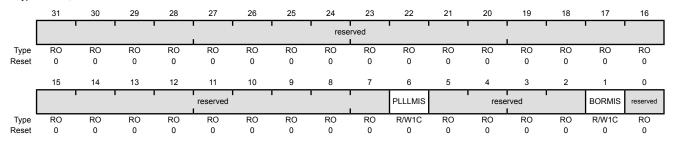

### Register 6: Masked Interrupt Status and Clear (MISC), offset 0x058

On a read, this register gives the current masked status value of the corresponding interrupt. All of the bits are R/W1C and this action also clears the corresponding raw interrupt bit in the RIS register (see page 76).

Masked Interrupt Status and Clear (MISC)

Base 0x400F.E000

Offset 0x058
Type R/W1C, reset 0x0000.0000

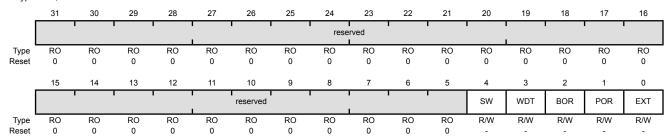

Bit/Field	Name	Туре	Reset	Description
31:7	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
6	PLLLMIS	R/W1C	0	PLL Lock Masked Interrupt Status
				This bit is set when the PLL $\rm T_{READY}$ timer asserts. The interrupt is cleared by writing a 1 to this bit.
5:2	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	BORMIS	R/W1C	0	BOR Masked Interrupt Status
				The ${\tt BORMIS}$ is simply the ${\tt BORRIS}$ ANDed with the mask value, ${\tt BORIM}.$
0	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

### Register 7: Reset Cause (RESC), offset 0x05C

This register is set with the reset cause after reset. The bits in this register are sticky and maintain their state across multiple reset sequences, except when an power-on reset is the cause, in which case, all bits other than POR in the **RESC** register are cleared.

Reset Cause (RESC)

Base 0x400F.E000 Offset 0x05C Type R/W, reset -

Bit/Field	Name	Type	Reset	Description
31:5	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
4	SW	R/W	-	Software Reset
				When set, indicates a software reset is the cause of the reset event.
3	WDT	R/W	-	Watchdog Timer Reset
				When set, indicates a watchdog reset is the cause of the reset event.
2	BOR	R/W	-	Brown-Out Reset
				When set, indicates a brown-out reset is the cause of the reset event.
1	POR	R/W	-	Power-On Reset
				When set, indicates a power-on reset is the cause of the reset event.
0	EXT	R/W	-	External Reset
				When set, indicates an external reset ( $\overline{\tt RST}$ assertion) is the cause of the reset event.

### Register 8: Run-Mode Clock Configuration (RCC), offset 0x060

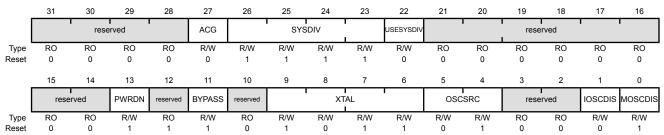

This register is defined to provide source control and frequency speed.

Run-Mode Clock Configuration (RCC)

Base 0x400F.E000 Offset 0x060

D:4/E: -1-4

Type R/W, reset 0x0780.3AD1

Bivrieid	name	туре	Reset	Description
31:28	reserved	RO	0x0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
27	ACG	R/W	0	Auto Clock Gating

**Auto Clock Gating** 

This bit specifies whether the system uses the Sleep-Mode Clock Gating Control (SCGCn) registers and Deep-Sleep-Mode Clock Gating Control (DCGCn) registers if the controller enters a Sleep or Deep-Sleep mode (respectively). If set, the **SCGCn** or **DCGCn** registers are used to control the clocks distributed to the peripherals when the controller is in a sleep mode. Otherwise, the Run-Mode Clock Gating Control (RCGCn) registers are used when the controller enters a sleep

The **RCGCn** registers are always used to control the clocks in Run mode.

This allows peripherals to consume less power when the controller is in a sleep mode and the peripheral is unused.

Bit/Field	Name	Type	Reset	Description	
26:23	SYSDIV	R/W	0xF	System Clock Divisor	
				Specifies which divisor PLL output.	or is used to generate the system clock from the
				Although the PLL VCC the divisor is applied.	O frequency is 400 MHz, it is predivided by 2 before
				Value Divisor (BYPA	SS=1) Frequency (BYPASS=0)

				0xF 8.192 MHz	
5:4	OSCSRC	R/W	0x1	Oscillator Source	
				Selects the input source for the OSC. The values are:	
				Value Input Source	
				0x0 MOSC	
				Main oscillator	
				0x1 IOSC	
				Internal oscillator (default)	
				0x2 IOSC/4	
				Internal oscillator / 4 (this is necessary if used as input to PLL	L)
				0x3 30 kHz	•
				30-KHz internal oscillator	
				For additional oscillator sources, see the RCC2 register.	

Bit/Field	Name	Туре	Reset	Description
3:2	reserved	RO	0x0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	IOSCDIS	R/W	0	Internal Oscillator Disable  0: Internal oscillator (IOSC) is enabled.
				1: Internal oscillator is disabled.
0	MOSCDIS	R/W	1	Main Oscillator Disable
				0: Main oscillator is enabled .
				1: Main oscillator is disabled (default).

### Register 9: XTAL to PLL Translation (PLLCFG), offset 0x064

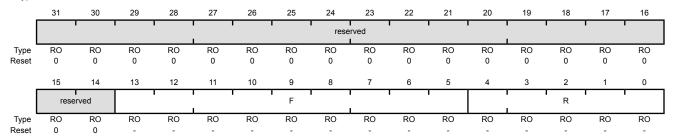

This register provides a means of translating external crystal frequencies into the appropriate PLL settings. This register is initialized during the reset sequence and updated anytime that the XTAL field changes in the **Run-Mode Clock Configuration (RCC)** register (see page 80).

The PLL frequency is calculated using the PLLCFG field values, as follows:

PLLFreq = OSCFreq \* F / (R + 1)

#### XTAL to PLL Translation (PLLCFG)

Base 0x400F.E000 Offset 0x064 Type RO, reset -

Bit/Field	Name	Туре	Reset	Description
31:14	reserved	RO	0x0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
13:5	F	RO	-	PLL F Value  This field specifies the value supplied to the PLL's F input.
4:0	R	RO	-	PLL R Value

This field specifies the value supplied to the PLL's R input.

### Register 10: Run-Mode Clock Configuration 2 (RCC2), offset 0x070

This register overrides the **RCC** equivalent register fields when the USERCC2 bit is set, allowing the extended capabilities of the RCC2 register to be used while also providing a means to be backward-compatible to previous parts. The fields within the **RCC2** register occupy the same bit positions as they do within the **RCC** register as LSB-justified.

The SYSDIV2 field is 2 bits wider than the SYSDIV field in the RCC register so that additional larger divisors are possible, allowing a lower system clock frequency for improved Deep Sleep power consumption. The PLL VCO frequency is 400 MHz.

Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be

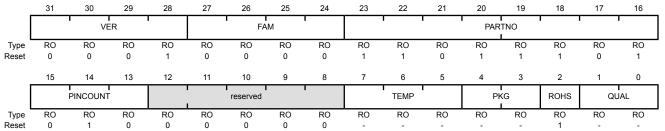

32 kHz

## Register 12: Device Identification 1 (DID1), offset 0x004

This register identifies the device family, part number, temperature range, pin count, and package type.

Device Identification 1 (DID1)

Base 0x400F.E000 Offset 0x004 Type RO, reset -

Reset 0	1 0 0	0 0	U	
Bit/Field	Name	Туре	Reset	Description
31:28	VER	RO	0x1	DID1 Version
				This field defines the <b>DID1</b> register format version. The version number is numeric. The value of the $\mathtt{VER}$ field is encoded as follows (all other encodings are reserved):
				Value Description
				0x1 Second version of the <b>DID1</b> register format.
27:24	FAM	RO	0x0	Family
				This field provides the family identification of the device within the Luminary Micro product portfolio. The value is encoded as follows (all other encodings are reserved):
				Value Description
				0x0 Stellaris family of microcontollers, that is, all devices with external part numbers starting with LM3S.
23:16	PARTNO	RO	0xDD	Part Number
				This field provides the part number of the device within the family. The value is encoded as follows (all other encodings are reserved):
				Value Description
				0xDD LM3S1911
15:13	PINCOUNT	RO	0x2	Package Pin Count
				This field specifies the number of pins on the device package. The value is encoded as follows (all other encodings are reserved):

Value Description

100-pin or 108-ball package

Bit/Field	Name	Туре	Reset	Description
12:8	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:5	TEMP	RO	-	Temperature Range
				This field specifies the temperature rating of the device. The value is encoded as follows (all other encodings are reserved):
				Value Description
				0x0 Commercial temperature range (0°C to 70°C)
				0x1 Industrial temperature range (-40°C to 85°C)
				0x2 Extended temperature range (-40°C to 105°C)
4:3	PKG	RO	-	Package Type
				This field specifies the package type. The value is encoded as follows (all other encodings are reserved):
				Value Description
				0x0 SOIC package
				0x1 LQFP package
				0x2 BGA package
2	ROHS	RO	1	RoHS-Compliance
				This bit specifies whether the device is RoHS-compliant. A 1 indicates the part is RoHS-compliant.
1:0	QUAL	RO	-	Qualification Status
				This field specifies the qualification status of the device. The value is encoded as follows (all other encodings are reserved):
				Value Description
				0x0 Engineering Sample (unqualified)
				0x1 Pilot Production (unqualified)
				0x2 Fully Qualified

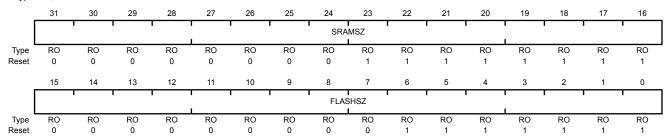

### Register 13: Device Capabilities 0 (DC0), offset 0x008

This register is predefined by the part and can be used to verify features.

Device Capabilities 0 (DC0)

Base 0x400F.E000 Offset 0x008

Type RO, reset 0x00FF.007F

Bit/Field	Name	Type	Reset	Description
31:16	SRAMSZ	RO	0x00FF	SRAM Size Indicates the size of the on-chip SRAM memory.  Value Description
15:0	FLASHSZ	RO	0x007F	0x00FF 64 KB of SRAM  Flash Size

Indicates the size of the on-chip flash memory.

Value Description 0x007F 256 KB of Flash

#### Register 14: Device Capabilities 1 (DC1), offset 0x010

This register provides a list of features available in the system. The Stellaris family uses this register format to indicate the availability of the following family features in the specific device: CANs, PWM, ADC, Watchdog timer, Hibernation module, and debug capabilities. This register also indicates the maximum clock frequency and maximum ADC sample rate. The format of this register is consistent with the RCGC0, SCGC0, and DCGC0 clock control registers and the SRCR0 software reset control register.

### Register 15: Device Capabilities 2 (DC2), offset 0x014

This register provides a list of features available in the system. The Stellaris family uses this register format to indicate the availability of the following family features in the specific device: Analog Comparators, General-Purpose Timers, I2Cs, QEIs, SSIs, and UARTs. The format of this register is consistent with the RCGC1, SCGC1, and DCGC1 clock control registers and the SRCR1 software reset control register.

				When set, indicates that GPIO Port A is present.

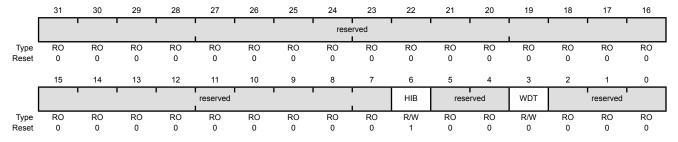

### Register 18: Run Mode Clock Gating Control Register 0 (RCGC0), offset 0x100

This register controls the clock gating logic. Each bit controls a clock enable for a given interface, function, or unit. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled (saving power). If the unit is unclocked, reads or writes to the unit will generate a bus fault. The reset state of these bits is 0 (unclocked) unless otherwise noted, so that all functional units are disabled. It is the responsibility of software to enable the ports necessary for the application. Note that these registers may contain more bits than there are interfaces, functions, or units to control. This is to assure reasonable code compatibility with other family and future parts. **RCGC0** is the clock configuration register for running operation, SCGC0 for Sleep operation, and DCGC0 for Deep-Sleep operation. Setting the ACG bit in the Run-Mode Clock Configuration (RCC) register specifies that the system uses sleep modes.

Run Mode Clock Gating Control Register 0 (RCGC0)

Base 0x400F.E000 Offset 0x100

Type R/W, reset 0x00000040

Bit/Field	Name	Туре	Reset	Description
31:7	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
6	HIB	R/W	1	HIB Clock Gating Control
				This bit controls the clock gating for the Hibernation module. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled.
5:4	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
3	WDT	R/W	0	WDT Clock Gating Control
				This bit controls the clock gating for the WDT module. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, a read or write to the unit generates a bus fault.
2:0	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

# Register 19: Sleep Mode Clock Gating Control Register 0 (SCGC0), offset 0x110

This register controls the clock gating logic. Each bit controls a clock enable for a given interface, function, or unit. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled (saving power). If the unit is unclocked, reads or writes to the unit will generate a bus fault. The reset state of these bits is 0 (unclocked) unless otherwise noted, so that all functional units are disabled. It is the responsibility of software to enable the ports necessary for the application. Note that these registers may contain more bits than there are interfaces, functions, or units to control. This is to assure reasonable code compatibility with other family and future parts. **RCGC0** is the clock configuration register for running operation, **SCGC0** for Sleep operation, and **DCGC0** for Deep-Sleep operation. Setting the ACG bit in the **Run-Mode Clock Configuration (RCC)** register specifies that the system uses sleep modes.

25	COMP1	R/W	0	Analog Comparator 1 Clock Gating
				This bit controls the clock gating for analog comparator 1. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.
24	COMP0	R/W	0	Analog Comparator 0 Clock Gating
				This bit controls the clock gating for analog comparator 0. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.
23:20	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
19	TIMER3	R/W	0	Timer 3 Clock Gating Control

This bit controls the clock gating for General-Purpose Timer module 3. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.

Bit/Field	Name	Туре	Reset	Description
18	TIMER2	R/W	0	Timer 2 Clock Gating Control
				This bit controls the clock gating for General-Purpose Timer module 2. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.
17	TIMER1	R/W	0	Timer 1 Clock Gating Control
				This bit controls the clock gating for General-Purpose Timer module 1. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.
16	TIMER0	R/W	0	Timer 0 Clock Gating Control
				This bit controls the clock gating for General-Purpose Timer module 0. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.
15	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
14	I2C1	R/W	0	I2C1 Clock Gating Control
				This bit controls the clock gating for I2C module 1. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.
13	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
12	I2C0	R/W	0	I2C0 Clock Gating Control
				This bit controls the clock gating for I2C module 0. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.
11:6	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
5	SSI1	R/W	0	SSI1 Clock Gating Control
				This bit controls the clock gating for SSI module 1. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.
4	SSI0	R/W	0	SSI0 Clock Gating Control
				This bit controls the clock gating for SSI module 0. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.
3	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

Bit/Field	Name	Туре	Reset	Description
2	UART2	R/W	0	UART2 Clock Gating Control
				This bit controls the clock gating for UART module 2. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.
1	UART1	R/W	0	UART1 Clock Gating Control
				This bit controls the clock gating for UART module 1. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.
0	UART0	R/W	0	UART0 Clock Gating Control
				This bit controls the clock gating for UART module 0. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled. If the unit is unclocked, reads or writes to the unit will generate a bus fault.

# Register 22: Sleep Mode Clock Gating Control Register 1 (SCGC1), offset 0x114

This register controls the clock gating logic. Each bit controls a clock enable for a given interface, function, or unit. If set, the unit receives a clock and functions. Otherwise, the unit is unclocked and disabled (saving power). If the unit is unclocked, reads or writes to the unit will generate a bus fault. The reset state of these bits is 0 (unclocked) unless otherwise noted, so that all functional units are disabled. It is the responsibility of software to enable the ports necessary for the application. Note that these registers may contain more bits than there are interfaces, functions, or units to control. This is to assure reasonable code compatibility with other family and future parts. **RCGC1** is the clock configuration register for running operation, **SCGC1** for Sleep operation, and **DCGC1** for Deep-Sleep operation. Setting the ACG bit in the **Run-Mode Clock Configuration (RCC)** register specifies that the system uses sleep modes.

## 7 Hibernation Module

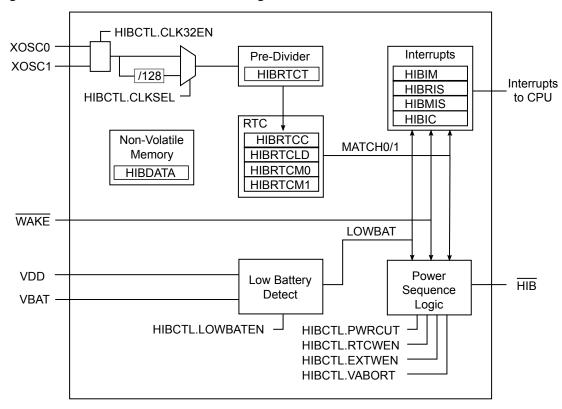

The Hibernation Module manages removal and restoration of power to provide a means for reducing power consumption. When the processor and peripherals are idle, power can be completely removed with only the Hibernation module remaining powered. Power can be restored based on an external signal, or at a certain time using the built-in Real-Time Clock (RTC). The Hibernation module can be independently supplied from a battery or an auxiliary power supply.

The Hibernation module has the following features:

- System power control using discrete external regulator
- Dedicated pin for waking from an external signal
- Low-battery detection, signaling, and interrupt generation
- 32-bit real-time counter (RTC)
- Two 32-bit RTC match registers for timed wake-up and interrupt generation
- Clock source from a 32.768-kHz external oscillator or a 4.194304-MHz crystal
- RTC predivider trim for making fine adjustments to the clock rate
- 64 32-bit words of non-volatile memory
- Programmable interrupts for RTC match, external wake, and low battery events

## 7.1 Block Diagram

Figure 7-1. Hibernation Module Block Diagram

# 7.2 Functional Description

The Hibernation module controls the power to the processor with an enable signal (HIB) that signals an external voltage regulator to turn off.

The Hibernation module power source is determined dynamically. The supply voltage of the Hibernation module is the larger of the main voltage source (VDD) or the battery/auxilliary voltage source (VBAT). A voting circuit indicates the larger and an internal power switch selects the appropriate voltage source. The Hibernation module also has a separate clock source to maintain a real-time clock (RTC). Once in hibernation, the module signals an external voltage regulator to turn back on the power when an external pin ( $\overline{\text{WAKE}}$ ) is asserted, or when the internal RTC reaches a certain value. The Hibernation module can also detect when the battery voltage is low, and optionally prevent hibernation when this occurs.

Power-up from a power cut to code execution is defined as the regulator turn-on time (specified at  $t_{HIB\ TO\ VDD}$  maximum) plus the normal chip POR (see "Hibernation Module" on page 427).

#### 7.2.1 Register Access Timing

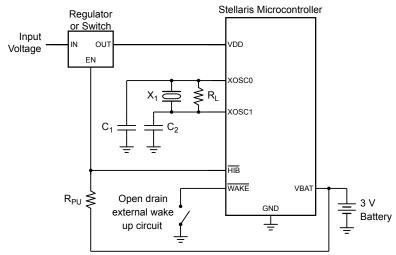

Because the Hibernation module has an independent clocking domain, certain registers must be written only with a timing gap between accesses. The delay time is  $t_{HIB\_REG\_WRITE}$ , therefore software must guarantee that a delay of  $t_{HIB\_REG\_WRITE}$  is inserted between back-to-back writes to certain Hibernation registers, or between a write followed by a read to those same registers. There is no restriction on timing for back-to-back reads from the Hibernation module.

#### 7.2.2 Clock Source

The Hibernation module must be clocked by an external source, even if the RTC feature is not used. An external oscillator or crystal can be used for this purpose. To use a crystal, a 4.194304-MHz crystal is connected to the <code>xosc0</code> and <code>xosc1</code> pins. This clock signal is divided by 128 internally to produce the 32.768-kHz clock reference. For an alternate clock source, a 32.768-kHz oscillator can be connected to the <code>xosc0</code> pin. See Figure 7-2 on page 123 and Figure 7-3 on page 124. Note that these diagrams only show the connection to the Hibernation pins and not to the full system. See "Hibernation Module" on page 427 for specific values.

The clock source is enabled by setting the CLK32EN bit of the **HIBCTL** register. The type of clock source is selected by setting the CLKSEL bit to 0 for a 4.194304-MHz clock source, and to 1 for a 32.768-kHz clock source. If the bit is set to 0, the 4.194304-MHz input clock is divided by 128, resulting in a 32.768-kHz clock source. If a crystal is used for the clock source, the software must leave a delay of  $t_{XOSC\_SETTLE}$  after setting the CLK32EN bit and before any other accesses to the Hibernation module registers. The delay allows the crystal to power up and stabilize. If an oscillator is used for the clock source, no delay is needed.

Figure 7-2. Clock Source Using Crystal

**Note:**  $X_1$  = Crystal frequency is  $f_{XOSC\_XTAL}$ .

 $C_{1,2}$  = Capacitor value derived from crystal vendor load capacitance specifications.

 $R_L$  = Load resistor is  $R_{XOSC\_LOAD}$ .

R<sub>PU</sub> = Pull-up resistor (1 M½).

See "Hibernation Module" on page 427 for specific parameter values.

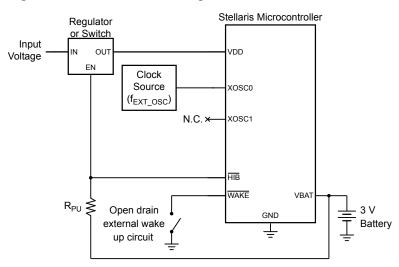

Figure 7-3. Clock Source Using Dedicated Oscillator

**Note:**  $R_{PU}$  = Pull-up resistor (1  $M\frac{1}{2}$ ).

#### 7.2.3 Battery Management

The Hibernation module can be independently powered by a battery or an auxiliary power source. The module can monitor the voltage level of the battery and detect when the voltage drops below  $V_{LOWBAT}$ . When this happens, an interrupt can be generated. The module can also be configured so that it will not go into Hibernate mode if the battery voltage drops below this threshold. Battery voltage is not measured while in Hibernate mode.

**Important:** System level factors may affect the accuracy of the low battery detect circuit. The designer should consider battery type, discharge characteristics, and a test load during battery voltage measurements.

Note that the Hibernation module draws power from whichever source (VBAT or VDD) has the higher voltage. Therefore, it is important to design the circuit to ensure that VDD is higher that VBAT under nominal conditions or else the Hibernation module draws power from the battery even when VDD is available.

The Hibernation module can be configured to detect a low battery condition by setting the LOWBATEN bit of the **HIBCTL** register. In this configuration, the LOWBAT bit of the **HIBRIS** register will be set when the battery level is low. If the VABORT bit is also set, then the module is prevented from entering Hibernation mode when a low battery is detected. The module can also be configured to generate an interrupt for the low-battery condition (see "Interrupts and Status" on page 126).

#### 7.2.4 Real-Time Clock

The Hibernation module includes a 32-bit counter that increments once per second with a proper clock source and configuration (see "Clock Source" on page 123). The 32.768-kHz clock signal is fed into a predivider register which counts down the 32.768-kHz clock ticks to achieve a once per second clock rate for the RTC. The rate can be adjusted to compensate for inaccuracies in the clock source by using the predivider trim register, **HIBRTCT**. This register has a nominal value of 0x7FFF, and is used for one second out of every 64 seconds to divide the input clock. This allows the software to make fine corrections to the clock rate by adjusting the predivider trim register up or down from 0x7FFF. The predivider trim should be adjusted up from 0x7FFF in order to slow down the RTC rate, and down from 0x7FFF in order to speed up the RTC rate.

The Hibernation module includes two 32-bit match registers that are compared to the value of the RTC counter. The match registers can be used to wake the processor from hibernation mode, or to generate an interrupt to the processor if it is not in hibernation.

The RTC must be enabled with the RTCEN bit of the **HIBCTL** register. The value of the RTC can be set at any time by writing to the **HIBRTCLD** register. The predivider trim can be adjusted by reading and writing the **HIBRTCT** register. The predivider uses this register once every 64 seconds to adjust the clock rate. The two match registers can be set by writing to the **HIBRTCM0** and **HIBRTCM1** registers. The RTC can be configured to generate interrupts by using the interrupt registers (see "Interrupts and Status" on page 126).

### 7.2.5 Non-Volatile Memory

The Hibernation module contains 64 32-bit words of memory which are retained during hibernation. This memory is powered from the battery or auxiliary power supply during hibernation. The processor software can save state information in this memory prior to hibernation, and can then recover the state upon waking. The non-volatile memory can be accessed through the **HIBDATA** registers.

#### 7.2.6 Power Control

**Important:** The Hibernation Module requires special system implementation considerations when using  $\overline{\mathtt{HIB}}$  to control power, as it is intended to power-down all other sections of its host device. All system signals and power supplies that connect to the chip must be driven to 0 V<sub>DC</sub> or powered down with the same regulator controlled by  $\overline{\mathtt{HIB}}$ . See "Hibernation Module" on page 427 for more details.

The Hibernation module controls power to the microcontroller through the use of the  $\overline{\mathtt{HIB}}$  pin. This pin is intended to be connected to the enable signal of the external regulator(s) providing 3.3 V and/or 2.5 V to the microcontroller. When the  $\overline{\mathtt{HIB}}$  signal is asserted by the Hibernation module, the external regulator is turned off and no longer powers the system. The Hibernation module remains powered from the VBAT supply (which could be a battery or an auxiliary power source) until a Wake event. Power to the device is restored by deasserting the  $\overline{\mathtt{HIB}}$  signal, which causes the external regulator to turn power back on to the chip.

#### 7.2.7 Initiating Hibernate

Hibernation mode is initiated by the microcontroller setting the HIBREQ bit of the **HIBCTL** register. Prior to doing this, a wake-up condition must be configured, either from the external WAKE pin, or by using an RTC match.

The Hibernation module is configured to wake from the external  $\overline{\text{WAKE}}$  pin by setting the PINWEN bit of the **HIBCTL** register. It is configured to wake from RTC match by setting the RTCWEN bit. Either one or both of these bits can be set prior to going into hibernation. The  $\overline{\text{WAKE}}$  pin includes a weak internal pull-up. Note that both the  $\overline{\text{HIB}}$  and  $\overline{\text{WAKE}}$  pins use the Hibernation module's internal power supply as the logic 1 reference.

When the Hibernation module wakes, the microcontroller will see a normal power-on reset. Software can detect that the power-on was due to a wake from hibernation by examining the raw interrupt status register (see "Interrupts and Status" on page 126) and by looking for state data in the non-volatile memory (see "Non-Volatile Memory" on page 125).

When the  $\overline{\text{HIB}}$  signal deasserts, enabling the external regulator, the external regulator must reach the operating voltage within  $t_{\text{HIB\_TO\_VDD}}$ .

#### 7.2.8 Interrupts and Status

The Hibernation module can generate interrupts when the following conditions occur:

- Assertion of WAKE pin
- RTC match
- Low battery detected

All of the interrupts are ORed together before being sent to the interrupt controller, so the Hibernate module can only generate a single interrupt request to the controller at any given time. The software interrupt handler can service multiple interrupt events by reading the **HIBMIS** register. Software can also read the status of the Hibernation module at any time by reading the **HIBRIS** register which shows all of the pending events. This register can be used at power-on to see if a wake condition is pending, which indicates to the software that a hibernation wake occurred.

The events that can trigger an interrupt are configured by setting the appropriate bits in the **HIBIM** register. Pending interrupts can be cleared by writing the corresponding bit in the **HIBIC** register.

## 7.3 Initialization and Configuration

The Hibernation module can be set in several different configurations. The following sections show the recommended programming sequence for various scenarios. The examples below assume that a 32.768-kHz oscillator is used, and thus always show bit 2 (CLKSEL) of the **HIBCTL** register set to 1. If a 4.194304-MHz crystal is used instead, then the CLKSEL bit remains cleared. Because the Hibernation module runs at 32.768 kHz and is asynchronous to the rest of the system, software must allow a delay of  $t_{HIB\_REG\_WRITE}$  after writes to certain registers (see "Register Access Timing" on page 122). The registers that require a delay are listed in a note in "Register Map" on page 127 as well as in each register description.

#### 7.3.1 Initialization

The Hibernation module clock source must be enabled first, even if the RTC feature is not used. If a 4.194304-MHz crystal is used, perform the following steps:

- 1. Write 0x40 to the **HIBCTL** register at offset 0x10 to enable the crystal and select the divide-by-128 input path.
- 2. Wait for a time of t<sub>XOSC\_SETTLE</sub> for the crystal to power up and stabilize before performing any other operations with the Hibernation module.

If a 32.678-kHz oscillator is used, then perform the following steps:

- Write 0x44 to the HIBCTL register at offset 0x10 to enable the oscillator input.
- 2. No delay is necessary.

The above is only necessary when the entire system is initialized for the first time. If the processor is powered due to a wake from hibernation, then the Hibernation module has already been powered up and the above steps are not necessary. The software can detect that the Hibernation module and clock are already powered by examining the CLK32EN bit of the **HIBCTL** register.

#### 7.3.2 RTC Match Functionality (No Hibernation)

Use the following steps to implement the RTC match functionality of the Hibernation module:

- 1. Write the required RTC match value to one of the **HIBRTCMn** registers at offset 0x004 or 0x008.
- 2. Write the required RTC load value to the **HIBRTCLD** register at offset 0x00C.
- 3. Set the required RTC match interrupt mask in the RTCALT0 and RTCALT1 bits (bits 1:0) in the HIBIM register at offset 0x014.
- **4.** Write 0x0000.0041 to the **HIBCTL** register at offset 0x010 to enable the RTC to begin counting.

### 7.3.3 RTC Match/Wake-Up from Hibernation

Use the following steps to implement the RTC match and wake-up functionality of the Hibernation module:

- 1. Write the required RTC match value to the **HIBRTCMn** registers at offset 0x004 or 0x008.
- 2. Write the required RTC load value to the **HIBRTCLD** register at offset 0x00C.
- 3. Write any data to be retained during power cut to the HIBDATA register at offsets 0x030-0x12C.
- **4.** Set the RTC Match Wake-Up and start the hibernation sequence by writing 0x0000.004F to the **HIBCTL** register at offset 0x010.

## 7.3.4 External Wake-Up from Hibernation

Use the following steps to implement the Hibernation module with the external  $\overline{\mathtt{WAKE}}$  pin as the wake-up source for the microcontroller:

- 1. Write any data to be retained during power cut to the **HIBDATA** register at offsets 0x030-0x12C.
- 2. Enable the external wake and start the hibernation sequence by writing 0x0000.0056 to the **HIBCTL** register at offset 0x010.

#### 7.3.5 RTC/External Wake-Up from Hibernation

- 1. Write the required RTC match value to the **HIBRTCMn** registers at offset 0x004 or 0x008.
- 2. Write the required RTC load value to the **HIBRTCLD** register at offset 0x00C.
- 3. Write any data to be retained during power cut to the **HIBDATA** register at offsets 0x030-0x12C.
- **4.** Set the RTC Match/External Wake-Up and start the hibernation sequence by writing 0x0000.005F to the **HIBCTL** register at offset 0x010.

## 7.4 Register Map

Table 7-1 on page 127 lists the Hibernation registers. All addresses given are relative to the Hibernation Module base address at 0x400F.C000.

# 7.5 Register Descriptions

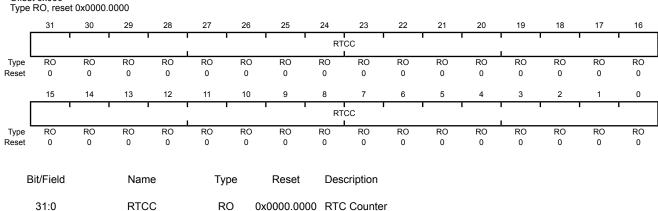

The remainder of this section lists and describes the Hibernation module registers, in numerical order by address offset.

## Register 1: Hibernation RTC Counter (HIBRTCC), offset 0x000

This register is the current 32-bit value of the RTC counter.

Hibernation RTC Counter (HIBRTCC)

Base 0x400F.C000 Offset 0x000

A read returns the 32-bit counter value. This register is read-only. To change the value, use the **HIBRTCLD** register.

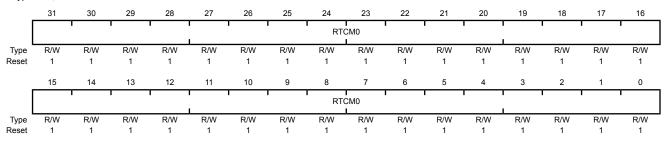

## Register 2: Hibernation RTC Match 0 (HIBRTCM0), offset 0x004

This register is the 32-bit match 0 register for the RTC counter.

Hibernation RTC Match 0 (HIBRTCM0)

Base 0x400F.C000 Offset 0x004

Type R/W, reset 0xFFF.FFF

Bit/Field Name Type Reset Description

31:0 RTCM0 R/W 0xFFF.FFFF RTC Match 0

A write loads the value into the RTC match register.

A read returns the current match value.

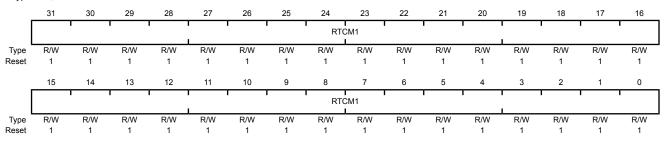

## Register 3: Hibernation RTC Match 1 (HIBRTCM1), offset 0x008

This register is the 32-bit match 1 register for the RTC counter.

Hibernation RTC Match 1 (HIBRTCM1)

Base 0x400F.C000 Offset 0x008

Type R/W, reset 0xFFFF.FFF

Bit/Field Name Type Reset Description

31:0 RTCM1 R/W 0xFFF.FFFF RTC Match 1

A write loads the value into the RTC match register.

A read returns the current match value.

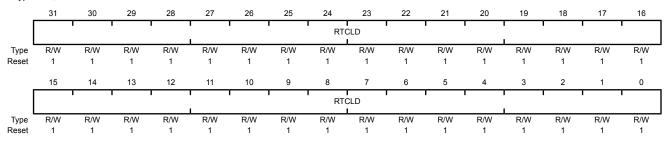

## Register 4: Hibernation RTC Load (HIBRTCLD), offset 0x00C

This register is the 32-bit value loaded into the RTC counter.

Hibernation RTC Load (HIBRTCLD)

Base 0x400F.C000 Offset 0x00C

Type R/W, reset 0xFFFF.FFF

Bit/Field Name Type Reset Description
31:0 RTCLD R/W 0xFFF.FFFF RTC Load

A write loads the current value into the RTC counter (RTCC).

A read returns the 32-bit load value.

## Register 5: Hibernation Control (HIBCTL), offset 0x010

This register is the control register for the Hibernation module.

Hibernation Control (HIBCTL)

**PINWEN** 

R/W

0

## Register 10: Hibernation RTC Trim (HIBRTCT), offset 0x024

This register contains the value that is used to trim the RTC clock predivider. It represents the computed underflow value that is used during the trim cycle. It is represented as  $0x7FFF \pm N$  clock cycles.

#### Hibernation RTC Trim (HIBRTCT)

Base 0x400F.C000

Offset 0x024 Type R/W, reset 0x0000.7FFF

Bit/Field	Name	Type	Reset	Description
31:16	reserved	RO	0x0000	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
15:0	TRIM	R/W	0x7FFF	RTC Trim Value

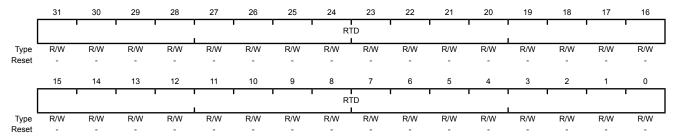

This value is loaded into the RTC predivider every 64 seconds. It is used to adjust the RTC rate to account for drift and inaccuracy in the clock source. The compensation is made by software by adjusting the default value of 0x7FFF up or down.

## Register 11: Hibernation Data (HIBDATA), offset 0x030-0x12C

This address space is implemented as a 64x32-bit memory (256 bytes). It can be loaded by the system processor in order to store any non-volatile state data and will not lose power during a power cut operation.

# 8 Internal Memory

The LM3S1911 microcontroller comes with 64 KB of bit-banded SRAM and 256 KB of flash memory. The flash controller provides a user-friendly interface, making flash programming a simple task. Flash protection can be applied to the flash memory on a 2-KB block basis.

## 8.1 Block Diagram

Figure 8-1 on page 141 illustrates the Flash functions. The dashed boxes in the figure indicate registers residing in the System Control module rather than the Flash Control module.

Figure 8-1. Flash Block Diagram

## 8.2 Functional Description

This section describes the functionality of the SRAM and Flash memories.

#### 8.2.1 SRAM Memory

The internal SRAM of the Stellaris<sup>®</sup> devices is located at address 0x2000.0000 of the device memory map. To reduce the number of time consuming read-modify-write (RMW) operations, ARM has introduced *bit-banding* technology in the Cortex-M3 processor. With a bit-band-enabled processor, certain regions in the memory map (SRAM and peripheral space) can use address aliases to access individual bits in a single, atomic operation.

The bit-band alias is calculated by using the formula:

```
bit-band alias = bit-band base + (byte offset * 32) + (bit number * 4)
```

For example, if bit 3 at address 0x2000.1000 is to be modified, the bit-band alias is calculated as:

```
0x2200.0000 + (0x1000 * 32) + (3 * 4) = 0x2202.000C
```

With the alias address calculated, an instruction performing a read/write to address 0x2202.000C allows direct access to only bit 3 of the byte at address 0x2000.1000.

For details about bit-banding, please refer to Chapter 4, "Memory Map" in the *ARM*® *Cortex*™-*M3 Technical Reference Manual*.

#### 8.2.2 Flash Memory

The flash is organized as a set of 1-KB blocks that can be individually erased. Erasing a block causes the entire contents of the block to be reset to all 1s. An individual 32-bit word can be programmed to change bits that are currently 1 to a 0. These blocks are paired into a set of 2-KB blocks that can be individually protected. The protection allows blocks to be marked as read-only or execute-only, providing different levels of code protection. Read-only blocks cannot be erased or programmed, protecting the contents of those blocks from being modified. Execute-only blocks cannot be erased or programmed, and can only be read by the controller instruction fetch mechanism, protecting the contents of those blocks from being read by either the controller or by a debugger.

See also "Serial Flash Loader" on page 432 for a preprogrammed flash-resident utility used to download code to the flash memory of a device without the use of a debug interface.

#### 8.2.2.1 Flash Memory Timing

The timing for the flash is automatically handled by the flash controller. However, in order to do so, it must know the clock rate of the system in order to time its internal signals properly. The number of clock cycles per microsecond must be provided to the flash controller for it to accomplish this timing. It is software's responsibility to keep the flash controller updated with this information via the **USec Reload (USECRL)** register.

On reset, the **USECRL** register is loaded with a value that configures the flash timing so that it works with the maximum clock rate of the part. If software changes the system operating frequency, the new operating frequency minus 1 (in MHz) must be loaded into **USECRL** before any flash modifications are attempted. For example, if the device is operating at a speed of 20 MHz, a value of 0x13 (20-1) must be written to the **USECRL** register.

#### 8.2.2.2 Flash Memory Protection

The user is provided two forms of flash protection per 2-KB flash blocks in four pairs of 32-bit wide registers. The protection policy for each form is controlled by individual bits (per policy per block) in the **FMPPEn** and **FMPREn** registers.

- Flash Memory Protection Program Enable (FMPPEn): If set, the block may be programmed (written) or erased. If cleared, the block may not be changed.
- Flash Memory Protection Read Enable (FMPREn): If set, the block may be executed or read by software or debuggers. If cleared, the block may only be executed and contents of the memory block are prohibited from being accessed as data.

The policies may be combined as shown in Table 8-1 on page 142.

**Table 8-1. Flash Protection Policy Combinations** 

FMPPEn	FMPREn	Protection
0	0	Execute-only protection. The block may only be executed and may not be written or erased. This mode is used to protect code.
1	0	The block may be written, erased or executed, but not read. This combination is unlikely to be used.

**Table 8-1. Flash Protection Policy Combinations (continued)** 

FMPPEn	FMPREn	Protection
0	1	Read-only protection. The block may be read or executed but may not be written or erased. This mode is used to lock the block from further modification while allowing any read or execute access.
1	1	No protection. The block may be written, erased, executed or read.

An access that attempts to program or erase a PE-protected block is prohibited. A controller interrupt may be optionally generated (by setting the AMASK bit in the **FIM** register) to alert software developers of poorly behaving software during the development and debug phases.

An access that attempts to read an RE-protected block is prohibited. Such accesses return data filled with all 0s. A controller interrupt may be optionally generated to alert software developers of poorly behaving software during the development and debug phases.

The factory settings for the **FMPREn** and **FMPPEn** registers are a value of 1 for all implemented banks. This implements a policy of open access and programmability. The register bits may be changed by writing the specific register bit. The changes are not permanent until the register is committed (saved), at which point the bit change is permanent. If a bit is changed from a 1 to a 0 and not committed, it may be restored by executing a power-on reset sequence. Details on programming these bits are discussed in "Nonvolatile Register Programming" on page 144.

## 8.3 Flash Memory Initialization and Configuration

### 8.3.1 Flash Programming

The Stellaris<sup>®</sup> devices provide a user-friendly interface for flash programming. All erase/program operations are handled via three registers: **FMA**, **FMD**, and **FMC**.

#### 8.3.1.1 To program a 32-bit word

- Write source data to the FMD register.
- 2. Write the target address to the **FMA** register.
- 3. Write the flash write key and the WRITE bit (a value of 0xA442.0001) to the FMC register.
- **4.** Poll the **FMC** register until the WRITE bit is cleared.

#### 8.3.1.2 To perform an erase of a 1-KB page

- 1. Write the page address to the **FMA** register.
- 2. Write the flash write key and the ERASE bit (a value of 0xA442.0002) to the FMC register.
- 3. Poll the FMC register until the ERASE bit is cleared.

#### 8.3.1.3 To perform a mass erase of the flash

- 1. Write the flash write key and the MERASE bit (a value of 0xA442.0004) to the **FMC** register.
- 2. Poll the FMC register until the MERASE bit is cleared.

### 8.3.2 Nonvolatile Register Programming

This section discusses how to update registers that are resident within the Flash memory itself. These registers exist in a separate space from the main Flash memory array and are not affected by an ERASE or MASS ERASE operation. The bits in these registers can be changed from 1 to 0 with a write operation. The register contents are unaffected by any reset condition except power-on reset, which returns the register contents to 0xFFFF.FFF. By committing the register values using the COMT bit in the **FMC** register, the register contents become nonvolatile and are therefore retained following power cycling. Once the register contents are committed, the **FMPREx** and **FMPPEx** registers can be restored to their factory default values by performing the sequence described in the section called "Recovering a "Locked" Device" on page 54. However, the **USER\_REGx** and **USER DBG** registers can never be restored to the factory default values.

With the exception of the **USER\_DBG** register, the settings in these registers can be tested before committing them to Flash memory. For the **USER\_DBG** register, the data to be written is loaded into the **FMD** register before it is committed. The **FMD** register is read only and does not allow the **USER\_DBG** operation to be tried before committing it to nonvolatile memory.

Important: These registers can only have bits changed from 1 to 0 by user programming. Once committed, the FMPREx and FMPPEx registers can only be restored to their factory default values only by performing the sequence described in the section called "Recovering a "Locked" Device" on page 54. The mass erase of the main Flash memory array caused by the sequence is performed prior to restoring these registers.

In addition, the USER\_REG0, USER\_REG1, USER\_REG2, USER\_REG3, and USER\_DBG registers each use bit 31 (NW) to indicate that they have not been committed and bits in the register may be changed from 1 to 0. These five registers can only be committed once whereas the Flash memory protection registers may be committed multiple times. Table 8-2 on page 144 provides the FMA address required for commitment of each of the registers and the source of the data to be written when the FMC register is written with a value of 0xA442.0008. After writing the COMT bit, the user may poll the FMC register to wait for the commit operation to complete.

Table 8-2. User-Programmable Flash Memory Resident Registers

Register to be Committed	FMA Value	Data Source
FMPRE0	0x0000.0000	FMPRE0
FMPRE1	0x0000.0002	FMPRE1

# 8.4 Register Map

Table 8-3 on page 145 lists the Flash memory and control registers. The offset listed is a hexadecimal increment to the register's address. The **FMA**, **FMD**, **FMC**, **FCRIS**, **FCIM**, and **FCMISC** register offsets are relative to the Flash memory control base address of 0x400F.D000. The Flash memory protection register offsets are relative to the System Control base address of 0x400F.E000.

# 8.5 Flash Register Descriptions (Flash Control Offset)

This section lists and describes the Flash Memory registers, in numerical order by address offset. Registers in this section are relative to the Flash control base address of 0x400F.D000.

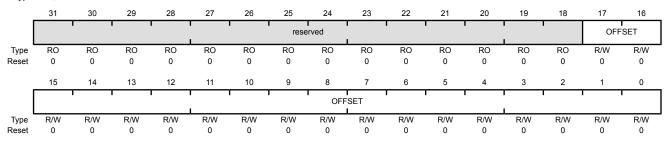

# Register 1: Flash Memory Address (FMA), offset 0x000

During a write operation, this register contains a 4-byte-aligned address and specifies where the data is written. During erase operations, this register contains a 1 KB-aligned address and specifies which page is erased. Note that the alignment requirements must be met by software or the results of the operation are unpredictable.

Flash Memory Address (FMA)

Base 0x400F.D000

Offset 0x000 Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:18	reserved	RO	0x0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
17:0	OFFSET	R/W	0x0	Address Offset

Address offset in flash where operation is performed, except for nonvolatile registers (see "Nonvolatile Register Programming" on page 144 for details on values for this field).

# Register 2: Flash Memory Data (FMD), offset 0x004

This register contains the data to be written during the programming cycle or read during the read cycle. Note that the contents of this register are undefined for a read access of an execute-only block. This register is not used during the erase cycles.

Flash Memory Data (FMD)

Base 0x400F.D000

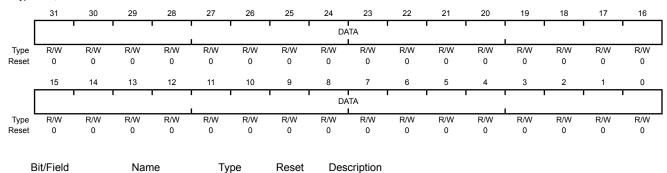

31:0

DATA

R/W

0x0

Offset 0x004 Type R/W, reset 0x0000.0000

Data Value

Data value for write operation.

# Register 3: Flash Memory Control (FMC), offset 0x008

When this register is written, the flash controller initiates the appropriate access cycle for the location specified by the **Flash Memory Address (FMA)** register (see page 146). If the access is a write access, the data contained in the **Flash Memory Data (FMD)** register (see page 147) is written.

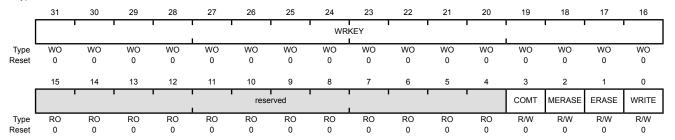

This is the final register written and initiates the memory operation. There are four control bits in the lower byte of this register that, when set, initiate the memory operation. The most used of these register bits are the ERASE and WRITE bits.

It is a programming error to write multiple control bits and the results of such an operation are unpredictable.

#### Flash Memory Control (FMC)

Base 0x400F.D000 Offset 0x008

Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:16	WRKEY	WO	0x0	Flash Write Key
				This field contains a write key, which is used to minimize the incidence of accidental flash writes. The value 0xA442 must be written into this field for a write to occur. Writes to the <b>FMC</b> register without this <code>WRKEY</code> value are ignored. A read of this field returns the value 0.
15:4	reserved	RO	0x0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
3	COMT	R/W	0	Commit Register Value
				Commit (write) of register value to nonvolatile storage. A write of 0 has no effect on the state of this bit.
				If read, the state of the previous commit access is provided. If the previous commit access is complete, a 0 is returned; otherwise, if the commit access is not complete, a 1 is returned.
				This can take up to 50 μs.
2	MERASE	R/W	0	Mass Erase Flash Memory
				If this bit is set, the flash main memory of the device is all erased. A write of 0 has no effect on the state of this bit.

If read, the state of the previous mass erase access is provided. If the previous mass erase access is complete, a 0 is returned; otherwise, if the previous mass erase access is not complete, a 1 is returned.

This can take up to 250 ms.

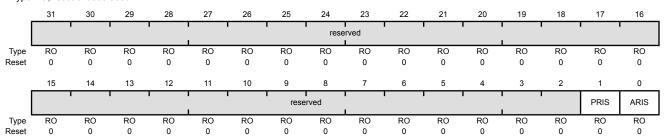

Bit/Field	Name	Туре	Reset	Description
1	ERASE	R/W	0	Erase a Page of Flash Memory
				If this bit is set, the page of flash main memory as specified by the contents of <b>FMA</b> is erased. A write of 0 has no effect on the state of this bit.
				If read, the state of the previous erase access is provided. If the previous erase access is complete, a 0 is returned; otherwise, if the previous erase access is not complete, a 1 is returned.
				This can take up to 25 ms.
0	WRITE	R/W	0	Write a Word into Flash Memory
				If this bit is set, the data stored in <b>FMD</b> is written into the location as specified by the contents of <b>FMA</b> . A write of 0 has no effect on the state of this bit.
				If read, the state of the previous write update is provided. If the previous write access is complete, a 0 is returned; otherwise, if the write access is not complete, a 1 is returned.
				This can take up to 50 μs.

# Register 4: Flash Controller Raw Interrupt Status (FCRIS), offset 0x00C

This register indicates that the flash controller has an interrupt condition. An interrupt is only signaled if the corresponding **FCIM** register bit is set.

Flash Controller Raw Interrupt Status (FCRIS)

Base 0x400F.D000 Offset 0x00C Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:2	reserved	RO	0x0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	PRIS	RO	0	Programming Raw Interrupt Status
				This bit indicates the current state of the programming cycle. If set, the programming cycle completed; if cleared, the programming cycle has not completed. Programming cycles are either write or erase actions generated through the <b>Flash Memory Control (FMC)</b> register bits (see page 148).
0	ARIS	RO	0	Access Raw Interrupt Status

This bit indicates if the flash was improperly accessed. If set, the program tried to access the flash counter to the policy as set in the Flash Memory Protection Read Enable (FMPREn) and Flash Memory Protection Program Enable (FMPPEn) registers. Otherwise, no access has tried to improperly access the flash.

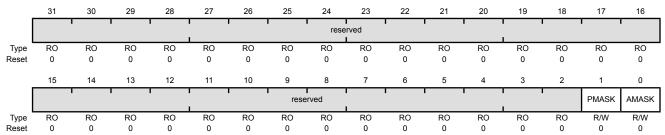

# Register 5: Flash Controller Interrupt Mask (FCIM), offset 0x010

This register controls whether the flash controller generates interrupts to the controller.

Flash Controller Interrupt Mask (FCIM)

Base 0x400F.D000 Offset 0x010

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:2	reserved	RO	0x0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	PMASK	R/W	0	Programming Interrupt Mask
				This bit controls the reporting of the programming raw interrupt status to the controller. If set, a programming-generated interrupt is promoted to the controller. Otherwise, interrupts are recorded but suppressed from the controller.
0	AMASK	R/W	0	Access Interrupt Mask

This bit controls the reporting of the access raw interrupt status to the controller. If set, an access-generated interrupt is promoted to the controller. Otherwise, interrupts are recorded but suppressed from the controller.

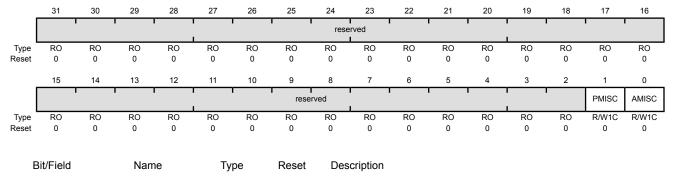

# Register 6: Flash Controller Masked Interrupt Status and Clear (FCMISC), offset 0x014

This register provides two functions. First, it reports the cause of an interrupt by indicating which interrupt source or sources are signalling the interrupt. Second, it serves as the method to clear the interrupt reporting.

Flash Controller Masked Interrupt Status and Clear (FCMISC)

Base 0x400F.D000

Offset 0x014
Type R/W1C, reset 0x0000.0000

31:2	reserved	RO	0x0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	PMISC	R/W1C	0	Programming Masked Interrupt Status and Clear
				This bit indicates whether an interrupt was signaled because a programming cycle completed and was not masked. This bit is cleared by writing a 1. The PRIS bit in the <b>FCRIS</b> register (see page 150) is also cleared when the PMISC bit is cleared.
0	AMISC	R/W1C	0	Access Masked Interrupt Status and Clear

This bit indicates whether an interrupt was signaled because an improper access was attempted and was not masked. This bit is cleared by writing a 1. The ARIS bit in the FCRIS register is also cleared when the AMISC bit is cleared.

#### 8.6 Flash Register Descriptions (System Control Offset)

The remainder of this section lists and describes the Flash Memory registers, in numerical order by address offset. Registers in this section are relative to the System Control base address of 0x400F.E000.

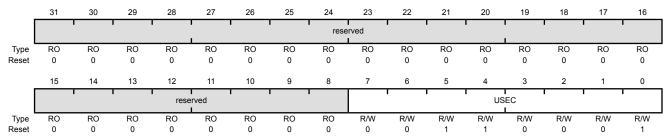

### Register 7: USec Reload (USECRL), offset 0x140

**Note:** Offset is relative to System Control base address of 0x400F.E000

This register is provided as a means of creating a 1-µs tick divider reload value for the flash controller. The internal flash has specific minimum and maximum requirements on the length of time the high voltage write pulse can be applied. It is required that this register contain the operating frequency (in MHz -1) whenever the flash is being erased or programmed. The user is required to change this value if the clocking conditions are changed for a flash erase/program operation.

#### USec Reload (USECRL)

Base 0x400F.E000 Offset 0x140 Type R/W, reset 0x31

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:∩	LISEC	DΛΛ	0v31	Microsecond Reload Value

MHz -1 of the controller clock when the flash is being erased or programmed.

If the maximum system frequency is being used, USEC should be set to 0x31 (50 MHz) whenever the flash is being erased or programmed.

# Register 8: Flash Memory Protection Read Enable 0 (FMPRE0), offset 0x130 and 0x200

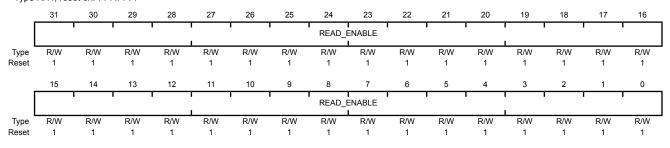

Note: This register is aliased for backwards compatability.

**Note:** Offset is relative to System Control base address of 0x400FE000.

This register stores the read-only protection bits for each 2-KB flash block (**FMPPEn** stores the execute-only bits). Flash memory up to a total of 64 KB is controlled by this register. Other **FMPREn** registers (if any) provide protection for other 64K blocks. This register is loaded during the power-on reset sequence. The factory settings for the **FMPREn** and **FMPPEn** registers are a value of 1 for all implemented banks. This achieves a policy of open access and programmability. The register bits may be changed by writing the specific register bit. However, this register is R/W0; the user can only change the protection bit from a 1 to a 0 (and may NOT change a 0 to a 1). The changes are not permanent until the register is committed (saved), at which point the bit change is permanent. If a bit is changed from a 1 to a 0 and not committed, it may be restored by executing a power-on reset sequence. The reset value shown only applies to power-on reset; any other type of reset does not affect this register. Once committed, the only way to restore the factory default value of this register is to perform the "Recover Locked Device" sequence detailed in the JTAG chapter. For additional information, see the "Flash Memory Protection" section.

#### Flash Memory Protection Read Enable 0 (FMPRE0)

Base 0x400F.E000 Offset 0x130 and 0x200 Type R/W, reset 0xFFF.FFFF

Bit/Field Name Type Reset Description

31:0 READ\_ENABLE R/W 0xFFFFFFF Flash Read Enable. Ena

Flash Read Enable. Enables 2-KB Flash memory blocks to be executed or read. The policies may be combined as shown in the table "Flash Protection Policy Combinations".

Value Description

0xFFFFFFF Bits [31:0] each enable protection on a 2-KB block of Flash memory up to the total of 64 KB.

# Register 9: Flash Memory Protection Program Enable 0 (FMPPE0), offset 0x134 and 0x400

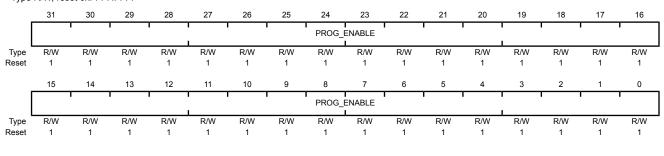

Note: This register is aliased for backwards compatability.

**Note:** Offset is relative to System Control base address of 0x400FE000.

This register stores the execute-only protection bits for each 2-KB flash block (**FMPREn** stores the execute-only bits). Flash memory up to a total of 64 KB is controlled by this register. Other **FMPPEn** registers (if any) provide protection for other 64K blocks. This register is loaded during the power-on reset sequence. The factory settings for the **FMPREn** and **FMPPEn** registers are a value of 1 for all implemented banks. This achieves a policy of open access and programmability. The register bits may be changed by writing the specific register bit. However, this register is R/W0; the user can only change the protection bit from a 1 to a 0 (and may NOT change a 0 to a 1). The changes are not permanent until the register is committed (saved), at which point the bit change is permanent. If a bit is changed from a 1 to a 0 and not committed, it may be restored by executing a power-on reset sequence. The reset value shown only applies to power-on reset; any other type of reset does not affect this register. Once committed, the only way to restore the factory default value of this register is to perform the "Recover Locked Device" sequence detailed in the JTAG chapter. For additional information, see the "Flash Memory Protection" section.

Flash Memory Protection Program Enable 0 (FMPPE0)

Base 0x400F.E000 Offset 0x134 and 0x400 Type R/W, reset 0xFFF.FFFF

Bit/Field Name Type Reset Description

31:0 PROG\_ENABLE R/W 0xFFFFFFF Flash Programming Enable

Configures 2-KB flash blocks to be execute only. The policies may be combined as shown in the table "Flash Protection Policy Combinations".

Value Description

0xFFFFFFF Bits [31:0] each enable protection on a 2-KB block of Flash memory up to the total of 64 KB.

## Register 10: User Debug (USER DBG), offset 0x1D0

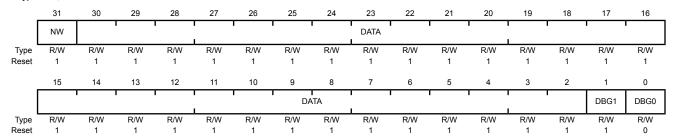

**Note:** Offset is relative to System Control base address of 0x400FE000.

This register provides a write-once mechanism to disable external debugger access to the device in addition to 27 additional bits of user-defined data. The DBG0 bit (bit 0) is set to 0 from the factory and the DBG1 bit (bit 1) is set to 1, which enables external debuggers. Changing the DBG1 bit to 0 disables any external debugger access to the device permanently, starting with the next power-up cycle of the device. The NW bit (bit 31) indicates that the register has not yet been committed and is controlled through hardware to ensure that the register is only committed once. Prior to being committed, bits can only be changed from 1 to 0. The reset value shown only applies to power-on reset; any other type of reset does not affect this register. Once committed, this register cannot be restored to the factory default value.

#### User Debug (USER\_DBG)

Base 0x400F.E000 Offset 0x1D0

Type R/W, reset 0xFFF.FFFE

Bit/Field	Name	Type	Reset	Description
31	NW	R/W	1	User Debug Not Written
				When set, this bit indicates that this 32-bit register has not been committed. When clear, this bit specifies that this register has been committed and may not be committed again.
30:2	DATA	R/W	0x1FFFFFF	User Data
				Contains the user data value. This field is initialized to all 1s and can only be committed once.
1	DBG1	R/W	1	Debug Control 1
				The $\mathtt{DBG1}$ bit must be 1 and $\mathtt{DBG0}$ must be 0 for debug to be available.
0	DBG0	R/W	0	Debug Control 0

The DBG1 bit must be 1 and DBG0 must be 0 for debug to be available.

# Register 11: User Register 0 (USER\_REG0), offset 0x1E0

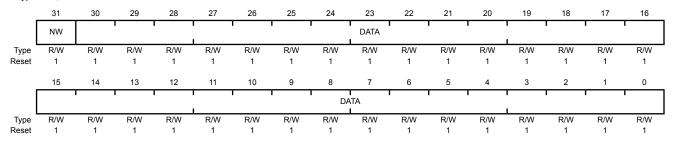

**Note:** Offset is relative to System Control base address of 0x400FE000.

This register provides 31 bits of user-defined data that is non-volatile and can only be committed once. Bit 31 indicates that the register is available to be committed and is controlled through hardware to ensure that the register is only committed once. Prior to being committed, bits can only be changed from 1 to 0. The reset value shown only applies to power-on reset; any other type of reset does not affect this register. The write-once characteristics of this register are useful for keeping static information like communication addresses that need to be unique per part and would otherwise require an external EEPROM or other non-volatile device. Once committed, this register cannot be restored to the factory default value.

User Register 0 (USER REG0)

Base 0x400F.E000 Offset 0x1E0

Type R/W, reset 0xFFFF.FFFF

Bit/Field	Name	Туре	Reset	Description
31	NW	R/W	1	Not Written
				When set, this bit indicates that this 32-bit register has not been committed. When clear, this bit specifies that this register has been committed and may not be committed again.
30:0	DATA	R/W	0x7FFFFFF	User Data

Contains the user data value. This field is initialized to all 1s and can only be committed once.

# Register 12: User Register 1 (USER\_REG1), offset 0x1E4

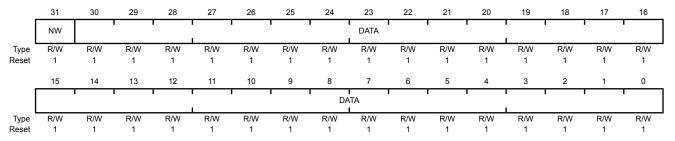

**Note:** Offset is relative to System Control base address of 0x400FE000.

This register provides 31 bits of user-defined data that is non-volatile and can only be committed once. Bit 31 indicates that the register is available to be committed and is controlled through hardware to ensure that the register is only committed once. Prior to being committed, bits can only be changed from 1 to 0. The reset value shown only applies to power-on reset; any other type of reset does not affect this register. The write-once characteristics of this register are useful for keeping static information like communication addresses that need to be unique per part and would otherwise require an external EEPROM or other non-volatile device. Once committed, this register cannot be restored to the factory default value.

User Register 1 (USER REG1)

Base 0x400F.E000 Offset 0x1E4

Type R/W, reset 0xFFFF.FFFF

Bit/Field	Name	Туре	Reset	Description
31	NW	R/W	1	Not Written
				When set, this bit indicates that this 32-bit register has not been committed. When clear, this bit specifies that this register has been committed and may not be committed again.
30:0	DATA	R/W	0x7FFFFFF	User Data

Contains the user data value. This field is initialized to all 1s and can only be committed once.

### Register 13: Flash Memory Protection Read Enable 1 (FMPRE1), offset 0x204

Note: Offset is relative to System Control base address of 0x400FE000.

This register stores the read-only protection bits for each 2-KB flash block (**FMPPEn** stores the execute-only bits). Flash memory up to a total of 64 KB is controlled by this register. Other **FMPREn** registers (if any) provide protection for other 64K blocks. This register is loaded during the power-on reset sequence. The factory settings for the **FMPREn** and **FMPPEn** registers are a value of 1 for all implemented banks. This achieves a policy of open access and programmability. The register bits may be changed by writing the specific register bit. However, this register is R/W0; the user can only change the protection bit from a 1 to a 0 (and may NOT change a 0 to a 1). The changes are not permanent until the register is committed (saved), at which point the bit change is permanent. If a bit is changed from a 1 to a 0 and not committed, it may be restored by executing a power-on reset sequence. The reset value shown only applies to power-on reset; any other type of reset does not affect this register. Once committed, the only way to restore the factory default value of this register is to perform the "Recover Locked Device" sequence detailed in the JTAG chapter. If the Flash memory size on the device is less than 64 KB, this register usually reads as zeroes, but software should not rely on these bits to be zero. For additional information, see the "Flash Memory Protection" section.

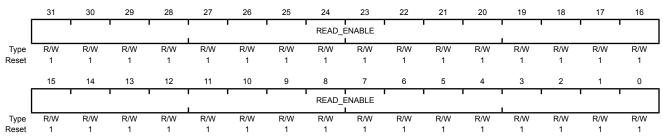

Flash Memory Protection Read Enable 1 (FMPRE1)

READ ENABLE

Base 0x400F.E000 Offset 0x204

31.0

Type R/W, reset 0xFFFF.FFF

Bit/Field Name Type Reset Description

R/W

0xFFFFFFF

Flash Read Enable. Enables 2-KB Flash memory blocks to be executed or read. The policies may be combined as shown in the table "Flash Protection Policy Combinations".

Value Description

0xFFFFFFF Bits [31:0] each enable protection on a 2-KB block of Flash memory in memory range from 65 to 128 KB.

## Register 14: Flash Memory Protection Read Enable 2 (FMPRE2), offset 0x208

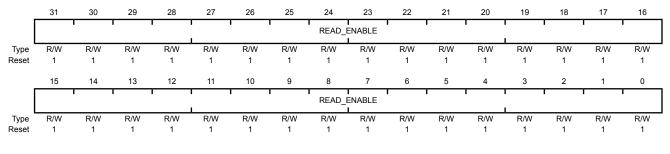

**Note:** Offset is relative to System Control base address of 0x400FE000.

This register stores the read-only protection bits for each 2-KB flash block (**FMPPEn** stores the execute-only bits). This register is loaded during the power-on reset sequence. The factory settings for the **FMPREn** and **FMPPEn** registers are a value of 1 for all implemented banks. This achieves a policy of open access and programmability. The register bits may be changed by writing the specific register bit. However, this register is R/W0; the user can only change the protection bit from a 1 to a 0 (and may NOT change a 0 to a 1). The changes are not permanent until the register is committed (saved), at which point the bit change is permanent. If a bit is changed from a 1 to a 0 and not committed, it may be restored by executing a power-on reset sequence. For additional information, see the "Flash Memory Protection" section.

Flash Memory Protection Read Enable 2 (FMPRE2)

Base 0x400F.E000 Offset 0x208

Type R/W, reset 0xFFFF.FFFF

Bit/Field Name Type Reset Description

31:0 READ\_ENABLE R/W 0xFFFFFFF Flash Read Enable

Enables 2-KB flash blocks to be executed or read. The policies may be combined as shown in the table "Flash Protection Policy Combinations".

Value Description

0xFFFFFFF Enables 256 KB of flash.

## Register 15: Flash Memory Protection Read Enable 3 (FMPRE3), offset 0x20C

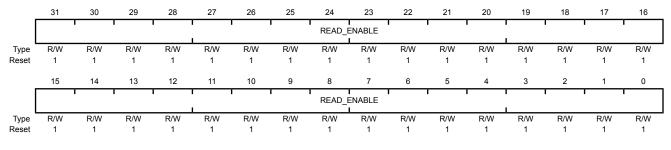

**Note:** Offset is relative to System Control base address of 0x400FE000.

This register stores the read-only protection bits for each 2-KB flash block (**FMPPEn** stores the execute-only bits). This register is loaded during the power-on reset sequence. The factory settings for the **FMPREn** and **FMPPEn** registers are a value of 1 for all implemented banks. This achieves a policy of open access and programmability. The register bits may be changed by writing the specific register bit. However, this register is R/W0; the user can only change the protection bit from a 1 to a 0 (and may NOT change a 0 to a 1). The changes are not permanent until the register is committed (saved), at which point the bit change is permanent. If a bit is changed from a 1 to a 0 and not committed, it may be restored by executing a power-on reset sequence. For additional information, see the "Flash Memory Protection" section.

Flash Memory Protection Read Enable 3 (FMPRE3)

Base 0x400F.E000 Offset 0x20C

Type R/W, reset 0xFFFF.FFFF

Bit/Field Name Type Reset Description

31:0 READ\_ENABLE R/W 0xFFFFFFF Flash Read Enable

Enables 2-KB flash blocks to be executed or read. The policies may be combined as shown in the table "Flash Protection Policy Combinations".

Value Description

0xFFFFFFF Enables 256 KB of flash.

# Register 16: Flash Memory Protection Program Enable 1 (FMPPE1), offset 0x404

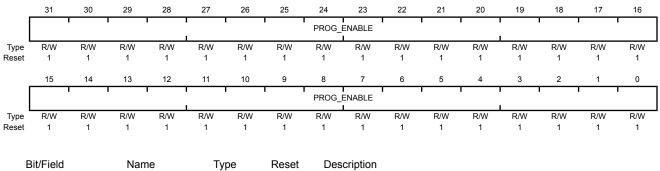

**Note:** Offset is relative to System Control base address of 0x400FE000.

This register stores the execute-only protection bits for each 2-KB flash block (**FMPREn** stores the execute-only bits). Flash memory up to a total of 64 KB is controlled by this register. Other **FMPPEn** registers (if any) provide protection for other 64K blocks. This register is loaded during the power-on reset sequence. The factory settings for the **FMPREn** and **FMPPEn** registers are a value of 1 for all implemented banks. This achieves a policy of open access and programmability. The register bits may be changed by writing the specific register bit. However, this register is R/W0; the user can only change the protection bit from a 1 to a 0 (and may NOT change a 0 to a 1). The changes are not permanent until the register is committed (saved), at which point the bit change is permanent. If a bit is changed from a 1 to a 0 and not committed, it may be restored by executing a power-on reset sequence. The reset value shown only applies to power-on reset; any other type of reset does not affect this register. Once committed, the only way to restore the factory default value of this register is to perform the "Recover Locked Device" sequence detailed in the JTAG chapter. If the Flash memory size on the device is less than 64 KB, this register usually reads as zeroes, but software should not rely on these bits to be zero. For additional information, see the "Flash Memory Protection" section.

Flash Memory Protection Program Enable 1 (FMPPE1)

Base 0x400F.E000 Offset 0x404

Type R/W, reset 0xFFFF.FFF

31:0 PROG\_ENABLE R/W 0xFFFFFFF Flash Programming Enable

Value Description

0xFFFFFFF Bits [31:0] each enable protection on a 2-KB block of Flash memory in memory range from 65 to 128 KB.

# Register 17: Flash Memory Protection Program Enable 2 (FMPPE2), offset 0x408

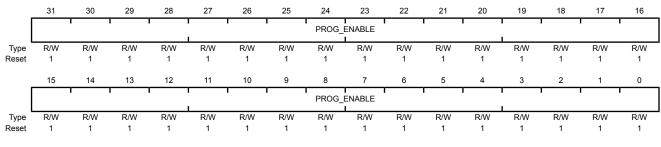

**Note:** Offset is relative to System Control base address of 0x400FE000.

This register stores the execute-only protection bits for each 2-KB flash block (**FMPREn** stores the execute-only bits). This register is loaded during the power-on reset sequence. The factory settings for the **FMPREn** and **FMPPEn** registers are a value of 1 for all implemented banks. This achieves a policy of open access and programmability. The register bits may be changed by writing the specific register bit. However, this register is R/W0; the user can only change the protection bit from a 1 to a 0 (and may NOT change a 0 to a 1). The changes are not permanent until the register is committed (saved), at which point the bit change is permanent. If a bit is changed from a 1 to a 0 and not committed, it may be restored by executing a power-on reset sequence. For additional information, see the "Flash Memory Protection" section.

Flash Memory Protection Program Enable 2 (FMPPE2)

Base 0x400F.E000 Offset 0x408

Type R/W, reset 0xFFFF.FFF

Bit/Field Name Type Reset Description

31:0 PROG\_ENABLE R/W 0xFFFFFFF Flash Programming Enable

Configures 2-KB flash blocks to be execute only. The policies may be combined as shown in the table "Flash Protection Policy Combinations".

Value Description

0xFFFFFFF Enables 256 KB of flash.

# Register 18: Flash Memory Protection Program Enable 3 (FMPPE3), offset 0x40C

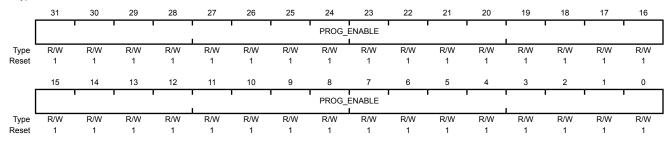

**Note:** Offset is relative to System Control base address of 0x400FE000.

This register stores the execute-only protection bits for each 2-KB flash block (**FMPREn** stores the execute-only bits). This register is loaded during the power-on reset sequence. The factory settings for the **FMPREn** and **FMPPEn** registers are a value of 1 for all implemented banks. This achieves a policy of open access and programmability. The register bits may be changed by writing the specific register bit. However, this register is R/W0; the user can only change the protection bit from a 1 to a 0 (and may NOT change a 0 to a 1). The changes are not permanent until the register is committed (saved), at which point the bit change is permanent. If a bit is changed from a 1 to a 0 and not committed, it may be restored by executing a power-on reset sequence. For additional information, see the "Flash Memory Protection" section.

Flash Memory Protection Program Enable 3 (FMPPE3)

Base 0x400F.E000 Offset 0x40C

Type R/W, reset 0xFFFF.FFFF

Bit/Field Name Type Reset Description

31:0 PROG\_ENABLE R/W 0xFFFFFFF Flash Programming Enable

Configures 2-KB flash blocks to be execute only. The policies may be combined as shown in the table "Flash Protection Policy Combinations".

Value Description

0xFFFFFFF Enables 256 KB of flash.

# 9 General-Purpose Input/Outputs (GPIOs)

The GPIO module is composed of eight physical GPIO blocks, each corresponding to an individual GPIO port (Port A, Port B, Port C, Port D, Port E, Port F, Port G, Port H). The GPIO module supports 23-60 programmable input/output pins, depending on the peripherals being used.

The GPIO module has the following features:

- 23-60 GPIOs, depending on configuration
- 5-V-tolerant input/outputs
- Programmable control for GPIO interrupts
  - Interrupt generation masking
  - Edge-triggered on rising, falling, or both
  - Level-sensitive on High or Low values
- Bit masking in both read and write operations through address lines
- Pins configured as digital inputs are Schmitt-triggered.
- Programmable control for GPIO pad configuration
  - Weak pull-up or pull-down resistors
  - 2-mA, 4-mA, and 8-mA pad drive for digital communication; up to four pads can be configured with an 18-mA pad drive for high-current applications
  - Slew rate control for the 8-mA drive
  - Open drain enables
  - Digital input enables

# 9.1 Functional Description

Important: All GPIO pins are tri-stated by default (GPIOAFSEL=0, GPIODEN=0, GPIOPDR=0, and GPIOPUR=0), with the exception of the five JTAG/SWD pins (PB7 and PC[3:0]). The JTAG/SWD pins default to their JTAG/SWD functionality (GPIOAFSEL=1, GPIODEN=1 and GPIOPUR=1). A Power-On-Reset (POR) or asserting RST puts both groups of pins back to their default state.

Each GPIO port is a separate hardware instantiation of the same physical block (see Figure 9-1 on page 166). The LM3S1911 microcontroller contains eight ports and thus eight of these physical GPIO blocks.

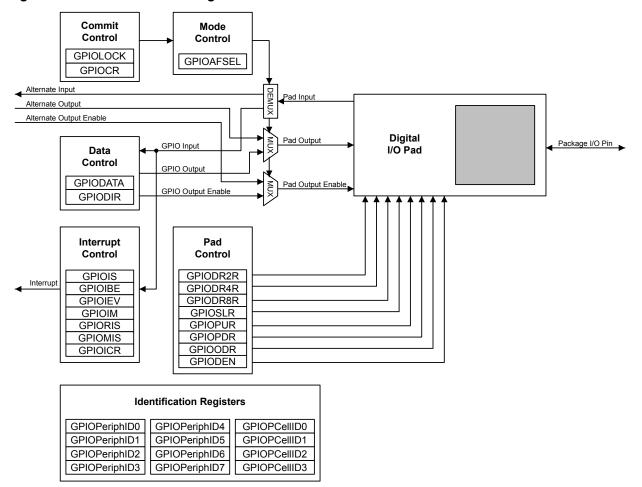

Figure 9-1. GPIO Port Block Diagram

#### 9.1.1 Data Control

The data control registers allow software to configure the operational modes of the GPIOs. The data direction register configures the GPIO as an input or an output while the data register either captures incoming data or drives it out to the pads.

### 9.1.1.1 Data Direction Operation

The **GPIO Direction (GPIODIR)** register (see page 173) is used to configure each individual pin as an input or output. When the data direction bit is set to 0, the GPIO is configured as an input and the corresponding data register bit will capture and store the value on the GPIO port. When the data direction bit is set to 1, the GPIO is configured as an output and the corresponding data register bit will be driven out on the GPIO port.

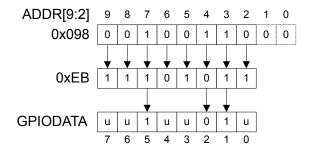

# 9.1.1.2 Data Register Operation

To aid in the efficiency of software, the GPIO ports allow for the modification of individual bits in the **GPIO Data (GPIODATA)** register (see page 172) by using bits [9:2] of the address bus as a mask. This allows software drivers to modify individual GPIO pins in a single instruction, without affecting the state of the other pins. This is in contrast to the "typical" method of doing a read-modify-write operation to set or clear an individual GPIO pin. To accommodate this feature, the **GPIODATA** register covers 256 locations in the memory map.

During a write, if the address bit associated with that data bit is set to 1, the value of the **GPIODATA** register is altered. If it is cleared to 0, it is left unchanged.

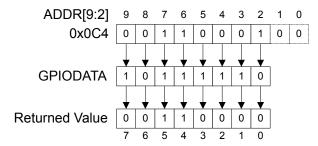

For example, writing a value of 0xEB to the address GPIODATA + 0x098 would yield as shown in Figure 9-2 on page 167, where  ${\bf u}$  is data unchanged by the write.

Figure 9-2. GPIODATA Write Example

During a read, if the address bit associated with the data bit is set to 1, the value is read. If the address bit associated with the data bit is set to 0, it is read as a zero, regardless of its actual value. For example, reading address GPIODATA + 0x0C4 yields as shown in Figure 9-3 on page 167.

Figure 9-3. GPIODATA Read Example

#### 9.1.2 Interrupt Control

The interrupt capabilities of each GPIO port are controlled by a set of seven registers. With these registers, it is possible to select the source of the interrupt, its polarity, and the edge properties. When one or more GPIO inputs cause an interrupt, a single interrupt output is sent to the interrupt controller for the entire GPIO port. For edge-triggered interrupts, software must clear the interrupt to enable any further interrupts. For a level-sensitive interrupt, it is assumed that the external source holds the level constant for the interrupt to be recognized by the controller.

Three registers are required to define the edge or sense that causes interrupts:

- GPIO Interrupt Sense (GPIOIS) register (see page 174)
- GPIO Interrupt Both Edges (GPIOIBE) register (see page 175)
- GPIO Interrupt Event (GPIOIEV) register (see page 176)

Interrupts are enabled/disabled via the GPIO Interrupt Mask (GPIOIM) register (see page 177).

When an interrupt condition occurs, the state of the interrupt signal can be viewed in two locations: the **GPIO Raw Interrupt Status (GPIORIS)** and **GPIO Masked Interrupt Status (GPIOMIS)** registers (see page 178 and page 179). As the name implies, the **GPIOMIS** register only shows interrupt

conditions that are allowed to be passed to the controller. The **GPIORIS** register indicates that a GPIO pin meets the conditions for an interrupt, but has not necessarily been sent to the controller.

Interrupts are cleared by writing a 1 to the appropriate bit of the **GPIO Interrupt Clear (GPIOICR)** register (see page 180).

When programming the following interrupt control registers, the interrupts should be masked (**GPIOIM** set to 0). Writing any value to an interrupt control register (**GPIOIS**, **GPIOIBE**, or **GPIOIEV**) can generate a spurious interrupt if the corresponding bits are enabled.

#### 9.1.3 Mode Control

The GPIO pins can be controlled by either hardware or software. When hardware control is enabled via the **GPIO Alternate Function Select (GPIOAFSEL)** register (see page 181), the pin state is controlled by its alternate function (that is, the peripheral). Software control corresponds to GPIO mode, where the **GPIODATA** register is used to read/write the corresponding pins.

#### 9.1.4 Commit Control

The GPIO commit control registers provide a layer of protection against accidental programming of critical hardware peripherals. Protection is currently provided for the five JTAG/SWD pins (PB7 and PC[3:0]). Writes to protected bits of the **GPIO Alternate Function Select (GPIOAFSEL)** register (see page 181) are not committed to storage unless the **GPIO Lock (GPIOLOCK)** register (see page 191) has been unlocked and the appropriate bits of the **GPIO Commit (GPIOCR)** register (see page 192) have been set to 1.

#### 9.1.5 Pad Control

The pad control registers allow for GPIO pad configuration by software based on the application requirements. The pad control registers include the GPIODR2R, GPIODR4R, GPIODR8R, GPIODDR, GPIOPUR, GPIOPUR, GPIOPUR, and GPIODEN registers. These registers control drive strength, open-drain configuration, pull-up and pull-down resistors, slew-rate control and digital input enable.

For special high-current applications, the GPIO output buffers may be used with the following restrictions. With the GPIO pins configured as 8-mA output drivers, a total of four GPIO outputs may be used to sink current loads up to 18 mA each. At 18-mA sink current loading, the  $V_{OL}$  value is specified as 1.2 V. The high-current GPIO package pins must be selected such that there are only a maximum of two per side of the physical package or BGA pin group with the total number of high-current GPIO outputs not exceeding four for the entire package.

#### 9.1.6 Identification

The identification registers configured at reset allow software to detect and identify the module as a GPIO block. The identification registers include the **GPIOPeriphID0-GPIOPeriphID7** registers as well as the **GPIOPCeIIID0-GPIOPCeIIID3** registers.

# 9.2 Initialization and Configuration

To use the GPIO, the peripheral clock must be enabled by setting the appropriate GPIO Port bit field (GPIOn) in the **RCGC2** register.

On reset, all GPIO pins (except for the five JTAG pins) are configured out of reset to be undriven (tristate): **GPIOAFSEL**=0, **GPIODEN**=0, **GPIOPDR**=0, and **GPIOPUR**=0. Table 9-1 on page 169 shows all possible configurations of the GPIO pads and the control register settings required to achieve them. Table 9-2 on page 169 shows how a rising edge interrupt would be configured for pin 2 of a GPIO port.

**Table 9-1. GPIO Pad Configuration Examples** 

Configuration	GPIO Register Bit Value <sup>a</sup>											
	AFSEL	DIR	ODR	DEN	PUR	PDR	DR2R	DR4R	DR8R	SLR		
Digital Input (GPIO)	0	0	0	1	?	?	Х	Х	Х	Х		
Digital Output (GPIO)	0	1	0	1	?	?	?	?	?	?

a. X=Ignored (don't care bit)

# 9.3 Register Map

Table 9-3 on page 170 lists the GPIO registers. The offset listed is a hexadecimal increment to the register's address, relative to that GPIO port's base address:

<sup>?=</sup>Can be either 0 or 1, depending on the configuration

- GPIO Port A: 0x4000.4000
- GPIO Port B: 0x4000.5000
- GPIO Port C: 0x4000.6000
- GPIO Port D: 0x4000.7000
- GPIO Port E: 0x4002.4000
- GPIO Port F: 0x4002.5000
- GPIO Port G: 0x4002.6000
- GPIO Port H: 0x4002.7000

**Important:** The GPIO registers in this chapter are duplicated in each GPIO block; however, depending on the block, all eight bits may not be connected to a GPIO pad. In those cases, writing to those unconnected bits has no effect, and reading those unconnected bits returns no meaningful data.

Note: The default reset value for the GPIOAFSEL, GPIOPUR, and GPIODEN registers are 0x0000.0000 for all GPIO pins, with the exception of the five JTAG/SWD pins (PB7 and PC[3:0]). These five pins default to JTAG/SWD functionality. Because of this, the default reset value of these registers for GPIO Port B is 0x0000.0080 while the default reset value for Port C is 0x0000.000F.

The default register type for the **GPIOCR** register is RO for all GPIO pins with the exception of the five JTAG/SWD pins (PB7 and PC[3:0]). These five pins are currently the only GPIOs that are protected by the **GPIOCR** register. Because of this, the register type for GPIO Port B7 and GPIO Port C[3:0] is R/W.

The default reset value for the **GPIOCR** register is 0x0000.00FF for all GPIO pins, with the exception of the five JTAG/SWD pins (PB7 and PC[3:0]). To ensure that the JTAG port is not accidentally programmed as a GPIO, these five pins default to non-committable. Because of this, the default reset value of **GPIOCR** for GPIO Port B is 0x0000.007F while the default reset value of GPIOCR for Port C is 0x0000.00F0.

# 9.4 Register Descriptions

The remainder of this section lists and describes the GPIO registers, in numerical order by address offset.

# Register 1: GPIO Data (GPIODATA), offset 0x000

The **GPIODATA** register is the data register. In software control mode, values written in the **GPIODATA** register are transferred onto the GPIO port pins if the respective pins have been configured as outputs through the **GPIO Direction (GPIODIR)** register (see page 173).

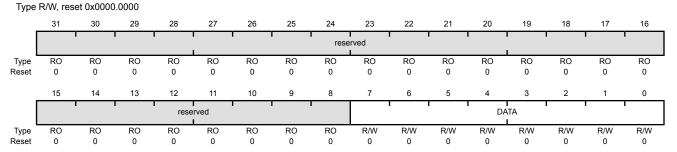

In order to write to **GPIODATA**, the corresponding bits in the mask, resulting from the address bus bits [9:2], must be High. Otherwise, the bit values remain unchanged by the write.

Similarly, the values read from this register are determined for each bit by the mask bit derived from the address used to access the data register, bits [9:2]. Bits that are 1 in the address mask cause the corresponding bits in **GPIODATA** to be read, and bits that are 0 in the address mask cause the corresponding bits in **GPIODATA** to be read as 0, regardless of their value.

A read from **GPIODATA** returns the last bit value written if the respective pins are configured as outputs, or it returns the value on the corresponding input pin when these are configured as inputs. All bits are cleared by a reset.

#### GPIO Data (GPIODATA)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	DATA	R/W	0x00	GPIO Data

This register is virtually mapped to 256 locations in the address space. To facilitate the reading and writing of data to these registers by independent drivers, the data read from and the data written to the registers are masked by the eight address lines  $\mathtt{ipaddr}[9:2]$ . Reads from this register return its current state. Writes to this register only affect bits that are not masked by  $\mathtt{ipaddr}[9:2]$  and are configured as outputs. See "Data Register Operation" on page 166 for examples of reads and writes.

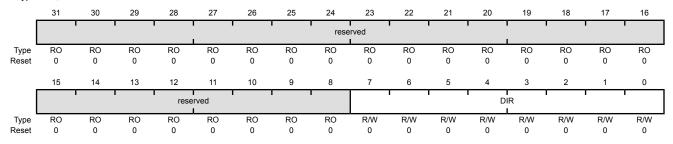

# Register 2: GPIO Direction (GPIODIR), offset 0x400

The **GPIODIR** register is the data direction register. Bits set to 1 in the **GPIODIR** register configure the corresponding pin to be an output, while bits set to 0 configure the pins to be inputs. All bits are cleared by a reset, meaning all GPIO pins are inputs by default.

#### GPIO Direction (GPIODIR)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x400

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	DIR	R/W	0x00	GPIO Data Direction

The DIR values are defined as follows:

- 0 Pins are inputs.
- Pins are outputs.

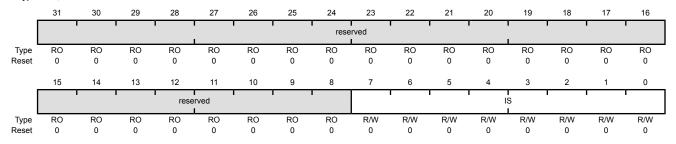

# Register 3: GPIO Interrupt Sense (GPIOIS), offset 0x404

The **GPIOIS** register is the interrupt sense register. Bits set to 1 in **GPIOIS** configure the corresponding pins to detect levels, while bits set to 0 configure the pins to detect edges. All bits are cleared by a reset.

#### GPIO Interrupt Sense (GPIOIS)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000

Offset 0x404 Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	IS	R/W	0x00	GPIO Interrupt Sense

The IS values are defined as follows:

- 0 Edge on corresponding pin is detected (edge-sensitive).
- 1 Level on corresponding pin is detected (level-sensitive).

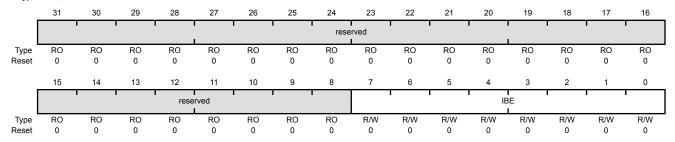

# Register 4: GPIO Interrupt Both Edges (GPIOIBE), offset 0x408

The **GPIOIBE** register is the interrupt both-edges register. When the corresponding bit in the **GPIO Interrupt Sense (GPIOIS)** register (see page 174) is set to detect edges, bits set to High in **GPIOIBE** configure the corresponding pin to detect both rising and falling edges, regardless of the corresponding bit in the **GPIO Interrupt Event (GPIOIEV)** register (see page 176). Clearing a bit configures the pin to be controlled by **GPIOIEV**. All bits are cleared by a reset.

#### GPIO Interrupt Both Edges (GPIOIBE)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 GPIO Port H base: 0x4002.7000

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	IBE	R/W	0x00	GPIO Interrupt Both Edges

The IBE values are defined as follows:

#### Value Description

- 0 Interrupt generation is controlled by the GPIO Interrupt Event (GPIOIEV) register (see page 176).
- 1 Both edges on the corresponding pin trigger an interrupt.

**Note:** Single edge is determined by the corresponding bit in **GPIOIEV**.

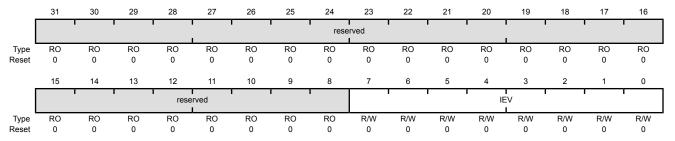

# Register 5: GPIO Interrupt Event (GPIOIEV), offset 0x40C

The **GPIOIEV** register is the interrupt event register. Bits set to High in **GPIOIEV** configure the corresponding pin to detect rising edges or high levels, depending on the corresponding bit value in the GPIO Interrupt Sense (GPIOIS) register (see page 174). Clearing a bit configures the pin to detect falling edges or low levels, depending on the corresponding bit value in GPIOIS. All bits are cleared by a reset.

#### GPIO Interrupt Event (GPIOIEV)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x40C

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	IEV	R/W	0x00	GPIO Interrupt Event

The IEV values are defined as follows:

- Falling edge or Low levels on corresponding pins trigger interrupts.
- Rising edge or High levels on corresponding pins trigger interrupts.

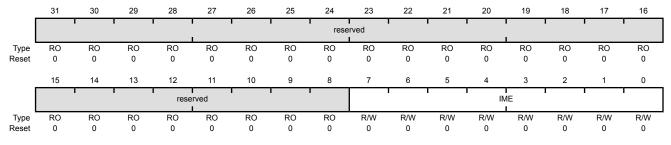

# Register 6: GPIO Interrupt Mask (GPIOIM), offset 0x410

The **GPIOIM** register is the interrupt mask register. Bits set to High in **GPIOIM** allow the corresponding pins to trigger their individual interrupts and the combined **GPIOINTR** line. Clearing a bit disables interrupt triggering on that pin. All bits are cleared by a reset.

#### GPIO Interrupt Mask (GPIOIM)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x410

Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	IME	R/W	0x00	GPIO Interrupt Mask Enable

The IME values are defined as follows:

- 0 Corresponding pin interrupt is masked.
- 1 Corresponding pin interrupt is not masked.

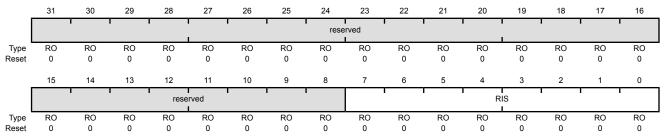

# Register 7: GPIO Raw Interrupt Status (GPIORIS), offset 0x414

The GPIORIS register is the raw interrupt status register. Bits read High in GPIORIS reflect the status of interrupt trigger conditions detected (raw, prior to masking), indicating that all the requirements have been met, before they are finally allowed to trigger by the GPIO Interrupt Mask (GPIOIM) register (see page 177). Bits read as zero indicate that corresponding input pins have not initiated an interrupt. All bits are cleared by a reset.

#### GPIO Raw Interrupt Status (GPIORIS)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x414

Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	RIS	RO	0×00	GPIO Interrunt Raw Status

Reflects the status of interrupt trigger condition detection on pins (raw, prior to masking).

The RIS values are defined as follows:

- Corresponding pin interrupt requirements not met.
- Corresponding pin interrupt has met requirements.

## Register 8: GPIO Masked Interrupt Status (GPIOMIS), offset 0x418

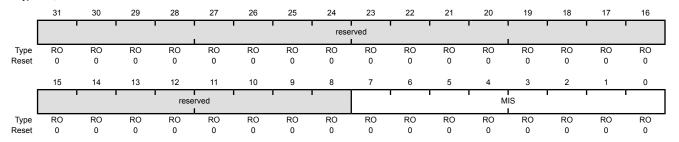

The **GPIOMIS** register is the masked interrupt status register. Bits read High in **GPIOMIS** reflect the status of input lines triggering an interrupt. Bits read as Low indicate that either no interrupt has been generated, or the interrupt is masked.

**GPIOMIS** is the state of the interrupt after masking.

#### GPIO Masked Interrupt Status (GPIOMIS)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x418

Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	MIS	RO	0x00	GPIO Masked Interrupt Status

Masked value of interrupt due to corresponding pin.

The MIS values are defined as follows:

- 0 Corresponding GPIO line interrupt not active.
- 1 Corresponding GPIO line asserting interrupt.

# Register 9: GPIO Interrupt Clear (GPIOICR), offset 0x41C

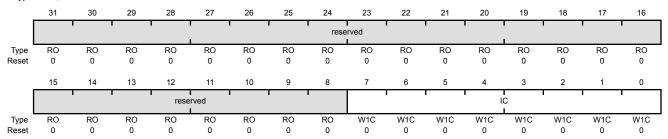

The **GPIOICR** register is the interrupt clear register. Writing a 1 to a bit in this register clears the corresponding interrupt edge detection logic register. Writing a 0 has no effect.

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000

GPIO Port H base: 0x4002.7000 Offset 0x41C

Type W1C, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	IC	W1C	0x00	GPIO Interrupt Clear

The IC values are defined as follows:

- 0 Corresponding interrupt is unaffected.
- Corresponding interrupt is cleared.

### Register 10: GPIO Alternate Function Select (GPIOAFSEL), offset 0x420

The **GPIOAFSEL** register is the mode control select register. Writing a 1 to any bit in this register selects the hardware control for the corresponding GPIO line. All bits are cleared by a reset, therefore no GPIO line is set to hardware control by default.

The GPIO commit control registers provide a layer of protection against accidental programming of critical hardware peripherals. Protection is currently provided for the five JTAG/SWD pins (PB7 and PC[3:0]). Writes to protected bits of the **GPIO Alternate Function Select (GPIOAFSEL)** register (see page 181) are not committed to storage unless the **GPIO Lock (GPIOLOCK)** register (see page 191) has been unlocked and the appropriate bits of the **GPIO Commit (GPIOCR)** register (see page 192) have been set to 1.

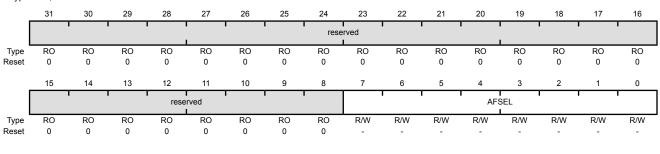

Important: All GPIO pins are tri-stated by default (GPIOAFSEL=0, GPIODEN=0, GPIOPDR=0, and GPIOPUR=0), with the exception of the five JTAG/SWD pins (PB7 and PC[3:0]). The JTAG/SWD pins default to their JTAG/SWD functionality (GPIOAFSEL=1, GPIODEN=1 and GPIOPUR=1). A Power-On-Reset (POR) or asserting RST puts both groups of pins back to their default state.

Caution – It is possible to create a software sequence that prevents the debugger from connecting to the Stellaris® microcontroller. If the program code loaded into flash immediately changes the JTAG pins to their GPIO functionality, the debugger may not have enough time to connect and halt the controller before the JTAG pin functionality switches. This may lock the debugger out of the part. This can be avoided with a software routine that restores JTAG functionality based on an external or software trigger.

#### GPIO Alternate Function Select (GPIOAFSEL)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000

Offset 0x420 Type R/W, reset -

Description

Bit/Field Name Type Reset

31:8 reserved RO 0x00

Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

Bit/Field	Name	Туре	Reset	Description
7:0	AFSFI	R/W	_	GPIO Alternate Function Select

The AFSEL values are defined as follows:

#### Value Description

- O Software control of corresponding GPIO line (GPIO mode).
- 1 Hardware control of corresponding GPIO line (alternate hardware function).

Note:

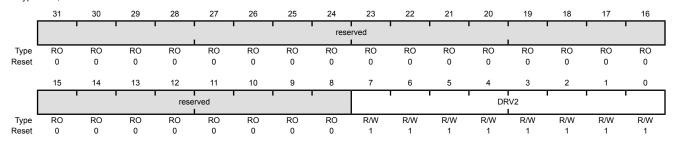

The default reset value for the **GPIOAFSEL**, **GPIOPUR**, and **GPIODEN** registers are 0x0000.0000 for all GPIO pins, with the exception of the five JTAG/SWD pins (PB7 and PC[3:0]). These five pins default to JTAG/SWD functionality. Because of this, the default reset value of these registers for GPIO Port B is 0x0000.0080 while the default reset value for Port C is 0x0000.000F.

# Register 11: GPIO 2-mA Drive Select (GPIODR2R), offset 0x500

The **GPIODR2R** register is the 2-mA drive control register. It allows for each GPIO signal in the port to be individually configured without affecting the other pads. When writing a DRV2 bit for a GPIO signal, the corresponding DRV4 bit in the **GPIODR4R** register and the DRV8 bit in the **GPIODR8R** register are automatically cleared by hardware.

#### GPIO 2-mA Drive Select (GPIODR2R)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x500 Type R/W, reset 0x0000.00FF

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	DRV2	R/W	0xFF	Output Pad 2-mA Drive Enable

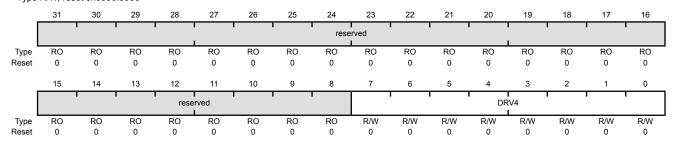

A write of 1 to either **GPIODR4[n]** or **GPIODR8[n]** clears the corresponding 2-mA enable bit. The change is effective on the second clock cycle after the write.

# Register 12: GPIO 4-mA Drive Select (GPIODR4R), offset 0x504

The **GPIODR4R** register is the 4-mA drive control register. It allows for each GPIO signal in the port to be individually configured without affecting the other pads. When writing the DRV4 bit for a GPIO signal, the corresponding DRV2 bit in the **GPIODR2R** register and the DRV8 bit in the **GPIODR8R** register are automatically cleared by hardware.

#### GPIO 4-mA Drive Select (GPIODR4R)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x504 Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	DRV4	R/W	0x00	Output Pad 4-mA Drive Enable

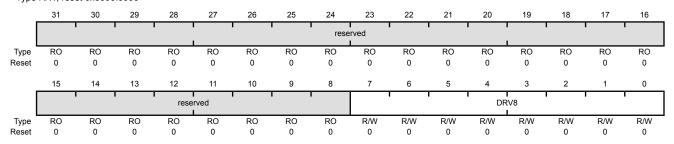

A write of 1 to either **GPIODR2[n]** or **GPIODR8[n]** clears the corresponding 4-mA enable bit. The change is effective on the second clock cycle after the write.

### Register 13: GPIO 8-mA Drive Select (GPIODR8R), offset 0x508

The **GPIODR8R** register is the 8-mA drive control register. It allows for each GPIO signal in the port to be individually configured without affecting the other pads. When writing the DRV8 bit for a GPIO signal, the corresponding DRV2 bit in the **GPIODR2R** register and the DRV4 bit in the **GPIODR4R** register are automatically cleared by hardware.

#### GPIO 8-mA Drive Select (GPIODR8R)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x508 Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	DRV8	R/W	0x00	Output Pad 8-mA Drive Enable

A write of 1 to either **GPIODR2[n]** or **GPIODR4[n]** clears the corresponding 8-mA enable bit. The change is effective on the second clock cycle after the write.

### Register 14: GPIO Open Drain Select (GPIOODR), offset 0x50C

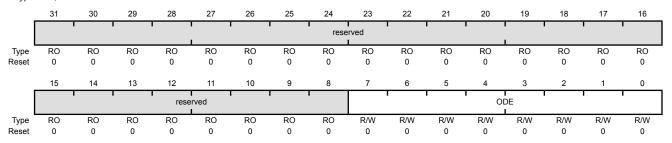

The **GPIOODR** register is the open drain control register. Setting a bit in this register enables the open drain configuration of the corresponding GPIO pad. When open drain mode is enabled, the corresponding bit should also be set in the **GPIO Digital Input Enable (GPIODEN)** register (see page 190). Corresponding bits in the drive strength registers (**GPIODR2R**, **GPIODR4R**, **GPIODR8R**, and **GPIOSLR**) can be set to achieve the desired rise and fall times. The GPIO acts as an open-drain input if the corresponding bit in the **GPIODIR** register is cleared. If open drain is selected while the GPIO is configured as an input, the GPIO will remain an input and the open-drain selection has no effect until the GPIO is changed to an output.

When using the I<sup>2</sup>C module, in addition to configuring the pin to open drain, the **GPIO Alternate Function Select (GPIOAFSEL)** register bits for the I<sup>2</sup>C clock and data pins should be set to 1 (see examples in "Initialization and Configuration" on page 168).

#### GPIO Open Drain Select (GPIOODR)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x50C

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	ODE	R/W	0x00	Output Pad Open Drain Enable

The ODE values are defined as follows:

#### Value Description

- 0 Open drain configuration is disabled.
- 1 Open drain configuration is enabled.

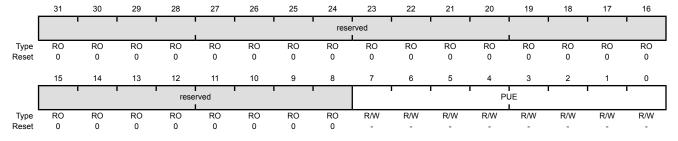

# Register 15: GPIO Pull-Up Select (GPIOPUR), offset 0x510

The **GPIOPUR** register is the pull-up control register. When a bit is set to 1, it enables a weak pull-up resistor on the corresponding GPIO signal. Setting a bit in **GPIOPUR** automatically clears the corresponding bit in the **GPIO Pull-Down Select (GPIOPDR)** register (see page 188).

#### GPIO Pull-Up Select (GPIOPUR)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x510

Type R/W, reset -

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	PUE	R/W	_	Pad Weak Pull-Up Enable

A write of 1 to **GPIOPDR[n]** clears the corresponding **GPIOPUR[n]** enables. The change is effective on the second clock cycle after the write.

#### Note:

The default reset value for the **GPIOAFSEL**, **GPIOPUR**, and **GPIODEN** registers are 0x0000.0000 for all GPIO pins, with the exception of the five JTAG/SWD pins (PB7 and PC[3:0]). These five pins default to JTAG/SWD functionality. Because of this, the default reset value of these registers for GPIO Port B is 0x0000.0080 while the default reset value for Port C is 0x0000.000F.

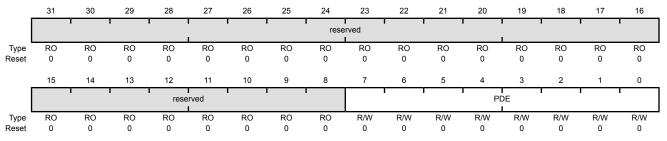

# Register 16: GPIO Pull-Down Select (GPIOPDR), offset 0x514

The **GPIOPDR** register is the pull-down control register. When a bit is set to 1, it enables a weak pull-down resistor on the corresponding GPIO signal. Setting a bit in **GPIOPDR** automatically clears the corresponding bit in the **GPIO Pull-Up Select (GPIOPUR)** register (see page 187).

#### GPIO Pull-Down Select (GPIOPDR)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x514

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	PDE	R/W	0x00	Pad Weak Pull-Down Enable

A write of 1 to **GPIOPUR[n]** clears the corresponding **GPIOPDR[n]** enables. The change is effective on the second clock cycle after the write.

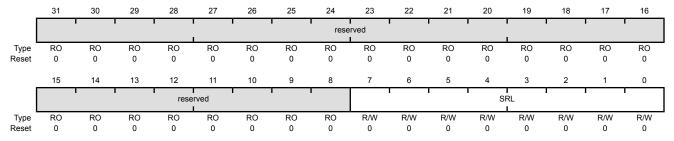

# Register 17: GPIO Slew Rate Control Select (GPIOSLR), offset 0x518

The **GPIOSLR** register is the slew rate control register. Slew rate control is only available when using the 8-mA drive strength option via the **GPIO 8-mA Drive Select (GPIODR8R)** register (see page 185).

### GPIO Slew Rate Control Select (GPIOSLR)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x518

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	SRL	R/W	0x00	Slew Rate Limit Enable (8-mA drive only)

The SRL values are defined as follows:

#### Value Description

- 0 Slew rate control disabled.
- Slew rate control enabled.

# Register 18: GPIO Digital Enable (GPIODEN), offset 0x51C

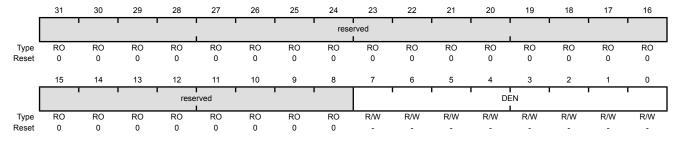

**Note:** Pins configured as digital inputs are Schmitt-triggered.

The **GPIODEN** register is the digital enable register. By default, with the exception of the GPIO signals used for JTAG/SWD function, all other GPIO signals are configured out of reset to be undriven (tristate). Their digital function is disabled; they do not drive a logic value on the pin and they do not allow the pin voltage into the GPIO receiver. To use the pin in a digital function (either GPIO or alternate function), the corresponding GPIODEN bit must be set.

#### GPIO Digital Enable (GPIODEN)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port H base: 0x4002.7000

Offset 0x51C Type R/W, reset -

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	DEN	R/W	-	Digital Enable

The DEN values are defined as follows:

#### Value Description

- 0 Digital functions disabled.
- Digital functions enabled.

Note:

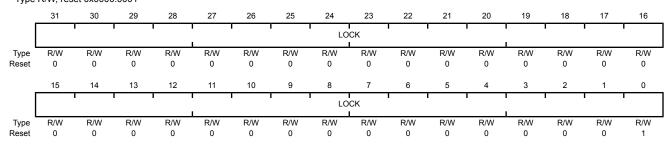

The default reset value for the **GPIOAFSEL**, **GPIOPUR**, and **GPIODEN** registers are 0x0000.0000 for all GPIO pins, with the exception of the five JTAG/SWD pins (PB7 and PC[3:0]). These five pins default to JTAG/SWD functionality. Because of this, the default reset value of these registers for GPIO Port B is 0x0000.0080 while the default reset value for Port C is 0x0000.000F.

# Register 19: GPIO Lock (GPIOLOCK), offset 0x520

The **GPIOLOCK** register enables write access to the **GPIOCR** register (see page 192). Writing 0x1ACC.E551 to the **GPIOLOCK** register will unlock the **GPIOCR** register. Writing any other value to the **GPIOLOCK** register re-enables the locked state. Reading the **GPIOLOCK** register returns the lock status rather than the 32-bit value that was previously written. Therefore, when write accesses are disabled, or locked, reading the **GPIOLOCK** register returns 0x00000001. When write accesses are enabled, or unlocked, reading the **GPIOLOCK** register returns 0x000000000.

#### GPIO Lock (GPIOLOCK)

GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000.5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x520 Type R/W, reset 0x0000.0001

Bit/Field	Name	Type	Reset	Description
31:0	LOCK	R/W	0x0000.0001	GPIO Lock

A write of the value 0x1ACC.E551 unlocks the **GPIO Commit (GPIOCR)** register for write access.

A write of any other value or a write to the **GPIOCR** register reapplies the lock, preventing any register updates. A read of this register returns the following values:

Value Description
0x0000.0001 locked
0x0000.0000 unlocked

### Register 20: GPIO Commit (GPIOCR), offset 0x524

The **GPIOCR** register is the commit register. The value of the **GPIOCR** register determines which bits of the **GPIOAFSEL** register are committed when a write to the **GPIOAFSEL** register is performed. If a bit in the **GPIOCR** register is a zero, the data being written to the corresponding bit in the **GPIOAFSEL** register will not be committed and will retain its previous value. If a bit in the **GPIOCR** register is a one, the data being written to the corresponding bit of the **GPIOAFSEL** register will be committed to the register and will reflect the new value.

The contents of the **GPIOCR** register can only be modified if the **GPIOLOCK** register is unlocked. Writes to the **GPIOCR** register are ignored if the **GPIOLOCK** register is locked.

Important: This register is designed to prevent accidental programming of the registers that control connectivity to the JTAG/SWD debug hardware. By initializing the bits of the GPIOCR register to 0 for PB7 and PC[3:0], the JTAG/SWD debug port can only be converted to GPIOs through a deliberate set of writes to the GPIOLOCK, GPIOCR, and the corresponding registers.

Because this protection is currently only implemented on the JTAG/SWD pins on PB7 and PC[3:0], all of the other bits in the **GPIOCR** registers cannot be written with 0x0. These bits are hardwired to 0x1, ensuring that it is always possible to commit new values to the **GPIOAFSEL**register bits of these other pins.

#### GPIO Commit (GPIOCR) GPIO Port A base: 0x4000.4000 GPIO Port B base: 0x4000 5000 GPIO Port C base: 0x4000.6000 GPIO Port D base: 0x4000.7000 GPIO Port E base: 0x4002.4000 GPIO Port F base: 0x4002.5000 GPIO Port G base: 0x4002.6000 GPIO Port H base: 0x4002.7000 Offset 0x524 Type -, reset 30 29 28 27 26 25 24 22 20 19 18 16 reserved RO Type Reset 0 0 0 0 0 0 0 0 0 0 0 0 0 0 12 8 6 3 2 15 13 10 n 14 11 CR reserved Туре RO RO RO RO RO RC RO Bit/Field Name Type Reset Description RO 0x00 31:8 reserved Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

Bit/Field	Name	Type	Reset	Description
7:0	CR	_	_	GPIO Commit

On a bit-wise basis, any bit set allows the corresponding **GPIOAFSEL** bit to be set to its alternate function.

#### Note:

The default register type for the **GPIOCR** register is RO for all GPIO pins with the exception of the five JTAG/SWD pins (PB7 and PC[3:0]). These five pins are currently the only GPIOs that are protected by the **GPIOCR** register. Because of this, the register type for GPIO Port B7 and GPIO Port C[3:0] is R/W.

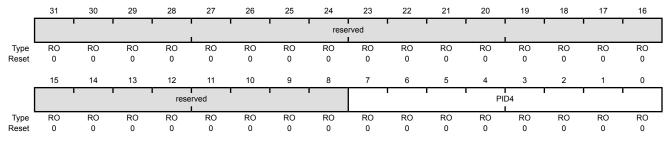

The default reset value for the **GPIOCR** register is 0x0000.00FF for all GPIO pins, with the exception of the five JTAG/SWD pins (PB7 and PC[3:0]). To ensure that the JTAG port is not accidentally programmed as a GPIO, these five pins default to non-committable. Because of this, the default reset value of **GPIOCR** for GPIO Port B is 0x0000.007F while the default reset value of GPIOCR for Port C is 0x0000.00F0.

# Register 21: GPIO Peripheral Identification 4 (GPIOPeriphID4), offset 0xFD0

The **GPIOPeriphID4**, **GPIOPeriphID5**, **GPIOPeriphID6**, and **GPIOPeriphID7** registers can conceptually be treated as one 32-bit register; each register contains eight bits of the 32-bit register, used by software to identify the peripheral.

# 10 General-Purpose Timers

Programmable timers can be used to count or time external events that drive the Timer input pins. The Stellaris® General-Purpose Timer Module (GPTM) contains four GPTM blocks (Timer0, Timer1, Timer 2, and Timer 3). Each GPTM block provides two 16-bit timers/counters (referred to as TimerA and TimerB) that can be configured to operate independently as timers or event counters, or configured to operate as one 32-bit timer or one 32-bit Real-Time Clock (RTC).

The GPT Module is one timing resource available on the Stellaris<sup>®</sup> microcontrollers. Other timer resources include the System Timer (SysTick) (see "System Timer (SysTick)" on page 41).

The General-Purpose Timers provide the following features:

- Four General-Purpose Timer Modules (GPTM), each of which provides two 16-bit timers. Each GPTM can be configured to operate independently:
  - As a single 32-bit timer
  - As one 32-bit Real-Time Clock (RTC) to event capture
  - For Pulse Width Modulation (PWM)
- 32-bit Timer modes
  - Programmable one-shot timer
  - Programmable periodic timer
  - Real-Time Clock when using an external 32.768-KHz clock as the input
  - Software-controlled event stalling (excluding RTC mode)
- 16-bit Timer modes
  - General-purpose timer function with an 8-bit prescaler (for one-shot and periodic modes only)
  - Programmable one-shot timer
  - Programmable periodic timer
  - User-enabled stalling when the controller asserts CPU Halt flag during debug
- 16-bit Input Capture modes
  - Input edge count capture
  - Input edge time capture
- 16-bit PWM mode
  - Simple PWM mode with software-programmable output inversion of the PWM signal

# 10.1 Block Diagram

**Note:** In Figure 10-1 on page 207, the specific CCP pins available depend on the Stellaris<sup>®</sup> device. See Table 10-1 on page 207 for the available CCPs.

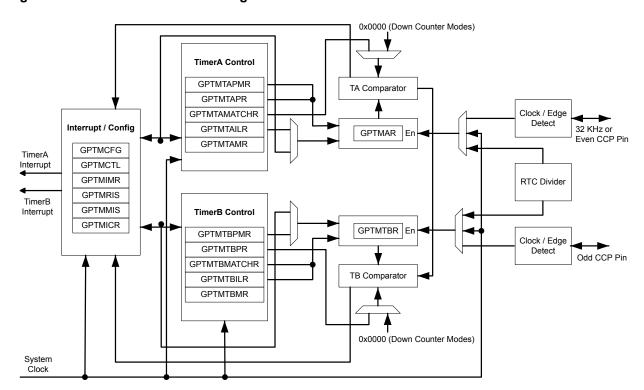

Figure 10-1. GPTM Module Block Diagram

Table 10-1. Available CCP Pins

Timer	16-Bit Up/Down Counter	Even CCP Pin	Odd CCP Pin
Timer 0	TimerA	CCP0	-
	TimerB	-	CCP1
Timer 1	TimerA	CCP2	-
	TimerB	-	CCP3
Timer 2	TimerA	CCP4	-
	TimerB	-	CCP5
Timer 3	TimerA	CCP6	-
	TimerB	-	CCP7

# 10.2 Functional Description

The main components of each GPTM block are two free-running 16-bit up/down counters (referred to as TimerA and TimerB), two 16-bit match registers, two prescaler match registers, and two 16-bit load/initialization registers and their associated control functions. The exact functionality of each GPTM is controlled by software and configured through the register interface.

Software configures the GPTM using the **GPTM Configuration (GPTMCFG)** register (see page 218), the **GPTM TimerA Mode (GPTMTAMR)** register (see page 219), and the **GPTM TimerB Mode (GPTMTBMR)** register (see page 221). When in one of the 32-bit modes, the timer can only act as a 32-bit timer. However, when configured in 16-bit mode, the GPTM can have its two 16-bit timers configured in any combination of the 16-bit modes.

### 10.2.1 GPTM Reset Conditions

After reset has been applied to the GPTM module, the module is in an inactive state, and all control registers are cleared and in their default states. Counters TimerA and TimerB are initialized to 0xFFFF, along with their corresponding load registers: the GPTM TimerA Interval Load (GPTMTAILR) register (see page 232) and the GPTM TimerB Interval Load (GPTMTBILR) register (see page 233). The prescale counters are initialized to 0x00: the GPTM TimerA Prescale (GPTMTAPR) register (see page 236) and the GPTM TimerB Prescale (GPTMTBPR) register (see page 237).

### 10.2.2 32-Bit Timer Operating Modes

This section describes the three GPTM 32-bit timer modes (One-Shot, Periodic, and RTC) and their configuration.

The GPTM is placed into 32-bit mode by writing a 0 (One-Shot/Periodic 32-bit timer mode) or a 1 (RTC mode) to the **GPTM Configuration (GPTMCFG)** register. In both configurations, certain GPTM registers are concatenated to form pseudo 32-bit registers. These registers include:

- GPTM TimerA Interval Load (GPTMTAILR) register [15:0], see page 232
- GPTM TimerB Interval Load (GPTMTBILR) register [15:0], see page 233
- GPTM TimerA (GPTMTAR) register [15:0], see page 240
- GPTM TimerB (GPTMTBR) register [15:0], see page 241

In the 32-bit modes, the GPTM translates a 32-bit write access to **GPTMTAILR** into a write access to both **GPTMTAILR** and **GPTMTBILR**. The resulting word ordering for such a write operation is:

```
GPTMTBILR[15:0]:GPTMTAILR[15:0]
```

Likewise, a read access to **GPTMTAR** returns the value:

```
GPTMTBR[15:0]:GPTMTAR[15:0]
```

#### 10.2.2.1 32-Bit One-Shot/Periodic Timer Mode

In 32-bit one-shot and periodic timer modes, the concatenated versions of the TimerA and TimerB registers are configured as a 32-bit down-counter. The selection of one-shot or periodic mode is determined by the value written to the TAMR field of the **GPTM TimerA Mode (GPTMTAMR)** register (see page 219), and there is no need to write to the **GPTM TimerB Mode (GPTMTBMR)** register.

When software writes the TAEN bit in the **GPTM Control (GPTMCTL)** register (see page 223), the timer begins counting down from its preloaded value. Once the 0x0000.0000 state is reached, the timer reloads its start value from the concatenated **GPTMTAILR** on the next cycle. If configured to be a one-shot timer, the timer stops counting and clears the TAEN bit in the **GPTMCTL** register. If configured as a periodic timer, it continues counting.

In addition to reloading the count value, the GPTM generates interrupts and triggers when it reaches the 0x000.0000 state. The GPTM sets the TATORIS bit in the GPTM Raw Interrupt Status (GPTMRIS) register (see page 228), and holds it until it is cleared by writing the GPTM Interrupt Clear (GPTMICR) register (see page 230). If the time-out interrupt is enabled in the GPTM Interrupt Mask (GPTIMR) register (see page 226), the GPTM also sets the TATOMIS bit in the GPTM Masked Interrupt Status (GPTMMIS) register (see page 229).

If software reloads the **GPTMTAILR** register while the counter is running, the counter loads the new value on the next clock cycle and continues counting from the new value.

If the TASTALL bit in the **GPTMCTL** register is asserted, the timer freezes counting until the signal is deasserted.

#### 10.2.2.2 32-Bit Real-Time Clock Timer Mode

In Real-Time Clock (RTC) mode, the concatenated versions of the TimerA and TimerB registers are configured as a 32-bit up-counter. When RTC mode is selected for the first time, the counter is loaded with a value of 0x0000.0001. All subsequent load values must be written to the **GPTM TimerA Match (GPTMTAMATCHR)** register (see page 234) by the controller.

The input clock on the CCP0, CCP2, or CCP4 pins is required to be 32.768 KHz in RTC mode. The clock signal is then divided down to a 1 Hz rate and is passed along to the input of the 32-bit counter.

When software writes the TAEN bit inthe **GPTMCTL** register, the counter starts counting up from its preloaded value of 0x0000.0001. When the current count value matches the preloaded value in the **GPTMTAMATCHR** register, it rolls over to a value of 0x0000.0000 and continues counting until either a hardware reset, or it is disabled by software (clearing the TAEN bit). When a match occurs, the GPTM asserts the RTCRIS bit in **GPTMRIS**. If the RTC interrupt is enabled in **GPTIMR**, the GPTM also sets the RTCMIS bit in **GPTMISR** and generates a controller interrupt. The status flags are cleared by writing the RTCCINT bit in **GPTMICR**.

If the TASTALL and/or TBSTALL bits in the **GPTMCTL** register are set, the timer does not freeze if the RTCEN bit is set in **GPTMCTL**.

### 10.2.3 16-Bit Timer Operating Modes

The GPTM is placed into global 16-bit mode by writing a value of 0x4 to the **GPTM Configuration** (**GPTMCFG**) register (see page 218). This section describes each of the GPTM 16-bit modes of operation. TimerA and TimerB have identical modes, so a single description is given using an **n** to reference both.

### 10.2.3.1 16-Bit One-Shot/Periodic Timer Mode

In 16-bit one-shot and periodic timer modes, the timer is configured as a 16-bit down-counter with an optional 8-bit prescaler that effectively extends the counting range of the timer to 24 bits. The selection of one-shot or periodic mode is determined by the value written to the TnMR field of the **GPTMTnMR** register. The optional prescaler is loaded into the **GPTM Timern Prescale (GPTMTnPR)** register.

When software writes the TnEN bit in the **GPTMCTL** register, the timer begins counting down from its preloaded value. Once the 0x0000 state is reached, the timer reloads its start value from **GPTMTnILR** and **GPTMTnPR** on the next cycle. If configured to be a one-shot timer, the timer stops counting and clears the TnEN bit in the **GPTMCTL** register. If configured as a periodic timer, it continues counting.

In addition to reloading the count value, the timer generates interrupts and triggers when it reaches the 0x0000 state. The GPTM sets the TnTORIS bit in the **GPTMRIS** register, and holds it until it is cleared by writing the **GPTMICR** register. If the time-out interrupt is enabled in **GPTIMR**, the GPTM also sets the TnTOMIS bit in **GPTMISR** and generates a controller interrupt.

If software reloads the **GPTMTAILR** register while the counter is running, the counter loads the new value on the next clock cycle and continues counting from the new value.

If the TnSTALL bit in the **GPTMCTL** register is enabled, the timer freezes counting until the signal is deasserted.

The following example shows a variety of configurations for a 16-bit free running timer while using the prescaler. All values assume a 50-MHz clock with Tc=20 ns (clock period).

Table 10-2. 16-Bit Timer With Prescaler Configurations

Prescale	#Clock (T c) <sup>a</sup>	Max Time	Units
00000000	1	1.3107	mS
0000001	2	2.6214	mS
0000010	3	3.9321	mS
11111100	254	332.9229	mS
11111110	255	334.2336	mS
11111111	256	335.5443	mS

a. Tc is the clock period.

### 10.2.3.2 16-Bit Input Edge Count Mode

**Note:** For rising-edge detection, the input signal must be High for at least two system clock periods following the rising edge. Similarly, for falling-edge detection, the input signal must be Low for at least two system clock periods following the falling edge. Based on this criteria, the maximum input frequency for edge detection is 1/4 of the system frequency.

**Note:** The prescaler is not available in 16-Bit Input Edge Count mode.

In Edge Count mode, the timer is configured as a down-counter capable of capturing three types of events: rising edge, falling edge, or both. To place the timer in Edge Count mode, the TnCMR bit of the GPTMTnMR register must be set to 0. The type of edge that the timer counts is determined by the TnEVENT fields of the GPTMCTL register. During initialization, the GPTM Timern Match (GPTMTnMATCHR) register is configured so that the difference between the value in the GPTMTnILR register and the GPTMTnMATCHR register equals the number of edge events that must be counted.

When software writes the TnEN bit in the **GPTM Control (GPTMCTL)** register, the timer is enabled for event capture. Each input event on the CCP pin decrements the counter by 1 until the event count matches **GPTMTnMATCHR**. When the counts match, the GPTM asserts the CnMRIS bit in the **GPTMRIS** register (and the CnMMIS bit, if the interrupt is not masked).

The counter is then reloaded using the value in **GPTMTnILR**, and stopped since the GPTM automatically clears the  $\mathtt{TnEN}$  bit in the **GPTMCTL** register. Once the event count has been reached, all further events are ignored until  $\mathtt{TnEN}$  is re-enabled by software.

Figure 10-2 on page 211 shows how input edge count mode works. In this case, the timer start value is set to **GPTMnILR** =0x000A and the match value is set to **GPTMnMATCHR** =0x0006 so that four edge events are counted. The counter is configured to detect both edges of the input signal.

Note that the last two edges are not counted since the timer automatically clears the TnEN bit after the current count matches the value in the **GPTMnMR** register.

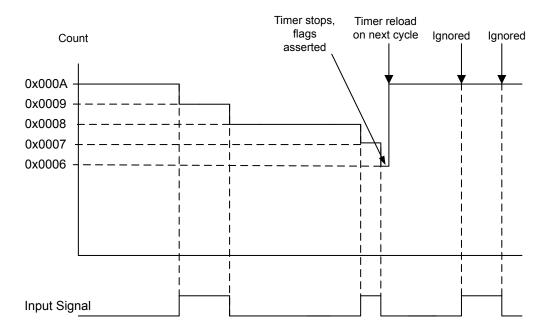

Figure 10-2. 16-Bit Input Edge Count Mode Example

### 10.2.3.3 16-Bit Input Edge Time Mode

**Note:** For rising-edge detection, the input signal must be High for at least two system clock periods following the rising edge. Similarly, for falling edge detection, the input signal must be Low for at least two system clock periods following the falling edge. Based on this criteria, the maximum input frequency for edge detection is 1/4 of the system frequency.

**Note:** The prescaler is not available in 16-Bit Input Edge Time mode.

In Edge Time mode, the timer is configured as a free-running down-counter initialized to the value loaded in the **GPTMTnILR** register (or 0xFFFF at reset). This mode allows for event capture of either rising or falling edges, but not both. The timer is placed into Edge Time mode by setting the TnCMR bit in the **GPTMTnMR** register, and the type of event that the timer captures is determined by the Tnevent fields of the **GPTMCnTL** register.

When software writes the TnEN bit in the **GPTMCTL** register, the timer is enabled for event capture. When the selected input event is detected, the current Tn counter value is captured in the **GPTMTnR** register and is available to be read by the controller. The GPTM then asserts the CnERIS bit (and the CnEMIS bit, if the interrupt is not masked).

After an event has been captured, the timer does not stop counting. It continues to count until the  $\mathtt{TnEN}$  bit is cleared. When the timer reaches the 0x0000 state, it is reloaded with the value from the **GPTMnILR** register.

Figure 10-3 on page 212 shows how input edge timing mode works. In the diagram, it is assumed that the start value of the timer is the default value of 0xFFFF, and the timer is configured to capture rising edge events.

Each time a rising edge event is detected, the current count value is loaded into the **GPTMTnR** register, and is held there until another rising edge is detected (at which point the new count value is loaded into **GPTMTnR**).

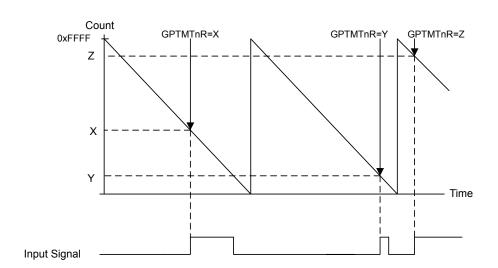

Figure 10-3. 16-Bit Input Edge Time Mode Example

#### 10.2.3.4 16-Bit PWM Mode

**Note:** The prescaler is not available in 16-Bit PWM mode.

The GPTM supports a simple PWM generation mode. In PWM mode, the timer is configured as a down-counter with a start value (and thus period) defined by **GPTMTnILR**. PWM mode is enabled with the **GPTMTnMR** register by setting the TnAMS bit to 0x1, the TnCMR bit to 0x0, and the TnMR field to 0x2.

When software writes the  $\mathtt{TnEN}$  bit in the **GPTMCTL** register, the counter begins counting down until it reaches the 0x0000 state. On the next counter cycle, the counter reloads its start value from **GPTMTnILR** and continues counting until disabled by software clearing the  $\mathtt{TnEN}$  bit in the **GPTMCTL** register. No interrupts or status bits are asserted in PWM mode.

The output PWM signal asserts when the counter is at the value of the **GPTMTnILR** register (its start state), and is deasserted when the counter value equals the value in the **GPTM Timern Match Register (GPTMnMATCHR)**. Software has the capability of inverting the output PWM signal by setting the TnPWML bit in the **GPTMCTL** register.

Figure 10-4 on page 213 shows how to generate an output PWM with a 1-ms period and a 66% duty cycle assuming a 50-MHz input clock and **TnPWML** =0 (duty cycle would be 33% for the **TnPWML** =1 configuration). For this example, the start value is **GPTMnIRL**=0xC350 and the match value is **GPTMnMR**=0x411A.

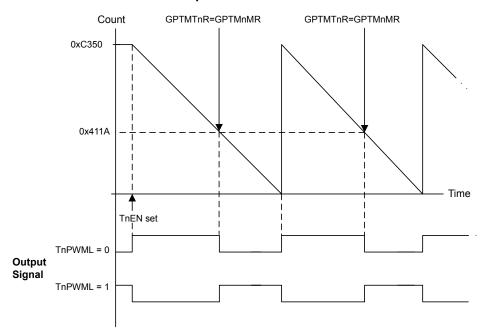

Figure 10-4. 16-Bit PWM Mode Example

# 10.3 Initialization and Configuration

To use the general-purpose timers, the peripheral clock must be enabled by setting the TIMER0, TIMER1, TIMER2, and TIMER3 bits in the **RCGC1** register.

This section shows module initialization and configuration examples for each of the supported timer modes.

#### 10.3.1 32-Bit One-Shot/Periodic Timer Mode

The GPTM is configured for 32-bit One-Shot and Periodic modes by the following sequence:

- 1. Ensure the timer is disabled (the TAEN bit in the **GPTMCTL** register is cleared) before making any changes.
- 2. Write the GPTM Configuration Register (GPTMCFG) with a value of 0x0.
- 3. Set the TAMR field in the GPTM TimerA Mode Register (GPTMTAMR):
  - **a.** Write a value of 0x1 for One-Shot mode.
  - **b.** Write a value of 0x2 for Periodic mode.
- 4. Load the start value into the GPTM TimerA Interval Load Register (GPTMTAILR).
- 5. If interrupts are required, set the TATOIM bit in the GPTM Interrupt Mask Register (GPTMIMR).
- 6. Set the TAEN bit in the **GPTMCTL** register to enable the timer and start counting.

7. Poll the TATORIS bit in the GPTMRIS register or wait for the interrupt to be generated (if enabled). In both cases, the status flags are cleared by writing a 1 to the TATOCINT bit of the GPTM Interrupt Clear Register (GPTMICR).

In One-Shot mode, the timer stops counting after step 7 on page 214. To re-enable the timer, repeat the sequence. A timer configured in Periodic mode does not stop counting after it times out.

### 10.3.2 32-Bit Real-Time Clock (RTC) Mode

To use the RTC mode, the timer must have a 32.768-KHz input signal on its CCP0, CCP2, or CCP4 pins. To enable the RTC feature, follow these steps:

- 1. Ensure the timer is disabled (the TAEN bit is cleared) before making any changes.
- 2. Write the GPTM Configuration Register (GPTMCFG) with a value of 0x1.
- 3. Write the desired match value to the GPTM TimerA Match Register (GPTMTAMATCHR).
- 4. Set/clear the RTCEN bit in the GPTM Control Register (GPTMCTL) as desired.
- If interrupts are required, set the RTCIM bit in the GPTM Interrupt Mask Register (GPTMIMR).
- **6.** Set the TAEN bit in the **GPTMCTL** register to enable the timer and start counting.

When the timer count equals the value in the **GPTMTAMATCHR** register, the counter is re-loaded with 0x0000.0000 and begins counting. If an interrupt is enabled, it does not have to be cleared.

### 10.3.3 16-Bit One-Shot/Periodic Timer Mode

A timer is configured for 16-bit One-Shot and Periodic modes by the following sequence:

- 1. Ensure the timer is disabled (the TnEN bit is cleared) before making any changes.
- 2. Write the GPTM Configuration Register (GPTMCFG) with a value of 0x4.
- 3. Set the TnMR field in the **GPTM Timer Mode (GPTMTnMR)** register:
  - **a.** Write a value of 0x1 for One-Shot mode.
  - **b.** Write a value of 0x2 for Periodic mode.
- 4. If a prescaler is to be used, write the prescale value to the GPTM Timern Prescale Register (GPTMTnPR).
- Load the start value into the GPTM Timer Interval Load Register (GPTMTnILR).
- 6. If interrupts are required, set the ThTOIM bit in the GPTM Interrupt Mask Register (GPTMIMR).
- 7. Set the TnEN bit in the **GPTM Control Register (GPTMCTL)** to enable the timer and start counting.
- 8. Poll the TnTORIS bit in the GPTMRIS register or wait for the interrupt to be generated (if enabled). In both cases, the status flags are cleared by writing a 1 to the TnTOCINT bit of the GPTM Interrupt Clear Register (GPTMICR).

In One-Shot mode, the timer stops counting after step 8 on page 214. To re-enable the timer, repeat the sequence. A timer configured in Periodic mode does not stop counting after it times out.

### 10.3.4 16-Bit Input Edge Count Mode

A timer is configured to Input Edge Count mode by the following sequence:

- 1. Ensure the timer is disabled (the TnEN bit is cleared) before making any changes.
- 2. Write the **GPTM Configuration (GPTMCFG)** register with a value of 0x4.
- 3. In the GPTM Timer Mode (GPTMTnMR) register, write the TnCMR field to 0x0 and the TnMR field to 0x3.
- **4.** Configure the type of event(s) that the timer captures by writing the TREVENT field of the **GPTM** Control (GPTMCTL) register.
- 5. Load the timer start value into the GPTM Timern Interval Load (GPTMTnILR) register.
- 6. Load the desired event count into the GPTM Timern Match (GPTMTnMATCHR) register.
- 7. If interrupts are required, set the CnMIM bit in the GPTM Interrupt Mask (GPTMIMR) register.
- 8. Set the TnEN bit in the **GPTMCTL** register to enable the timer and begin waiting for edge events.
- 9. Poll the CnMRIS bit in the GPTMRIS register or wait for the interrupt to be generated (if enabled). In both cases, the status flags are cleared by writing a 1 to the CnMCINT bit of the GPTM Interrupt Clear (GPTMICR) register.

In Input Edge Count Mode, the timer stops after the desired number of edge events has been detected. To re-enable the timer, ensure that the  ${\tt TnEN}$  bit is cleared and repeat step 4 on page 215 through step 9 on page 215.

### 10.3.5 16-Bit Input Edge Timing Mode

A timer is configured to Input Edge Timing mode by the following sequence:

- 1. Ensure the timer is disabled (the TnEN bit is cleared) before making any changes.
- 2. Write the **GPTM Configuration (GPTMCFG)** register with a value of 0x4.
- 3. In the GPTM Timer Mode (GPTMTnMR) register, write the TnCMR field to 0x1 and the TnMR field to 0x3.
- **4.** Configure the type of event that the timer captures by writing the Tnevent field of the **GPTM Control (GPTMCTL)** register.
- 5. Load the timer start value into the GPTM Timern Interval Load (GPTMTnILR) register.
- 6. If interrupts are required, set the CnEIM bit in the GPTM Interrupt Mask (GPTMIMR) register.
- 7. Set the Then bit in the **GPTM Control (GPTMCTL)** register to enable the timer and start counting.
- 8. Poll the Cners bit in the **GPTMRIS** register or wait for the interrupt to be generated (if enabled). In both cases, the status flags are cleared by writing a 1 to the Cnecint bit of the **GPTM**

**Interrupt Clear (GPTMICR)** register. The time at which the event happened can be obtained by reading the **GPTM Timern (GPTMTnR)** register.

In Input Edge Timing mode, the timer continues running after an edge event has been detected, but the timer interval can be changed at any time by writing the **GPTMTnILR** register. The change takes effect at the next cycle after the write.

#### 10.3.6 16-Bit PWM Mode

A timer is configured to PWM mode using the following sequence:

- 1. Ensure the timer is disabled (the TnEN bit is cleared) before making any changes.
- 2. Write the **GPTM Configuration (GPTMCFG)** register with a value of 0x4.
- 3. In the **GPTM Timer Mode (GPTMTnMR)** register, set the TnAMS bit to 0x1, the TnCMR bit to 0x0, and the TnMR field to 0x2.
- **4.** Configure the output state of the PWM signal (whether or not it is inverted) in the TREVENT field of the **GPTM Control (GPTMCTL)** register.
- 5. Load the timer start value into the GPTM Timern Interval Load (GPTMTnILR) register.
- 6. Load the GPTM Timern Match (GPTMTnMATCHR) register with the desired value.
- 7. Set the TnEN bit in the **GPTM Control (GPTMCTL)** register to enable the timer and begin generation of the output PWM signal.

In PWM Timing mode, the timer continues running after the PWM signal has been generated. The PWM period can be adjusted at any time by writing the **GPTMTnILR** register, and the change takes effect at the next cycle after the write.

# 10.4 Register Map

Table 10-3 on page 216 lists the GPTM registers. The offset listed is a hexadecimal increment to the register's address, relative to that timer's base address:

Timer0: 0x4003.0000
 Timer1: 0x4003.1000
 Timer2: 0x4003.2000
 Timer3: 0x4003.3000

Table 10-3. Timers Register Map

Offset	Name	Туре	Reset	Description	See page
0x000	GPTMCFG	R/W	0x0000.0000	GPTM Configuration	218
0x004	GPTMTAMR	R/W	0x0000.0000	GPTM TimerA Mode	219
0x008	GPTMTBMR	R/W	0x0000.0000	GPTM TimerB Mode	221
0x00C	GPTMCTL	R/W	0x0000.0000	GPTM Control	223
0x018	GPTMIMR	R/W	0x0000.0000	GPTM Interrupt Mask	226
0x01C	GPTMRIS	RO	0x0000.0000	GPTM Raw Interrupt Status	228

Table 10-3. Timers Register Map (continued)

Offset	Name	Type	Reset	Description	See page

# 10.5 Register Descriptions

The remainder of this section lists and describes the GPTM registers, in numerical order by address offset.

## Register 1: GPTM Configuration (GPTMCFG), offset 0x000

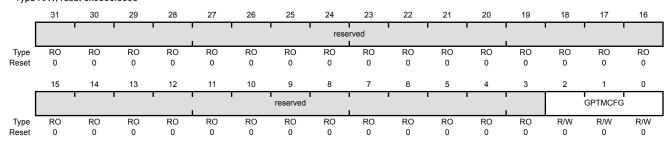

This register configures the global operation of the GPTM module. The value written to this register determines whether the GPTM is in 32- or 16-bit mode.

#### GPTM Configuration (GPTMCFG)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x000

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:3	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
2:0	GPTMCFG	R/W	0x0	GPTM Configuration

The GPTMCFG values are defined as follows:

Value Description

0x0 32-bit timer configuration.

0x1 32-bit real-time clock (RTC) counter configuration.

0x2 Reserved0x3 Reserved

0x4-0x7 16-bit timer configuration, function is controlled by bits 1:0 of **GPTMTAMR** and **GPTMTBMR**.

## Register 2: GPTM TimerA Mode (GPTMTAMR), offset 0x004

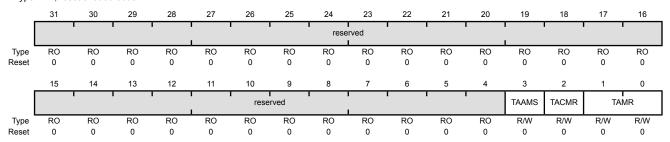

This register configures the GPTM based on the configuration selected in the **GPTMCFG** register. When in 16-bit PWM mode, set the TAAMS bit to 0x1, the TACMR bit to 0x0, and the TAMR field to 0x2.

#### GPTM TimerA Mode (GPTMTAMR)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x004

Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:4	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
3	TAAMS	R/W	0	GPTM TimerA Alternate Mode Select

The TAAMS values are defined as follows:

Value Description

Capture mode is enabled.

1 PWM mode is enabled.

**Note:** To enable PWM mode, you must also clear the TACMR bit and set the TAMR field to 0x2.

2 TACMR R/W 0 GPTM TimerA Capture Mode

The TACMR values are defined as follows:

Value Description

0 Edge-Count mode

1 Edge-Time mode

Bit/Field	Name	Type	Reset	Description
1:0	TAMR	R/W	0x0	GPTM TimerA Mode
				The TAMR values are defined as follows:
				Value Description
				0x0 Reserved
				0x1 One-Shot Timer mode
				0x2 Periodic Timer mode
				0x3 Capture mode
				The Timer mode is based on the timer configuration defined by bits 2:0 in the <b>GPTMCFG</b> register (16-or 32-bit).
				In 16-bit timer configuration, TAMR controls the 16-bit timer modes for

TimerA.

In 32-bit timer configuration, this register controls the mode and the contents of  $\ensuremath{\mathbf{GPTMTBMR}}$  are ignored.

## Register 3: GPTM TimerB Mode (GPTMTBMR), offset 0x008

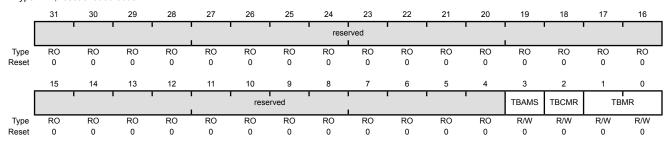

This register configures the GPTM based on the configuration selected in the GPTMCFG register. When in 16-bit PWM mode, set the TBAMS bit to 0x1, the TBCMR bit to 0x0, and the TBMR field to 0x2.

#### GPTM TimerB Mode (GPTMTBMR)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x008

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:4	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
3	TBAMS	R/W	0	GPTM TimerB Alternate Mode Select

The TBAMS values are defined as follows:

Value Description

Capture mode is enabled.

PWM mode is enabled.

To enable PWM mode, you must also clear the TBCMR Note: bit and set the TBMR field to 0x2.

**GPTM TimerB Capture Mode** 2 **TBCMR** R/W

The TBCMR values are defined as follows:

Value Description

Edge-Count mode

Edge-Time mode

Name

Type

Reset

Bit/Field

1:0	TBMR	R/W	0x0	GPTM TimerB Mode	
				The TBMR values are defined as follows:	
				Value Description	
				0x0 Reserved	
				0x1 One-Shot Timer mode	
				0x2 Periodic Timer mode	
				0x3 Capture mode	

Description

The timer mode is based on the timer configuration defined by bits 2:0 in the  $\mbox{\bf GPTMCFG}$  register.

In 16-bit timer configuration, these bits control the 16-bit timer modes for TimerB

In 32-bit timer configuration, this register's contents are ignored and  $\ensuremath{\mathbf{GPTMTAMR}}$  is used.

## Register 4: GPTM Control (GPTMCTL), offset 0x00C

This register is used alongside the **GPTMCFG** and **GMTMTnMR** registers to fine-tune the timer configuration, and to enable other features such as timer stall.

#### GPTM Control (GPTMCTL)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

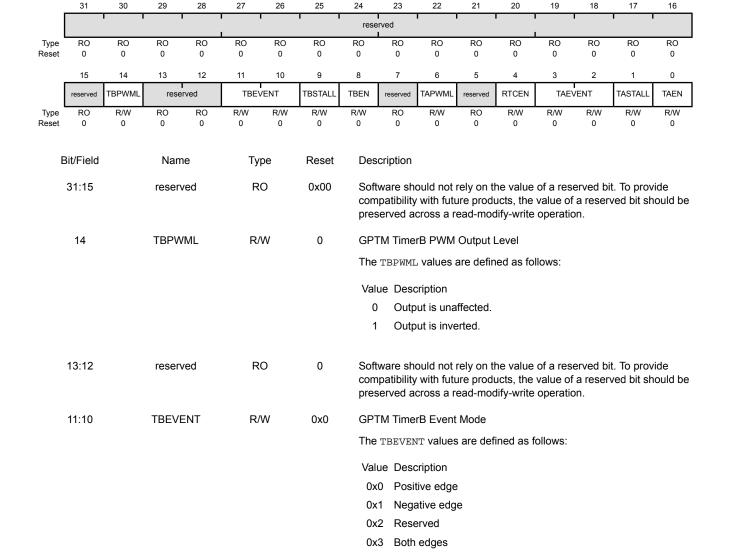

Offset 0x00C

9

**TBSTALL** 

R/W

Type R/W, reset 0x0000.0000

October 13, 2009 223

**GPTM TimerB Stall Enable** 

Value Description

The TBSTALL values are defined as follows:

TimerB stalling is disabled. TimerB stalling is enabled.

Bit/Field	Name	Туре	Reset	Description
8	TBEN	R/W	0	GPTM TimerB Enable
				The TBEN values are defined as follows:
				Value Description
				0 TimerB is disabled.
				1 TimerB is enabled and begins counting or the capture logic is enabled based on the GPTMCFG register.
7	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
6	TAPWML	R/W	0	GPTM TimerA PWM Output Level
				The TAPWML values are defined as follows:
				Value Description
				0 Output is unaffected.
				1 Output is inverted.
5	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
4	RTCEN	R/W	0	GPTM RTC Enable
				The RTCEN values are defined as follows:
				Value Description
				0 RTC counting is disabled.
				1 RTC counting is enabled.
3:2	TAEVENT	R/W	0x0	GPTM TimerA Event Mode
				The TAEVENT values are defined as follows:
				Value Description
				0x0 Positive edge
				0x1 Negative edge
				0x2 Reserved
				0x3 Both edges
1	TASTALL	R/W	0	GPTM TimerA Stall Enable
				The TASTALL values are defined as follows:
				Value Description
				0 TimerA stalling is disabled.
				1 TimerA stalling is enabled.

Bit/Field	Name	Туре	Reset	Description
0	TAEN	R/W	0	GPTM TimerA Enable

The TAEN values are defined as follows:

Value Description

- 0 TimerA is disabled.
- 1 TimerA is enabled and begins counting or the capture logic is enabled based on the GPTMCFG register.

## Register 5: GPTM Interrupt Mask (GPTMIMR), offset 0x018

This register allows software to enable/disable GPTM controller-level interrupts. Writing a 1 enables the interrupt, while writing a 0 disables it.

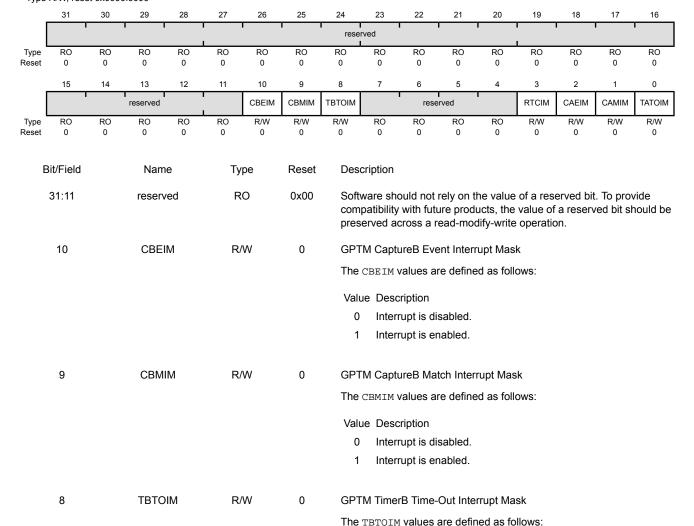

#### **GPTM Interrupt Mask (GPTMIMR)**

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Value Description

Interrupt is disabled.
Interrupt is enabled.

Software should not rely on the value of a reserved bit. To provide

preserved across a read-modify-write operation.

compatibility with future products, the value of a reserved bit should be

Bit/Field	Name	Туре	Reset	Description
3	RTCIM	R/W	0	GPTM RTC Interrupt Mask The RTCIM values are defined as follows:  Value Description 0 Interrupt is disabled. 1 Interrupt is enabled.
2	CAEIM	R/W	0	GPTM CaptureA Event Interrupt Mask The CAEIM values are defined as follows:  Value Description 0 Interrupt is disabled. 1 Interrupt is enabled.
1	CAMIM	R/W	0	GPTM CaptureA Match Interrupt Mask The CAMIM values are defined as follows:  Value Description  0 Interrupt is disabled.  1 Interrupt is enabled.
0	TATOIM	R/W	0	GPTM TimerA Time-Out Interrupt Mask The TATOIM values are defined as follows:  Value Description 0 Interrupt is disabled. 1 Interrupt is enabled.

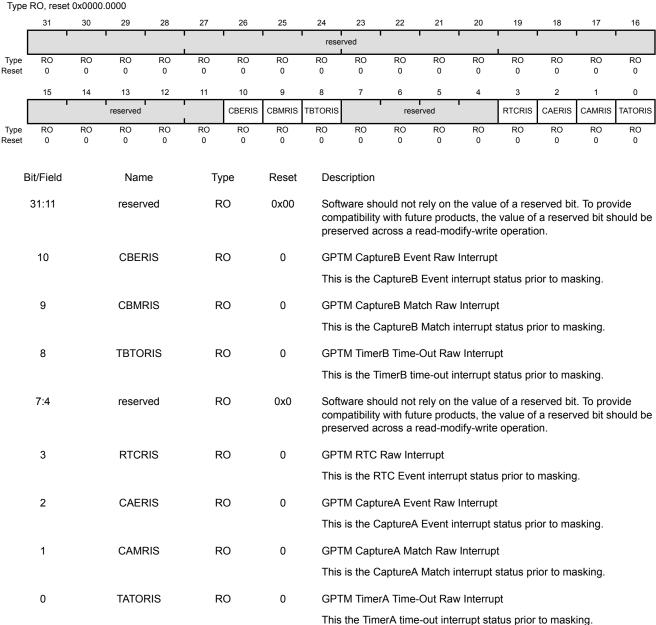

### Register 6: GPTM Raw Interrupt Status (GPTMRIS), offset 0x01C

This register shows the state of the GPTM's internal interrupt signal. These bits are set whether or not the interrupt is masked in the **GPTMIMR** register. Each bit can be cleared by writing a 1 to its corresponding bit in **GPTMICR**.

#### GPTM Raw Interrupt Status (GPTMRIS)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x01C

#### Register 7: GPTM Masked Interrupt Status (GPTMMIS), offset 0x020

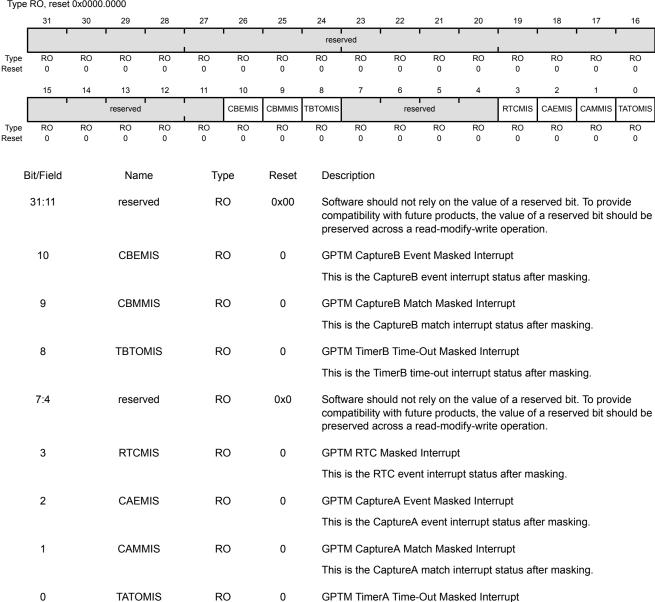

This register show the state of the GPTM's controller-level interrupt. If an interrupt is unmasked in GPTMIMR, and there is an event that causes the interrupt to be asserted, the corresponding bit is set in this register. All bits are cleared by writing a 1 to the corresponding bit in GPTMICR.

#### **GPTM Masked Interrupt Status (GPTMMIS)**

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x020

Type RO, reset 0x0000.0000

This is the TimerA time-out interrupt status after masking.

## Register 8: GPTM Interrupt Clear (GPTMICR), offset 0x024

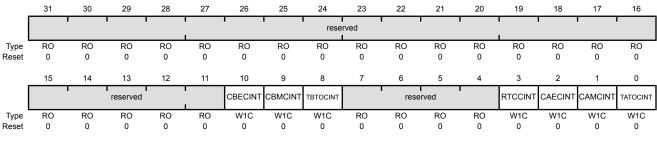

This register is used to clear the status bits in the **GPTMRIS** and **GPTMMIS** registers. Writing a 1 to a bit clears the corresponding bit in the **GPTMRIS** and **GPTMMIS** registers.

#### GPTM Interrupt Clear (GPTMICR)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x024

Type W1C, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:11	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
10	CBECINT	W1C	0	GPTM CaptureB Event Interrupt Clear
				The CBECINT values are defined as follows:
				Value Description
				0 The interrupt is unaffected.
				1 The interrupt is cleared.
9	CBMCINT	W1C	0	GPTM CaptureB Match Interrupt Clear
				The CBMCINT values are defined as follows:
				Value Description
				0 The interrupt is unaffected.
				1 The interrupt is cleared.
8	TBTOCINT	W1C	0	GPTM TimerB Time-Out Interrupt Clear
				The TBTOCINT values are defined as follows:
				Value Description
				0 The interrupt is unaffected.
				1 The interrupt is cleared.
7:4	reserved	RO	0x0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

Bit/Field	Name	Туре	Reset	Description
3	RTCCINT	W1C	0	GPTM RTC Interrupt Clear
				The RTCCINT values are defined as follows:
				Value Description
				0 The interrupt is unaffected.
				1 The interrupt is cleared.
2	CAECINT	W1C	0	GPTM CaptureA Event Interrupt Clear
				The CAECINT values are defined as follows:
				Value Description
				0 The interrupt is unaffected.
				1 The interrupt is cleared.
1	CAMCINT	W1C	0	GPTM CaptureA Match Raw Interrupt
				This is the CaptureA match interrupt status after masking.
0	TATOCINT	W1C	0	GPTM TimerA Time-Out Raw Interrupt
				The TATOCINT values are defined as follows:
				Value Description
				0 The interrupt is unaffected.

The interrupt is cleared.

October 13, 2009 231

## Register 9: GPTM TimerA Interval Load (GPTMTAILR), offset 0x028

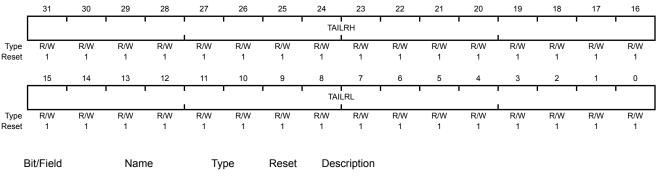

This register is used to load the starting count value into the timer. When GPTM is configured to one of the 32-bit modes, **GPTMTAILR** appears as a 32-bit register (the upper 16-bits correspond to the contents of the **GPTM TimerB Interval Load (GPTMTBILR)** register). In 16-bit mode, the upper 16 bits of this register read as 0s and have no effect on the state of **GPTMTBILR**.

#### GPTM TimerA Interval Load (GPTMTAILR)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x028

Type R/W, reset 0xFFFF.FFF

31:16	TAILRH	R/W	0xFFFF	GPTM TimerA Interval Load Register High

When configured for 32-bit mode via the **GPTMCFG** register, the **GPTM TimerB Interval Load (GPTMTBILR)** register loads this value on a write. A read returns the current value of **GPTMTBILR**.

In 16-bit mode, this field reads as 0 and does not have an effect on the state of **GPTMTBILR**.

15:0 TAILRL R/W 0xFFFF

GPTM TimerA Interval Load Register Low

For both 16- and 32-bit modes, writing this field loads the counter for TimerA. A read returns the current value of **GPTMTAILR**.

### Register 10: GPTM TimerB Interval Load (GPTMTBILR), offset 0x02C

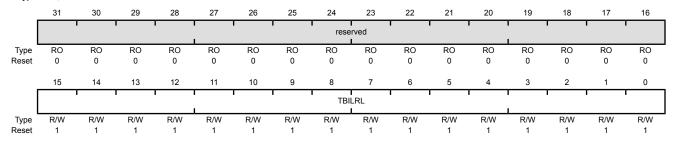

This register is used to load the starting count value into TimerB. When the GPTM is configured to a 32-bit mode, **GPTMTBILR** returns the current value of TimerB and ignores writes.

#### GPTM TimerB Interval Load (GPTMTBILR)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x02C

Type R/W, reset 0x0000.FFFF

Bit/Field	Name	Type	Reset	Description
31:16	reserved	RO	0x0000	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
15:0	TBILRL	R/W	0xFFFF	GPTM TimerB Interval Load Register

When the GPTM is not configured as a 32-bit timer, a write to this field updates **GPTMTBILR**. In 32-bit mode, writes are ignored, and reads return the current value of **GPTMTBILR**.

### Register 11: GPTM TimerA Match (GPTMTAMATCHR), offset 0x030

This register is used in 32-bit Real-Time Clock mode and 16-bit PWM and Input Edge Count modes.

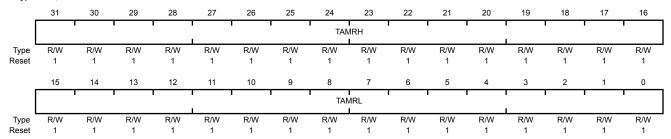

#### GPTM TimerA Match (GPTMTAMATCHR)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x030

Bit/Field

Type R/W, reset 0xFFFF.FFF

Description

31:16 TAMRH R/W 0xFFFF GPTM TimerA Match Register High

Type

Reset

When configured for 32-bit Real-Time Clock (RTC) mode via the **GPTMCFG** register, this value is compared to the upper half of **GPTMTAR**, to determine match events.

In 16-bit mode, this field reads as 0 and does not have an effect on the state of **GPTMTBMATCHR**.

15:0 TAMRL R/W 0xFFFF

Name

**GPTM TimerA Match Register Low** 

When configured for 32-bit Real-Time Clock (RTC) mode via the **GPTMCFG** register, this value is compared to the lower half of **GPTMTAR**, to determine match events.

When configured for PWM mode, this value along with **GPTMTAILR**, determines the duty cycle of the output PWM signal.

When configured for Edge Count mode, this value along with **GPTMTAILR**, determines how many edge events are counted. The total number of edge events counted is equal to the value in **GPTMTAILR** minus this value.

### Register 12: GPTM TimerB Match (GPTMTBMATCHR), offset 0x034

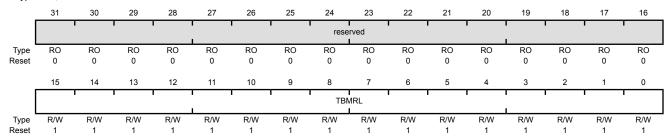

This register is used in 16-bit PWM and Input Edge Count modes.

#### GPTM TimerB Match (GPTMTBMATCHR)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x034

Type R/W, reset 0x0000.FFFF

Bit/Field	Name	Туре	Reset	Description
31:16	reserved	RO	0x0000	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
15:0	TBMRL	R/W	0xFFFF	GPTM TimerB Match Register Low

When configured for DWM made, this value clong with

When configured for PWM mode, this value along with  $\ensuremath{\mathbf{GPTMTBILR}}$  , determines the duty cycle of the output PWM signal.

When configured for Edge Count mode, this value along with **GPTMTBILR**, determines how many edge events are counted. The total number of edge events counted is equal to the value in **GPTMTBILR** minus this value.

### Register 13: GPTM TimerA Prescale (GPTMTAPR), offset 0x038

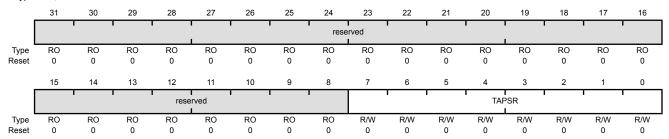

This register allows software to extend the range of the 16-bit timers when operating in one-shot or periodic mode.

#### GPTM TimerA Prescale (GPTMTAPR)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x038

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	TAPSR	R/W	0x00	GPTM TimerA Prescale

The register loads this value on a write. A read returns the current value of the register.

Refer to Table 10-2 on page 210 for more details and an example.

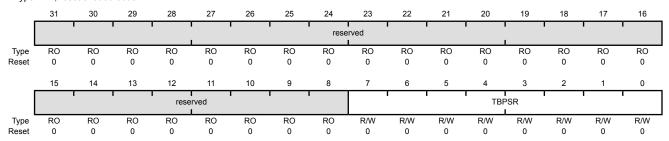

### Register 14: GPTM TimerB Prescale (GPTMTBPR), offset 0x03C

This register allows software to extend the range of the 16-bit timers when operating in one-shot or periodic mode.

#### GPTM TimerB Prescale (GPTMTBPR)

Timer0 base: 0x4003.0000
Timer1 base: 0x4003.1000
Timer2 base: 0x4003.2000
Timer3 base: 0x4003.3000
Offset 0x03C

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	TBPSR	R/W	0x00	GPTM TimerB Prescale

The register loads this value on a write. A read returns the current value of this register.

Refer to Table 10-2 on page 210 for more details and an example.

## Register 15: GPTM TimerA Prescale Match (GPTMTAPMR), offset 0x040

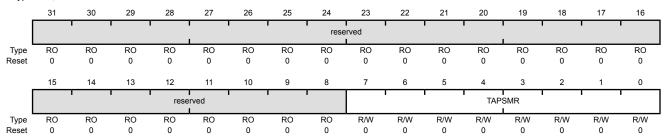

This register effectively extends the range of **GPTMTAMATCHR** to 24 bits when operating in 16-bit one-shot or periodic mode.

#### GPTM TimerA Prescale Match (GPTMTAPMR)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x040

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	TAPSMR	R/W	0x00	GPTM TimerA Prescale Match

This value is used alongside **GPTMTAMATCHR** to detect timer match events while using a prescaler.

## Register 16: GPTM TimerB Prescale Match (GPTMTBPMR), offset 0x044

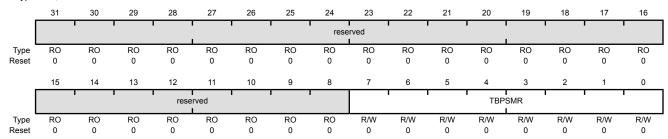

This register effectively extends the range of GPTMTBMATCHR to 24 bits when operating in 16-bit one-shot or periodic mode.

#### GPTM TimerB Prescale Match (GPTMTBPMR)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x044

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	TBPSMR	R/W	0x00	GPTM TimerB Prescale Match

This value is used alongside **GPTMTBMATCHR** to detect timer match events while using a prescaler.

### Register 17: GPTM TimerA (GPTMTAR), offset 0x048

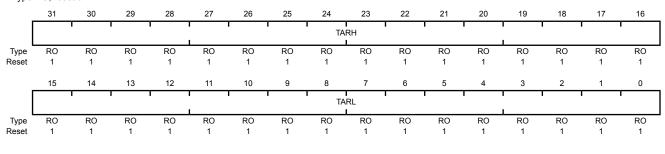

This register shows the current value of the TimerA counter in all cases except for Input Edge Count mode. When in this mode, this register contains the time at which the last edge event took place.

#### **GPTM TimerA (GPTMTAR)**

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x048

Type RO, reset 0xFFFF.FFF

Bit/Field	Name	Type	Reset	Description
31:16	TARH	RO	0xFFFF	GPTM TimerA Register High
				If the <b>GPTMCFG</b> is in a 32-bit mode, TimerB value is read. If the <b>GPTMCFG</b> is in a 16-bit mode, this is read as zero.
15:0	TARL	RO	0xFFFF	GPTM TimerA Register Low

A read returns the current value of the **GPTM TimerA Count Register**, except in Input Edge Count mode, when it returns the timestamp from the last edge event.

### Register 18: GPTM TimerB (GPTMTBR), offset 0x04C

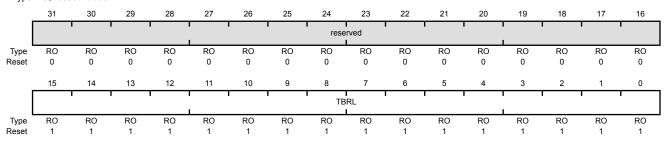

This register shows the current value of the TimerB counter in all cases except for Input Edge Count mode. When in this mode, this register contains the time at which the last edge event took place.

#### GPTM TimerB (GPTMTBR)

Timer0 base: 0x4003.0000 Timer1 base: 0x4003.1000 Timer2 base: 0x4003.2000 Timer3 base: 0x4003.3000

Offset 0x04C

Type RO, reset 0x0000.FFFF

Bit/Field	Name	Type	Reset	Description
31:16	reserved	RO	0x0000	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
15:0	TBRL	RO	0xFFFF	GPTM TimerB

A read returns the current value of the **GPTM TimerB Count Register**, except in Input Edge Count mode, when it returns the timestamp from the last edge event.

# 11 Watchdog Timer

A watchdog timer can generate nonmaskable interrupts (NMIs) or a reset when a time-out value is reached. The watchdog timer is used to regain control when a system has failed due to a software error or due to the failure of an external device to respond in the expected way.

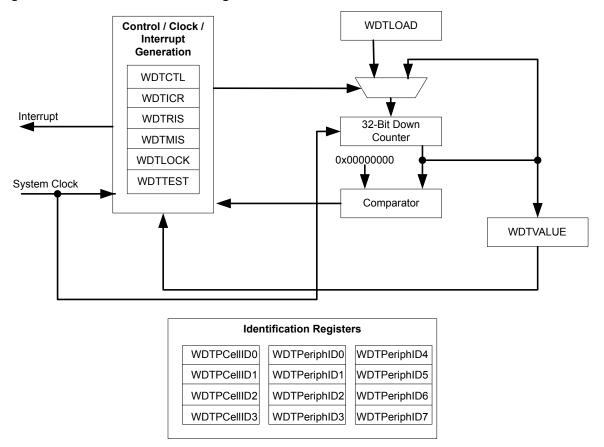

The Stellaris® Watchdog Timer module has the following features:

- 32-bit down counter with a programmable load register
- Separate watchdog clock with an enable
- Programmable interrupt generation logic with interrupt masking
- Lock register protection from runaway software
- Reset generation logic with an enable/disable
- User-enabled stalling when the controller asserts the CPU Halt flag during debug

The Watchdog Timer can be configured to generate an interrupt to the controller on its first time-out, and to generate a reset signal on its second time-out. Once the Watchdog Timer has been configured, the lock register can be written to prevent the timer configuration from being inadvertently altered.

## 11.1 Block Diagram

Figure 11-1. WDT Module Block Diagram

# 11.2 Functional Description

The Watchdog Timer module generates the first time-out signal when the 32-bit counter reaches the zero state after being enabled; enabling the counter also enables the watchdog timer interrupt. After the first time-out event, the 32-bit counter is re-loaded with the value of the **Watchdog Timer Load (WDTLOAD)** register, and the timer resumes counting down from that value. Once the Watchdog Timer has been configured, the **Watchdog Timer Lock (WDTLOCK)** register is written, which prevents the timer configuration from being inadvertently altered by software.

If the timer counts down to its zero state again before the first time-out interrupt is cleared, and the reset signal has been enabled (via the WatchdogResetEnable function), the Watchdog timer asserts its reset signal to the system. If the interrupt is cleared before the 32-bit counter reaches its second time-out, the 32-bit counter is loaded with the value in the **WDTLOAD** register, and counting resumes from that value.

If **WDTLOAD** is written with a new value while the Watchdog Timer counter is counting, then the counter is loaded with the new value and continues counting.

Writing to **WDTLOAD** does not clear an active interrupt. An interrupt must be specifically cleared by writing to the **Watchdog Interrupt Clear (WDTICR)** register.

The Watchdog module interrupt and reset generation can be enabled or disabled as required. When the interrupt is re-enabled, the 32-bit counter is preloaded with the load register value and not its last state.

## 11.3 Initialization and Configuration

To use the WDT, its peripheral clock must be enabled by setting the WDT bit in the **RCGC0** register. The Watchdog Timer is configured using the following sequence:

- 1. Load the WDTLOAD register with the desired timer load value.
- 2. If the Watchdog is configured to trigger system resets, set the RESEN bit in the WDTCTL register.
- 3. Set the INTEN bit in the WDTCTL register to enable the Watchdog and lock the control register.

If software requires that all of the watchdog registers are locked, the Watchdog Timer module can be fully locked by writing any value to the **WDTLOCK** register. To unlock the Watchdog Timer, write a value of 0x1ACC.E551.

## 11.4 Register Map

Table 11-1 on page 244 lists the Watchdog registers. The offset listed is a hexadecimal increment to the register's address, relative to the Watchdog Timer base address of 0x4000.0000.

Table 11-1. Watchdog Timer Register Map

Offset	Name	Туре	Reset	Description	See page
0x000	WDTLOAD	R/W	0xFFFF.FFFF	Watchdog Load	246
0x004	WDTVALUE	RO	0xFFFF.FFFF	Watchdog Value	247

# 11.5 Register Descriptions

The remainder of this section lists and describes the WDT registers, in numerical order by address offset.

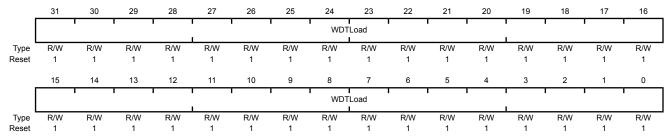

## Register 1: Watchdog Load (WDTLOAD), offset 0x000

This register is the 32-bit interval value used by the 32-bit counter. When this register is written, the value is immediately loaded and the counter restarts counting down from the new value. If the **WDTLOAD** register is loaded with 0x0000.0000, an interrupt is immediately generated.

#### Watchdog Load (WDTLOAD)

Base 0x4000.0000

Offset 0x000 Type R/W, reset 0xFFFF.FFF

Bit/Field Description Name Type Reset 31:0 WDTLoad R/W 0xFFFF.FFFF Watchdog Load Value

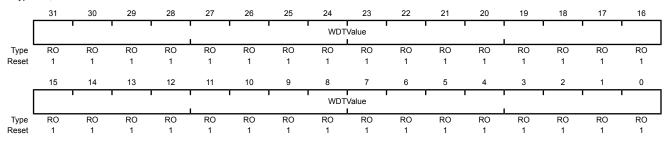

## Register 2: Watchdog Value (WDTVALUE), offset 0x004

This register contains the current count value of the timer.

Watchdog Value (WDTVALUE)

Base 0x4000.0000 Offset 0x004

Type RO, reset 0xFFFF.FFF

Bit/Field Name Type Reset Description

31:0 WDTValue RO 0xFFF.FFFF Watchdog Value

Current value of the 32-bit down counter.

## Register 3: Watchdog Control (WDTCTL), offset 0x008

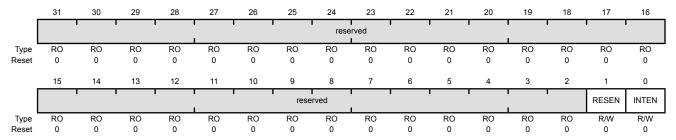

This register is the watchdog control register. The watchdog timer can be configured to generate a reset signal (on second time-out) or an interrupt on time-out.

When the watchdog interrupt has been enabled, all subsequent writes to the control register are ignored. The only mechanism that can re-enable writes is a hardware reset.

#### Watchdog Control (WDTCTL)

Base 0x4000.0000 Offset 0x008

Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:2	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	RESEN	R/W	0	Watchdog Reset Enable The RESEN values are defined as follows:
				Value Description
				0 Disabled.
				1 Enable the Watchdog module reset output.
0	INTEN	R/W	0	Watchdog Interrupt Enable

#### Value Description

The INTEN values are defined as follows:

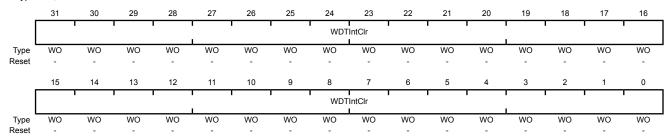

- 0 Interrupt event disabled (once this bit is set, it can only be cleared by a hardware reset).
- 1 Interrupt event enabled. Once enabled, all writes are ignored.

## Register 4: Watchdog Interrupt Clear (WDTICR), offset 0x00C

This register is the interrupt clear register. A write of any value to this register clears the Watchdog interrupt and reloads the 32-bit counter from the **WDTLOAD** register. Value for a read or reset is indeterminate.

Watchdog Interrupt Clear (WDTICR)

Base 0x4000.0000 Offset 0x00C Type WO, reset -

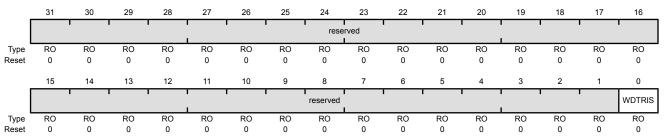

Bit/Field	Name	Type	Reset	Description
31:0	WDTIntClr	WO	-	Watchdog Interrupt Clear

### Register 5: Watchdog Raw Interrupt Status (WDTRIS), offset 0x010

This register is the raw interrupt status register. Watchdog interrupt events can be monitored via this register if the controller interrupt is masked.

#### Watchdog Raw Interrupt Status (WDTRIS)

Base 0x4000.0000 Offset 0x010 Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:1	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
0	WDTRIS	RO	0	Watchdog Raw Interrupt Status

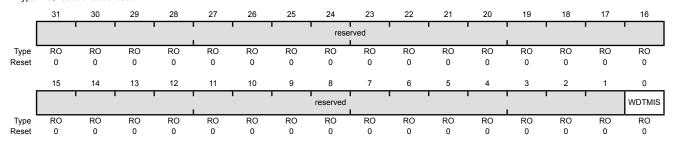

Gives the raw interrupt state (prior to masking) of WDTINTR.

## Register 6: Watchdog Masked Interrupt Status (WDTMIS), offset 0x014

This register is the masked interrupt status register. The value of this register is the logical AND of the raw interrupt bit and the Watchdog interrupt enable bit.

Watchdog Masked Interrupt Status (WDTMIS)

Base 0x4000.0000 Offset 0x014 Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:1	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
0	WDTMIS	RO	0	Watchdog Masked Interrupt Status

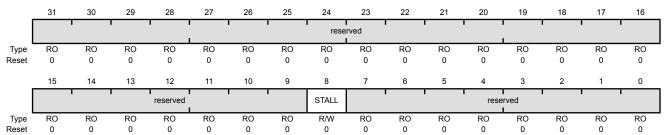

Gives the masked interrupt state (after masking) of the WDTINTR interrupt.

## Register 7: Watchdog Test (WDTTEST), offset 0x418

This register provides user-enabled stalling when the microcontroller asserts the CPU halt flag during debug.

### Watchdog Test (WDTTEST)

Base 0x4000.0000 Offset 0x418 Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:9	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
8	STALL	R/W	0	Watchdog Stall Enable
				When set to 1, if the Stellaris <sup>®</sup> microcontroller is stopped with a debugger, the watchdog timer stops counting. Once the microcontroller is restarted, the watchdog timer resumes counting.
7:0	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

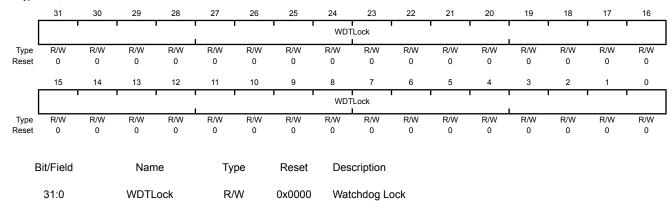

# Register 8: Watchdog Lock (WDTLOCK), offset 0xC00

Writing 0x1ACC.E551 to the **WDTLOCK** register enables write access to all other registers. Writing any other value to the **WDTLOCK** register re-enables the locked state for register writes to all the other registers. Reading the **WDTLOCK** register returns the lock status rather than the 32-bit value written. Therefore, when write accesses are disabled, reading the **WDTLOCK** register returns 0x0000.0001 (when locked; otherwise, the returned value is 0x0000.0000 (unlocked)).

#### Watchdog Lock (WDTLOCK)

Base 0x4000.0000 Offset 0xC00

Type R/W, reset 0x0000.0000

A write of the value 0x1ACC.E551 unlocks the watchdog registers for write access. A write of any other value reapplies the lock, preventing any register updates.

A read of this register returns the following values:

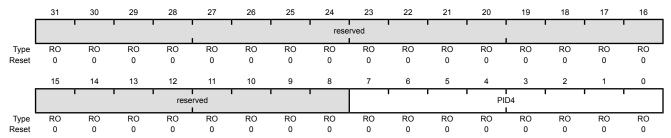

Value Description
0x0000.0001 Locked
0x0000.0000 Unlocked

# Register 9: Watchdog Peripheral Identification 4 (WDTPeriphID4), offset 0xFD0

The WDTPeriphIDn registers are hard-coded and the fields within the register determine the reset value.

Watchdog Peripheral Identification 4 (WDTPeriphID4)

Base 0x4000.0000 Offset 0xFD0 Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	PID4	RO	0x00	WDT Peripheral ID Register[7:0]

# Register 10: Watchdog Peripheral Identification 5 (WDTPeriphID5), offset 0xFD4

The **WDTPeriphIDn** registers are hard-coded and the fields within the register determine the reset value.

# 12 Universal Asynchronous Receivers/Transmitters (UARTs)

Each Stellaris® Universal Asynchronous Receiver/Transmitter (UART) has the following features:

- Three fully programmable 16C550-type UARTs with IrDA support
- Separate 16x8 transmit (TX) and receive (RX) FIFOs to reduce CPU interrupt service loading
- Programmable baud-rate generator allowing speeds up to 3.125 Mbps
- Programmable FIFO length, including 1-byte deep operation providing conventional double-buffered interface
- FIFO trigger levels of 1/8, 1/4, 1/2, 3/4, and 7/8
- Standard asynchronous communication bits for start, stop, and parity
- False-start bit detection
- Line-break generation and detection
- Fully programmable serial interface characteristics
  - 5, 6, 7, or 8 data bits
  - Even, odd, stick, or no-parity bit generation/detection
  - 1 or 2 stop bit generation
- IrDA serial-IR (SIR) encoder/decoder providing
  - Programmable use of IrDA Serial Infrared (SIR) or UART input/output
  - Support of IrDA SIR encoder/decoder functions for data rates up to 115.2 Kbps half-duplex
  - Support of normal 3/16 and low-power (1.41-2.23 μs) bit durations
  - Programmable internal clock generator enabling division of reference clock by 1 to 256 for low-power mode bit duration

# 12.1 Block Diagram

Figure 12-1. UART Module Block Diagram

# 12.2 Functional Description

Each Stellaris<sup>®</sup> UART performs the functions of parallel-to-serial and serial-to-parallel conversions. It is similar in functionality to a 16C550 UART, but is not register compatible.

The UART is configured for transmit and/or receive via the TXE and RXE bits of the **UART Control** (**UARTCTL**) register (see page 285). Transmit and receive are both enabled out of reset. Before any control registers are programmed, the UART must be disabled by clearing the UARTEN bit in **UARTCTL**. If the UART is disabled during a TX or RX operation, the current transaction is completed prior to the UART stopping.

The UART peripheral also includes a serial IR (SIR) encoder/decoder block that can be connected to an infrared transceiver to implement an IrDA SIR physical layer. The SIR function is programmed using the UARTCTL register.

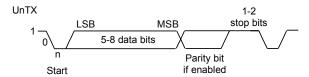

#### 12.2.1 Transmit/Receive Logic

The transmit logic performs parallel-to-serial conversion on the data read from the transmit FIFO. The control logic outputs the serial bit stream beginning with a start bit, and followed by the data

bits (LSB first), parity bit, and the stop bits according to the programmed configuration in the control registers. See Figure 12-2 on page 268 for details.

The receive logic performs serial-to-parallel conversion on the received bit stream after a valid start pulse has been detected. Overrun, parity, frame error checking, and line-break detection are also performed, and their status accompanies the data that is written to the receive FIFO.

Figure 12-2. UART Character Frame

#### 12.2.2 Baud-Rate Generation

The baud-rate divisor is a 22-bit number consisting of a 16-bit integer and a 6-bit fractional part. The number formed by these two values is used by the baud-rate generator to determine the bit period. Having a fractional baud-rate divider allows the UART to generate all the standard baud rates.

The 16-bit integer is loaded through the **UART Integer Baud-Rate Divisor (UARTIBRD)** register (see page 281) and the 6-bit fractional part is loaded with the **UART Fractional Baud-Rate Divisor (UARTFBRD)** register (see page 282). The baud-rate divisor (BRD) has the following relationship to the system clock (where *BRDI* is the integer part of the BRD and *BRDF* is the fractional part, separated by a decimal place.)

```
BRD = BRDI + BRDF = UARTSysClk / (16 * Baud Rate)
```

where UARTSysClk is the system clock connected to the UART.

The 6-bit fractional number (that is to be loaded into the DIVFRAC bit field in the **UARTFBRD** register) can be calculated by taking the fractional part of the baud-rate divisor, multiplying it by 64, and adding 0.5 to account for rounding errors:

```
UARTFBRD[DIVFRAC] = integer(BRDF * 64 + 0.5)
```

The UART generates an internal baud-rate reference clock at 16x the baud-rate (referred to as Baud16). This reference clock is divided by 16 to generate the transmit clock, and is used for error detection during receive operations.

Along with the **UART Line Control**, **High Byte (UARTLCRH)** register (see page 283), the **UARTIBRD** and **UARTFBRD** registers form an internal 30-bit register. This internal register is only updated when a write operation to **UARTLCRH** is performed, so any changes to the baud-rate divisor must be followed by a write to the **UARTLCRH** register for the changes to take effect.

To update the baud-rate registers, there are four possible sequences:

- UARTIBRD write, UARTFBRD write, and UARTLCRH write
- UARTFBRD write, UARTIBRD write, and UARTLCRH write
- UARTIBRD write and UARTLCRH write
- UARTFBRD write and UARTLCRH write

#### 12.2.3 Data Transmission

Data received or transmitted is stored in two 16-byte FIFOs, though the receive FIFO has an extra four bits per character for status information. For transmission, data is written into the transmit FIFO. If the UART is enabled, it causes a data frame to start transmitting with the parameters indicated in the **UARTLCRH** register. Data continues to be transmitted until there is no data left in the transmit FIFO. The BUSY bit in the **UART Flag (UARTFR)** register (see page 278) is asserted as soon as data is written to the transmit FIFO (that is, if the FIFO is non-empty) and remains asserted while data is being transmitted. The BUSY bit is negated only when the transmit FIFO is empty, and the last character has been transmitted from the shift register, including the stop bits. The UART can indicate that it is busy even though the UART may no longer be enabled.

When the receiver is idle (the UnRx is continuously 1) and the data input goes Low (a start bit has been received), the receive counter begins running and data is sampled on the eighth cycle of Baud16 (described in "Transmit/Receive Logic" on page 267).

The start bit is valid if UnRx is still low on the eighth cycle of Baud16, otherwise a false start bit is detected and it is ignored. Start bit errors can be viewed in the **UART Receive Status (UARTRSR)** register (see page 276). If the start bit was valid, successive data bits are sampled on every 16th cycle of Baud16 (that is, one bit period later) according to the programmed length of the data characters. The parity bit is then checked if parity mode was enabled. Data length and parity are defined in the **UARTLCRH** register.

Lastly, a valid stop bit is confirmed if UnRx is High, otherwise a framing error has occurred. When a full word is received, the data is stored in the receive FIFO, with any error bits associated with that word.

#### **12.2.4** Serial IR (SIR)

The UART peripheral includes an IrDA serial-IR (SIR) encoder/decoder block. The IrDA SIR block provides functionality that converts between an asynchronous UART data stream, and half-duplex serial SIR interface. No analog processing is performed on-chip. The role of the SIR block is to provide a digital encoded output and decoded input to the UART. The UART signal pins can be connected to an infrared transceiver to implement an IrDA SIR physical layer link. The SIR block has two modes of operation:

- In normal IrDA mode, a zero logic level is transmitted as high pulse of 3/16th duration of the selected baud rate bit period on the output pin, while logic one levels are transmitted as a static LOW signal. These levels control the driver of an infrared transmitter, sending a pulse of light for each zero. On the reception side, the incoming light pulses energize the photo transistor base of the receiver, pulling its output LOW. This drives the UART input pin LOW.
- In low-power IrDA mode, the width of the transmitted infrared pulse is set to three times the period of the internally generated IrLPBaud16 signal (1.63 μs, assuming a nominal 1.8432 MHz frequency) by changing the appropriate bit in the **UARTCR** register. See page 280 for more information on IrDA low-power pulse-duration configuration.

Figure 12-3 on page 270 shows the UART transmit and receive signals, with and without IrDA modulation.

UnTx with IrDA

UnRx with IrDA

Figure 12-3. IrDA Data Modulation

In both normal and low-power IrDA modes:

- During transmission, the UART data bit is used as the base for encoding
- During reception, the decoded bits are transferred to the UART receive logic

The IrDA SIR physical layer specifies a half-duplex communication link, with a minimum 10 ms delay between transmission and reception. This delay must be generated by software because it is not automatically supported by the UART. The delay is required because the infrared receiver electronics might become biased, or even saturated from the optical power coupled from the adjacent transmitter LED. This delay is known as latency, or receiver setup time.

If the application does not require the use of the UnRx signal, the GPIO pin that has the UnRx signal as an alternate function must be configured as the UnRx signal and pulled High.

#### 12.2.5 FIFO Operation

The UART has two 16-entry FIFOs; one for transmit and one for receive. Both FIFOs are accessed via the **UART Data (UARTDR)** register (see page 274). Read operations of the **UARTDR** register return a 12-bit value consisting of 8 data bits and 4 error flags while write operations place 8-bit data in the transmit FIFO.

Out of reset, both FIFOs are disabled and act as 1-byte-deep holding registers. The FIFOs are enabled by setting the FEN bit in **UARTLCRH** (page 283).

FIFO status can be monitored via the **UART Flag (UARTFR)** register (see page 278) and the **UART Receive Status (UARTRSR)** register. Hardware monitors empty, full and overrun conditions. The **UARTFR** register contains empty and full flags (TXFE, TXFF, RXFE, and RXFF bits) and the **UARTRSR** register shows overrun status via the OE bit.

The trigger points at which the FIFOs generate interrupts is controlled via the **UART Interrupt FIFO Level Select (UARTIFLS)** register (see page 287). Both FIFOs can be individually configured to trigger interrupts at different levels. Available configurations include 1/8, ½, ½, ¾, and 7/8. For example, if the ¼ option is selected for the receive FIFO, the UART generates a receive interrupt after 4 data bytes are received. Out of reset, both FIFOs are configured to trigger an interrupt at the ½ mark.

#### 12.2.6 Interrupts

The UART can generate interrupts when the following conditions are observed:

- Overrun Error
- Break Error
- Parity Error
- Framing Error
- Receive Timeout
- Transmit (when condition defined in the TXIFLSEL bit in the UARTIFLS register is met)
- Receive (when condition defined in the RXIFLSEL bit in the **UARTIFLS** register is met)

All of the interrupt events are ORed together before being sent to the interrupt controller, so the UART can only generate a single interrupt request to the controller at any given time. Software can service multiple interrupt events in a single interrupt service routine by reading the **UART Masked Interrupt Status (UARTMIS)** register (see page 292).

The interrupt events that can trigger a controller-level interrupt are defined in the **UART Interrupt Mask (UARTIM**) register (see page 289) by setting the corresponding IM bit to 1. If interrupts are not used, the raw interrupt status is always visible via the **UART Raw Interrupt Status (UARTRIS)** register (see page 291).

Interrupts are always cleared (for both the **UARTMIS** and **UARTRIS** registers) by setting the corresponding bit in the **UART Interrupt Clear (UARTICR)** register (see page 293).

The receive timeout interrupt is asserted when the receive FIFO is not empty, and no further data is received over a 32-bit period. The receive timeout interrupt is cleared either when the FIFO becomes empty through reading all the data (or by reading the holding register), or when a 1 is written to the corresponding bit in the **UARTICR** register.

#### 12.2.7 Loopback Operation

The UART can be placed into an internal loopback mode for diagnostic or debug work. This is accomplished by setting the LBE bit in the **UARTCTL** register (see page 285). In loopback mode, data transmitted on UnTx is received on the UnRx input.

#### 12.2.8 IrDA SIR block

The IrDA SIR block contains an IrDA serial IR (SIR) protocol encoder/decoder. When enabled, the SIR block uses the  $\mathtt{UnTx}$  and  $\mathtt{UnRx}$  pins for the SIR protocol, which should be connected to an IR transceiver.

The SIR block can receive and transmit, but it is only half-duplex so it cannot do both at the same time. Transmission must be stopped before data can be received. The IrDA SIR physical layer specifies a minimum 10-ms delay between transmission and reception.

# 12.3 Initialization and Configuration

To use the UARTs, the peripheral clock must be enabled by setting the <code>UART0</code>, <code>UART1</code>, or <code>UART2</code> bits in the **RCGC1** register.

This section discusses the steps that are required to use a UART module. For this example, the UART clock is assumed to be 20 MHz and the desired UART configuration is:

■ 115200 baud rate

- Data length of 8 bits
- One stop bit
- No parity
- FIFOs disabled
- No interrupts

The first thing to consider when programming the UART is the baud-rate divisor (BRD), since the **UARTIBRD** and **UARTFBRD** registers must be written before the **UARTLCRH** register. Using the equation described in "Baud-Rate Generation" on page 268, the BRD can be calculated:

```
BRD = 20,000,000 / (16 * 115,200) = 10.8507
```

which means that the DIVINT field of the **UARTIBRD** register (see page 281) should be set to 10. The value to be loaded into the **UARTFBRD** register (see page 282) is calculated by the equation:

```
UARTFBRD[DIVFRAC] = integer(0.8507 * 64 + 0.5) = 54
```

With the BRD values in hand, the UART configuration is written to the module in the following order:

- 1. Disable the UART by clearing the UARTEN bit in the **UARTCTL** register.
- 2. Write the integer portion of the BRD to the **UARTIBRD** register.
- **3.** Write the fractional portion of the BRD to the **UARTFBRD** register.
- **4.** Write the desired serial parameters to the **UARTLCRH** register (in this case, a value of 0x0000.0060).
- **5.** Enable the UART by setting the UARTEN bit in the **UARTCTL** register.

# 12.4 Register Map

Table 12-1 on page 272 lists the UART registers. The offset listed is a hexadecimal increment to the register's address, relative to that UART's base address:

UART0: 0x4000.C000UART1: 0x4000.D000UART2: 0x4000.E000

**Note:** The UART must be disabled (see the UARTEN bit in the **UARTCTL** register on page 285) before any of the control registers are reprogrammed. When the UART is disabled during a TX or RX operation, the current transaction is completed prior to the UART stopping.

Table 12-1. UART Register Map

# 12.5 Register Descriptions

The remainder of this section lists and describes the UART registers, in numerical order by address offset.

## Register 1: UART Data (UARTDR), offset 0x000

**Important:** Use caution when reading this register. Performing a read may change bit status.

This register is the data register (the interface to the FIFOs).

When FIFOs are enabled, data written to this location is pushed onto the transmit FIFO. If FIFOs are disabled, data is stored in the transmitter holding register (the bottom word of the transmit FIFO). A write to this register initiates a transmission from the UART.

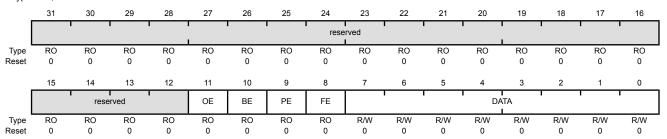

For received data, if the FIFO is enabled, the data byte and the 4-bit status (break, frame, parity, and overrun) is pushed onto the 12-bit wide receive FIFO. If FIFOs are disabled, the data byte and status are stored in the receiving holding register (the bottom word of the receive FIFO). The received data can be retrieved by reading this register.

#### UART Data (UARTDR)

UART0 base: 0x4000.C000 UART1 base: 0x4000.D000 UART2 base: 0x4000.E000

Offset 0x000

Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:12	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
11	OE	RO	0	UART Overrun Error  The OE values are defined as follows:  Value Description  0 There has been no data loss due to a FIFO overrun.  1 New data was received when the FIFO was full, resulting in data loss.
10	BE	RO	0	UART Break Error

This bit is set to 1 when a break condition is detected, indicating that the receive data input was held Low for longer than a full-word transmission time (defined as start, data, parity, and stop bits).

In FIFO mode, this error is associated with the character at the top of the FIFO. When a break occurs, only one 0 character is loaded into the FIFO. The next character is only enabled after the received data input goes to a 1 (marking state) and the next valid start bit is received.

Bit/Field	Name	Type	Reset	Description
9	PE	RO	0	UART Parity Error
				This bit is set to 1 when the parity of the received data character does not match the parity defined by bits 2 and 7 of the <b>UARTLCRH</b> register.
				In FIFO mode, this error is associated with the character at the top of the FIFO.
8	FE	RO	0	UART Framing Error
				This bit is set to 1 when the received character does not have a valid stop bit (a valid stop bit is 1).
7:0	DATA	R/W	0	Data Transmitted or Received
				When written, the data that is to be transmitted via the UART. When read, the data that was received by the UART.

# Register 2: UART Receive Status/Error Clear (UARTRSR/UARTECR), offset 0x004

The UARTRSR/UARTECR register is the receive status register/error clear register.

In addition to the **UARTDR** register, receive status can also be read from the **UARTRSR** register. If the status is read from this register, then the status information corresponds to the entry read from **UARTDR** prior to reading **UARTRSR**. The status information for overrun is set immediately when an overrun condition occurs.

The **UARTRSR** register cannot be written.

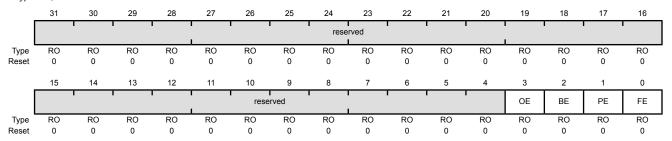

A write of any value to the **UARTECR** register clears the framing, parity, break, and overrun errors. All the bits are cleared to 0 on reset.

#### Reads

UART Receive Status/Error Clear (UARTRSR/UARTECR)

UART0 base: 0x4000.C000 UART1 base: 0x4000.D000 UART2 base: 0x4000.E000 Offset 0x004

Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:4	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
3	OE	RO	0	UART Overrun Error
				When this bit is set to 1, data is received and the FIFO is already full. This bit is cleared to 0 by a write to <b>UARTECR</b> .
				The FIFO contents remain valid since no further data is written when the FIFO is full, only the contents of the shift register are overwritten. The CPU must now read the data in order to empty the FIFO.
2	BE	RO	0	UART Break Error

This bit is set to 1 when a break condition is detected, indicating that the received data input was held Low for longer than a full-word transmission time (defined as start, data, parity, and stop bits).

This bit is cleared to 0 by a write to **UARTECR**.

In FIFO mode, this error is associated with the character at the top of the FIFO. When a break occurs, only one 0 character is loaded into the FIFO. The next character is only enabled after the receive data input goes to a 1 (marking state) and the next valid start bit is received.

Bit/Field	Name	Type	Reset	Description
1	PE	RO	0	UART Parity Error
				This bit is set to 1 when the parity of the received data character does not match the parity defined by bits 2 and 7 of the <b>UARTLCRH</b> register.
				This bit is cleared to 0 by a write to <b>UARTECR</b> .
0	FE	RO	0	UART Framing Error
				This bit is set to 1 when the received character does not have a valid stop bit (a valid stop bit is 1).

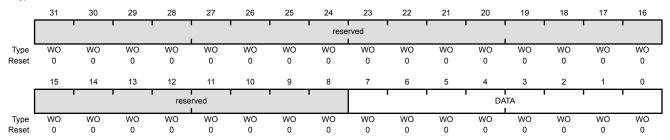

This bit is cleared to 0 by a write to **UARTECR**.

In FIFO mode, this error is associated with the character at the top of the FIFO.

#### Writes

UART Receive Status/Error Clear (UARTRSR/UARTECR)

UART0 base: 0x4000.C000 UART1 base: 0x4000.D000 UART2 base: 0x4000.E000 Offset 0x004 Type WO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	WO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	DATA	WO	0	Error Clear

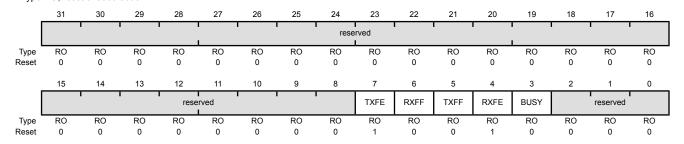

A write to this register of any data clears the framing, parity, break, and overrun flags.

# Register 3: UART Flag (UARTFR), offset 0x018

The **UARTFR** register is the flag register. After reset, the TXFF, RXFF, and BUSY bits are 0, and TXFE and RXFE bits are 1.

#### **UART Flag (UARTFR)**

UART0 base: 0x4000.C000 UART1 base: 0x4000.D000 UART2 base: 0x4000.E000 Offset 0x018 Type RO, reset 0x0000.0090

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7	TXFE	RO	1	UART Transmit FIFO Empty
				The meaning of this bit depends on the state of the ${\tt FEN}$ bit in the ${\tt UARTLCRH}$ register.
				If the FIFO is disabled (FEN is 0), this bit is set when the transmit holding register is empty.
				If the FIFO is enabled (FEN is 1), this bit is set when the transmit FIFO is empty.
6	RXFF	RO	0	UART Receive FIFO Full
				The meaning of this bit depends on the state of the ${\tt FEN}$ bit in the ${\tt UARTLCRH}$ register.
				If the FIFO is disabled, this bit is set when the receive holding register is full.
				If the FIFO is enabled, this bit is set when the receive FIFO is full.
5	TXFF	RO	0	UART Transmit FIFO Full
				The meaning of this bit depends on the state of the ${\tt FEN}$ bit in the ${\tt UARTLCRH}$ register.

If the FIFO is enabled, this bit is set when the transmit FIFO is full.

If the FIFO is disabled, this bit is set when the transmit holding register

Bit/Field	Name	Туре	Reset	Description
4	RXFE	RO	1	UART Receive FIFO Empty
				The meaning of this bit depends on the state of the ${\tt FEN}$ bit in the ${\tt UARTLCRH}$ register.
				If the FIFO is disabled, this bit is set when the receive holding register is empty.
				If the FIFO is enabled, this bit is set when the receive FIFO is empty.
3	BUSY	RO	0	UART Busy
				When this bit is 1, the UART is busy transmitting data. This bit remains set until the complete byte, including all stop bits, has been sent from the shift register.
				This bit is set as soon as the transmit FIFO becomes non-empty (regardless of whether UART is enabled).
2:0	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

#### Register 4: UART IrDA Low-Power Register (UARTILPR), offset 0x020

The **UARTILPR** register is an 8-bit read/write register that stores the low-power counter divisor value used to derive the low-power SIR pulse width clock by dividing down the system clock (SysClk). All the bits are cleared to 0 when reset.

The internal IrlpBaud16 clock is generated by dividing down SysClk according to the low-power divisor value written to **UARTILPR**. The duration of SIR pulses generated when low-power mode is enabled is three times the period of the IrlpBaud16 clock. The low-power divisor value is calculated as follows:

ILPDVSR = SysClk / F<sub>IrLPBaud16</sub>

where  $F_{IrLPBaud16}$  is nominally 1.8432 MHz.

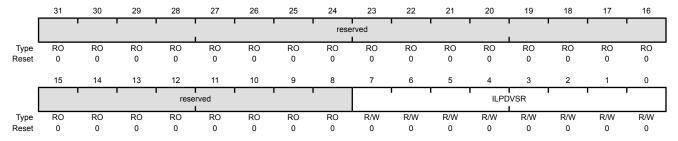

You must choose the divisor so that  $1.42\,\mathrm{MHz} < \mathrm{F}_{\mathtt{IrlPBaud16}} < 2.12\,\mathrm{MHz}$ , which results in a low-power pulse duration of  $1.41-2.11\,\mu s$  (three times the period of  $\mathtt{IrlPBaud16}$ ). The minimum frequency of  $\mathtt{IrlPBaud16}$  ensures that pulses less than one period of  $\mathtt{IrlPBaud16}$  are rejected, but that pulses greater than  $1.4\,\mu s$  are accepted as valid pulses.

**Note:** Zero is an illegal value. Programming a zero value results in no IrLPBaud16 pulses being generated.

#### UART IrDA Low-Power Register (UARTILPR)

UART0 base: 0x4000.C000 UART1 base: 0x4000.D000 UART2 base: 0x4000.E000 Offset 0x020

Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:8	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	ILPDVSR	R/W	0x00	IrDA Low-Power Divisor

This is an 8-bit low-power divisor value.

# Register 5: UART Integer Baud-Rate Divisor (UARTIBRD), offset 0x024

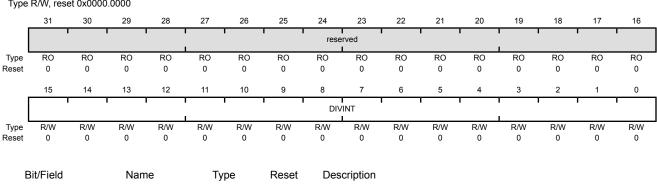

The **UARTIBRD** register is the integer part of the baud-rate divisor value. All the bits are cleared on reset. The minimum possible divide ratio is 1 (when UARTIBRD=0), in which case the UARTFBRD register is ignored. When changing the **UARTIBRD** register, the new value does not take effect until transmission/reception of the current character is complete. Any changes to the baud-rate divisor must be followed by a write to the **UARTLCRH** register. See "Baud-Rate Generation" on page 268 for configuration details.

#### UART Integer Baud-Rate Divisor (UARTIBRD)

UART0 base: 0x4000.C000 UART1 base: 0x4000.D000 UART2 base: 0x4000.E000

Offset 0x024

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:16	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
15:0	DIVINT	R/W	0x0000	Integer Baud-Rate Divisor

#### Register 6: UART Fractional Baud-Rate Divisor (UARTFBRD), offset 0x028

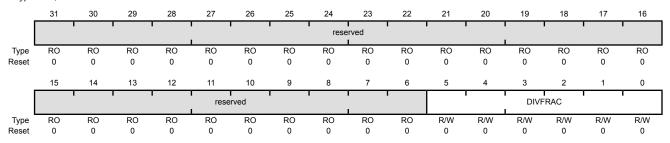

The **UARTFBRD** register is the fractional part of the baud-rate divisor value. All the bits are cleared on reset. When changing the **UARTFBRD** register, the new value does not take effect until transmission/reception of the current character is complete. Any changes to the baud-rate divisor must be followed by a write to the **UARTLCRH** register. See "Baud-Rate Generation" on page 268 for configuration details.

#### UART Fractional Baud-Rate Divisor (UARTFBRD)

UART0 base: 0x4000.C000 UART1 base: 0x4000.D000 UART2 base: 0x4000.E000

Offset 0x028

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:6	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
5:0	DIVFRAC	R/W	0x000	Fractional Baud-Rate Divisor

# Register 7: UART Line Control (UARTLCRH), offset 0x02C

The **UARTLCRH** register is the line control register. Serial parameters such as data length, parity, and stop bit selection are implemented in this register.

When updating the baud-rate divisor (**UARTIBRD** and/or **UARTIFRD**), the **UARTLCRH** register must also be written. The write strobe for the baud-rate divisor registers is tied to the **UARTLCRH** register.

#### UART Line Control (UARTLCRH)

UART0 base: 0x4000.C000 UART1 base: 0x4000.D000 UART2 base: 0x4000.E000 Offset 0x02C

Type R/W, reset 0x0000.0000

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit/Field	Name	Type	Reset	Description		
31:8	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.		
7	SPS	R/W	0	UART Stick Parity Select		
				When bits 1, 2, and 7 of <b>UARTLCRH</b> are set, the parity bit is transmitted and checked as a 0. When bits 1 and 7 are set and 2 is cleared, the parity bit is transmitted and checked as a 1.		
				When this bit is cleared, stick parity is disabled.		
6:5	WLEN	R/W	0	UART Word Length		
				The bits indicate the number of data bits transmitted or received in a frame as follows:		
				Value Description		
				0x3 8 bits		
				0x2 7 bits		
				0x1 6 bits		
				0x0 5 bits (default)		
4	FEN	R/W	0	UART Enable FIFOs		
				If this bit is set to 1, transmit and receive FIFO buffers are enabled (FIFO		

October 13, 2009 283

mode).

When cleared to 0, FIFOs are disabled (Character mode). The FIFOs

become 1-byte-deep holding registers.

Bit/Field	Name	Туре	Reset	Description
3	STP2	R/W	0	UART Two Stop Bits Select
				If this bit is set to 1, two stop bits are transmitted at the end of a frame. The receive logic does not check for two stop bits being received.
2	EPS	R/W	0	UART Even Parity Select
				If this bit is set to 1, even parity generation and checking is performed during transmission and reception, which checks for an even number of 1s in data and parity bits.
				When cleared to 0, then odd parity is performed, which checks for an odd number of 1s.
				This bit has no effect when parity is disabled by the ${\tt PEN}$ bit.
1	PEN	R/W	0	UART Parity Enable
				If this bit is set to 1, parity checking and generation is enabled; otherwise, parity is disabled and no parity bit is added to the data frame.
0	BRK	R/W	0	UART Send Break
				If this bit is set to 1, a Low level is continually output on the ${\tt UnTX}$ output, after completing transmission of the current character. For the proper execution of the break command, the software must set this bit for at least two frames (character periods). For normal use, this bit must be cleared to 0.

# Register 8: UART Control (UARTCTL), offset 0x030

The **UARTCTL** register is the control register. All the bits are cleared on reset except for the Transmit Enable (TXE) and Receive Enable (RXE) bits, which are set to 1.

To enable the UART module, the UARTEN bit must be set to 1. If software requires a configuration change in the module, the UARTEN bit must be cleared before the configuration changes are written. If the UART is disabled during a transmit or receive operation, the current transaction is completed prior to the UART stopping.

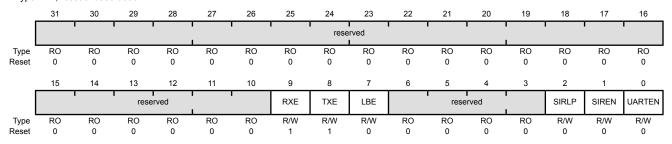

**Note:** The **UARTCTL** register should not be changed while the UART is enabled or else the results are unpredictable. The following sequence is recommended for making changes to the **UARTCTL** register.

- 1. Disable the UART.
- 2. Wait for the end of transmission or reception of the current character.
- 3. Flush the transmit FIFO by disabling bit 4 (FEN) in the line control register (UARTLCRH).
- **4.** Reprogram the control register.
- 5. Enable the UART.

#### **UART Control (UARTCTL)**

UART0 base: 0x4000.C000 UART1 base: 0x4000.D000 UART2 base: 0x4000.E000 Offset 0x030

Type R/W, reset 0x0000.0300

Bit/Field	Name	Type	Reset	Description
31:10	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
q	RXF	R/W	1	LIART Receive Enable

If this bit is set to 1, the receive section of the UART is enabled. When the UART is disabled in the middle of a receive, it completes the current character before stopping.

Note: To enable reception, the  $\mathtt{UARTEN}$  bit must also be set.

Bit/Field	Name	Туре	Reset	Description
8	TXE	R/W	1	UART Transmit Enable
				If this bit is set to 1, the transmit section of the UART is enabled. When the UART is disabled in the middle of a transmission, it completes the current character before stopping.
				<b>Note:</b> To enable transmission, the UARTEN bit must also be set.
7	LBE	R/W	0	UART Loop Back Enable
				If this bit is set to 1, the ${\tt UnTX}$ path is fed through the ${\tt UnRX}$ path.
6:3	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
2	SIRLP	R/W	0	UART SIR Low Power Mode
				This bit selects the IrDA encoding mode. If this bit is cleared to 0, low-level bits are transmitted as an active High pulse with a width of 3/16th of the bit period. If this bit is set to 1, low-level bits are transmitted with a pulse width which is 3 times the period of the IrlpBaud16 input signal, regardless of the selected bit rate. Setting this bit uses less power, but might reduce transmission distances. See page 280 for more information.
1	SIREN	R/W	0	UART SIR Enable
				If this bit is set to 1, the IrDA SIR block is enabled, and the UART will transmit and receive data using SIR protocol.
0	UARTEN	R/W	0	UART Enable
				If this bit is set to 1, the UART is enabled. When the UART is disabled in the middle of transmission or reception, it completes the current character before stopping.

# Register 9: UART Interrupt FIFO Level Select (UARTIFLS), offset 0x034

The **UARTIFLS** register is the interrupt FIFO level select register. You can use this register to define the FIFO level at which the TXRIS and RXRIS bits in the **UARTRIS** register are triggered.

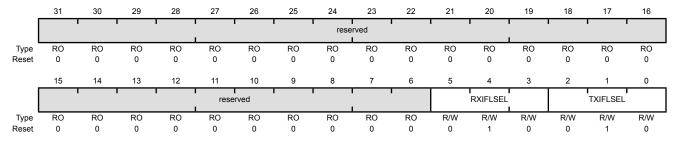

The interrupts are generated based on a transition through a level rather than being based on the level. That is, the interrupts are generated when the fill level progresses through the trigger level. For example, if the receive trigger level is set to the half-way mark, the interrupt is triggered as the module is receiving the 9th character.

Out of reset, the TXIFLSEL and RXIFLSEL bits are configured so that the FIFOs trigger an interrupt at the half-way mark.

#### UART Interrupt FIFO Level Select (UARTIFLS)

UART0 base: 0x4000.C000 UART1 base: 0x4000.D000 UART2 base: 0x4000.E000 Offset 0x034

Type R/W, reset 0x0000.0012

Bit/Field	Name	Type	Reset	Description
31:6	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
5:3	RXIFLSEL	R/W	0x2	UART Receive Interrupt FIFO Level Select

The trigger points for the receive interrupt are as follows:

Value Description 0x0 RX FIFO ≥ 1/8 full 0x1 RX FIFO ≥ ½ full 0x2 RX FIFO ≥ ½ full (default) 0x3 RX FIFO ≥ ¾ full 0x4 RX FIFO ≥ 7/8 full

0x5-0x7 Reserved

Bit/Field	Name	Туре	Reset	Descripti	on
2:0	TXIFLSEL	R/W	0x2	UART Tr	ansmit Interrupt FIFO Level Select
				The trigg	er points for the transmit interrupt are as follows:
				Value	Description
				0x0	TX FIFO ≤ 1/8 full
				0x1	TX FIFO ≤ ¼ full
				0x2	TX FIFO ≤ ½ full (default)
				0x3	TX FIFO ≤ ¾ full
				0x4	TX FIFO ≤ 7/8 full
				0x5-0x7	Reserved

### Register 10: UART Interrupt Mask (UARTIM), offset 0x038

The **UARTIM** register is the interrupt mask set/clear register.

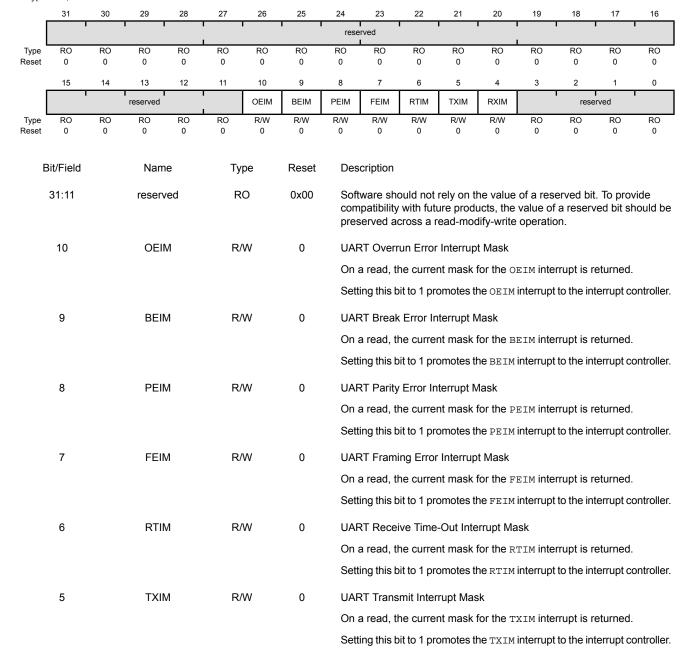

On a read, this register gives the current value of the mask on the relevant interrupt. Writing a 1 to a bit allows the corresponding raw interrupt signal to be routed to the interrupt controller. Writing a 0 prevents the raw interrupt signal from being sent to the interrupt controller.

#### **UART Interrupt Mask (UARTIM)**

UART0 base: 0x4000.C000 UART1 base: 0x4000.D000 UART2 base: 0x4000.E000

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
4	RXIM	R/W	0	UART Receive Interrupt Mask
				On a read, the current mask for the ${\tt RXIM}$ interrupt is returned.
				Setting this bit to 1 promotes the ${\tt RXIM}$ interrupt to the interrupt controller.
3:0	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

## Register 11: UART Raw Interrupt Status (UARTRIS), offset 0x03C

The **UARTRIS** register is the raw interrupt status register. On a read, this register gives the current raw status value of the corresponding interrupt. A write has no effect.

#### UART Raw Interrupt Status (UARTRIS)

UART0 base: 0x4000.C000
UART1 base: 0x4000.D000
UART2 base: 0x4000.E000
Offset 0x03C
Type RO, reset 0x0000.000F

# 13 Synchronous Serial Interface (SSI)

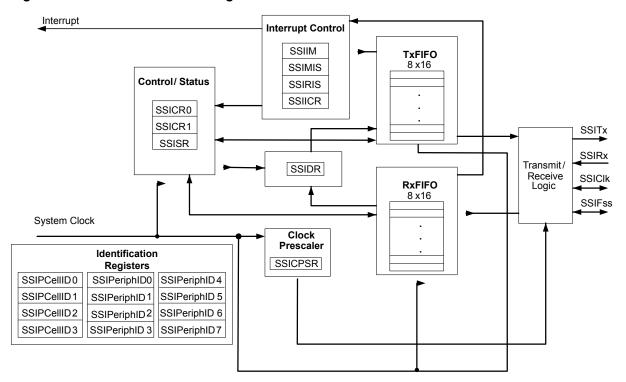

The Stellaris<sup>®</sup> microcontroller includes two Synchronous Serial Interface (SSI) modules. Each SSI is a master or slave interface for synchronous serial communication with peripheral devices that have either Freescale SPI, MICROWIRE, or Texas Instruments synchronous serial interfaces.

Each Stellaris® SSI module has the following features:

- Two SSI modules, each with the following features:
- Master or slave operation
- Programmable clock bit rate and prescale
- Separate transmit and receive FIFOs, 16 bits wide, 8 locations deep
- Programmable interface operation for Freescale SPI, MICROWIRE, or Texas Instruments synchronous serial interfaces
- Programmable data frame size from 4 to 16 bits
- Internal loopback test mode for diagnostic/debug testing

## 13.1 Block Diagram

Figure 13-1. SSI Module Block Diagram

## 13.2 Functional Description

The SSI performs serial-to-parallel conversion on data received from a peripheral device. The CPU accesses data, control, and status information. The transmit and receive paths are buffered with internal FIFO memories allowing up to eight 16-bit values to be stored independently in both transmit and receive modes.

#### 13.2.1 Bit Rate Generation

The SSI includes a programmable bit rate clock divider and prescaler to generate the serial output clock. Bit rates are supported to 2 MHz and higher, although maximum bit rate is determined by peripheral devices.

The serial bit rate is derived by dividing down the input clock (FSysClk). The clock is first divided by an even prescale value CPSDVSR from 2 to 254, which is programmed in the **SSI Clock Prescale** (**SSICPSR**) register (see page 326). The clock is further divided by a value from 1 to 256, which is 1 + SCR, where SCR is the value programmed in the **SSI Control0 (SSICR0)** register (see page 319).

The frequency of the output clock SSIClk is defined by:

```
SSIClk = FSysClk / (CPSDVSR * (1 + SCR))
```

**Note:** For master mode, the system clock must be at least two times faster than the SSIClk. For slave mode, the system clock must be at least 12 times faster than the SSIClk.

See "Synchronous Serial Interface (SSI)" on page 429 to view SSI timing parameters.

#### 13.2.2 FIFO Operation

#### 13.2.2.1 Transmit FIFO

The common transmit FIFO is a 16-bit wide, 8-locations deep, first-in, first-out memory buffer. The CPU writes data to the FIFO by writing the **SSI Data (SSIDR)** register (see page 323), and data is stored in the FIFO until it is read out by the transmission logic.

When configured as a master or a slave, parallel data is written into the transmit FIFO prior to serial conversion and transmission to the attached slave or master, respectively, through the SSITX pin.

In slave mode, the SSI transmits data each time it receives data from the master. It is possible that the slave may be required to transmit when the transmit FIFO has no valid data. In this situation, whatever data in the FIFO that the TX FIFO pointer points to is transmitted even though it is not valid. The TX FIFO pointer is not incremented and upon request, the same invalid data is transferred unless valid data has been written to the FIFO.

#### 13.2.2.2 Receive FIFO

The common receive FIFO is a 16-bit wide, 8-locations deep, first-in, first-out memory buffer. Received data from the serial interface is stored in the buffer until read out by the CPU, which accesses the read FIFO by reading the **SSIDR** register.

When configured as a master or slave, serial data received through the SSIRx pin is registered prior to parallel loading into the attached slave or master receive FIFO, respectively.

#### 13.2.3 Interrupts

The SSI can generate interrupts when the following conditions are observed:

Transmit FIFO service

- Receive FIFO service
- Receive FIFO time-out
- Receive FIFO overrun

All of the interrupt events are ORed together before being sent to the interrupt controller, so the SSI can only generate a single interrupt request to the controller at any given time. You can mask each of the four individual maskable interrupts by setting the appropriate bits in the **SSI Interrupt Mask** (**SSIIM**) register (see page 327). Setting the appropriate mask bit to 1 enables the interrupt.

Provision of the individual outputs, as well as a combined interrupt output, allows use of either a global interrupt service routine, or modular device drivers to handle interrupts. The transmit and receive dynamic dataflow interrupts have been separated from the status interrupts so that data can be read or written in response to the FIFO trigger levels. The status of the individual interrupt sources can be read from the **SSI Raw Interrupt Status (SSIRIS)** and **SSI Masked Interrupt Status (SSIMIS)** registers (see page 329 and page 330, respectively).

#### 13.2.4 Frame Formats

Each data frame is between 4 and 16 bits long, depending on the size of data programmed, and is transmitted starting with the MSB. There are three basic frame types that can be selected:

- Texas Instruments synchronous serial
- Freescale SPI
- MICROWIRE

For all three formats, the serial clock (SSIClk) is held inactive while the SSI is idle, and SSIClk transitions at the programmed frequency only during active transmission or reception of data. The idle state of SSIClk is utilized to provide a receive timeout indication that occurs when the receive FIFO still contains data after a timeout period.

For Freescale SPI and MICROWIRE frame formats, the serial frame (SSIFss) pin is active Low, and is asserted (pulled down) during the entire transmission of the frame.

For Texas Instruments synchronous serial frame format, the SSIFSS pin is pulsed for one serial clock period starting at its rising edge, prior to the transmission of each frame. For this frame format, both the SSI and the off-chip slave device drive their output data on the rising edge of SSIC1k, and latch data from the other device on the falling edge.

Unlike the full-duplex transmission of the other two frame formats, the MICROWIRE format uses a special master-slave messaging technique, which operates at half-duplex. In this mode, when a frame begins, an 8-bit control message is transmitted to the off-chip slave. During this transmit, no incoming data is received by the SSI. After the message has been sent, the off-chip slave decodes it and, after waiting one serial clock after the last bit of the 8-bit control message has been sent, responds with the requested data. The returned data can be 4 to 16 bits in length, making the total frame length anywhere from 13 to 25 bits.

### 13.2.4.1 Texas Instruments Synchronous Serial Frame Format

Figure 13-2 on page 310 shows the Texas Instruments synchronous serial frame format for a single transmitted frame.

SSICIK

SSIFss

SSITx/SSIRx

MSB

4 to 16 bits

Figure 13-2. TI Synchronous Serial Frame Format (Single Transfer)

In this mode, SSIClk and SSIFSS are forced Low, and the transmit data line SSITx is tristated whenever the SSI is idle. Once the bottom entry of the transmit FIFO contains data, SSIFSS is pulsed High for one SSIClk period. The value to be transmitted is also transferred from the transmit FIFO to the serial shift register of the transmit logic. On the next rising edge of SSIClk, the MSB of the 4 to 16-bit data frame is shifted out on the SSITx pin. Likewise, the MSB of the received data is shifted onto the SSIRx pin by the off-chip serial slave device.

Both the SSI and the off-chip serial slave device then clock each data bit into their serial shifter on the falling edge of each SSIClk. The received data is transferred from the serial shifter to the receive FIFO on the first rising edge of SSIClk after the LSB has been latched.

Figure 13-3 on page 310 shows the Texas Instruments synchronous serial frame format when back-to-back frames are transmitted.

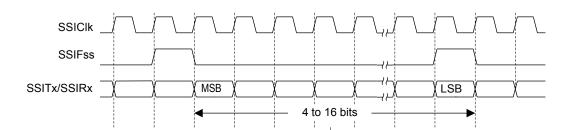

Figure 13-3. TI Synchronous Serial Frame Format (Continuous Transfer)

#### 13.2.4.2 Freescale SPI Frame Format

The Freescale SPI interface is a four-wire interface where the  ${\tt SSIFss}$  signal behaves as a slave select. The main feature of the Freescale SPI format is that the inactive state and phase of the  ${\tt SSIClk}$  signal are programmable through the  ${\tt SPO}$  and  ${\tt SPH}$  bits within the  ${\tt SSISCR0}$  control register.

#### SPO Clock Polarity Bit

When the SPO clock polarity control bit is Low, it produces a steady state Low value on the SSIC1k pin. If the SPO bit is High, a steady state High value is placed on the SSIC1k pin when data is not being transferred.

#### SPH Phase Control Bit

The SPH phase control bit selects the clock edge that captures data and allows it to change state. It has the most impact on the first bit transmitted by either allowing or not allowing a clock transition before the first data capture edge. When the SPH phase control bit is Low, data is captured on the first clock edge transition. If the SPH bit is High, data is captured on the second clock edge transition.

#### 13.2.4.3 Freescale SPI Frame Format with SPO=0 and SPH=0

Single and continuous transmission signal sequences for Freescale SPI format with SPO=0 and SPH=0 are shown in Figure 13-4 on page 311 and Figure 13-5 on page 311.

Figure 13-4. Freescale SPI Format (Single Transfer) with SPO=0 and SPH=0

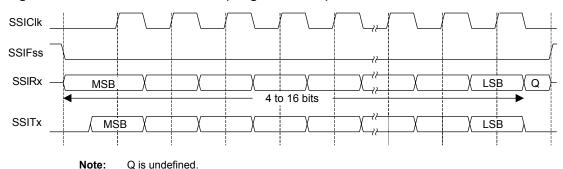

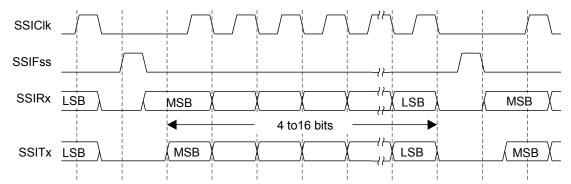

Figure 13-5. Freescale SPI Format (Continuous Transfer) with SPO=0 and SPH=0

In this configuration, during idle periods:

- SSIClk is forced Low
- SSIFss is forced High
- The transmit data line SSITx is arbitrarily forced Low
- When the SSI is configured as a master, it enables the SSIClk pad
- When the SSI is configured as a slave, it disables the SSIClk pad

If the SSI is enabled and there is valid data within the transmit FIFO, the start of transmission is signified by the SSIFss master signal being driven Low. This causes slave data to be enabled onto the SSIRx input line of the master. The master SSITx output pad is enabled.

One half SSIClk period later, valid master data is transferred to the SSITx pin. Now that both the master and slave data have been set, the SSIClk master clock pin goes High after one further half SSIClk period.

The data is now captured on the rising and propagated on the falling edges of the SSIClk signal.

In the case of a single word transmission, after all bits of the data word have been transferred, the SSIFss line is returned to its idle High state one SSIClk period after the last bit has been captured.

However, in the case of continuous back-to-back transmissions, the SSIFss signal must be pulsed High between each data word transfer. This is because the slave select pin freezes the data in its serial peripheral register and does not allow it to be altered if the SPH bit is logic zero. Therefore, the master device must raise the SSIFss pin of the slave device between each data transfer to enable the serial peripheral data write. On completion of the continuous transfer, the SSIFss pin is returned to its idle state one SSIClk period after the last bit has been captured.

#### 13.2.4.4 Freescale SPI Frame Format with SPO=0 and SPH=1

The transfer signal sequence for Freescale SPI format with SPO=0 and SPH=1 is shown in Figure 13-6 on page 312, which covers both single and continuous transfers.

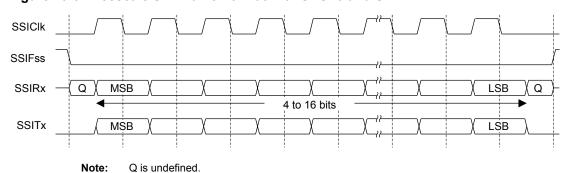

Figure 13-6. Freescale SPI Frame Format with SPO=0 and SPH=1

In this configuration, during idle periods:

- SSIClk is forced Low
- SSIFss is forced High
- The transmit data line SSITx is arbitrarily forced Low
- When the SSI is configured as a master, it enables the SSIClk pad
- When the SSI is configured as a slave, it disables the SSIClk pad

If the SSI is enabled and there is valid data within the transmit FIFO, the start of transmission is signified by the  ${\tt SSIFss}$  master signal being driven Low. The master  ${\tt SSITx}$  output is enabled. After a further one half  ${\tt SSIClk}$  period, both master and slave valid data is enabled onto their respective transmission lines. At the same time, the  ${\tt SSIClk}$  is enabled with a rising edge transition.

Data is then captured on the falling edges and propagated on the rising edges of the SSIC1k signal.

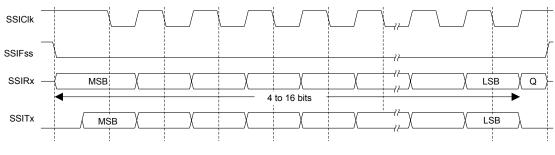

In the case of a single word transfer, after all bits have been transferred, the SSIFss line is returned to its idle High state one SSIClk period after the last bit has been captured.

For continuous back-to-back transfers, the SSIFss pin is held Low between successive data words and termination is the same as that of the single word transfer.

#### 13.2.4.5 Freescale SPI Frame Format with SPO=1 and SPH=0

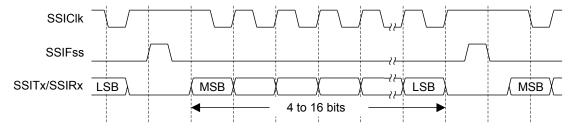

Single and continuous transmission signal sequences for Freescale SPI format with SPO=1 and SPH=0 are shown in Figure 13-7 on page 313 and Figure 13-8 on page 313.

Figure 13-7. Freescale SPI Frame Format (Single Transfer) with SPO=1 and SPH=0

Note: Q is undefined.

Figure 13-8. Freescale SPI Frame Format (Continuous Transfer) with SPO=1 and SPH=0

In this configuration, during idle periods:

- SSIClk is forced High
- SSIFss is forced High
- The transmit data line SSITx is arbitrarily forced Low
- When the SSI is configured as a master, it enables the SSIClk pad
- When the SSI is configured as a slave, it disables the SSIClk pad

If the SSI is enabled and there is valid data within the transmit FIFO, the start of transmission is signified by the SSIFss master signal being driven Low, which causes slave data to be immediately transferred onto the SSIRx line of the master. The master SSITx output pad is enabled.

One half period later, valid master data is transferred to the SSITx line. Now that both the master and slave data have been set, the SSIClk master clock pin becomes Low after one further half SSIClk period. This means that data is captured on the falling edges and propagated on the rising edges of the SSIClk signal.

In the case of a single word transmission, after all bits of the data word are transferred, the SSIFss line is returned to its idle High state one SSIClk period after the last bit has been captured.

However, in the case of continuous back-to-back transmissions, the SSIFss signal must be pulsed High between each data word transfer. This is because the slave select pin freezes the data in its serial peripheral register and does not allow it to be altered if the SPH bit is logic zero. Therefore, the master device must raise the SSIFss pin of the slave device between each data transfer to enable the serial peripheral data write. On completion of the continuous transfer, the SSIFss pin is returned to its idle state one SSIClk period after the last bit has been captured.

#### 13.2.4.6 Freescale SPI Frame Format with SPO=1 and SPH=1

The transfer signal sequence for Freescale SPI format with SPO=1 and SPH=1 is shown in Figure 13-9 on page 314, which covers both single and continuous transfers.

Figure 13-9. Freescale SPI Frame Format with SPO=1 and SPH=1

Note: Q is undefined.

In this configuration, during idle periods:

- SSIClk is forced High
- SSIFss is forced High
- The transmit data line SSITx is arbitrarily forced Low
- When the SSI is configured as a master, it enables the SSIClk pad
- When the SSI is configured as a slave, it disables the SSIClk pad

If the SSI is enabled and there is valid data within the transmit FIFO, the start of transmission is signified by the SSIFss master signal being driven Low. The master SSITx output pad is enabled. After a further one-half SSIClk period, both master and slave data are enabled onto their respective transmission lines. At the same time, SSIClk is enabled with a falling edge transition. Data is then captured on the rising edges and propagated on the falling edges of the SSIClk signal.

After all bits have been transferred, in the case of a single word transmission, the SSIFss line is returned to its idle high state one SSIClk period after the last bit has been captured.

For continuous back-to-back transmissions, the SSIFss pin remains in its active Low state, until the final bit of the last word has been captured, and then returns to its idle state as described above.

For continuous back-to-back transfers, the  $\mathtt{SSIFss}$  pin is held Low between successive data words and termination is the same as that of the single word transfer.

#### 13.2.4.7 MICROWIRE Frame Format

Figure 13-10 on page 315 shows the MICROWIRE frame format, again for a single frame. Figure 13-11 on page 316 shows the same format when back-to-back frames are transmitted.

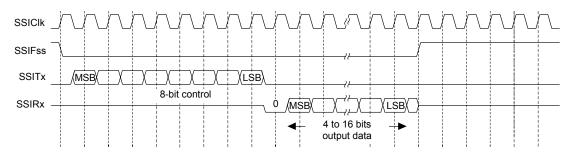

Figure 13-10. MICROWIRE Frame Format (Single Frame)

MICROWIRE format is very similar to SPI format, except that transmission is half-duplex instead of full-duplex, using a master-slave message passing technique. Each serial transmission begins with an 8-bit control word that is transmitted from the SSI to the off-chip slave device. During this transmission, no incoming data is received by the SSI. After the message has been sent, the off-chip slave decodes it and, after waiting one serial clock after the last bit of the 8-bit control message has been sent, responds with the required data. The returned data is 4 to 16 bits in length, making the total frame length anywhere from 13 to 25 bits.

In this configuration, during idle periods:

- SSIC1k is forced Low
- SSIFss is forced High
- The transmit data line SSITx is arbitrarily forced Low

A transmission is triggered by writing a control byte to the transmit FIFO. The falling edge of SSIFss causes the value contained in the bottom entry of the transmit FIFO to be transferred to the serial shift register of the transmit logic, and the MSB of the 8-bit control frame to be shifted out onto the SSITx pin. SSIFss remains Low for the duration of the frame transmission. The SSIRx pin remains tristated during this transmission.

The off-chip serial slave device latches each control bit into its serial shifter on the rising edge of each SSIClk. After the last bit is latched by the slave device, the control byte is decoded during a one clock wait-state, and the slave responds by transmitting data back to the SSI. Each bit is driven onto the SSIRx line on the falling edge of SSIClk. The SSI in turn latches each bit on the rising edge of SSIClk. At the end of the frame, for single transfers, the SSIFss signal is pulled High one clock period after the last bit has been latched in the receive serial shifter, which causes the data to be transferred to the receive FIFO.

Note: The off-chip slave device can tristate the receive line either on the falling edge of SSIClk after the LSB has been latched by the receive shifter, or when the SSIFss pin goes High.

For continuous transfers, data transmission begins and ends in the same manner as a single transfer. However, the SSIFss line is continuously asserted (held Low) and transmission of data occurs back-to-back. The control byte of the next frame follows directly after the LSB of the received data from the current frame. Each of the received values is transferred from the receive shifter on the falling edge of SSIClk, after the LSB of the frame has been latched into the SSI.

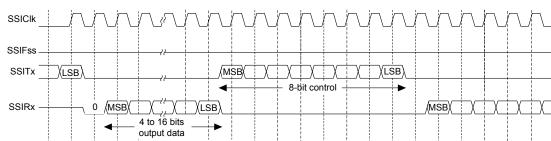

Figure 13-11. MICROWIRE Frame Format (Continuous Transfer)

In the MICROWIRE mode, the SSI slave samples the first bit of receive data on the rising edge of SSIClk after SSIFss has gone Low. Masters that drive a free-running SSIClk must ensure that the SSIFss signal has sufficient setup and hold margins with respect to the rising edge of SSIClk.

Figure 13-12 on page 316 illustrates these setup and hold time requirements. With respect to the SSIClk rising edge on which the first bit of receive data is to be sampled by the SSI slave, SSIFss must have a setup of at least two times the period of SSIClk on which the SSI operates. With respect to the SSIClk rising edge previous to this edge, SSIFss must have a hold of at least one SSIClk period.

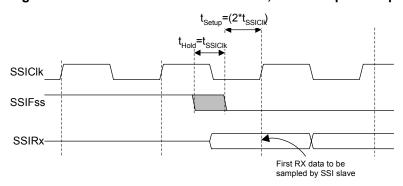

Figure 13-12. MICROWIRE Frame Format, SSIFss Input Setup and Hold Requirements

## 13.3 Initialization and Configuration

To use the SSI, its peripheral clock must be enabled by setting the SSI bit in the RCGC1 register.

For each of the frame formats, the SSI is configured using the following steps:

- 1. Ensure that the SSE bit in the SSICR1 register is disabled before making any configuration changes.
- 2. Select whether the SSI is a master or slave:
  - **a.** For master operations, set the **SSICR1** register to 0x0000.0000.
  - **b.** For slave mode (output enabled), set the **SSICR1** register to 0x0000.0004.
  - **c.** For slave mode (output disabled), set the **SSICR1** register to 0x0000.000C.
- **3.** Configure the clock prescale divisor by writing the **SSICPSR** register.
- 4. Write the **SSICR0** register with the following configuration:

- Serial clock rate (SCR)
- Desired clock phase/polarity, if using Freescale SPI mode (SPH and SPO)
- The protocol mode: Freescale SPI, TI SSF, MICROWIRE (FRF)
- The data size (DSS)
- 5. Enable the SSI by setting the SSE bit in the SSICR1 register.

As an example, assume the SSI must be configured to operate with the following parameters:

- Master operation
- Freescale SPI mode (SPO=1, SPH=1)
- 1 Mbps bit rate
- 8 data bits

Assuming the system clock is 20 MHz, the bit rate calculation would be:

```
FSSIClk = FSysClk / (CPSDVSR * (1 + SCR))
1x106 = 20x106 / (CPSDVSR * (1 + SCR))
```

In this case, if CPSDVSR=2, SCR must be 9.

The configuration sequence would be as follows:

- 1. Ensure that the SSE bit in the SSICR1 register is disabled.
- 2. Write the SSICR1 register with a value of 0x0000.0000.
- **3.** Write the **SSICPSR** register with a value of 0x0000.0002.
- **4.** Write the **SSICR0** register with a value of 0x0000.09C7.
- **5.** The SSI is then enabled by setting the SSE bit in the **SSICR1** register to 1.

## 13.4 Register Map

Table 13-1 on page 317 lists the SSI registers. The offset listed is a hexadecimal increment to the register's address, relative to that SSI module's base address:

SSI0: 0x4000.8000SSI1: 0x4000.9000

**Note:** The SSI must be disabled (see the SSE bit in the **SSICR1** register) before any of the control registers are reprogrammed.

# 13.5 Register Descriptions

The remainder of this section lists and describes the SSI registers, in numerical order by address offset.

### Register 1: SSI Control 0 (SSICR0), offset 0x000

**SSICR0** is control register 0 and contains bit fields that control various functions within the SSI module. Functionality such as protocol mode, clock rate, and data size are configured in this register.

#### SSI Control 0 (SSICR0)

SSI0 base: 0x4000.8000 SSI1 base: 0x4000.9000

Offset 0x000

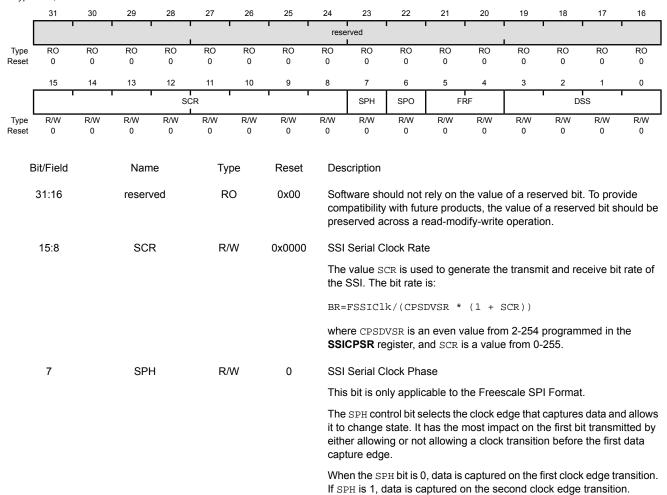

6

SPO

R/W

0

Type R/W, reset 0x0000.0000

This bit is only applicable to the Freescale SPI Format.

SSI Serial Clock Polarity

When the SPO bit is 0, it produces a steady state Low value on the SSIClk pin. If SPO is 1, a steady state High value is placed on the SSIClk pin when data is not being transferred.

Bit/Field	Name	Туре	Reset	Description
5:4	FRF	R/W	0x0	SSI Frame Format Select
				The FRF values are defined as follows:
				Value Frame Format
				0x0 Freescale SPI Frame Format
				0x1 Texas Instruments Synchronous Serial Frame Format
				0x2 MICROWIRE Frame Format
				0x3 Reserved
3:0	DSS	R/W	0x00	SSI Data Size Select
				The DSS values are defined as follows:
				Value Data Size
				0x0-0x2 Reserved
				0x3 4-bit data
				0x4 5-bit data
				0x5 6-bit data
				0x6 7-bit data
				0x7 8-bit data
				0x8 9-bit data
				0x9 10-bit data
				0xA 11-bit data
				0xB 12-bit data
				0xC 13-bit data
				0xD 14-bit data
				0xE 15-bit data
				0xF 16-bit data

### Register 2: SSI Control 1 (SSICR1), offset 0x004

SSICR1 is control register 1 and contains bit fields that control various functions within the SSI module. Master and slave mode functionality is controlled by this register.

#### SSI Control 1 (SSICR1)

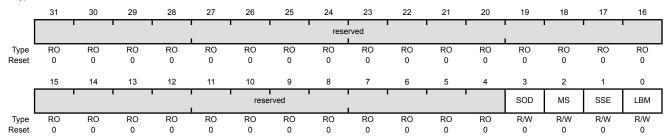

SSI0 base: 0x4000.8000 SSI1 base: 0x4000.9000

Offset 0x004

3

SOD

Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:4	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

SSI Slave Mode Output Disable

This bit is relevant only in the Slave mode (MS=1). In multiple-slave systems, it is possible for the SSI master to broadcast a message to all slaves in the system while ensuring that only one slave drives data onto the serial output line. In such systems, the TXD lines from multiple slaves could be tied together. To operate in such a system, the SOD bit can be configured so that the SSI slave does not drive the SSITx pin.

The SOD values are defined as follows:

#### Value Description

- SSI can drive SSITx output in Slave Output mode.
- SSI must not drive the SSITx output in Slave mode.

2 MS R/W SSI Master/Slave Select

R/W

0

This bit selects Master or Slave mode and can be modified only when SSI is disabled (SSE=0).

The MS values are defined as follows:

#### Value Description

- Device configured as a master.
- Device configured as a slave.

Bit/Field	Name	Туре	Reset	Description
1	SSE	R/W	0	SSI Synchronous Serial Port Enable Setting this bit enables SSI operation. The SSE values are defined as follows:  Value Description 0 SSI operation disabled. 1 SSI operation enabled.
				<b>Note:</b> This bit must be set to 0 before any control registers are reprogrammed.
0	LBM	R/W	0	SSI Loopback Mode Setting this bit enables Loopback Test mode.

Value Description

0 Normal serial port operation enabled.

The LBM values are defined as follows:

Output of the transmit serial shift register is connected internally to the input of the receive serial shift register.

#### Register 3: SSI Data (SSIDR), offset 0x008

Important: Use caution when reading this register. Performing a read may change bit status.

**SSIDR** is the data register and is 16-bits wide. When **SSIDR** is read, the entry in the receive FIFO (pointed to by the current FIFO read pointer) is accessed. As data values are removed by the SSI receive logic from the incoming data frame, they are placed into the entry in the receive FIFO (pointed to by the current FIFO write pointer).

When **SSIDR** is written to, the entry in the transmit FIFO (pointed to by the write pointer) is written to. Data values are removed from the transmit FIFO one value at a time by the transmit logic. It is loaded into the transmit serial shifter, then serially shifted out onto the SSITx pin at the programmed bit rate.

When a data size of less than 16 bits is selected, the user must right-justify data written to the transmit FIFO. The transmit logic ignores the unused bits. Received data less than 16 bits is automatically right-justified in the receive buffer.

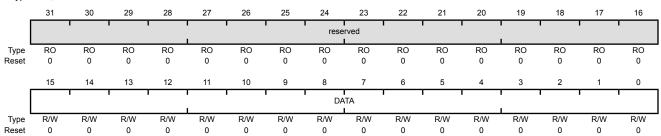

When the SSI is programmed for MICROWIRE frame format, the default size for transmit data is eight bits (the most significant byte is ignored). The receive data size is controlled by the programmer. The transmit FIFO and the receive FIFO are not cleared even when the SSE bit in the **SSICR1** register is set to zero. This allows the software to fill the transmit FIFO before enabling the SSI.

#### SSI Data (SSIDR)

SSI0 base: 0x4000.8000 SSI1 base: 0x4000.9000

Offset 0x008

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:16	reserved	RO	0x0000	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
15:0	DATA	R/W	0x0000	SSI Receive/Transmit Data

A read operation reads the receive FIFO. A write operation writes the transmit FIFO.

Software must right-justify data when the SSI is programmed for a data size that is less than 16 bits. Unused bits at the top are ignored by the transmit logic. The receive logic automatically right-justifies the data.

## Register 4: SSI Status (SSISR), offset 0x00C

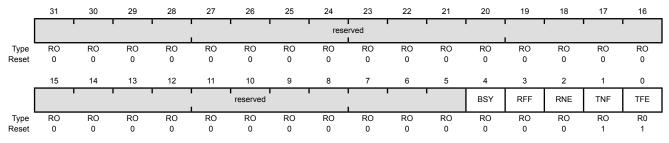

SSISR is a status register that contains bits that indicate the FIFO fill status and the SSI busy status.

SSI Status (SSISR)

SSI0 base: 0x4000.8000 SSI1 base: 0x4000.9000

Offset 0x00C

Type RO, reset 0x0000.0003

Bit/Field	Name	Type	Reset	Description
31:5	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
4	BSY	RO	0	SSI Busy Bit
				The BSY values are defined as follows:
				Value Description
				0 SSI is idle.
				SSI is currently transmitting and/or receiving a frame, or the transmit FIFO is not empty.
3	RFF	RO	0	SSI Receive FIFO Full
				The RFF values are defined as follows:
				Value Description

Receive FIFO is not full. 0

Receive FIFO is full.

2 RNE RO 0 SSI Receive FIFO Not Empty

The  ${\tt RNE}$  values are defined as follows:

Value Description

Receive FIFO is empty.

Receive FIFO is not empty.

Bit/Field	Name	Туре	Reset	Description
1	TNF	RO	1	SSI Transmit FIFO Not Full The TNF values are defined as follows:
				Value Description  O Transmit FIFO is full.  1 Transmit FIFO is not full.
0	TFE	R0	1	SSI Transmit FIFO Empty The TFE values are defined as follows:  Value Description 0 Transmit FIFO is not empty.

Transmit FIFO is empty.

### Register 5: SSI Clock Prescale (SSICPSR), offset 0x010

**SSICPSR** is the clock prescale register and specifies the division factor by which the system clock must be internally divided before further use.

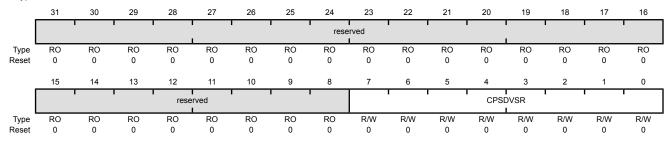

The value programmed into this register must be an even number between 2 and 254. The least-significant bit of the programmed number is hard-coded to zero. If an odd number is written to this register, data read back from this register has the least-significant bit as zero.

#### SSI Clock Prescale (SSICPSR)

SSI0 base: 0x4000.8000 SSI1 base: 0x4000.9000

Offset 0x010

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	CPSDVSR	R/W	0x00	SSI Clock Prescale Divisor

This value must be an even number from 2 to 254, depending on the frequency of  ${\tt SSIClk}.$  The LSB always returns 0 on reads.

### Register 6: SSI Interrupt Mask (SSIIM), offset 0x014

The SSIIM register is the interrupt mask set or clear register. It is a read/write register and all bits are cleared to 0 on reset.

On a read, this register gives the current value of the mask on the relevant interrupt. A write of 1 to the particular bit sets the mask, enabling the interrupt to be read. A write of 0 clears the corresponding mask.

#### SSI Interrupt Mask (SSIIM)

Offset 0x014

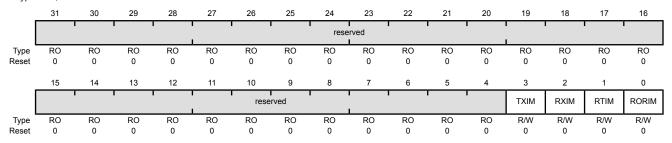

Bit/Field

Name

Type

Reset

Type R/W, reset 0x0000.0000

Description

31:4	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
3	TXIM	R/W	0	SSI Transmit FIFO Interrupt Mask The TXIM values are defined as follows:
				Value Description  O TX FIFO half-full or less condition interrupt is masked.  1 TX FIFO half-full or less condition interrupt is not masked.
2	RXIM	R/W	0	SSI Receive FIFO Interrupt Mask The RXIM values are defined as follows:  Value Description 0 RX FIFO half-full or more condition interrupt is masked. 1 RX FIFO half-full or more condition interrupt is not masked.
1	RTIM	R/W	0	SSI Receive Time-Out Interrupt Mask The RTIM values are defined as follows:

Value Description

RX FIFO time-out interrupt is masked. RX FIFO time-out interrupt is not masked.

Bit/Field	Name	Туре	Reset	Description
0	RORIM	R/W	0	SSI Receive Overrun Interrupt Mask
				The RORIM values are defined as follows:
				Value Description
				0 RX FIFO overrun interrupt is masked.
				1 RX FIFO overrun interrupt is not masked.

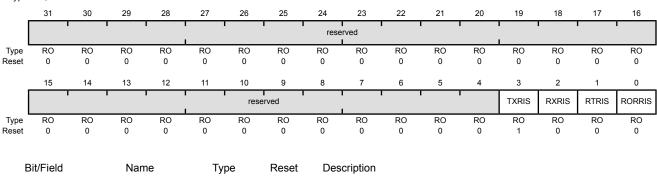

# Register 7: SSI Raw Interrupt Status (SSIRIS), offset 0x018

The **SSIRIS** register is the raw interrupt status register. On a read, this register gives the current raw status value of the corresponding interrupt prior to masking. A write has no effect.

SSI Raw Interrupt Status (SSIRIS)

SSI0 base: 0x4000.8000 SSI1 base: 0x4000.9000 Offset 0x018

Type RO, reset 0x0000.0008

Bit/Field	Name	Type	Reset	Description
31:4	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
3	TXRIS	RO	1	SSI Transmit FIFO Raw Interrupt Status Indicates that the transmit FIFO is half full or less, when set.
2	RXRIS	RO	0	SSI Receive FIFO Raw Interrupt Status Indicates that the receive FIFO is half full or more, when set.
1	RTRIS	RO	0	SSI Receive Time-Out Raw Interrupt Status Indicates that the receive time-out has occurred, when set.
0	RORRIS	RO	0	SSI Receive Overrun Raw Interrupt Status Indicates that the receive FIFO has overflowed, when set.

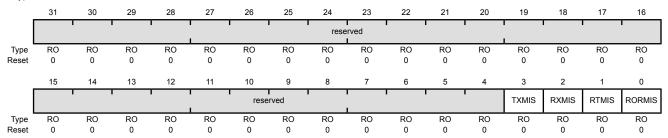

# Register 8: SSI Masked Interrupt Status (SSIMIS), offset 0x01C

The **SSIMIS** register is the masked interrupt status register. On a read, this register gives the current masked status value of the corresponding interrupt. A write has no effect.

SSI Masked Interrupt Status (SSIMIS)

SSI0 base: 0x4000.8000 SSI1 base: 0x4000.9000 Offset 0x01C

Type RO, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:4	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
3	TXMIS	RO	0	SSI Transmit FIFO Masked Interrupt Status Indicates that the transmit FIFO is half full or less, when set.
2	RXMIS	RO	0	SSI Receive FIFO Masked Interrupt Status Indicates that the receive FIFO is half full or more, when set.
1	RTMIS	RO	0	SSI Receive Time-Out Masked Interrupt Status Indicates that the receive time-out has occurred, when set.
0	RORMIS	RO	0	SSI Receive Overrun Masked Interrupt Status Indicates that the receive FIFO has overflowed, when set.

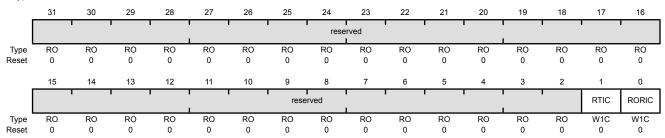

### Register 9: SSI Interrupt Clear (SSIICR), offset 0x020

The SSIICR register is the interrupt clear register. On a write of 1, the corresponding interrupt is cleared. A write of 0 has no effect.

SSI Interrupt Clear (SSIICR)

SSI0 base: 0x4000.8000 SSI1 base: 0x4000.9000 Offset 0x020

Type W1C, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:2	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	RTIC	W1C	0	SSI Receive Time-Out Interrupt Clear The RTIC values are defined as follows:  Value Description  0 No effect on interrupt.  1 Clears interrupt.
0	RORIC	W1C	0	SSI Receive Overrun Interrupt Clear

Value Description

No effect on interrupt.

The RORIC values are defined as follows:

Clears interrupt.

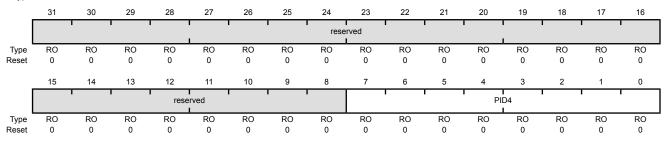

# Register 10: SSI Peripheral Identification 4 (SSIPeriphID4), offset 0xFD0

The SSIPeriphIDn registers are hard-coded and the fields within the register determine the reset value.

SSI Peripheral Identification 4 (SSIPeriphID4)

SSI0 base: 0x4000.8000 SSI1 base: 0x4000.9000 Offset 0xFD0

# 14 Inter-Integrated Circuit (I<sup>2</sup>C) Interface

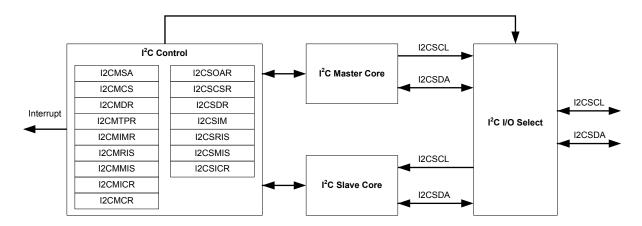

The Inter-Integrated Circuit ( $I^2C$ ) bus provides bi-directional data transfer through a two-wire design (a serial data line SDA and a serial clock line SCL), and interfaces to external  $I^2C$  devices such as serial memory (RAMs and ROMs), networking devices, LCDs, tone generators, and so on. The  $I^2C$  bus may also be used for system testing and diagnostic purposes in product development and manufacture. The LM3S1911 microcontroller includes two  $I^2C$  modules, providing the ability to interact (both send and receive) with other  $I^2C$  devices on the bus.

The Stellaris® I2C interface has the following features:

- Two I<sup>2</sup>C modules, each with the following features:
- Devices on the I<sup>2</sup>C bus can be designated as either a master or a slave
  - Supports both sending and receiving data as either a master or a slave
  - Supports simultaneous master and slave operation
- Four I<sup>2</sup>C modes
  - Master transmit
  - Master receive
  - Slave transmit
  - Slave receive
- Two transmission speeds: Standard (100 Kbps) and Fast (400 Kbps)
- Master and slave interrupt generation
  - Master generates interrupts when a transmit or receive operation completes (or aborts due to an error)
  - Slave generates interrupts when data has been sent or requested by a master
- Master with arbitration and clock synchronization, multimaster support, and 7-bit addressing mode

# 14.1 Block Diagram

Figure 14-1. I<sup>2</sup>C Block Diagram

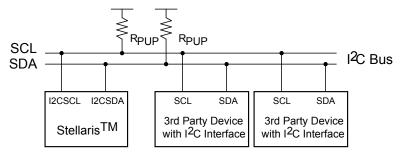

# 14.2 Functional Description

Each I<sup>2</sup>C module is comprised of both master and slave functions which are implemented as separate peripherals. For proper operation, the SDA and SCL pins must be connected to bi-directional open-drain pads. A typical I<sup>2</sup>C bus configuration is shown in Figure 14-2 on page 345.

See "Inter-Integrated Circuit (I<sup>2</sup>C) Interface" on page 430 for I<sup>2</sup>C timing diagrams.

Figure 14-2. I<sup>2</sup>C Bus Configuration

### 14.2.1 I<sup>2</sup>C Bus Functional Overview

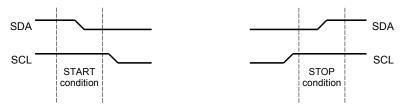

The I<sup>2</sup>C bus uses only two signals: SDA and SCL, named I2CSDA and I2CSCL on Stellaris® microcontrollers. SDA is the bi-directional serial data line and SCL is the bi-directional serial clock line. The bus is considered idle when both lines are High.

Every transaction on the I<sup>2</sup>C bus is nine bits long, consisting of eight data bits and a single acknowledge bit. The number of bytes per transfer (defined as the time between a valid START and STOP condition, described in "START and STOP Conditions" on page 346) is unrestricted, but each byte has to be followed by an acknowledge bit, and data must be transferred MSB first. When a receiver cannot receive another complete byte, it can hold the clock line SCL Low and force the transmitter into a wait state. The data transfer continues when the receiver releases the clock SCL.

#### 14.2.1.1 START and STOP Conditions

The protocol of the I<sup>2</sup>C bus defines two states to begin and end a transaction: START and STOP. A High-to-Low transition on the SDA line while the SCL is High is defined as a START condition, and a Low-to-High transition on the SDA line while SCL is High is defined as a STOP condition. The bus is considered busy after a START condition and free after a STOP condition. See Figure 14-3 on page 346.

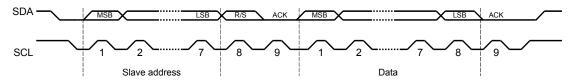

Figure 14-3. START and STOP Conditions

#### 14.2.1.2 Data Format with 7-Bit Address

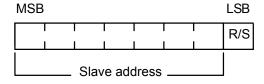

Data transfers follow the format shown in Figure 14-4 on page 346. After the START condition, a slave address is sent. This address is 7-bits long followed by an eighth bit, which is a data direction bit ( $\mathbb{R}/\mathbb{S}$  bit in the **I2CMSA** register). A zero indicates a transmit operation (send), and a one indicates a request for data (receive). A data transfer is always terminated by a STOP condition generated by the master, however, a master can initiate communications with another device on the bus by generating a repeated START condition and addressing another slave without first generating a STOP condition. Various combinations of receive/send formats are then possible within a single transfer.

Figure 14-4. Complete Data Transfer with a 7-Bit Address

The first seven bits of the first byte make up the slave address (see Figure 14-5 on page 346). The eighth bit determines the direction of the message. A zero in the R/S position of the first byte means that the master will write (send) data to the selected slave, and a one in this position means that the master will receive data from the slave.

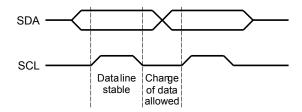

Figure 14-5. R/S Bit in First Byte

### 14.2.1.3 Data Validity

The data on the SDA line must be stable during the high period of the clock, and the data line can only change when SCL is Low (see Figure 14-6 on page 347).

Figure 14-6. Data Validity During Bit Transfer on the I<sup>2</sup>C Bus

### 14.2.1.4 Acknowledge

All bus transactions have a required acknowledge clock cycle that is generated by the master. During the acknowledge cycle, the transmitter (which can be the master or slave) releases the SDA line. To acknowledge the transaction, the receiver must pull down SDA during the acknowledge clock cycle. The data sent out by the receiver during the acknowledge cycle must comply with the data validity requirements described in "Data Validity" on page 346.

When a slave receiver does not acknowledge the slave address, SDA must be left High by the slave so that the master can generate a STOP condition and abort the current transfer. If the master device is acting as a receiver during a transfer, it is responsible for acknowledging each transfer made by the slave. Since the master controls the number of bytes in the transfer, it signals the end of data to the slave transmitter by not generating an acknowledge on the last data byte. The slave transmitter must then release SDA to allow the master to generate the STOP or a repeated START condition.

#### 14.2.1.5 Arbitration

A master may start a transfer only if the bus is idle. It's possible for two or more masters to generate a START condition within minimum hold time of the START condition. In these situations, an arbitration scheme takes place on the SDA line, while SCL is High. During arbitration, the first of the competing master devices to place a '1' (High) on SDA while another master transmits a '0' (Low) will switch off its data output stage and retire until the bus is idle again.

Arbitration can take place over several bits. Its first stage is a comparison of address bits, and if both masters are trying to address the same device, arbitration continues on to the comparison of data bits.

### 14.2.2 Available Speed Modes

The I<sup>2</sup>C clock rate is determined by the parameters: CLK\_PRD, TIMER\_PRD, SCL\_LP, and SCL\_HP. where:

CLK\_PRD is the system clock period

SCL\_LP is the low phase of SCL (fixed at 6)

SCL HP is the high phase of SCL (fixed at 4)

TIMER\_PRD is the programmed value in the  $I^2C$  Master Timer Period (I2CMTPR) register (see page 365).

The I<sup>2</sup>C clock period is calculated as follows:

SCL\_PERIOD = 2\*(1 + TIMER\_PRD)\*(SCL\_LP + SCL\_HP)\*CLK\_PRD

For example:

```
CLK_PRD = 50 ns
TIMER_PRD = 2
SCL_LP=6
SCL HP=4
```

yields a SCL frequency of:

1/T = 333 Khz

Table 14-1 on page 348 gives examples of timer period, system clock, and speed mode (Standard or Fast).

Table 14-1. Examples of I<sup>2</sup>C Master Timer Period versus Speed Mode

System Clock	Timer Period	Standard Mode	Timer Period	Fast Mode
4 MHz	0x01	100 Kbps	-	-
6 MHz	0x02	100 Kbps	-	-
12.5 MHz	0x06	89 Kbps	0x01	312 Kbps
16.7 MHz	0x08	93 Kbps	0x02	278 Kbps
20 MHz	0x09	100 Kbps	0x02	333 Kbps
25 MHz	0x0C	96.2 Kbps	0x03	312 Kbps
33 MHz	0x10	97.1 Kbps	0x04	330 Kbps
40 MHz	0x13	100 Kbps	0x04	400 Kbps
50 MHz	0x18	100 Kbps	0x06	357 Kbps

### 14.2.3 Interrupts

The I<sup>2</sup>C can generate interrupts when the following conditions are observed:

- Master transaction completed
- Master transaction error
- Slave transaction received
- Slave transaction requested

There is a separate interrupt signal for the  $I^2C$  master and  $I^2C$  slave modules. While both modules can generate interrupts for multiple conditions, only a single interrupt signal is sent to the interrupt controller.

### 14.2.3.1 I<sup>2</sup>C Master Interrupts

The I<sup>2</sup>C master module generates an interrupt when a transaction completes (either transmit or receive), or when an error occurs during a transaction. To enable the I<sup>2</sup>C master interrupt, software must write a '1' to the I<sup>2</sup>C Master Interrupt Mask (I2CMIMR) register. When an interrupt condition is met, software must check the ERROR bit in the I<sup>2</sup>C Master Control/Status (I2CMCS) register to verify that an error didn't occur during the last transaction. An error condition is asserted if the last transaction wasn't acknowledge by the slave or if the master was forced to give up ownership of the bus due to a lost arbitration round with another master. If an error is not detected, the application can proceed with the transfer. The interrupt is cleared by writing a '1' to the I<sup>2</sup>C Master Interrupt Clear (I2CMICR) register.

If the application doesn't require the use of interrupts, the raw interrupt status is always visible via the I<sup>2</sup>C Master Raw Interrupt Status (I2CMRIS) register.

### 14.2.3.2 I<sup>2</sup>C Slave Interrupts

The slave module can generate an interrupt when data has been received or requested. This interrupt is enabled by writing a 1 to the DATAIM bit in the  $I^2C$  Slave Interrupt Mask (I2CSIMR) register. Software determines whether the module should write (transmit) or read (receive) data from the  $I^2C$  Slave Data (I2CSDR) register, by checking the RREQ and TREQ bits of the  $I^2C$  Slave Control/Status (I2CSCSR) register. If the slave module is in receive mode and the first byte of a transfer is received, the FBR bit is set along with the RREQ bit. The interrupt is cleared by writing a 1 to the DATAIC bit in the  $I^2C$  Slave Interrupt Clear (I2CSICR) register.

If the application doesn't require the use of interrupts, the raw interrupt status is always visible via the  $I^2C$  Slave Raw Interrupt Status (I2CSRIS) register.

### 14.2.4 Loopback Operation

The  $I^2C$  modules can be placed into an internal loopback mode for diagnostic or debug work. This is accomplished by setting the LPBK bit in the  $I^2C$  Master Configuration (I2CMCR) register. In loopback mode, the SDA and SCL signals from the master and slave modules are tied together.

### 14.2.5 Command Sequence Flow Charts

This section details the steps required to perform the various I<sup>2</sup>C transfer types in both master and slave mode.

### 14.2.5.1 I<sup>2</sup>C Master Command Sequences

The figures that follow show the command sequences available for the I<sup>2</sup>C master.

### 14.2.5.2 I<sup>2</sup>C Slave Command Sequences

Figure 14-13 on page 356 presents the command sequence available for the I<sup>2</sup>C slave.

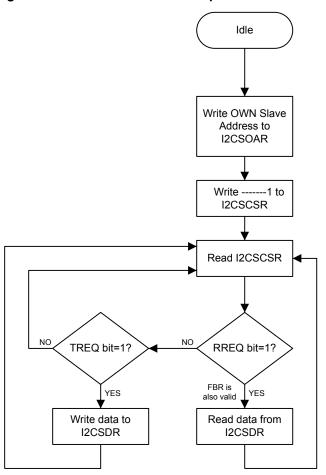

Figure 14-13. Slave Command Sequence

# 14.3 Initialization and Configuration

The following example shows how to configure the  $I^2C$  module to send a single byte as a master. This assumes the system clock is 20 MHz.

- 1. Enable the I<sup>2</sup>C clock by writing a value of 0x0000.1000 to the **RCGC1** register in the System Control module.
- Enable the clock to the appropriate GPIO module via the RCGC2 register in the System Control module.
- **3.** In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. Also, be sure to enable the same pins for Open Drain operation.
- **4.** Initialize the I<sup>2</sup>C Master by writing the **I2CMCR** register with a value of 0x0000.0020.
- **5.** Set the desired SCL clock speed of 100 Kbps by writing the **I2CMTPR** register with the correct value. The value written to the **I2CMTPR** register represents the number of system clock periods in one SCL clock period. The TPR value is determined by the following equation:

```
TPR = (System Clock / (2 * (SCL_LP + SCL_HP) * SCL_CLK)) - 1;

TPR = (20MHz / (2 * (6 + 4) * 100000)) - 1;

TPR = 9
```

Write the **I2CMTPR** register with the value of 0x0000.0009.

- **6.** Specify the slave address of the master and that the next operation will be a Send by writing the **I2CMSA** register with a value of 0x0000.0076. This sets the slave address to 0x3B.
- 7. Place data (byte) to be sent in the data register by writing the **I2CMDR** register with the desired data.
- **8.** Initiate a single byte send of the data from Master to Slave by writing the **I2CMCS** register with a value of 0x0000.0007 (STOP, START, RUN).
- **9.** Wait until the transmission completes by polling the **I2CMCS** register's BUSBSY bit until it has been cleared.

# 14.4 Register Map

Table 14-2 on page 357 lists the I<sup>2</sup>C registers. All addresses given are relative to the I<sup>2</sup>C base addresses for the master and slave:

I<sup>2</sup>C Master 0: 0x4002.0000
 I<sup>2</sup>C Slave 0: 0x4002.0800
 I<sup>2</sup>C Master 1: 0x4002.1000
 I<sup>2</sup>C Slave 1: 0x4002.1800

7:1	SA	R/W	0	I <sup>2</sup> C Slave Address
				This field specifies bits A6 through A0 of the slave address.
0	R/S	R/W	0	Receive/Send

The  $\mathbb{R}/S$  bit specifies if the next operation is a Receive (High) or Send (Low).

Value Description

0 Send.

1 Receive.

# Register 2: I<sup>2</sup>C Master Control/Status (I2CMCS), offset 0x004

This register accesses four control bits when written, and accesses seven status bits when read.

The status register consists of seven bits, which when read determine the state of the I<sup>2</sup>C bus controller.

The control register consists of four bits: the RUN, START, STOP, and ACK bits. The START bit causes the generation of the START, or REPEATED START condition.

The STOP bit determines if the cycle stops at the end of the data cycle, or continues on to a burst. To generate a single send cycle, the  $I^2C$  Master Slave Address (I2CMSA) register is written with the desired address, the R/S bit is set to 0, and the Control register is written with ACK=X (0 or 1), STOP=1, START=1, and RUN=1 to perform the operation and stop. When the operation is completed (or aborted due an error), the interrupt pin becomes active and the data may be read from the I2CMDR register. When the  $I^2C$  module operates in Master receiver mode, the ACK bit must be set normally to logic 1. This causes the  $I^2C$  bus controller to send an acknowledge automatically after each byte. This bit must be reset when the  $I^2C$  bus controller requires no further data to be sent from the slave transmitter.

				This bit specifies the result of the last data operation. If set, the transmitted data was not acknowledged; otherwise, the data was acknowledged.
2	ADRACK	RO	0	Acknowledge Address
				This bit specifies the result of the last address operation. If set, the transmitted address was not acknowledged; otherwise, the address was acknowledged.
1	ERROR	RO	0	Error
				This bit specifies the result of the last bus operation. If set, an error occurred on the last operation; otherwise, no error was detected. The error can be from the slave address not being acknowledged, the transmit data not being acknowledged, or because the controller lost arbitration.
0	BUSY	RO	0	I <sup>2</sup> C Busy
				This bit specifies the state of the controller. If set, the controller is busy; otherwise, the controller is idle. When the BUSY bit is set, the other status

bits are not valid.

#### Writes

#### I2C Master Control/Status (I2CMCS)

I2C Master 0 base: 0x4002.0000 I2C Master 1 base: 0x4002.1000 Offset 0x004 Type WO, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:4	reserved	WO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
3	ACK	WO	0	Data Acknowledge Enable
				When set, causes received data byte to be acknowledged automatically by the master. See field decoding in Table 14-3 on page 362.
2	STOP	WO	0	Generate STOP
				When set, causes the generation of the STOP condition. See field decoding in Table 14-3 on page 362.

Bit/Field	Name	Type	Reset	Description
1	START	WO	0	Generate START
				When set, causes the generation of a START or repeated START condition. See field decoding in Table 14-3 on page 362.
0	RUN	WO	0	I <sup>2</sup> C Master Enable

When set, allows the master to send or receive data. See field decoding in Table 14-3 on page 362.

Table 14-3. Write Field Decoding for I2CMCS[3:0] Field (Sheet 1 of 3)

	12CMSA[0]   12CMCS[3:0]			Description		
State	R/S	ACK	STOP	START	RUN	
Idle	0	X <sup>a</sup>	0	1	1	START condition followed by SEND (master goes to the Master Transmit state).
	0	Х	1	1	1	START condition followed by a SEND and STOP condition (master remains in Idle state).
	1	0	0	1	1	START condition followed by RECEIVE operation with negative ACK (master goes to the Master Receive state).
	1	0	1	1	1	START condition followed by RECEIVE and STOP condition (master remains in Idle state).
	1	1	0	1	1	START condition followed by RECEIVE (master goes to the Master Receive state).
	1	1	1	1	1	Illegal.
	All other co	mbination	s not listed	are non-op	erations.	NOP.
Master Transmit	Х	Х	0	0	1	SEND operation (master remains in Master Transmit state).
	Х	Х	1	0	0	STOP condition (master goes to Idle state).
	Х	Х	1	0	1	SEND followed by STOP condition (master goes to Idle state).
	0	Х	0	1	1	Repeated START condition followed by a SEND (master remains in Master Transmit state).
	0	Х	1	1	1	Repeated START condition followed by SEND and STOP condition (master goes to Idle state).
	1	0	0	1	1	Repeated START condition followed by a RECEIVE operation with a negative ACK (master goes to Master Receive state).
	1	0	1	1	1	Repeated START condition followed by a SEND and STOP condition (master goes to Idle state).
	1	1	0	1	1	Repeated START condition followed by RECEIVE (master goes to Master Receive state).
	1	1	1	1	1	Illegal.
	All other co	mbination	s not listed	are non-op	erations.	NOP.

Table 14-3. Write Field Decoding for I2CMCS[3:0] Field (Sheet 1 of 3) (continued)

Current	I2CMSA[0]		I2CMC	S[3:0]		Description
State	R/S	ACK	STOP	START	RUN	
Master Receive	Х	0	0	0	1	RECEIVE operation with negative ACK (master remains in Master Receive state).
	Х	Х	1	0	0	STOP condition (master goes to Idle state).b
	Х	0	1	0	1	RECEIVE followed by STOP condition (master goes to Idle state).
	Х	1	0	0	1	RECEIVE operation (master remains in Master Receive state).
	Х	1	1	0	1	Illegal.
	1	0	0	1	1	Repeated START condition followed by RECEIVE operation with a negative ACK (master remains in Master Receive state).
	1	0	1	1	1	Repeated START condition followed by RECEIVE and STOP condition (master goes to Idle state).
	1	1	0	1	1	Repeated START condition followed by RECEIVE (master remains in Master Receive state).
	0	Х	0	1	1	Repeated START condition followed by SEND (master goes to Master Transmit state).
	0	Х	1	1	1	Repeated START condition followed by SEND and STOP condition (master goes to Idle state).
	All other co	mbination	s not listed	are non-op	erations.	NOP.

a. An X in a table cell indicates the bit can be 0 or 1.

b. In Master Receive mode, a STOP condition should be generated only after a Data Negative Acknowledge executed by the master or an Address Negative Acknowledge executed by the slave.

## Register 3: I<sup>2</sup>C Master Data (I2CMDR), offset 0x008

**Important:** Use caution when reading this register. Performing a read may change bit status.

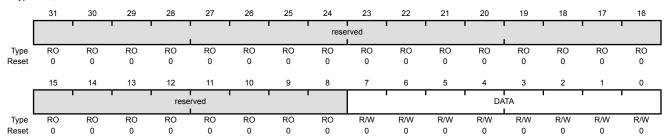

This register contains the data to be transmitted when in the Master Transmit state, and the data received when in the Master Receive state.

#### I2C Master Data (I2CMDR)

I2C Master 0 base: 0x4002.0000 I2C Master 1 base: 0x4002.1000

Offset 0x008

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	DATA	R/W	0x00	Data Transferred

Data transferred during transaction.

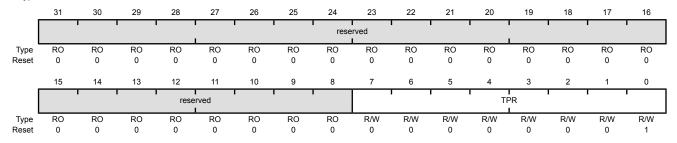

## Register 4: I<sup>2</sup>C Master Timer Period (I2CMTPR), offset 0x00C

This register specifies the period of the SCL clock.

#### I2C Master Timer Period (I2CMTPR)

I2C Master 0 base: 0x4002.0000 I2C Master 1 base: 0x4002.1000 Offset 0x00C

Type R/W, reset 0x0000.0001

Bit/Field	Name	Туре	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	TPR	R/W	0x1	SCL Clock Period

This field specifies the period of the SCL clock.

SCL\_PRD = 2\*(1 + TPR)\*(SCL\_LP + SCL\_HP)\*CLK\_PRD

#### where:

 ${\tt SCL\_PRD}$  is the SCL line period (I ${\tt ^2C}$  clock).

 $\ensuremath{\mathtt{TPR}}$  is the Timer Period register value (range of 1 to 255).

SCL\_LP is the SCL Low period (fixed at 6).

 ${\tt SCL\_HP}$  is the SCL High period (fixed at 4).

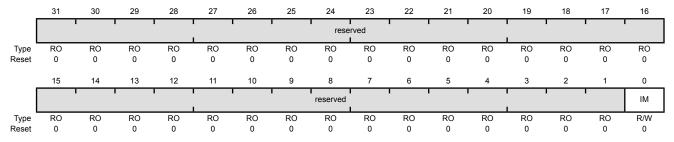

## Register 5: I<sup>2</sup>C Master Interrupt Mask (I2CMIMR), offset 0x010

This register controls whether a raw interrupt is promoted to a controller interrupt.

#### I2C Master Interrupt Mask (I2CMIMR)

I2C Master 0 base: 0x4002.0000 I2C Master 1 base: 0x4002.1000 Offset 0x010

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:1	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
0	IM	R/W	0	Interrupt Mask

This bit controls whether a raw interrupt is promoted to a controller interrupt. If set, the interrupt is not masked and the interrupt is promoted; otherwise, the interrupt is masked.

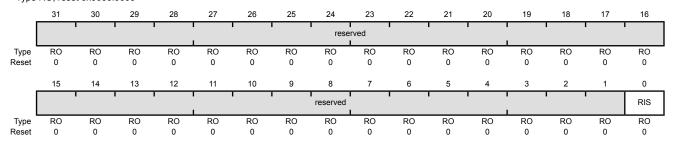

# Register 6: I<sup>2</sup>C Master Raw Interrupt Status (I2CMRIS), offset 0x014

This register specifies whether an interrupt is pending.

#### I2C Master Raw Interrupt Status (I2CMRIS)

I2C Master 0 base: 0x4002.0000 I2C Master 1 base: 0x4002.1000 Offset 0x014

Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:1	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
0	RIS	RO	0	Raw Interrupt Status

This bit specifies the raw interrupt state (prior to masking) of the  $I^2C$  master block. If set, an interrupt is pending; otherwise, an interrupt is not pending.

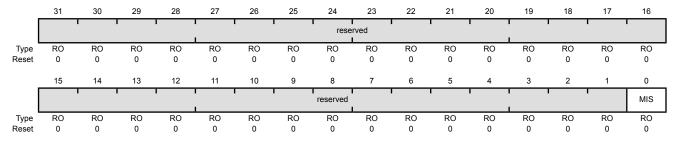

## Register 7: I<sup>2</sup>C Master Masked Interrupt Status (I2CMMIS), offset 0x018

This register specifies whether an interrupt was signaled.

#### I2C Master Masked Interrupt Status (I2CMMIS)

I2C Master 0 base: 0x4002.0000 I2C Master 1 base: 0x4002.1000 Offset 0x018

Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:1	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
0	MIS	RO	0	Masked Interrupt Status

This bit specifies the raw interrupt state (after masking) of the I<sup>2</sup>C master block. If set, an interrupt was signaled; otherwise, an interrupt has not been generated since the bit was last cleared.

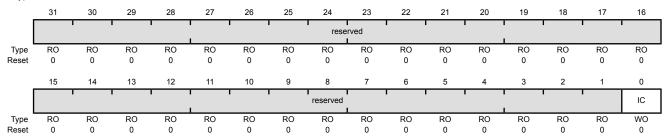

## Register 8: I<sup>2</sup>C Master Interrupt Clear (I2CMICR), offset 0x01C

This register clears the raw interrupt.

#### I2C Master Interrupt Clear (I2CMICR)

I2C Master 0 base: 0x4002.0000 I2C Master 1 base: 0x4002.1000 Offset 0x01C

Type WO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:1	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
0	IC	WO	0	Interrupt Clear

This bit controls the clearing of the raw interrupt. A write of 1 clears the interrupt; otherwise, a write of 0 has no affect on the interrupt state. A read of this register returns no meaningful data.

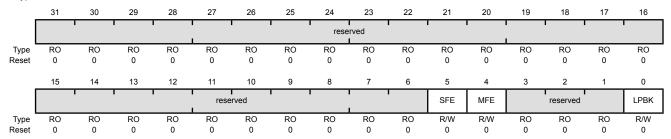

## Register 9: I<sup>2</sup>C Master Configuration (I2CMCR), offset 0x020

This register configures the mode (Master or Slave) and sets the interface for test mode loopback.

#### I2C Master Configuration (I2CMCR)

I2C Master 0 base: 0x4002.0000 I2C Master 1 base: 0x4002.1000 Offset 0x020

Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:6	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
5	SFE	R/W	0	I <sup>2</sup> C Slave Function Enable
				This bit specifies whether the interface may operate in Slave mode. If set, Slave mode is enabled; otherwise, Slave mode is disabled.
4	MFE	R/W	0	I <sup>2</sup> C Master Function Enable
				This bit specifies whether the interface may operate in Master mode. If set, Master mode is enabled; otherwise, Master mode is disabled and the interface clock is disabled.
3:1	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
0	LPBK	R/W	0	I <sup>2</sup> C Loopback

This bit specifies whether the interface is operating normally or in Loopback mode. If set, the device is put in a test mode loopback configuration; otherwise, the device operates normally.

# 14.6 Register Descriptions (I<sup>2</sup>C Slave)

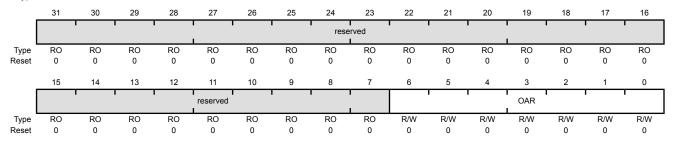

The remainder of this section lists and describes the  $I^2C$  slave registers, in numerical order by address offset. See also "Register Descriptions ( $I^2C$  Master)" on page 358.

## Register 10: I<sup>2</sup>C Slave Own Address (I2CSOAR), offset 0x000

This register consists of seven address bits that identify the Stellaris<sup>®</sup> I<sup>2</sup>C device on the I<sup>2</sup>C bus.

#### I2C Slave Own Address (I2CSOAR)

I2C Slave 0 base: 0x4002.0800 I2C Slave 1 base: 0x4002.1800 Offset 0x000 Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:7	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
6:0	OAR	R/W	0x00	I <sup>2</sup> C Slave Own Address

This field specifies bits A6 through A0 of the slave address.

## Register 11: I<sup>2</sup>C Slave Control/Status (I2CSCSR), offset 0x004

This register accesses one control bit when written, and three status bits when read.

The read-only Status register consists of three bits: the FBR, RREQ, and TREQ bits. The First Byte Received (FBR) bit is set only after the Stellaris® device detects its own slave address and receives the first data byte from the  $I^2C$  master. The Receive Request (RREQ) bit indicates that the Stellaris®  $I^2C$  device has received a data byte from an  $I^2C$  master. Read one data byte from the  $I^2C$  Slave Data (I2CSDR) register to clear the RREQ bit. The Transmit Request (TREQ) bit indicates that the Stellaris®  $I^2C$  device is addressed as a Slave Transmitter. Write one data byte into the  $I^2C$  Slave Data (I2CSDR) register to clear the TREQ bit.

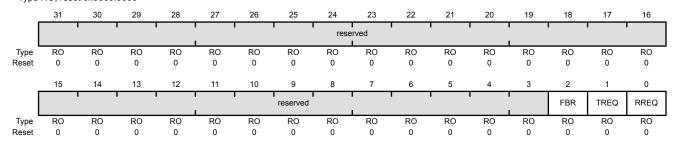

The write-only Control register consists of one bit: the DA bit. The DA bit enables and disables the Stellaris $^{\circ}$  I<sup>2</sup>C slave operation.

#### Reads

Dit/Eiold

I2C Slave Control/Status (I2CSCSR)

I2C Slave 0 base: 0x4002.0800 I2C Slave 1 base: 0x4002.1800 Offset 0x004 Type RO, reset 0x0000.0000

Bit/Field	name	туре	Reset	Description
31:3	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
2	FBR	RO	0	First Byte Received
				Indicates that the first byte following the slave's own address is received. This bit is only valid when the RREQ bit is set, and is automatically cleared when data has been read from the I2CSDR register.
				<b>Note:</b> This bit is not used for slave transmit operations.
1	TREQ	RO	0	Transmit Request

This bit specifies the state of the  $I^2C$  slave with regards to outstanding transmit requests. If set, the  $I^2C$  unit has been addressed as a slave transmitter and uses clock stretching to delay the master until data has been written to the  $I^2CSDR$  register. Otherwise, there is no outstanding transmit request.

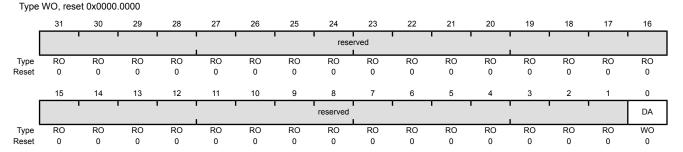

Bit/Field	Name	Type	Reset	Description
0	RREQ	RO	0	Receive Request

This bit specifies the status of the  $I^2C$  slave with regards to outstanding receive requests. If set, the  $I^2C$  unit has outstanding receive data from the  $I^2C$  master and uses clock stretching to delay the master until the data has been read from the  $I^2CSDR$  register. Otherwise, no receive data is outstanding.

#### Writes

#### I2C Slave Control/Status (I2CSCSR)

I2C Slave 0 base: 0x4002.0800 I2C Slave 1 base: 0x4002.1800 Offset 0x004

Bit/Field	Name	Type	Reset	Description
31:1	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
0	DΔ	WO	0	Device Active

Value Description

- 0 Disables the I<sup>2</sup>C slave operation.
- 1 Enables the I<sup>2</sup>C slave operation.

## Register 12: I<sup>2</sup>C Slave Data (I2CSDR), offset 0x008

**Important:** Use caution when reading this register. Performing a read may change bit status.

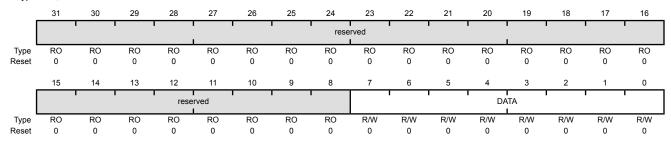

This register contains the data to be transmitted when in the Slave Transmit state, and the data received when in the Slave Receive state.

#### I2C Slave Data (I2CSDR)

I2C Slave 0 base: 0x4002.0800 I2C Slave 1 base: 0x4002.1800

Offset 0x008

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:8	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
7:0	DATA	R/W	0x0	Data for Transfer

This field contains the data for transfer during a slave receive or transmit operation.

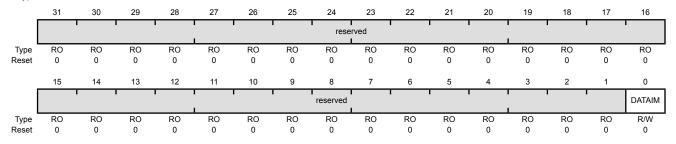

## Register 13: I<sup>2</sup>C Slave Interrupt Mask (I2CSIMR), offset 0x00C

This register controls whether a raw interrupt is promoted to a controller interrupt.

#### I2C Slave Interrupt Mask (I2CSIMR)

I2C Slave 0 base: 0x4002.0800 I2C Slave 1 base: 0x4002.1800 Offset 0x00C

Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:1	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
0	DATAIM	R/W	0	Data Interrupt Mask

This bit controls whether the raw interrupt for data received and data requested is promoted to a controller interrupt. If set, the interrupt is not masked and the interrupt is promoted; otherwise, the interrupt is masked.

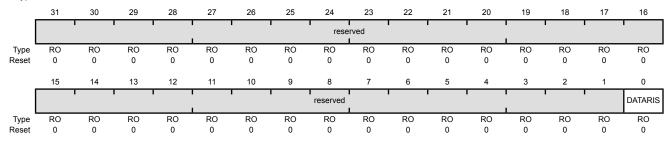

## Register 14: I<sup>2</sup>C Slave Raw Interrupt Status (I2CSRIS), offset 0x010

This register specifies whether an interrupt is pending.

#### I2C Slave Raw Interrupt Status (I2CSRIS)

I2C Slave 0 base: 0x4002.0800 I2C Slave 1 base: 0x4002.1800 Offset 0x010

Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:1	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
0	DATARIS	RO	0	Data Raw Interrupt Status

This bit specifies the raw interrupt state for data received and data requested (prior to masking) of the I<sup>2</sup>C slave block. If set, an interrupt is pending; otherwise, an interrupt is not pending.

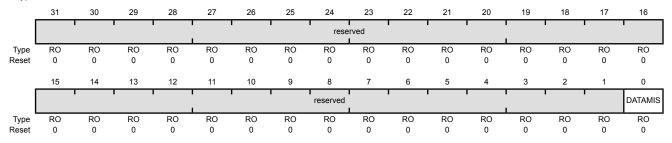

## Register 15: I<sup>2</sup>C Slave Masked Interrupt Status (I2CSMIS), offset 0x014

This register specifies whether an interrupt was signaled.

#### I2C Slave Masked Interrupt Status (I2CSMIS)

I2C Slave 0 base: 0x4002.0800 I2C Slave 1 base: 0x4002.1800 Offset 0x014

Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:1	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
0	DATAMIS	RO	0	Data Masked Interrupt Status

This bit specifies the interrupt state for data received and data requested (after masking) of the I<sup>2</sup>C slave block. If set, an interrupt was signaled; otherwise, an interrupt has not been generated since the bit was last cleared.

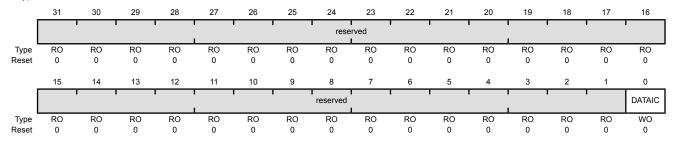

## Register 16: I<sup>2</sup>C Slave Interrupt Clear (I2CSICR), offset 0x018

This register clears the raw interrupt. A read of this register returns no meaningful data.

#### I2C Slave Interrupt Clear (I2CSICR)

I2C Slave 0 base: 0x4002.0800 I2C Slave 1 base: 0x4002.1800 Offset 0x018

Type WO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:1	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
0	DATAIC	WO	0	Data Interrupt Clear

This bit controls the clearing of the raw interrupt for data received and data requested. When set, it clears the DATARIS interrupt bit; otherwise, it has no effect on the DATARIS bit value.

## 15 Analog Comparators

An analog comparator is a peripheral that compares two analog voltages, and provides a logical output that signals the comparison result.

**Note:** Not all comparators have the option to drive an output pin.

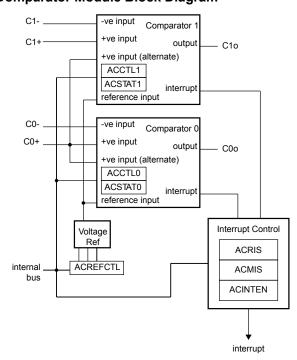

The comparator can provide its output to a device pin, acting as a replacement for an analog comparator on the board, or it can be used to signal the application via interrupts to cause it to start capturing a sample sequence.

The Stellaris<sup>®</sup> Analog Comparators module has the following features:

- Two independent integrated analog comparators
- Configurable for output to drive an output pin or generate an interrupt
- Compare external pin input to external pin input or to internal programmable voltage reference
- Compare a test voltage against any one of these voltages
  - An individual external reference voltage
  - A shared single external reference voltage
  - A shared internal reference voltage

## 15.1 Block Diagram

Figure 15-1. Analog Comparator Module Block Diagram

## 15.2 Functional Description

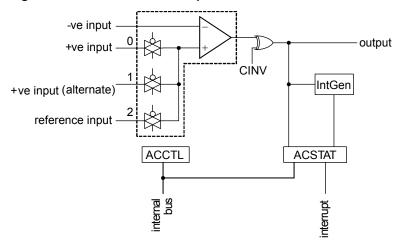

**Important:** It is recommended that the Digital-Input enable (the GPIODEN bit in the GPIO module) for the analog input pin be disabled to prevent excessive current draw from the I/O pads.

The comparator compares the VIN- and VIN+ inputs to produce an output, VOUT.

```
VIN- < VIN+, VOUT = 1
VIN- > VIN+, VOUT = 0
```

As shown in Figure 15-2 on page 381, the input source for VIN- is an external input. In addition to an external input, input sources for VIN+ can be the +ve input of comparator 0 or an internal reference.

Figure 15-2. Structure of Comparator Unit

A comparator is configured through two status/control registers (ACCTL and ACSTAT). The internal reference is configured through one control register (ACREFCTL). Interrupt status and control is configured through three registers (ACMIS, ACRIS, and ACINTEN).

Typically, the comparator output is used internally to generate controller interrupts. It may also be used to drive an external pin.

**Important:** The ASRCP bits in the **ACCTLn** register must be set before using the analog comparators.

#### 15.2.1 Internal Reference Programming

The structure of the internal reference is shown in Figure 15-3 on page 382. This is controlled by a single configuration register (**ACREFCTL**). Table 15-1 on page 382 shows the programming options to develop specific internal reference values, to compare an external voltage against a particular voltage generated internally.

Figure 15-3. Comparator Internal Reference Structure

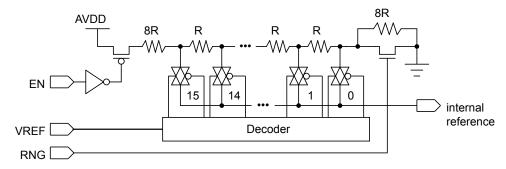

Table 15-1. Internal Reference Voltage and ACREFCTL Field Values

ACREFCTL Regi	ster	Output Reference Voltage Based on VREF Field Value		
EN Bit Value	RNG Bit Value			
EN=0	RNG=X	0 V (GND) for any value of VREF; however, it is recommended that RNG=1 and VREF=0 for the least noisy ground reference.		
EN=1		Total resistance in ladder is 31 R. $V_{REF} = AV_{DD} \times \frac{Rv_{REF}}{R_T}$ $V_{REF} = AV_{DD} \times \frac{(VREF + 8)}{31}$ $V_{REF} = 0.85 + 0.106 \times VREF$ The range of internal reference in this mode is 0.85-2.448 V.		
		Total resistance in ladder is 23 R. $V_{\it REF} = AV_{\it DD} \times \frac{Rv_{\it REF}}{Rr}$ $V_{\it REF} = AV_{\it DD} \times \frac{VREF}{23}$ $V_{\it REF} = 0.143 \times VREF$ The range of internal reference for this mode is 0-2.152 V.		

## 15.3 Initialization and Configuration

The following example shows how to configure an analog comparator to read back its output value from an internal register.

- 1. Enable the analog comparator 0 clock by writing a value of 0x0010.0000 to the **RCGC1** register in the System Control module.
- 2. In the GPIO module, enable the GPIO port/pin associated with C0 as a GPIO input.
- **3.** Configure the internal voltage reference to 1.65 V by writing the **ACREFCTL** register with the value 0x0000.030C.

- **4.** Configure comparator 0 to use the internal voltage reference and to *not* invert the output by writing the **ACCTL0** register with the value of 0x0000.040C.
- **5.** Delay for some time.
- **6.** Read the comparator output value by reading the **ACSTAT0** register's OVAL value.

Change the level of the signal input on CO- to see the OVAL value change.

## 15.4 Register Map

Table 15-2 on page 383 lists the comparator registers. The offset listed is a hexadecimal increment to the register's address, relative to the Analog Comparator base address of 0x4003.C000.

Table 15-2. Analog Comparators Register Map

Offset	Name	Туре	Reset	Description	See page
0x000	ACMIS	R/W1C	0x0000.0000	Analog Comparator Masked Interrupt Status	384
0x004	ACRIS	RO	0x0000.0000	Analog Comparator Raw Interrupt Status	385
0x008	ACINTEN	R/W	0x0000.0000	Analog Comparator Interrupt Enable	386
0x010	ACREFCTL	R/W	0x0000.0000	Analog Comparator Reference Voltage Control	387
0x020	ACSTAT0	RO	0x0000.0000	Analog Comparator Status 0	388
0x024	ACCTL0	R/W	0x0000.0000	Analog Comparator Control 0	389
0x040	ACSTAT1	RO	0x0000.0000	Analog Comparator Status 1	388
0x044	ACCTL1	R/W	0x0000.0000	Analog Comparator Control 1	389

## 15.5 Register Descriptions

The remainder of this section lists and describes the Analog Comparator registers, in numerical order by address offset.

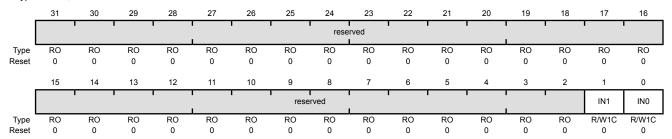

## Register 1: Analog Comparator Masked Interrupt Status (ACMIS), offset 0x000

This register provides a summary of the interrupt status (masked) of the comparators.

Analog Comparator Masked Interrupt Status (ACMIS)

Base 0x4003.C000 Offset 0x000

Type R/W1C, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:2	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	IN1	R/W1C	0	Comparator 1 Masked Interrupt Status
				Gives the masked interrupt state of this interrupt. Write 1 to this bit to clear the pending interrupt.
0	IN0	R/W1C	0	Comparator 0 Masked Interrupt Status

Gives the masked interrupt state of this interrupt. Write 1 to this bit to clear the pending interrupt.

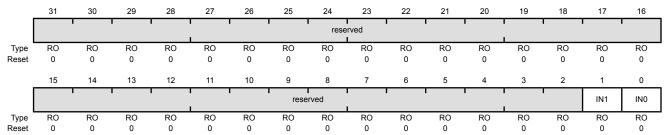

## Register 2: Analog Comparator Raw Interrupt Status (ACRIS), offset 0x004

This register provides a summary of the interrupt status (raw) of the comparators.

Analog Comparator Raw Interrupt Status (ACRIS)

Base 0x4003.C000 Offset 0x004

Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:2	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	IN1	RO	0	Comparator 1 Interrupt Status  When set, indicates that an interrupt has been generated by comparator 1.
0	IN0	RO	0	Comparator 0 Interrupt Status  When set, indicates that an interrupt has been generated by comparator

0.

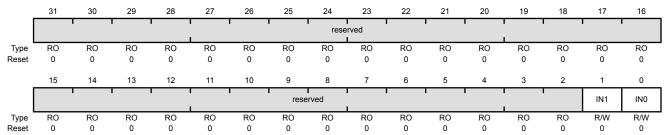

## Register 3: Analog Comparator Interrupt Enable (ACINTEN), offset 0x008

This register provides the interrupt enable for the comparators.

Analog Comparator Interrupt Enable (ACINTEN)

Base 0x4003.C000

Offset 0x008 Type R/W, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:2	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	IN1	R/W	0	Comparator 1 Interrupt Enable
				When set, enables the controller interrupt from the comparator 1 output.
0	IN0	R/W	0	Comparator 0 Interrupt Enable

When set, enables the controller interrupt from the comparator 0 output.

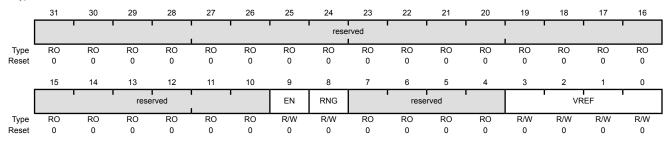

### Register 4: Analog Comparator Reference Voltage Control (ACREFCTL), offset 0x010

This register specifies whether the resistor ladder is powered on as well as the range and tap.

Analog Comparator Reference Voltage Control (ACREFCTL)

Base 0x4003.C000

Offset 0x010
Type R/W, reset 0x0000.0000

Bit/Field	Name	Туре	Reset	Description
31:10	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
9	EN	R/W	0	Resistor Ladder Enable
				The EN bit specifies whether the resistor ladder is powered on. If 0, the resistor ladder is unpowered. If 1, the resistor ladder is connected to the analog $V_{\text{DD}}$ .
				This bit is reset to 0 so that the internal reference consumes the least amount of power if not used and programmed.
8	RNG	R/W	0	Resistor Ladder Range
				The RNG bit specifies the range of the resistor ladder. If 0, the resistor ladder has a total resistance of 31 R. If 1, the resistor ladder has a total resistance of 23 R.
7:4	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
3:0	VREF	R/W	0x00	Resistor Ladder Voltage Ref

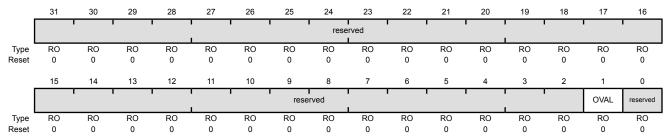

The  $\mathtt{VREF}$  bit field specifies the resistor ladder tap that is passed through an analog multiplexer. The voltage corresponding to the tap position is the internal reference voltage available for comparison. See Table 15-1 on page 382 for some output reference voltage examples.

## Register 5: Analog Comparator Status 0 (ACSTAT0), offset 0x020 Register 6: Analog Comparator Status 1 (ACSTAT1), offset 0x040

These registers specify the current output value of the comparator.

## Analog Comparator Status 0 (ACSTAT0)

Base 0x4003.C000 Offset 0x020 Type RO, reset 0x0000.0000

Bit/Field	Name	Type	Reset	Description
31:2	reserved	RO	0x00	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.
1	OVAL	RO	0	Comparator Output Value  The OVAL bit specifies the current output value of the comparator.
0	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

# Register 7: Analog Comparator Control 0 (ACCTL0), offset 0x024 Register 8: Analog Comparator Control 1 (ACCTL1), offset 0x044

These registers configure the comparator's input and output.

Analog Comparator Control 0 (ACCTL0)

Base 0x4003.C000 Offset 0x024

8:5

reserved

ISLVAL

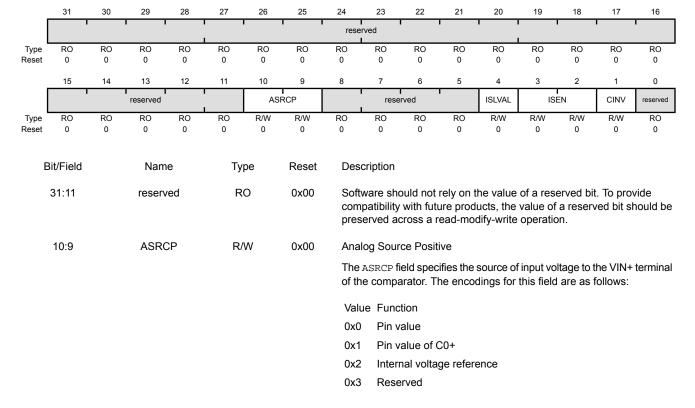

RO

R/W

0

0

Type R/W, reset 0x0000.0000

The ISLVAL bit specifies the sense value of the input that generates an interrupt if in Level Sense mode. If 0, an interrupt is generated if the comparator output is Low. Otherwise, an interrupt is generated if the comparator output is High.

Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be

preserved across a read-modify-write operation.

Interrupt Sense Level Value

Bit/Field	Name	Туре	Reset	Description
3:2	ISEN	R/W	0x0	Interrupt Sense
				The ISEN field specifies the sense of the comparator output that generates an interrupt. The sense conditioning is as follows:
				Value Function
				0x0 Level sense, see ISLVAL
				0x1 Falling edge
				0x2 Rising edge
				0x3 Either edge
1	CINV	R/W	0	Comparator Output Invert
				The CINV bit conditionally inverts the output of the comparator. If 0, the output of the comparator is unchanged. If 1, the output of the comparator is inverted prior to being processed by hardware.
0	reserved	RO	0	Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.

# 16 Pin Diagram

# 17 Signal Tables

The following tables list the signals available for each pin. Functionality is enabled by software with the **GPIOAFSEL** register.

**Important:** All multiplexed pins are GPIOs by default, with the exception of the five JTAG pins (PB7 and PC[3:0]) which default to the JTAG functionality.

Table 17-1 on page 393 shows the pin-to-signal-name mapping, including functional characteristics of the signals. Table 17-2 on page 397 lists the signals in alphabetical order by signal name.

Table 17-3 on page 401 groups the signals by functionality, except for GPIOs. Table 17-4 on page 403 lists the GPIO pins and their alternate functionality.

## 17.1 100-Pin LQFP Package Pin Tables

Table 17-1. Signals by Pin Number

Pin Number	Pin Name	Pin Type	Buffer Type <sup>a</sup>	Description
1	PE7	I/O	TTL	GPIO port E bit 7.
2	PE6	I/O	TTL	GPIO port E bit 6.
	Clo	0	TTL	Analog comparator 1 output.
3	VDDA	-	Power	The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions.
4	GNDA	-	Power	The ground reference for the analog circuits (Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.
5	PE5	I/O	TTL	GPIO port E bit 5.
6	PE4	I/O	TTL	GPIO port E bit 4.
7	LDO	-	Power	Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDD25 pins at the board level in addition to the decoupling capacitor(s).
8	VDD	-	Power	Positive supply for I/O and some logic.
9	GND	-	Power	Ground reference for logic and I/O pins.
10	PD0	I/O	TTL	GPIO port D bit 0.
11	PD1	I/O	TTL	GPIO port D bit 1.
12	PD2	I/O	TTL	GPIO port D bit 2.
	UlRx	I	TTL	UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.
13	PD3	I/O	TTL	GPIO port D bit 3.
	UlTx	0	TTL	UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.
14	VDD25	-	Power	Positive supply for most of the logic function, including the processor core and most peripherals.
15	GND	-	Power	Ground reference for logic and I/O pins.
16	PG3	I/O	TTL	GPIO port G bit 3.

Table 17-1. Signals by Pin Number (continued)

Pin Number	Pin Name	Pin Type	Buffer Type <sup>a</sup>	Description
17	PG2	I/O	TTL	GPIO port G bit 2.
18	PG1	I/O	TTL	GPIO port G bit 1.
	U2Tx	0	TTL	UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.
19	PG0	I/O	TTL	GPIO port G bit 0.
	U2Rx	I	TTL	UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.
20	VDD	-	Power	Positive supply for I/O and some logic.
21	GND	-	Power	Ground reference for logic and I/O pins.
22	PC7	I/O	TTL	GPIO port C bit 7.
	CCP4	I/O	TTL	Capture/Compare/PWM 4.
23	PC6	I/O	TTL	GPIO port C bit 6.
	CCP3	I/O	TTL	Capture/Compare/PWM 3.
24	PC5	I/O	TTL	GPIO port C bit 5.
	C1+	I	Analog	Analog comparator 1 positive input.
25	PC4	I/O	TTL	GPIO port C bit 4.
	CCP5	I/O	TTL	Capture/Compare/PWM 5.
26	PA0	I/O	TTL	GPIO port A bit 0.
	U0Rx	1	TTL	UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.
27	PA1	I/O	TTL	GPIO port A bit 1.
	UOTx	0	TTL	UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.
28	PA2	I/O	TTL	GPIO port A bit 2.
	SSI0Clk	I/O	TTL	SSI module 0 clock.
29	PA3	I/O	TTL	GPIO port A bit 3.
	SSI0Fss	I/O	TTL	SSI module 0 frame.
30	PA4	I/O	TTL	GPIO port A bit 4.
	SSIORx	I	TTL	SSI module 0 receive.
31	PA5	I/O	TTL	GPIO port A bit 5.
	SSIOTX	0	TTL	SSI module 0 transmit.
32	VDD	-	Power	Positive supply for I/O and some logic.
33	GND	-	Power	Ground reference for logic and I/O pins.
34	PA6	I/O	TTL	GPIO port A bit 6.
	I2C1SCL	I/O	OD	I <sup>2</sup> C module 1 clock.
35	PA7	I/O	TTL	GPIO port A bit 7.
	I2C1SDA	I/O	OD	I <sup>2</sup> C module 1 data.
36	PG7	I/O	TTL	GPIO port G bit 7.
37	PG6	I/O	TTL	GPIO port G bit 6.
38	VDD25	-	Power	Positive supply for most of the logic function, including the processor core and most peripherals.
39	GND	-	Power	Ground reference for logic and I/O pins.
40	PG5	I/O	TTL	GPIO port G bit 5.

Table 17-1. Signals by Pin Number (continued)

Pin Number	Pin Name	Pin Type	Buffer Type <sup>a</sup>	Description
41	PG4	I/O	TTL	GPIO port G bit 4.
42	PF7	I/O	TTL	GPIO port F bit 7.
43	PF6	I/O	TTL	GPIO port F bit 6.
44	VDD	-	Power	Positive supply for I/O and some logic.
45	GND	-	Power	Ground reference for logic and I/O pins.
46	PF5	I/O	TTL	GPIO port F bit 5.
47	PF0	I/O	TTL	GPIO port F bit 0.
48	osc0	I	Analog	Main oscillator crystal input or an external clock reference input.
49	OSC1	0	Analog	Main oscillator crystal output.
50	WAKE	I	TTL	An external input that brings the processor out of Hibernate mode when asserted.
51	ΉΙΒ	0	OD	An open-drain output with internal pull-up that indicates the processor is in Hibernate mode.
52	xosc0	I	Analog	Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.
53	XOSC1	0	Analog	Hibernation module oscillator crystal output.
54	GND	-	Power	Ground reference for logic and I/O pins.
55	VBAT	-	Power	Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.
56	VDD	-	Power	Positive supply for I/O and some logic.
57	GND	-	Power	Ground reference for logic and I/O pins.
58	PF4	I/O	TTL	GPIO port F bit 4.
Γ	C0o	0	TTL	Analog comparator 0 output.
59	PF3	I/O	TTL	GPIO port F bit 3.
60	PF2	I/O	TTL	GPIO port F bit 2.
61	PF1	I/O	TTL	GPIO port F bit 1.
62	VDD25	-	Power	Positive supply for most of the logic function, including the processor core and most peripherals.
63	GND	-	Power	Ground reference for logic and I/O pins.
64	RST	I	TTL	System reset input.
65	CMOD0	I/O	TTL	CPU Mode bit 0. Input must be set to logic 0 (grounded); other encodings reserved.
66	PB0	I/O	TTL	GPIO port B bit 0.
	CCP0	I/O	TTL	Capture/Compare/PWM 0.
67	PB1	I/O	TTL	GPIO port B bit 1.
	CCP2	I/O	TTL	Capture/Compare/PWM 2.
68	VDD	-	Power	Positive supply for I/O and some logic.
69	GND	-	Power	Ground reference for logic and I/O pins.
70	PB2	I/O	TTL	GPIO port B bit 2.
	I2C0SCL	I/O	OD	I <sup>2</sup> C module 0 clock.

Table 17-1. Signals by Pin Number (continued)

Pin Number	Pin Name	Pin Type	Buffer Type <sup>a</sup>	Description
71	PB3	I/O	TTL	GPIO port B bit 3.
	I2C0SDA	I/O	OD	I <sup>2</sup> C module 0 data.
72	PE0	I/O	TTL	GPIO port E bit 0.
	SSI1Clk	I/O	TTL	SSI module 1 clock.
73	PE1	I/O	TTL	GPIO port E bit 1.
	SSI1Fss	I/O	TTL	SSI module 1 frame.
74	PE2	I/O	TTL	GPIO port E bit 2.
	SSI1Rx	I	TTL	SSI module 1 receive.
75	PE3	I/O	TTL	GPIO port E bit 3.
	SSI1Tx	0	TTL	SSI module 1 transmit.
76	CMOD1	I/O	TTL	CPU Mode bit 1. Input must be set to logic 0 (grounded); other encodings reserved.
77	PC3	I/O	TTL	GPIO port C bit 3.
	TDO	0	TTL	JTAG TDO and SWO.
	SWO	0	TTL	JTAG TDO and SWO.
78	PC2	I/O	TTL	GPIO port C bit 2.
	TDI	I	TTL	JTAG TDI.
79	PC1	I/O	TTL	GPIO port C bit 1.
	TMS	I/O	TTL	JTAG TMS and SWDIO.
	SWDIO	I/O	TTL	JTAG TMS and SWDIO.
80	PC0	I/O	TTL	GPIO port C bit 0.
	TCK	I	TTL	JTAG/SWD CLK.
	SWCLK	I	TTL	JTAG/SWD CLK.
81	VDD	-	Power	Positive supply for I/O and some logic.
82	GND	-	Power	Ground reference for logic and I/O pins.
83	РН3	I/O	TTL	GPIO port H bit 3.
84	PH2	I/O	TTL	GPIO port H bit 2.
85	PH1	I/O	TTL	GPIO port H bit 1.
	CCP7	I/O	TTL	Capture/Compare/PWM 7.
86	РН0	I/O	TTL	GPIO port H bit 0.
	CCP6	I/O	TTL	Capture/Compare/PWM 6.
87	GND	-	Power	Ground reference for logic and I/O pins.
88	VDD25	-	Power	Positive supply for most of the logic function, including the processor core and most peripherals.
89	PB7	I/O	TTL	GPIO port B bit 7.
	TRST	I	TTL	JTAG TRST.
90	PB6	I/O	TTL	GPIO port B bit 6.
	C0+	I	Analog	Analog comparator 0 positive input.
91	PB5	I/O	TTL	GPIO port B bit 5.
	C1-	I	Analog	Analog comparator 1 negative input.
92	PB4	I/O	TTL	GPIO port B bit 4.
	C0-	I	Analog	Analog comparator 0 negative input.

Table 17-1. Signals by Pin Number (continued)

Pin Number	Pin Name	Pin Type	Buffer Type <sup>a</sup>	Description
93	VDD	-	Power	Positive supply for I/O and some logic.
94	GND	-	Power	Ground reference for logic and I/O pins.
95	PD4	I/O	TTL	GPIO port D bit 4.
96	PD5	I/O	TTL	GPIO port D bit 5.
97	GNDA	-	Power	The ground reference for the analog circuits (Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.
98	VDDA	-	Power The positive supply (3.3 V) for the analog circuits (ADC, Comparators, etc.). These are separated from VDD to n the electrical noise contained on VDD from affecting the functions.	
99	PD6	I/O	TTL	GPIO port D bit 6.
100	PD7	I/O	TTL	GPIO port D bit 7.
	CCP1	I/O	TTL	Capture/Compare/PWM 1.

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 17-2. Signals by Signal Name

Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
C0+	90	I	Analog	Analog comparator 0 positive input.
C0-	92	I	Analog	Analog comparator 0 negative input.
C0o	58	0	TTL	Analog comparator 0 output.
C1+	24	I	Analog	Analog comparator 1 positive input.
C1-	91	I	Analog	Analog comparator 1 negative input.
Clo	2	0	TTL	Analog comparator 1 output.
CCP0	66	I/O	TTL	Capture/Compare/PWM 0.
CCP1	100	I/O	TTL	Capture/Compare/PWM 1.
CCP2	67	I/O	TTL	Capture/Compare/PWM 2.
CCP3	23	I/O	TTL	Capture/Compare/PWM 3.
CCP4	22	I/O	TTL	Capture/Compare/PWM 4.
CCP5	25	I/O	TTL	Capture/Compare/PWM 5.
CCP6	86	I/O	TTL	Capture/Compare/PWM 6.
CCP7	85	I/O	TTL	Capture/Compare/PWM 7.
CMOD0	65	I/O	TTL	CPU Mode bit 0. Input must be set to logic 0 (grounded); other encodings reserved.
CMOD1	76	I/O	TTL	CPU Mode bit 1. Input must be set to logic 0 (grounded); other encodings reserved.

Table 17-2. Signals by Signal Name (continued)

Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
GND	9 15 21 33 39 45 54 57 63 69 82 87 94	-	Power	Ground reference for logic and I/O pins.
GNDA	4 97	-	Power	The ground reference for the analog circuits ( Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.
HIB	51	0	OD	An open-drain output with internal pull-up that indicates the processor is in Hibernate mode.
I2C0SCL	70	I/O	OD	I <sup>2</sup> C module 0 clock.
I2C0SDA	71	I/O	OD	I <sup>2</sup> C module 0 data.
I2C1SCL	34	I/O	OD	I <sup>2</sup> C module 1 clock.
I2C1SDA	35	I/O	OD	I <sup>2</sup> C module 1 data.
LDO	7	-	Power	Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDD25 pins at the board level in addition to the decoupling capacitor(s).
osc0	48	I	Analog	Main oscillator crystal input or an external clock reference input.

PF4	58	I/O	TTL	GPIO port F bit 4.
PF5	46	I/O	TTL	GPIO port F bit 5.
PF6	43	I/O	TTL	GPIO port F bit 6.
PF7	42	I/O	TTL	GPIO port F bit 7.
PG0	19	I/O	TTL	GPIO port G bit 0.
PG1	18	I/O	TTL	GPIO port G bit 1.
PG2	17	I/O	TTL	GPIO port G bit 2.
PG3	16	I/O	TTL	GPIO port G bit 3.
PG4	41	I/O	TTL	GPIO port G bit 4.
PG5	40	I/O	TTL	GPIO port G bit 5.
PG6	37	I/O	TTL	GPIO port G bit 6.
PG7	36	I/O	TTL	GPIO port G bit 7.
PH0	86	I/O	TTL	GPIO port H bit 0.

Table 17-2. Signals by Signal Name (continued)

Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
PH1	85	I/O	TTL	GPIO port H bit 1.
PH2	84	I/O	TTL	GPIO port H bit 2.
PH3	83	I/O	TTL	GPIO port H bit 3.
RST	64	Į	TTL	System reset input.
SSIOClk	28	I/O	TTL	SSI module 0 clock.
SSI0Fss	29	I/O	TTL	SSI module 0 frame.
SSI0Rx	30	Į	TTL	SSI module 0 receive.
SSIOTx	31	0	TTL	SSI module 0 transmit.
SSI1Clk	72	I/O	TTL	SSI module 1 clock.
SSI1Fss	73	I/O	TTL	SSI module 1 frame.
SSI1Rx	74	I	TTL	SSI module 1 receive.
SSI1Tx	75	0	TTL	SSI module 1 transmit.
SWCLK	80	Į	TTL	JTAG/SWD CLK.
SWDIO	79	I/O	TTL	JTAG TMS and SWDIO.
SWO	77	0	TTL	JTAG TDO and SWO.
TCK	80	I	TTL	JTAG/SWD CLK.
TDI	78	I	TTL	JTAG TDI.
TDO	77	0	TTL	JTAG TDO and SWO.
TMS	79	I/O	TTL	JTAG TMS and SWDIO.
TRST	89	I	TTL	JTAG TRST.
U0Rx	26	I	TTL	UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.
UOTx	27	0	TTL	UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.
U1Rx	12	I	TTL	UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.
UlTx	13	0	TTL	UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.
U2Rx	19	I	TTL	UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.
U2Tx	18	0	TTL	UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.
VBAT	55	-	Power	Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.
VDD	8 20 32 44 56 68 81 93	-	Power	Positive supply for I/O and some logic.
VDD25	14 38 62 88	-	Power	Positive supply for most of the logic function, including the processor core and most peripherals.

Table 17-2. Signals by Signal Name (continued)

Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
VDDA	3 98	-	Power	The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions.
WAKE	50	I	TTL	An external input that brings the processor out of Hibernate mode when asserted.
xosc0	52	ı	Analog	Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.
XOSC1	53	0	Analog	Hibernation module oscillator crystal output.

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 17-3. Signals by Function, Except for GPIO

Function	Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
Analog Comparators	C0+	90	I	Analog	Analog comparator 0 positive input.
	C0-	92	I	Analog	Analog comparator 0 negative input.
	C0o	58	0	TTL	Analog comparator 0 output.
	C1+	24	I	Analog	Analog comparator 1 positive input.
	C1-	91	I	Analog	Analog comparator 1 negative input.
	Clo	2	0	TTL	Analog comparator 1 output.
General-Purpose	CCP0	66	I/O	TTL	Capture/Compare/PWM 0.
Timers	CCP1	100	I/O	TTL	Capture/Compare/PWM 1.
	CCP2	67	I/O	TTL	Capture/Compare/PWM 2.
	CCP3	23	I/O	TTL	Capture/Compare/PWM 3.
	CCP4	22	I/O	TTL	Capture/Compare/PWM 4.
	CCP5	25	I/O	TTL	Capture/Compare/PWM 5.
	CCP6	86	I/O	TTL	Capture/Compare/PWM 6.
	CCP7	85	I/O	TTL	Capture/Compare/PWM 7.
Hibernate	HIB	51	0	OD	An open-drain output with internal pull-up that indicates the processor is in Hibernate mode.
	VBAT	55	-	Power	Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.
	WAKE	50	I	TTL	An external input that brings the processor out of Hibernate mode when asserted.
	XOSC0	52	I	Analog	Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.
	XOSC1	53	0	Analog	Hibernation module oscillator crystal output.

Table 17-3. Signals by Function, Except for GPIO (continued)

Function	Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
I2C	I2C0SCL	70	I/O	OD	I <sup>2</sup> C module 0 clock.
	I2C0SDA	71	I/O	OD	I <sup>2</sup> C module 0 data.
	I2C1SCL	34	I/O	OD	I <sup>2</sup> C module 1 clock.
	I2C1SDA	35	I/O	OD	I <sup>2</sup> C module 1 data.
JTAG/SWD/SWO	SWCLK	80	I	TTL	JTAG/SWD CLK.
	SWDIO	79	I/O	TTL	JTAG TMS and SWDIO.
	SWO	77	0	TTL	JTAG TDO and SWO.
	TCK	80	I	TTL	JTAG/SWD CLK.
	TDI	78	I	TTL	JTAG TDI.
	TDO	77	0	TTL	JTAG TDO and SWO.
	TMS	79	I/O	TTL	JTAG TMS and SWDIO.
	TRST	89	I	TTL	JTAG TRST.
Power	GND	9 15 21 33 39 45 54 57 63 69 82 87 94	-	Power	Ground reference for logic and I/O pins.
	GNDA	4 97	-	Power	The ground reference for the analog circuits (Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.
	LDO	7	-	Power	Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 µF or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDD25 pins at the board level in addition to the decoupling capacitor(s).
	VDD	8 20 32 44 56 68 81 93	-	Power	Positive supply for I/O and some logic.
	VDD25	14 38 62 88	-	Power	Positive supply for most of the logic function, including the processor core and most peripherals.
	VDDA	3 98	-	Power	The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions.

Table 17-3. Signals by Function, Except for GPIO (continued)

Function	Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
SSI	SSI0Clk	28	I/O	TTL	SSI module 0 clock.
	SSI0Fss	29	I/O	TTL	SSI module 0 frame.
	SSI0Rx	30	I	TTL	SSI module 0 receive.
	SSIOTx	31	0	TTL	SSI module 0 transmit.
	SSI1Clk	72	I/O	TTL	SSI module 1 clock.
	SSI1Fss	73	I/O	TTL	SSI module 1 frame.
	SSI1Rx	74	I	TTL	SSI module 1 receive.
	SSI1Tx	75	0	TTL	SSI module 1 transmit.
System Control & Clocks	CMOD0	65	I/O	TTL	CPU Mode bit 0. Input must be set to logic 0 (grounded); other encodings reserved.
	CMOD1	76	I/O	TTL	CPU Mode bit 1. Input must be set to logic 0 (grounded); other encodings reserved.
	osc0	48	I	Analog	Main oscillator crystal input or an external clock reference input.
	osc1	49	0	Analog	Main oscillator crystal output.
	RST	64	I	TTL	System reset input.
UART	U0Rx	26	I	TTL	UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.
	UOTx	27	0	TTL	UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.
	U1Rx	12	I	TTL	UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.
	UlTx	13	0	TTL	UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.
	U2Rx	19	I	TTL	UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.
	U2Tx	18	0	TTL	UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 17-5. Signals by Pin Number

Pin Number	Pin Name	Pin Type	Buffer Type <sup>a</sup>	Description	
A1	NC	-	-	No connect. Leave the pin electrically unconnected/isolated.	
A2	NC	-	-	No connect. Leave the pin electrically unconnected/isolated.	
A3	NC	-	-	No connect. Leave the pin electrically unconnected/isolated.	
A4	NC	-	-	No connect. Leave the pin electrically unconnected/isolated.	
A5	GNDA	-	Power	The ground reference for the analog circuits (Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.	
A6	PB4	I/O	TTL	GPIO port B bit 4.	
	C0-	I	Analog	Analog comparator 0 negative input.	
A7	PB6	I/O	TTL	GPIO port B bit 6.	
	C0+	I	Analog	Analog comparator 0 positive input.	
A8	PB7	I/O	TTL	GPIO port B bit 7.	
	TRST	I	TTL	JTAG TRST.	
A9	PC0	I/O	TTL	GPIO port C bit 0.	
	TCK	I	TTL	JTAG/SWD CLK.	
	SWCLK	I	TTL	JTAG/SWD CLK.	
A10	PC3	I/O	TTL	GPIO port C bit 3.	
	TDO	0	TTL	JTAG TDO and SWO.	
	SWO	0	TTL	JTAG TDO and SWO.	
A11	PE0	I/O	TTL	GPIO port E bit 0.	
	SSI1Clk	I/O	TTL	SSI module 1 clock.	
A12	PE3	I/O	TTL	GPIO port E bit 3.	
	SSI1Tx	0	TTL	SSI module 1 transmit.	
B1	NC	-	-	No connect. Leave the pin electrically unconnected/isolated.	
B2	NC	-	-	No connect. Leave the pin electrically unconnected/isolated.	
В3	NC	-	-	No connect. Leave the pin electrically unconnected/isolated.	
B4	NC	-	-	No connect. Leave the pin electrically unconnected/isolated.	
B5	GNDA	-	Power	The ground reference for the analog circuits (Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.	
В6	GND	-	Power	Ground reference for logic and I/O pins.	

Table 17-5. Signals by Pin Number (continued)

Pin Number	Pin Name	Pin Type	Buffer Type <sup>a</sup>	Description		
B7	PB5	I/O	TTL	GPIO port B bit 5.		
	C1-	I	Analog	Analog comparator 1 negative input.		
B8	PC2	I/O	TTL	GPIO port C bit 2.		
	TDI	I	TTL	JTAG TDI.		
В9	PC1	I/O	TTL	GPIO port C bit 1.		
	TMS	I/O	TTL	JTAG TMS and SWDIO.		
	SWDIO	I/O	TTL	JTAG TMS and SWDIO.		
B10	CMOD1	I/O	TTL	CPU Mode bit 1. Input must be set to logic 0 (grounded); other encodings reserved.		
B11	PE2	I/O	TTL	GPIO port E bit 2.		
	SSI1Rx	I	TTL	SSI module 1 receive.		
B12	PE1	I/O	TTL	GPIO port E bit 1.		
	SSI1Fss	I/O	TTL	SSI module 1 frame.		
C1	PE7	I/O	TTL	GPIO port E bit 7.		
C2	PE6	I/O	TTL	GPIO port E bit 6.		
	C1o	0	TTL	Analog comparator 1 output.		
C3	VDD25	-	Power	Positive supply for most of the logic function, including the processor core and most peripherals.		
C4	GND	-	Power	Ground reference for logic and I/O pins.		
C5	GND	-	Power	Ground reference for logic and I/O pins.		
C6	VDDA	-	Power	The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions.		
C7	VDDA	-	Power	The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions.		
C8	PH1	I/O	TTL	GPIO port H bit 1.		
	CCP7	I/O	TTL	Capture/Compare/PWM 7.		
C9	PH0	I/O	TTL	GPIO port H bit 0.		
	CCP6	I/O	TTL	Capture/Compare/PWM 6.		
C10	PG7	I/O	TTL	GPIO port G bit 7.		
C11	PB2	I/O	TTL	GPIO port B bit 2.		
	I2C0SCL	I/O	OD	I <sup>2</sup> C module 0 clock.		
C12	PB3	I/O	TTL	GPIO port B bit 3.		
	I2C0SDA	I/O	OD	I <sup>2</sup> C module 0 data.		
D1	PE4	I/O	TTL	GPIO port E bit 4.		
D2	PE5	I/O	TTL	GPIO port E bit 5.		
D3	VDD25	-	Power	Positive supply for most of the logic function, including the processor core and most peripherals.		
D10	РН3	I/O	TTL	GPIO port H bit 3.		
D11	PH2	I/O	TTL	GPIO port H bit 2.		

Table 17-5. Signals by Pin Number (continued)

Pin Number	Pin Name	Pin Type	Buffer Type <sup>a</sup>	Description
D12	PB1	I/O	TTL	GPIO port B bit 1.
	CCP2	I/O	TTL	Capture/Compare/PWM 2.
E1	PD4	I/O	TTL	GPIO port D bit 4.
E2	PD5	I/O	TTL	GPIO port D bit 5.
E3	LDO	-	Power	Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu\text{F}$ or greater. When the on-chip LDO is used to provide power to the logic, the $_{\rm LDO}$ pin must also be connected to the $_{\rm VDD25}$ pins at the board level in addition to the decoupling capacitor(s).
E10	VDD33	-	Power	Positive supply for I/O and some logic.
E11	CMOD0	I/O	TTL	CPU Mode bit 0. Input must be set to logic 0 (grounded); other encodings reserved.
E12	PB0	I/O	TTL	GPIO port B bit 0.
	CCP0	I/O	TTL	Capture/Compare/PWM 0.
F1	PD7	I/O	TTL	GPIO port D bit 7.
	CCP1	I/O	TTL	Capture/Compare/PWM 1.
F2	PD6	I/O	TTL	GPIO port D bit 6.
F3	VDD25	-	Power	Positive supply for most of the logic function, including the processor core and most peripherals.
F10	GND	-	Power	Ground reference for logic and I/O pins.
F11	GND	-	Power	Ground reference for logic and I/O pins.
F12	GND	-	Power	Ground reference for logic and I/O pins.
G1	PD0	I/O	TTL	GPIO port D bit 0.
G2	PD1	I/O	TTL	GPIO port D bit 1.
G3	VDD25	-	Power	Positive supply for most of the logic function, including the processor core and most peripherals.
G10	VDD33	-	Power	Positive supply for I/O and some logic.
G11	VDD33	-	Power	Positive supply for I/O and some logic.
G12	VDD33	-	Power	Positive supply for I/O and some logic.
H1	PD3	I/O	TTL	GPIO port D bit 3.
	U1Tx	0	TTL	UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.
H2	PD2	I/O	TTL	GPIO port D bit 2.
	U1Rx	I	TTL	UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.
H3	GND	-	Power	Ground reference for logic and I/O pins.
H10	VDD33	-	Power	Positive supply for I/O and some logic.
H11	RST	I	TTL	System reset input.
H12	PF1	I/O	TTL	GPIO port F bit 1.
J1	PG2	I/O	TTL	GPIO port G bit 2.
J2	PG3	I/O	TTL	GPIO port G bit 3.
J3	GND	-	Power	Ground reference for logic and I/O pins.
J10	GND	-	Power	Ground reference for logic and I/O pins.
J11	PF2	I/O	TTL	GPIO port F bit 2.

Table 17-5. Signals by Pin Number (continued)

Pin Number	Pin Name	Pin Type	Buffer Type <sup>a</sup>	Description	
J12	PF3	I/O	TTL	GPIO port F bit 3.	
K1	PG0	I/O	TTL	GPIO port G bit 0.	
	U2Rx	1	TTL	UART module 2 receive. When in IrDA mode, this signal has Ir modulation.	
K2	PG1	I/O	TTL	GPIO port G bit 1.	
	U2Tx	0	TTL	UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.	
K3	PG4	I/O	TTL	GPIO port G bit 4.	
K4	PF7	I/O	TTL	GPIO port F bit 7.	
K5	GND	-	Power	Ground reference for logic and I/O pins.	
K6	GND	-	Power	Ground reference for logic and I/O pins.	
K7	VDD33	-	Power	Positive supply for I/O and some logic.	
K8	VDD33	-	Power	Positive supply for I/O and some logic.	
K9	VDD33	-	Power	Positive supply for I/O and some logic.	
K10	GND	-	Power	Ground reference for logic and I/O pins.	
K11	XOSC0	I	Analog	Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.	
K12	XOSC1	0	Analog	Hibernation module oscillator crystal output.	
L1	PC4	I/O	TTL	GPIO port C bit 4.	
	CCP5	I/O	TTL	Capture/Compare/PWM 5.	
L2	PC7	I/O	TTL	GPIO port C bit 7.	
	CCP4	I/O	TTL	Capture/Compare/PWM 4.	
L3	PA0	I/O	TTL	GPIO port A bit 0.	
	UORx	I	TTL	UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.	
L4	PA3	I/O	TTL	GPIO port A bit 3.	
	SSI0Fss	I/O	TTL	SSI module 0 frame.	
L5	PA4	I/O	TTL	GPIO port A bit 4.	
	SSIORx	I	TTL	SSI module 0 receive.	
L6	PA6	I/O	TTL	GPIO port A bit 6.	
	I2C1SCL	I/O	OD	I <sup>2</sup> C module 1 clock.	
L7	PG6	I/O	TTL	GPIO port G bit 6.	
L8	PF5	I/O	TTL	GPIO port F bit 5.	
L9	PF4	I/O	TTL	GPIO port F bit 4.	
	C0o	0	TTL	Analog comparator 0 output.	
L10	GND	-	Power	Ground reference for logic and I/O pins.	
L11	OSC0	I	Analog	Main oscillator crystal input or an external clock reference input.	
L12	VBAT	-	Power	Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.	
M1	PC5	I/O	TTL	GPIO port C bit 5.	
	C1+	ı	Analog	Analog comparator 1 positive input.	

Table 17-5. Signals by Pin Number (continued)

Pin Number	Pin Name	Pin Type	Buffer Type <sup>a</sup>	Description
M2	PC6	I/O	TTL	GPIO port C bit 6.
	CCP3	I/O	TTL	Capture/Compare/PWM 3.
М3	PA1	I/O	TTL	GPIO port A bit 1.
	UOTx	0	TTL	UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.
M4	PA2	I/O	TTL	GPIO port A bit 2.
	SSI0Clk	I/O	TTL	SSI module 0 clock.
M5	PA5	I/O	TTL	GPIO port A bit 5.
	SSI0Tx	0	TTL	SSI module 0 transmit.
M6	PA7	I/O	TTL	GPIO port A bit 7.
	I2C1SDA	I/O	OD	I <sup>2</sup> C module 1 data.
M7	PG5	I/O	TTL	GPIO port G bit 5.
M8	PF6	I/O	TTL	GPIO port F bit 6.
M9	PF0	I/O	TTL	GPIO port F bit 0.
M10	WAKE	I	TTL	An external input that brings the processor out of Hibernate mode when asserted.
M11	OSC1	0	Analog	Main oscillator crystal output.
M12	HIB	0	OD	An open-drain output with internal pull-up that indicates the processor is in Hibernate mode.

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 17-6. Signals by Signal Name

Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
C0+	A7	I	Analog	Analog comparator 0 positive input.
C0-	A6	I	Analog	Analog comparator 0 negative input.
C0o	L9	0	TTL	Analog comparator 0 output.
C1+	M1	I	Analog	Analog comparator 1 positive input.
C1-	В7	1	Analog	Analog comparator 1 negative input.
Clo	C2	0	TTL	Analog comparator 1 output.
CCP0	E12	I/O	TTL	Capture/Compare/PWM 0.
CCP1	F1	I/O	TTL	Capture/Compare/PWM 1.
CCP2	D12	I/O	TTL	Capture/Compare/PWM 2.
CCP3	M2	I/O	TTL	Capture/Compare/PWM 3.
CCP4	L2	I/O	TTL	Capture/Compare/PWM 4.
CCP5	L1	I/O	TTL	Capture/Compare/PWM 5.
CCP6	C9	I/O	TTL	Capture/Compare/PWM 6.
CCP7	C8	I/O	TTL	Capture/Compare/PWM 7.
CMOD0	E11	I/O	TTL	CPU Mode bit 0. Input must be set to logic 0 (grounded); other encodings reserved.
CMOD1	B10	I/O	TTL	CPU Mode bit 1. Input must be set to logic 0 (grounded); other encodings reserved.

Table 17-6. Signals by Signal Name (continued)

Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
GND	B6 C4 C5 F10 F11 F12 H3 J3 J10 K5 K6 K10 L10	-	Power	Ground reference for logic and I/O pins.  The ground reference for the analog circuits ( Analog
	B5			Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.
HIB	M12	0	OD	An open-drain output with internal pull-up that indicates the processor is in Hibernate mode.
I2C0SCL	C11	I/O	OD	I <sup>2</sup> C module 0 clock.
I2C0SDA	C12	I/O	OD	I <sup>2</sup> C module 0 data.
I2C1SCL	L6	I/O	OD	I <sup>2</sup> C module 1 clock.
I2C1SDA	M6	I/O	OD	I <sup>2</sup> C module 1 data.
LDO	E3	-	Power	Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDD25 pins at the board level in addition to the decoupling capacitor(s).
NC	A1 A2 A3 A4 B1 B2 B3 B4	-	-	No connect. Leave the pin electrically unconnected/isolated.
osc0	L11	I	Analog	Main oscillator crystal input or an external clock reference input.
OSC1	M11	0	Analog	Main oscillator crystal output.
PA0	L3	I/O	TTL	GPIO port A bit 0.
PA1	M3	I/O	TTL	GPIO port A bit 1.
PA2	M4	I/O	TTL	GPIO port A bit 2.
PA3	L4	I/O	TTL	GPIO port A bit 3.

SSI0Fss	L4	I/O	TTL	SSI module 0 frame.	
SSI0Rx	L5	I	TTL	SSI module 0 receive.	
SSIOTx	M5	0	TTL	SSI module 0 transmit.	
SSI1Clk	A11	I/O	TTL	SSI module 1 clock.	
SSI1Fss	B12	I/O	TTL	SSI module 1 frame.	
SSI1Rx	B11	I	TTL	SSI module 1 receive.	
SSI1Tx	A12	0	TTL	SSI module 1 transmit.	
SWCLK	A9	I	TTL	JTAG/SWD CLK.	
SWDIO	В9	I/O	TTL	JTAG TMS and SWDIO.	
SWO	A10	0	TTL	JTAG TDO and SWO.	
TCK	A9	I	TTL	JTAG/SWD CLK.	
TDI	В8	I	TTL	JTAG TDI.	
TDO	A10	0	TTL	JTAG TDO and SWO.	
TMS	В9	I/O	TTL	JTAG TMS and SWDIO.	
TRST	A8	I	TTL	JTAG TRST.	
UORx	L3	I	TTL	UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.	
UOTx	M3	0	TTL	UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.	
UlRx	H2	I	TTL	UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.	
UlTx	H1	0	TTL	UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.	
U2Rx	K1	I	TTL	UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.	
U2Tx	K2	0	TTL	UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.	
VBAT	L12	-	Power	Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves a the battery backup/Hibernation module power-source supply	
VDD25	C3 D3 F3 G3	-	Power	Positive supply for most of the logic function, including the processor core and most peripherals.	

Table 17-6. Signals by Signal Name (continued)

Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
VDD33	E10 G10 G11 G12 H10 K7 K8	-	Power	Positive supply for I/O and some logic.
VDDA	C6 C7	-	Power	The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions.
WAKE	M10	I	TTL	An external input that brings the processor out of Hibernate mode when asserted.
xosc0	K11	ı	Analog	Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.
XOSC1	K12	0	Analog	Hibernation module oscillator crystal output.

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 17-7. Signals by Function, Except for GPIO

Function	Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
Analog Comparators	C0+	A7	I	Analog	Analog comparator 0 positive input.
	C0-	A6	I	Analog	Analog comparator 0 negative input.
	C0o	L9	0	TTL	Analog comparator 0 output.
	C1+	M1	I	Analog	Analog comparator 1 positive input.
	C1-	B7	I	Analog	Analog comparator 1 negative input.
	C1o	C2	0	TTL	Analog comparator 1 output.
General-Purpose	CCP0	E12	I/O	TTL	Capture/Compare/PWM 0.
Timers	CCP1	F1	I/O	TTL	Capture/Compare/PWM 1.
	CCP2	D12	I/O	TTL	Capture/Compare/PWM 2.
	CCP3	M2	I/O	TTL	Capture/Compare/PWM 3.
	CCP4	L2	I/O	TTL	Capture/Compare/PWM 4.
	CCP5	L1	I/O	TTL	Capture/Compare/PWM 5.
	CCP6	C9	I/O	TTL	Capture/Compare/PWM 6.
	CCP7	C8	I/O	TTL	Capture/Compare/PWM 7.

Table 17-7. Signals by Function, Except for GPIO (continued)

Function	Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
Hibernate	нів	M12	0	OD	An open-drain output with internal pull-up that indicates the processor is in Hibernate mode.
	VBAT	L12	-	Power	Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.
	WAKE	M10	I	TTL	An external input that brings the processor out of Hibernate mode when asserted.
	xosc0	K11	I	Analog	Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.
	XOSC1	K12	0	Analog	Hibernation module oscillator crystal output.
I2C	I2C0SCL	C11	I/O	OD	I <sup>2</sup> C module 0 clock.
	I2C0SDA	C12	I/O	OD	I <sup>2</sup> C module 0 data.
	I2C1SCL	L6	I/O	OD	I <sup>2</sup> C module 1 clock.
	I2C1SDA	M6	I/O	OD	I <sup>2</sup> C module 1 data.
JTAG/SWD/SWO	SWCLK	A9	I	TTL	JTAG/SWD CLK.
	SWDIO	В9	I/O	TTL	JTAG TMS and SWDIO.
	SWO	A10	0	TTL	JTAG TDO and SWO.
	TCK	A9	I	TTL	JTAG/SWD CLK.
	TDI	B8	I	TTL	JTAG TDI.
	TDO	A10	0	TTL	JTAG TDO and SWO.
	TMS	В9	I/O	TTL	JTAG TMS and SWDIO.
	TRST	A8	I	TTL	JTAG TRST.

Table 17-7. Signals by Function, Except for GPIO (continued)

Function	Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
Power	GND	B6 C4 C5 F10 F11 F12 H3 J3 J10 K5 K6 K10	-	Power	Ground reference for logic and I/O pins.
	GNDA	A5 B5	-	Power	The ground reference for the analog circuits ( Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.
	LDO	E3	-	Power	Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDD25 pins at the board level in addition to the decoupling capacitor(s).
	VDD25	C3 D3 F3 G3	-	Power	Positive supply for most of the logic function, including the processor core and most peripherals.
	VDD33	E10 G10 G11 G12 H10 K7 K8	-	Power	Positive supply for I/O and some logic.
	VDDA	C6 C7	-	Power	The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions.
SSI	SSI0Clk	M4	I/O	TTL	SSI module 0 clock.
	SSI0Fss	L4	I/O	TTL	SSI module 0 frame.
	SSIORx	L5	ı	TTL	SSI module 0 receive.
	SSI0Tx	M5	0	TTL	SSI module 0 transmit.
	SSI1Clk	A11	I/O	TTL	SSI module 1 clock.
	SSI1Fss	B12	I/O	TTL	SSI module 1 frame.
	SSI1Rx	B11	ı	TTL	SSI module 1 receive.
	SSI1Tx	A12	0	TTL	SSI module 1 transmit.

Table 17-7. Signals by Function, Except for GPIO (continued)

Function	Pin Name	Pin Number	Pin Type	Buffer Type <sup>a</sup>	Description
System Control & Clocks	CMOD0	E11	I/O	TTL	CPU Mode bit 0. Input must be set to logic 0 (grounded); other encodings reserved.
	CMOD1	B10	I/O	TTL	CPU Mode bit 1. Input must be set to logic 0 (grounded); other encodings reserved.
	osco	L11	I	Analog	Main oscillator crystal input or an external clock reference input.
	osc1	M11	0	Analog	Main oscillator crystal output.
	RST	H11	I	TTL	System reset input.
UART	U0Rx	L3	I	TTL	UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.
	UOTx	M3	0	TTL	UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.
	U1Rx	H2	I	TTL	UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.
	U1Tx	H1	0	TTL	UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.
	U2Rx	K1	I	TTL	UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.
	U2Tx	K2	0	TTL	UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

# 18 Operating Characteristics

**Table 18-1. Temperature Characteristics** 

Characteristic <sup>a</sup>	Symbol	Value	Unit
Industrial operating temperature range	T <sub>A</sub>	-40 to +85	°C
Extended operating temperature range	T <sub>A</sub>	-40 to +105	°C

a. Maximum storage temperature is 150°C.

#### **Table 18-2. Thermal Characteristics**

Characteristic	Symbol	Value	Unit
Thermal resistance (junction to ambient) <sup>a</sup>	$\Theta_{JA}$	34	°C/W
Average junction temperature <sup>b</sup>	T <sub>J</sub>	$T_A + (P_{AVG} \cdot \Theta_{JA})$	°C

a. Junction to ambient thermal resistance  $\theta_{\text{JA}}$  numbers are determined by a package simulator.

b. Power dissipation is a function of temperature.

# 19 Electrical Characteristics

#### 19.1 DC Characteristics

### 19.1.1 Maximum Ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device.

**Note:** The device is not guaranteed to operate properly at the maximum ratings.

Table 19-1. Maximum Ratings

Characteristic	Symbol	Vá	Unit	
a		Min	Max	
I/O supply voltage (V <sub>DD</sub> )	V <sub>DD</sub>	0	4	V
Core supply voltage (V <sub>DD25</sub> )	V <sub>DD25</sub>	0	3	V
Analog supply voltage (V <sub>DDA</sub> )	$V_{DDA}$	0	4	V
Battery supply voltage (V <sub>BAT</sub> )	V <sub>BAT</sub>	0	4	V
Input voltage	V <sub>IN</sub>	-0.3	5.5	V
Maximum current per output pins	I	-	25	mA

a. Voltages are measured with respect to GND.

**Important:** This device contains circuitry to protect the inputs against damage due to high-static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are connected to an appropriate logic voltage level (for example, either  $\mbox{GND}$  or  $\mbox{V}_{\mbox{DD}}$ ).

#### 19.1.2 Recommended DC Operating Conditions

For special high-current applications, the GPIO output buffers may be used with the following restrictions. With the GPIO pins configured as 8-mA output drivers, a total of four GPIO outputs may be used to sink current loads up to 18 mA each. At 18-mA sink current loading, the  $V_{OL}$  value is specified as 1.2 V. The high-current GPIO package pins must be selected such that there are only a maximum of two per side of the physical package or BGA pin group with the total number of high-current GPIO outputs not exceeding four for the entire package.

Table 19-2. Recommended DC Operating Conditions

Parameter	Parameter Name	Min	Nom	Max	Unit
V <sub>DD</sub>	I/O supply voltage	3.0	3.3	3.6	V
V <sub>DD25</sub>	Core supply voltage	2.25	2.5	2.75	V
$V_{DDA}$	Analog supply voltage	3.0	3.3	3.6	V
V <sub>BAT</sub>	Battery supply voltage	2.3	3.0	3.6	V
V <sub>IH</sub>	High-level input voltage	2.0	-	5.0	V
V <sub>IL</sub>	Low-level input voltage	-0.3	-	1.3	V
V <sub>OH</sub>	High-level output voltage	2.4	-	-	V
V <sub>OL</sub> <sup>a</sup>	Low-level output voltage	-	-	0.4	V

**Table 19-2. Recommended DC Operating Conditions (continued)** 

Parameter	Parameter Name	Min	Nom	Max	Unit		
I <sub>OH</sub>	High-level source current, V <sub>OH</sub> =2.4 V						
	2-mA Drive	2.0	-	-	mA		
	4-mA Drive	4.0	-	-	mA		
	8-mA Drive	8.0	-	-	mA		
I <sub>OL</sub>	Low-level sink current, V <sub>OL</sub> =0.4 V						
	2-mA Drive	2.0	-	-	mA		
	4-mA Drive	4.0	-	-	mA		
	8-mA Drive	8.0	-	-	mA		

a.  $\rm V_{OL}$  and  $\rm V_{OH}$  shift to 1.2 V when using high-current GPIOs.

### 19.1.3 On-Chip Low Drop-Out (LDO) Regulator Characteristics

**Table 19-3. LDO Regulator Characteristics** 

Parameter	Parameter Name	Min	Nom	Max	Unit
V <sub>LDOOUT</sub>	Programmable internal (logic) power supply output value	2.25	2.5	2.75	V
	Output voltage accuracy	-	2%	-	%
t <sub>PON</sub>	Power-on time	-	-	100	μs
t <sub>ON</sub>	Time on	-	-	200	μs
t <sub>OFF</sub>	Time off	-	-	100	μs
V <sub>STEP</sub>	Step programming incremental voltage	-	50	-	mV
C <sub>LDO</sub>	External filter capacitor size for internal power supply	1.0	-	3.0	μF

#### 19.1.4 GPIO Module Characteristics

**Table 19-4. GPIO Module DC Characteristics** 

Parameter	Parameter Name	Min	Nom	Max	Unit
R <sub>GPIOPU</sub>	GPIO internal pull-up resistor	50	-	110	kΩ
R <sub>GPIOPD</sub>	GPIO internal pull-down resistor	55	-	180	kΩ

#### 19.1.5 Power Specifications

The power measurements specified in the tables that follow are run on the core processor using SRAM with the following specifications (except as noted):

- V<sub>DD</sub> = 3.3 V
- V<sub>DD25</sub> = 2.50 V
- V<sub>BAT</sub> = 3.0 V
- V<sub>DDA</sub> = 3.3 V
- Temperature = 25°C

- Clock Source (MOSC) =3.579545 MHz Crystal Oscillator
- Main oscillator (MOSC) = enabled
- Internal oscillator (IOSC) = disabled

**Table 19-5. Detailed Power Specifications** 

Parameter	Parameter Name	Conditions		3.3 V V <sub>DD</sub> , V <sub>DDA</sub>		V V <sub>DD25</sub>	3.0 V V <sub>BAT</sub>		Unit
			Nom	Max	Nom	Max	Nom	Max	
I <sub>DD_RUN</sub>	Run mode 1	V <sub>DD25</sub> = 2.50 V	3	pending <sup>a</sup>	108	pendinga	0	pendinga	mA
	(Flash loop)	Code= while(1){} executed in Flash							
		Peripherals = All ON							
		System Clock = 50 MHz (with PLL)							
	Run mode 2	V <sub>DD25</sub> = 2.50 V	0	pendinga	53	pendinga	0	pendinga	mA
	(Flash loop)	Code= while(1){} executed in Flash							
		Peripherals = All OFF							
		System Clock = 50 MHz (with PLL)							
	Run mode 1	V <sub>DD25</sub> = 2.50 V	3	pendinga	102	pendinga	0	pending <sup>a</sup>	mA
	(SRAM loop)	Code= while(1){} executed in SRAM							
		Peripherals = All ON							
		System Clock = 50 MHz (with PLL)							
	Run mode 2	V <sub>DD25</sub> = 2.50 V	0	pendinga	47	pendinga	0	pendinga	mA
	(SRAM loop)	Code= while(1){} executed in SRAM							
		Peripherals = All OFF							
		System Clock = 50 MHz (with PLL)							
I <sub>DD_SLEEP</sub>	Sleep mode	V <sub>DD25</sub> = 2.50 V	0	pendinga	17	pendinga	0	pendinga	mA
		Peripherals = All OFF							
		System Clock = 50 MHz (with PLL)							
I <sub>DD_DEEPSLEEP</sub>	Deep-Sleep	LDO = 2.25 V	0.14	pendinga	0.18	pendinga	0	pending <sup>a</sup>	mA
	mode	Peripherals = All OFF							
		System Clock = IOSC30KHZ/64							

Table 19-5. Detailed Power Specifications (continued)

Parameter	Parameter Name	Conditions	3.3 V V <sub>DD</sub> , V <sub>DDA</sub>				/ V <sub>DD25</sub>	3.0	V V <sub>BAT</sub>	Unit
			Nom	Max	Nom	Max	Nom	Max		
I <sub>DD_HIBERNATE</sub>		V <sub>BAT</sub> = 3.0 V	0	0	0	0	16	pendinga	μA	
	mode	V <sub>DD</sub> = 0 V								
		V <sub>DD25</sub> = 0 V								
		V <sub>DDA</sub> = 0 V								
		Peripherals = All OFF								
		System Clock = OFF								
		Hibernate Module = 32 kHz								

a. Pending characterization completion.

#### 19.1.6 Flash Memory Characteristics

**Table 19-6. Flash Memory Characteristics** 

Parameter	Parameter Name	Min	Nom	Max	Unit
PE <sub>CYC</sub>	Number of guaranteed program/erase cycles before failure <sup>a</sup>	10,000	100,000	-	cycles
T <sub>RET</sub>	Data retention at average operating temperature of 85°C (industrial) or 105°C (extended)	10	-	-	years
T <sub>PROG</sub>	Word program time	20	-	-	μs
T <sub>ERASE</sub>	Page erase time	20	-	-	ms
T <sub>ME</sub>	Mass erase time	200	-	-	ms

a. A program/erase cycle is defined as switching the bits from 1 -> 0 -> 1.

#### 19.1.7 Hibernation

**Table 19-7. Hibernation Module DC Characteristics** 

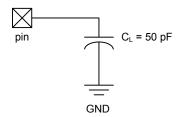

Parameter	Parameter Name	Value	Unit
V <sub>LOWBAT</sub>	Low battery detect voltage	2.35	V
R <sub>WAKEPU</sub>	WAKE internal pull-up resistor	200	kΩ

#### 19.2 AC Characteristics

#### 19.2.1 Load Conditions

Unless otherwise specified, the following conditions are true for all timing measurements. Timing measurements are for 4-mA drive strength.

Figure 19-1. Load Conditions

#### 19.2.2 Clocks

Table 19-8. Phase Locked Loop (PLL) Characteristics

Parameter	Parameter Name	Min	Nom	Max	Unit
f <sub>ref_crystal</sub>	Crystal reference <sup>a</sup>	3.579545	-	8.192	MHz
f <sub>ref_ext</sub>	External clock reference <sup>a</sup>	3.579545	-	8.192	MHz
f <sub>pll</sub>	PLL frequency <sup>b</sup>	-	400	-	MHz
T <sub>READY</sub>	PLL lock time	-	-	0.5	ms

a. The exact value is determined by the crystal value programmed into the XTAL field of the **Run-Mode Clock Configuration** (RCC) register.

Table 19-9 on page 423 shows the actual frequency of the PLL based on the crystal frequency used (defined by the XTAL field in the **RCC** register).

Table 19-9. Actual PLL Frequency

XTAL	Crystal Frequency (MHz)	PLL Frequency (MHz)	Error
0x4	3.5795	400.904	0.0023%
0x5	3.6864	398.1312	0.0047%
0x6	4.0	400	-
0x7	4.096	401.408	0.0035%

#### 19.2.5 Hibernation Module

The Hibernation Module requires special system implementation considerations since it is intended to power-down all other sections of its host device. The system power-supply distribution and interfaces to the device must be driven to 0  $V_{DC}$  or powered down with the same external voltage regulator controlled by  $\overline{\text{HIB}}$ .

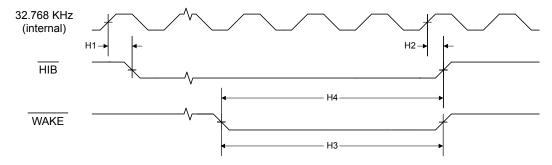

The external voltage regulators controlled by  $\overline{\mathtt{HIB}}$  must have a settling time of 250  $\mu s$  or less.

**Table 19-14. Hibernation Module AC Characteristics** 

Parameter No	Parameter	Parameter Name	Min	Nom	Max	Unit
H1	t <sub>HIB_LOW</sub>	Internal 32.768 KHz clock reference rising edge to /HIB asserted	-	200	-	μs
H2	t <sub>HIB_HIGH</sub>	Internal 32.768 KHz clock reference rising edge to /HIB deasserted	-	30	-	μs
H3	t <sub>WAKE_ASSERT</sub>	/WAKE assertion time	62	-	-	μs
H4	t <sub>WAKETOHIB</sub>	/WAKE assert to /HIB desassert	62	-	124	μs
H5	t <sub>XOSC_SETTLE</sub>	XOSC settling time <sup>a</sup>	20	-	-	ms
H6	thib_reg_access	Access time to or from a non-volatile register in HIB module to complete	92	-	-	μs
H7	t <sub>HIB_TO_VDD</sub>	$\overline{\mathtt{HIB}}$ deassert to VDD and VDD25 at minimum operational level	-	-	250	μs

a. This parameter is highly sensitive to PCB layout and trace lengths, which may make this parameter time longer. Care must be taken in PCB design to minimize trace lengths and RLC (resistance, inductance, capacitance).

## 19.2.8 Inter-Integrated Circuit (I<sup>2</sup>C) Interface

Table 19-17. I<sup>2</sup>C Characteristics

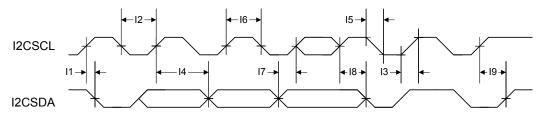

Parameter No.	Parameter	Parameter Name	Min	Nom	Max	Unit
I1 <sup>a</sup>	t <sub>SCH</sub>	Start condition hold time	36	-	-	system clocks
I2 <sup>a</sup>	t <sub>LP</sub>	Clock Low period	36	-	-	system clocks
I3 <sup>b</sup>	t <sub>SRT</sub>	I2CSCL/I2CSDA rise time (V $_{IL}$ =0.5 V to V $_{IH}$ =2.4 V)	-	-	(see note b)	ns
I4 <sup>a</sup>	t <sub>DH</sub>	Data hold time	2	-	-	system clocks
I5 <sup>c</sup>	t <sub>SFT</sub>	I2CSCL/I2CSDA fall time (V $_{IH}$ =2.4 V to V $_{IL}$ =0.5 V)	-	9	10	ns
I6 <sup>a</sup>	t <sub>HT</sub>	Clock High time	24	-	-	system clocks
I7 <sup>a</sup>	t <sub>DS</sub>	Data setup time	18	-	-	system clocks
I8 <sup>a</sup>	t <sub>SCSR</sub>	Start condition setup time (for repeated start condition only)	36	-	-	system clocks
I9 <sup>a</sup>	t <sub>SCS</sub>	Stop condition setup time	24	-	-	system clocks

a. Values depend on the value programmed into the TPR bit in the I<sup>2</sup>C Master Timer Period (I2CMTPR) register; a TPR programmed for the maximum I2CSCL frequency (TPR=0x2) results in a minimum output timing as shown in the table above. The I<sup>2</sup>C interface is designed to scale the actual data transition time to move it to the middle of the I2CSCL Low period. The actual position is affected by the value programmed into the TPR; however, the numbers given in the above values are minimum values.

b. Because I2CSCL and I2CSDA are open-drain-type outputs, which the controller can only actively drive Low, the time I2CSCL or I2CSDA takes to reach a high level depends on external signal capacitance and pull-up resistor values.

c. Specified at a nominal 50 pF load.

Figure 19-14. I<sup>2</sup>C Timing

# 19.2.9 Analog Comparator

**Table 19-18. Analog Comparator Characteristics**

# A Serial Flash Loader

#### A.1 Serial Flash Loader

The Stellaris® serial flash loader is a preprogrammed flash-resident utility used to download code to the flash memory of a device without the use of a debug interface. The serial flash loader uses a simple packet interface to provide synchronous communication with the device. The flash loader runs off the crystal and does not enable the PLL, so its speed is determined by the crystal used. The two serial interfaces that can be used are the UART0 and SSI0 interfaces. For simplicity, both the data format and communication protocol are identical for both serial interfaces.

### A.2 Interfaces

Once communication with the flash loader is established via one of the serial interfaces, that interface is used until the flash loader is reset or new code takes over. For example, once you start communicating using the SSI port, communications with the flash loader via the UART are disabled until the device is reset.

#### A.2.1 UART

The Universal Asynchronous Receivers/Transmitters (UART) communication uses a fixed serial format of 8 bits of data, no parity, and 1 stop bit. The baud rate used for communication is automatically detected by the flash loader and can be any valid baud rate supported by the host and the device. The auto detection sequence requires that the baud rate should be no more than 1/32 the crystal frequency of the board that is running the serial flash loader. This is actually the same as the hardware limitation for the maximum baud rate for any UART on a Stellaris<sup>®</sup> device which is calculated as follows:

Max Baud Rate = System Clock Frequency / 16

In order to determine the baud rate, the serial flash loader needs to determine the relationship between its own crystal frequency and the baud rate. This is enough information for the flash loader to configure its UART to the same baud rate as the host. This automatic baud-rate detection allows the host to use any valid baud rate that it wants to communicate with the device.

The method used to perform this automatic synchronization relies on the host sending the flash loader two bytes that are both 0x55. This generates a series of pulses to the flash loader that it can use to calculate the ratios needed to program the UART to match the host's baud rate. After the host sends the pattern, it attempts to read back one byte of data from the UART. The flash loader returns the value of 0xCC to indicate successful detection of the baud rate. If this byte is not received after at least twice the time required to transfer the two bytes, the host can resend another pattern of 0x55, 0x55, and wait for the 0xCC byte again until the flash loader acknowledges that it has received a synchronization pattern correctly. For example, the time to wait for data back from the flash loader should be calculated as at least 2\*(20(bits/sync)/baud rate (bits/sec)). For a baud rate of 115200, this time is 2\*(20/115200) or 0.35 ms.

#### A.2.2 SSI

The Synchronous Serial Interface (SSI) port also uses a fixed serial format for communications, with the framing defined as Motorola format with SPH set to 1 and SPO set to 1. See "Frame Formats" on page 309 in the SSI chapter for more information on formats for this transfer protocol. Like the UART, this interface has hardware requirements that limit the maximum speed that the SSI clock can run. This allows the SSI clock to be at most 1/12 the crystal frequency of the board running

the flash loader. Since the host device is the master, the SSI on the flash loader device does not need to determine the clock as it is provided directly by the host.

## A.3 Packet Handling

All communications, with the exception of the UART auto-baud, are done via defined packets that are acknowledged (ACK) or not acknowledged (NAK) by the devices. The packets use the same format for receiving and sending packets, including the method used to acknowledge successful or unsuccessful reception of a packet.

#### A.3.1 Packet Format

All packets sent and received from the device use the following byte-packed format.

```
struct
{
  unsigned char ucSize;
  unsigned char ucCheckSum;
  unsigned char Data[];
};
```

ucSize The first byte received holds the total size of the transfer including

the size and checksum bytes.

ucChecksum This holds a simple checksum of the bytes in the data buffer only.

The algorithm is Data[0]+Data[1]+...+ Data[ucSize-3].

Data This is the raw data intended for the device, which is formatted in

some form of command interface. There should be ucSize-2 bytes of data provided in this buffer to or from the device.

### A.3.2 Sending Packets

The actual bytes of the packet can be sent individually or all at once; the only limitation is that commands that cause flash memory access should limit the download sizes to prevent losing bytes during flash programming. This limitation is discussed further in the section that describes the serial flash loader command, COMMAND\_SEND\_DATA (see "COMMAND\_SEND\_DATA (0x24)" on page 435).

Once the packet has been formatted correctly by the host, it should be sent out over the UART or SSI interface. Then the host should poll the UART or SSI interface for the first non-zero data returned from the device. The first non-zero byte will either be an ACK (0xCC) or a NAK (0x33) byte from the device indicating the packet was received successfully (ACK) or unsuccessfully (NAK). This does not indicate that the actual contents of the command issued in the data portion of the packet were valid, just that the packet was received correctly.

## A.3.3 Receiving Packets

The flash loader sends a packet of data in the same format that it receives a packet. The flash loader may transfer leading zero data before the first actual byte of data is sent out. The first non-zero byte is the size of the packet followed by a checksum byte, and finally followed by the data itself. There is no break in the data after the first non-zero byte is sent from the flash loader. Once the device communicating with the flash loader receives all the bytes, it must either ACK or NAK the packet to indicate that the transmission was successful. The appropriate response after sending a NAK to the flash loader is to resend the command that failed and request the data again. If needed, the host may send leading zeros before sending down the ACK/NAK signal to the flash loader, as the

flash loader only accepts the first non-zero data as a valid response. This zero padding is needed by the SSI interface in order to receive data to or from the flash loader.

#### A.4 Commands

The next section defines the list of commands that can be sent to the flash loader. The first byte of the data should always be one of the defined commands, followed by data or parameters as determined by the command that is sent.

## A.4.1 COMMAND\_PING (0X20)

This command simply accepts the command and sets the global status to success. The format of the packet is as follows:

```
Byte[0] = 0x03;
Byte[1] = checksum(Byte[2]);
Byte[2] = COMMAND_PING;
```

The ping command has 3 bytes and the value for COMMAND\_PING is 0x20 and the checksum of one byte is that same byte, making Byte[1] also 0x20. Since the ping command has no real return status, the receipt of an ACK can be interpreted as a successful ping to the flash loader.

## A.4.2 COMMAND\_GET\_STATUS (0x23)

This command returns the status of the last command that was issued. Typically, this command should be sent after every command to ensure that the previous command was successful or to properly respond to a failure. The command requires one byte in the data of the packet and should be followed by reading a packet with one byte of data that contains a status code. The last step is to ACK or NAK the received data so the flash loader knows that the data has been read.

```
Byte[0] = 0x03
Byte[1] = checksum(Byte[2])
Byte[2] = COMMAND_GET_STATUS
```

## A.4.3 COMMAND\_DOWNLOAD (0x21)

This command is sent to the flash loader to indicate where to store data and how many bytes will be sent by the COMMAND\_SEND\_DATA commands that follow. The command consists of two 32-bit values that are both transferred MSB first. The first 32-bit value is the address to start programming data into, while the second is the 32-bit size of the data that will be sent. This command also triggers an erase of the full area to be programmed so this command takes longer than other commands. This results in a longer time to receive the ACK/NAK back from the board. This command should be followed by a COMMAND\_GET\_STATUS to ensure that the Program Address and Program size are valid for the device running the flash loader.

The format of the packet to send this command is a follows:

```
Byte[0] = 11
Byte[1] = checksum(Bytes[2:10])
Byte[2] = COMMAND_DOWNLOAD
Byte[3] = Program Address [31:24]
Byte[4] = Program Address [23:16]
Byte[5] = Program Address [15:8]
Byte[6] = Program Address [7:0]
Byte[7] = Program Size [31:24]
```

```
Byte[8] = Program Size [23:16]
Byte[9] = Program Size [15:8]
Byte[10] = Program Size [7:0]
```

### A.4.4 COMMAND\_SEND\_DATA (0x24)

This command should only follow a COMMAND\_DOWNLOAD command or another COMMAND\_SEND\_DATA command if more data is needed. Consecutive send data commands automatically increment address and continue programming from the previous location. The caller should limit transfers of data to a maximum 8 bytes of packet data to allow the flash to program successfully and not overflow input buffers of the serial interfaces. The command terminates programming once the number of bytes indicated by the COMMAND\_DOWNLOAD command has been received. Each time this function is called it should be followed by a COMMAND\_GET\_STATUS to ensure that the data was successfully programmed into the flash. If the flash loader sends a NAK to this command, the flash loader does not increment the current address to allow retransmission of the previous data.

```
Byte[0] = 11
Byte[1] = checksum(Bytes[2:10])
Byte[2] = COMMAND_SEND_DATA
Byte[3] = Data[0]
Byte[4] = Data[1]
Byte[5] = Data[2]
Byte[6] = Data[3]
Byte[7] = Data[4]
Byte[8] = Data[5]
Byte[9] = Data[6]
Byte[10] = Data[7]
```

## A.4.5 COMMAND\_RUN (0x22)

This command is used to tell the flash loader to execute from the address passed as the parameter in this command. This command consists of a single 32-bit value that is interpreted as the address to execute. The 32-bit value is transmitted MSB first and the flash loader responds with an ACK signal back to the host device before actually executing the code at the given address. This allows the host to know that the command was received successfully and the code is now running.

```
Byte[0] = 7
Byte[1] = checksum(Bytes[2:6])
Byte[2] = COMMAND_RUN
Byte[3] = Execute Address[31:24]
Byte[4] = Execute Address[23:16]
Byte[5] = Execute Address[15:8]
Byte[6] = Execute Address[7:0]
```

## A.4.6 COMMAND\_RESET (0x25)

This command is used to tell the flash loader device to reset. This is useful when downloading a new image that overwrote the flash loader and wants to start from a full reset. Unlike the COMMAND\_RUN command, this allows the initial stack pointer to be read by the hardware and set up for the new code. It can also be used to reset the flash loader if a critical error occurs and the host device wants to restart communication with the flash loader.

```
Byte[0] = 3
Byte[1] = checksum(Byte[2])
Byte[2] = COMMAND_RESET
```

The flash loader responds with an ACK signal back to the host device before actually executing the software reset to the device running the flash loader. This allows the host to know that the command was received successfully and the part will be reset.

## C Ordering and Contact Information

## C.1 Ordering Information

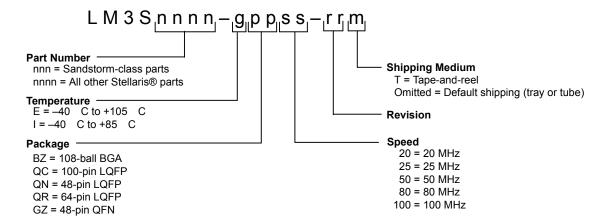

Table C-1. Part Ordering Information

Orderable Part Number	Description
LM3S1911-IBZ50-A2	Stellaris® LM3S1911 Microcontroller Industrial Temperature 108-ball BGA
LM3S1911-IBZ50-A2T	Stellaris® LM3S1911 Microcontroller Industrial Temperature 108-ball BGA Tape-and-reel
LM3S1911-EQC50-A2	Stellaris® LM3S1911 Microcontroller Extended Temperature 100-pin LQFP
LM3S1911-EQC50-A2T	Stellaris <sup>®</sup> LM3S1911 Microcontroller Extended Temperature 100-pin LQFP Tape-and-reel
LM3S1911-IQC50-A2	Stellaris® LM3S1911 Microcontroller Industrial Temperature 100-pin LQFP
LM3S1911-IQC50-A2T	Stellaris <sup>®</sup> LM3S1911 Microcontroller Industrial Temperature 100-pin LQFP Tape-and-reel

## C.2 Part Markings

The Stellaris<sup>®</sup> microcontrollers are marked with an identifying number. This code contains the following information:

- The first line indicates the part number. In the example figure below, this is the LM3S6965.
- The first seven characters in the second line indicate the temperature, package, speed, and revision. In the example figure below, this is an Industrial temperature (I), 100-pin LQFP package (QC), 50-MHz (50), revision A2 (A2) device.
- The remaining characters contain internal tracking numbers.

#### C.3 Kits

The Stellaris<sup>®</sup> Family provides the hardware and software tools that engineers need to begin development quickly.

- Reference Design Kits accelerate product development by providing ready-to-run hardware and comprehensive documentation including hardware design files:
  - http://www.luminarymicro.com/products/reference design kits/
- Evaluation Kits provide a low-cost and effective means of evaluating Stellaris<sup>®</sup> microcontrollers before purchase:
  - http://www.luminarymicro.com/products/kits.html
- Development Kits provide you with all the tools you need to develop and prototype embedded applications right out of the box:
  - http://www.luminarymicro.com/products/development kits.html

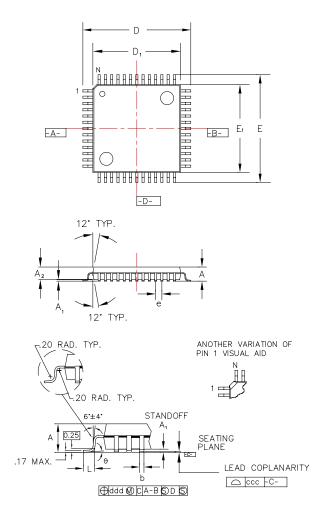

See the website for the latest tools available, or ask your distributor.

## **C.4** Support Information

For support on Stellaris® products, contact: support\_lmi@ti.com

## D Package Information

Figure D-1. 100-Pin LQFP Package

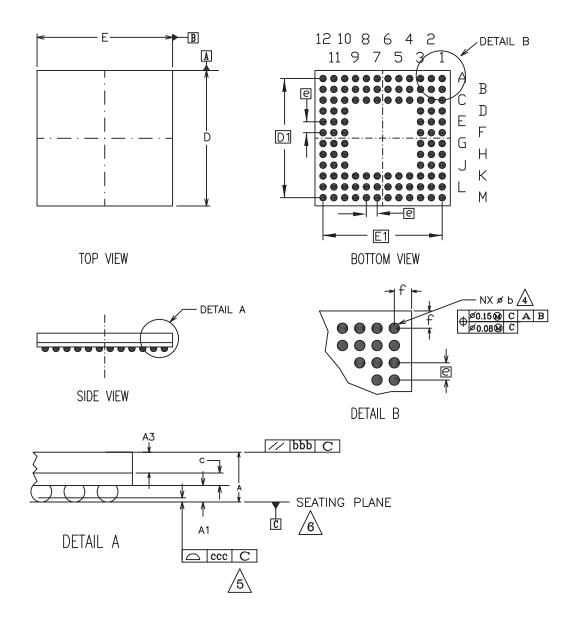

**Note:** The following notes apply to the package drawing.

- 1. All dimensions shown in mm.
- 2. Dimensions shown are nominal with tolerances indicated.
- **3.** Foot length 'L' is measured at gage plane 0.25 mm above seating plane.

Body +2.00 mm Footprint, 1.4 mm package thickness					
Symbols	Leads	100L			
Α	Max.	1.60			
A <sub>1</sub>	-	0.05 Min./0.15 Max.

Figure D-2. 108-Ball BGA Package

**Note:** The following notes apply to the package drawing.

- 1. ALL DIMENSIONS ARE IN MILLIMETERS.
- 2. 'e' REPRESENTS THE BASIC SOLDER BALL GRID PITCH.
- "M" REPRESENTS THE BASIC SOLDER BALL MATRIX SIZE. AND SYMBOL 'N' IS THE NUMBER OF BALLS AFTER DEPOPULATING.
- $\triangle$  'b' IS MEASURABLE AT THE MAXIMUM SOLDER BALL DIAMETER AFTER REFLOW PARALLEL TO PRIMARY DAIUM  $\boxed{\mathbb{C}}$  .
- ⚠ DIMENSION 'ccc' IS MEASURED PARALLEL TO PRIMARY DATUM [].
- PRIMARY DATUM [] AND SEATING PLANE ARE DEFINED BY THE SPHERICAL CROWNS OF THE SOLDER BALLS.
- 7. PACKAGE SURFACE SHALL BE MATTE FINISH CHARMILLES 24 TO 27.
- 8. SUBSTRATE MATERIAL BASE IS BT RESIN.
- 9. THE OVERALL PACKAGE THICKNESS "A" ALREADY CONSIDERS COLLAPSE BALLS
- 10. DIMENSIONING AND TOLERANCING PER ASME Y14.5M 1994.
- A EXCEPT DIMENSION b.

#### **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
