#### 1 GENERAL DESCRIPTION

The NuMicro<sup>™</sup> NUC100 Series is 32-bit microcontrollers with embedded ARM<sup>®</sup> Cortex<sup>™</sup>-M0 core for industrial control and applications which need rich communication interfaces. The Cortex<sup>™</sup>-M0 is the newest ARM<sup>®</sup> embedded processor with 32-bit performance and at a cost equivalent to traditional 8-bit microcontroller. NuMicro<sup>™</sup> NUC100 Series includes NUC100, NUC120, NUC130 and NUC140 product line.

The NuMicro<sup>™</sup> NUC130 Automotive Line with CAN function embeds Cortex<sup>™</sup>-M0 core running up to 50 MHz with 32K/64K/128K-byte embedded flash, 4K/8K/16K-byte embedded SRAM, and 4K-byte loader ROM for the ISP. It also equips with plenty of peripheral devices, such as Timers, Watchdog Timer, RTC, PDMA, UART, SPI, I<sup>2</sup>C, I<sup>2</sup>S, PWM Timer, GPIO, LIN, CAN, PS/2, 12-bit ADC, Analog Comparator, Low Voltage Reset Controller and Brown-out Detector.

The NuMicro<sup>™</sup> NUC140 Connectivity Line with USB 2.0 full-speed and CAN functions embeds Cortex<sup>™</sup>-M0 core running up to 50 MHz with 32K/64K/128K-byte embedded flash, 4K/8K/16K-byte embedded SRAM, and 4K-byte loader ROM for the ISP.. It also equips with plenty of peripheral devices, such as Timers, Watchdog Timer, RTC, PDMA, UART, SPI, I<sup>2</sup>C, I<sup>2</sup>S, PWM Timer, GPIO, LIN, CAN, PS/2, USB 2.0 FS Device, 12-bit ADC, Analog Comparator, Low Voltage Reset Controller and Brown-out Detector.

#### 2 FEATURES

The equipped features are dependent on the product line and their sub products.

#### 2.1 NuMicro™ NUC130 Features – Automotive Line

- Core
  - ARM<sup>®</sup> Cortex<sup>™</sup>-M0 core runs up to 50 MHz
  - One 24-bit system timer
  - Supports low power sleep mode
  - Single-cycle 32-bit hardware multiplier
  - NVIC for the 32 interrupt inputs, each with 4-levels of priority
  - Serial Wire Debug supports with 2 watchpoints/4 breakpoints
- Build-in LDO for wide operating voltage ranges from 2.5 V to 5.5 V
- Flash Memory
  - 32K/64K/128K bytes Flash for program code
  - 4KB flash for ISP loader
  - Support In-system program (ISP) application code update
  - 512 byte page erase for flash
  - Configurable data flash address and size for 128KB system, fixed 4KB data flash for the 32KB and 64KB system
  - Support 2 wire ICP update through SWD/ICE interface
  - Support fast parallel programming mode by external programmer
- SRAM Memory
  - 4K/8K/16K bytes embedded SRAM
  - Support PDMA mode
- PDMA (Peripheral DMA)
  - Support 9 channels PDMA for automatic data transfer between SRAM and peripherals
- Clock Control
  - Flexible selection for different applications
  - Built-in 22.1184 MHz high speed OSC for system operation
    - Trimmed to  $\pm$  1 % at +25 °C and V<sub>DD</sub> = 5 V
    - Trimmed to  $\pm$  3 % at -40  $^\circ$ C ~ +85  $^\circ$ C and V<sub>DD</sub> = 2.5 V ~ 5.5 V
  - Built-in 10 kHz low speed OSC for Watchdog Timer and Wake-up operation
  - Support one PLL, up to 50 MHz, for high performance system operation
  - External 4~24 MHz high speed crystal input for precise timing operation
  - External 32.768 kHz low speed crystal input for RTC function and low power system operation
- GPIO
  - Four I/O modes:
    - Quasi bi-direction
    - Push-Pull output
    - Open-Drain output
    - Input only with high impendence
  - TTL/Schmitt trigger input selectable
  - I/O pin can be configured as interrupt source with edge/level setting
  - High driver and high sink IO mode support

- Timer
  - Support 4 sets of 32-bit timers with 24-bit up-timer and one 8-bit pre-scale counter
  - Independent clock source for each timer
  - Provides one-shot, periodic, toggle and continuous counting operation modes
  - Support event counting function
  - Support input capture function
- Watchdog Timer
  - Multiple clock sources
  - 8 selectable time out period from 1.6ms ~ 26.0sec (depends on clock source)
  - WDT can wake-up from power down or idle mode
  - Interrupt or reset selectable on watchdog time-out
- RTC
  - Support software compensation by setting frequency compensate register (FCR)
  - Support RTC counter (second, minute, hour) and calendar counter (day, month, year)
  - Support Alarm registers (second, minute, hour, day, month, year)
  - Selectable 12-hour or 24-hour mode
  - Automatic leap year recognition
  - Support periodic time tick interrupt with 8 period options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second
  - Support wake-up function
- PWM/Capture
  - Built-in up to four 16-bit PWM generators provide eight PWM outputs or four complementary paired PWM outputs
  - Each PWM generator equipped with one clock source selector, one clock divider, one 8-bit prescaler and one Dead-Zone generator for complementary paired PWM
  - Up to eight 16-bit digital Capture timers (shared with PWM timers) provide eight rising/falling capture inputs
  - Support Capture interrupt
- UART
  - Up to three UART controllers
  - UART ports with flow control (TXD, RXD, CTS and RTS)
  - UART0 with 64-byte FIFO is for high speed
  - UART1/2(optional) with 16-byte FIFO for standard device
  - Support IrDA (SIR) and LIN function
  - Support RS-485 9-bit mode and direction control.
  - Programmable baud-rate generator up to 1/16 system clock
  - Support PDMA mode
- SPI
  - Up to four sets of SPI controller
  - Master up to 32 MHz, and Slave up to 10 MHz (chip working @ 5V)
  - Support SPI master/slave mode
  - Full duplex synchronous serial data transfer
  - Variable length of transfer data from 1 to 32 bits
  - MSB or LSB first data transfer
  - Rx and Tx on both rising or falling edge of serial clock independently
  - 2 slave/device select lines when it is as the master, and 1 slave/device select line when it is as the slave
  - Support byte suspend mode in 32-bit transmission
  - Support PDMA mode
  - Support three wire, no slave select signal, bi-direction interface

# nuvoTon

• I<sup>2</sup>C

- Up to two sets of I<sup>2</sup>C device
- Master/Slave mode
- Bidirectional data transfer between masters and slaves
- Multi-master bus (no central master)
- Arbitration between simultaneously transmitting masters without corruption of serial data on the bus
- Serial clock synchronization allows devices with different bit rates to communicate via one serial bus
- Serial clock synchronization can be used as a handshake mechanism to suspend and resume serial transfer
- Programmable clocks allow versatile rate control
- Support multiple address recognition (four slave address with mask option)

•I<sup>2</sup>S

- Interface with external audio CODEC
- Operate as either master or slave mode
- Capable of handling 8-, 16-, 24- and 32-bit word sizes
- Mono and stereo audio data supported
- I<sup>2</sup>S and MSB justified data format supported
- Two 8 word FIFO data buffers are provided, one for transmit and one for receive
- Generates interrupt requests when buffer levels cross a programmable boundary
- Support two DMA requests, one for transmit and one for receive
- PS/2 Device Controller
  - Host communication inhibit and request to send detection
  - Reception frame error detection
  - Programmable 1 to 16 bytes transmit buffer to reduce CPU intervention
  - Double buffer for data reception
  - S/W override bus
- CAN 2.0
  - Supports CAN protocol version 2.0 part A and B
  - Bit rates up to 1M bit/s
  - 32 Message Objects
  - Each Message Object has its won identifier mask
  - Programmable FIFO mode (concatenation of Message Object)
  - Maskable interrupt
  - Disabled Automatic Re-transmission mode for Time Triggered CAN applications
  - Support power down wake-up function
- EBI (External bus interface) support (100-pin and 64-pin Package Only)
  - Accessible space: 64KB in 8-bit mode or 128KB in 16-bit mode
  - Support 8-/16-bit data width
  - Support byte write in 16-bit data width mode
- ADC
  - 12-bit SAR ADC with 700K SPS
  - Up to 8-ch single-end input or 4-ch differential input
  - Single scan/single cycle scan/continuous scan
  - Each channel with individual result register
  - Scan on enabled channels
  - Threshold voltage detection
  - Conversion start by software programming or external input

- Support PDMA mode
- Analog Comparator
  - Up to two analog comparator
  - External input or internal bandgap voltage selectable at negative node
  - Interrupt when compare result change
  - Power down wake-up
- $\bullet$  One built-in temperature sensor with 1  $^\circ\!\mathrm{C}$  resolution
- Brown-Out detector
  - With 4 levels: 4.5 V/3.8 V/2.7 V/2.2 V
  - Support Brown-Out Interrupt and Reset option
- Low Voltage Reset
  - Threshold voltage levels: 2.0 V
- Operating Temperature: -40°C ~85°C
- Packages:
  - All Green package (RoHS)
  - LQFP 100-pin / 64-pin / 48-pin

### NuMicro™ NUC130/NUC140 Technical Reference Manual

## nuvoTon

#### 2.2 NuMicro<sup>™</sup> NUC140 Features – Connectivity Line

#### • Core

- ARM<sup>®</sup> Cortex<sup>™</sup>-M0 core runs up to 50 MHz
- One 24-bit system timer
- Supports low power sleep mode
- Single-cycle 32-bit hardware multiplier
- NVIC for the 32 interrupt inputs, each with 4-levels of priority
- Serial Wire Debug supports with 2 watchpoints/4 breakpoints
- Build-in LDO for wide operating voltage ranges from 2.5 V to 5.5 V
- Flash Memory
  - 32K/64K/128K bytes Flash for program code
  - 4KB flash for ISP loader
  - Support In-system program (ISP) application code update
  - 512 byte page erase for flash
  - Configurable data flash address and size for 128KB system, fixed 4KB data flash for the 32KB and 64KB system
  - Support 2 wire ICP update through SWD/ICE interface
  - Support fast parallel programming mode by external programmer
- SRAM Memory
  - 4K/8K/16K bytes embedded SRAM
  - Support PDMA mode
- PDMA (Peripheral DMA)
  - Support 9 channels PDMA for automatic data transfer between SRAM and peripherals
- Clock Control
  - Flexible selection for different applications
    - Built-in 22.1184 MHz high speed OSC for system operation
      - Trimmed to  $\pm$  1 % at +25 °C and V<sub>DD</sub> = 5 V
      - Trimmed to  $\pm$  3 % at -40  $^\circ$ C ~ +85  $^\circ$ C and V<sub>DD</sub> = 2.5 V ~ 5.5 V
  - Built-in 10 KHz low speed OSC for Watchdog Timer and Wake-up operation
  - Support one PLL, up to 50 MHz, for high performance system operation
  - External 4~24 MHz high speed crystal input for USB and precise timing operation
  - External 32.768 kHz low speed crystal input for RTC function and low power system operation
- GPIO
  - Four I/O modes:
    - Quasi bi-direction
    - Push-Pull output
    - Open-Drain output
    - Input only with high impendence
  - TTL/Schmitt trigger input selectable
  - I/O pin can be configured as interrupt source with edge/level setting
  - High driver and high sink IO mode support
- Timer
  - Support 4 sets of 32-bit timers with 24-bit up-timer and one 8-bit pre-scale counter
  - Independent clock source for each timer

### NuMicro™ NUC130/NUC140 Technical Reference Manual

## nuvoTon

- Provides one-shot, periodic, toggle and continuous counting operation modes
- Support event counting function
- Support input capture function
- Watchdog Timer
  - Multiple clock sources
  - 8 selectable time out period from 1.6ms ~ 26.0sec (depends on clock source)
  - WDT can wake-up from power down or idle mode
  - Interrupt or reset selectable on watchdog time-out

RTC

- Support software compensation by setting frequency compensate register (FCR)
- Support RTC counter (second, minute, hour) and calendar counter (day, month, year)
- Support Alarm registers (second, minute, hour, day, month, year)
- Selectable 12-hour or 24-hour mode
- Automatic leap year recognition
- Support periodic time tick interrupt with 8 period options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second
- Support wake-up function
- PWM/Capture
  - Built-in up to four 16-bit PWM generators provide eight PWM outputs or four complementary paired PWM outputs
  - Each PWM generator equipped with one clock source selector, one clock divider, one 8-bit prescaler and one Dead-Zone generator for complementary paired PWM
  - Up to eight 16-bit digital Capture timers (shared with PWM timers) provide eight rising/falling capture inputs
  - Support Capture interrupt

• UART

- Up to three UART controllers
- UART ports with flow control (TXD, RXD, CTS and RTS)
- UART0 with 64-byte FIFO is for high speed
- UART1/2(optional) with 16-byte FIFO for standard device
- Support IrDA (SIR) and LIN function
- Support RS-485 9-bit mode and direction control.
- Programmable baud-rate generator up to 1/16 system clock
- Support PDMA mode

• SPI

- Up to four sets of SPI controller
- Master up to 32 MHz, and Slave up to 10 MHz (chip working @ 5V)
- Support SPI master/slave mode
- Full duplex synchronous serial data transfer
- Variable length of transfer data from 1 to 32 bits
- MSB or LSB first data transfer
- Rx and Tx on both rising or falling edge of serial clock independently
- 2 slave/device select lines when it is as the master, and 1 slave/device select line when it is as the slave
- Support byte suspend mode in 32-bit transmission
- Support PDMA mode
- Support three wire, no slave select signal, bi-direction interface

# nuvoTon

• I<sup>2</sup>C

- Up to two sets of I<sup>2</sup>C device
- Master/Slave mode
- Bidirectional data transfer between masters and slaves
- Multi-master bus (no central master)
- Arbitration between simultaneously transmitting masters without corruption of serial data on the bus
- Serial clock synchronization allows devices with different bit rates to communicate via one serial bus
- Serial clock synchronization can be used as a handshake mechanism to suspend and resume serial transfer
- Programmable clocks allow versatile rate control
- Support multiple address recognition (four slave address with mask option)

•I<sup>2</sup>S

- Interface with external audio CODEC
- Operate as either master or slave mode
- Capable of handling 8-, 16-, 24- and 32-bit word sizes
- Mono and stereo audio data supported
- I<sup>2</sup>S and MSB justified data format supported
- Two 8 word FIFO data buffers are provided, one for transmit and one for receive
- Generates interrupt requests when buffer levels cross a programmable boundary
- Support two DMA requests, one for transmit and one for receive
- CAN 2.0
  - Supports CAN protocol version 2.0 part A and B
  - Bit rates up to 1M bit/s
  - 32 Message Objects
  - Each Message Object has its won identifier mask
  - Programmable FIFO mode (concatenation of Message Object)
  - Maskable interrupt
  - Disabled Automatic Re-transmission mode for Time Triggered CAN applications
  - Support power down wake-up function
- PS/2 Device Controller
  - Host communication inhibit and request to send detection
  - Reception frame error detection
  - Programmable 1 to 16 bytes transmit buffer to reduce CPU intervention
  - Double buffer for data reception
  - S/W override bus
- USB 2.0 Full-Speed Device
  - One set of USB 2.0 FS Device 12Mbps
  - On-chip USB Transceiver
  - Provide 1 interrupt source with 4 interrupt events
  - Support Control, Bulk In/Out, Interrupt and Isochronous transfers
  - Auto suspend function when no bus signaling for 3 ms
  - Provide 6 programmable endpoints
  - Include 512 Bytes internal SRAM as USB buffer
  - Provide remote wake-up capability
- EBI (External bus interface) support (100-pin and 64-pin Package Only)
  - Accessible space: 64KB in 8-bit mode or 128KB in 16-bit mode
  - Support 8-/16-bit data width

## nuvoTon

Support byte write in 16-bit data width mode

• ADC

- 12-bit SAR ADC with 700K SPS
- Up to 8-ch single-end input or 4-ch differential input
- Single scan/single cycle scan/continuous scan
- Each channel with individual result register
- Scan on enabled channels
- Threshold voltage detection
- Conversion start by software programming or external input
- Support PDMA Mode
- Analog Comparator
  - Up to two analog comparators
  - External input or internal bandgap voltage selectable at negative node
  - Interrupt when compare result change
  - Power down wake-up
- $\bullet$  One built-in temperature sensor with 1  $^\circ\!\mathbb{C}$  resolution
- Brown-Out detector
  - With 4 levels: 4.5 V/3.8 V/2.7 V/2.2 V
  - Support Brown-Out Interrupt and Reset option
- Low Voltage Reset
  - Threshold voltage levels: 2.0 V
- Operating Temperature: -40°C ~85°C
- Packages:
  - All Green package (RoHS)
  - LQFP 100-pin / 64-pin / 48-pin

#### 5 FUNCTIONAL DESCRIPTION

#### 5.1 ARM<sup>®</sup> Cortex<sup>™</sup>-M0 Core

The Cortex<sup>™</sup>-M0 processor is a configurable, multistage, 32-bit RISC processor. It has an AMBA AHB-Lite interface and includes an NVIC component. It also has optional hardware debug functionality. The processor can execute Thumb code and is compatible with other Cortex-M profile processor. The profile supports two modes -Thread mode and Handler mode. Handler mode is entered as a result of an exception. An exception return can only be issued in Handler mode. Thread mode is entered on Reset, and can be entered as a result of an exception return. Figure 5-1 shows the functional controller of processor.

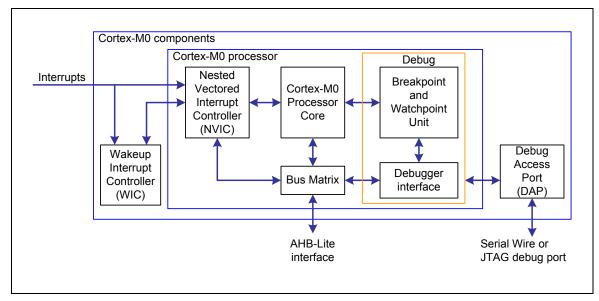

Figure 5-1 Functional Controller Diagram

The implemented device provides:

- A low gate count processor that features:
  - The ARMv6-M Thumb® instruction set
  - Thumb-2 technology
  - ARMv6-M compliant 24-bit SysTick timer
  - A 32-bit hardware multiplier
  - The system interface supports little-endian data accesses
  - The ability to have deterministic, fixed-latency, interrupt handling
  - Load/store-multiples and multicycle-multiplies that can be abandoned and restarted to facilitate rapid interrupt handling
  - C Application Binary Interface compliant exception model. This is the ARMv6-M, C Application Binary Interface (C-ABI) compliant exception model that enables the use of pure C functions as interrupt handlers
  - Low power sleep mode entry using Wait For Interrupt (WFI), Wait For Event

## nuvoTon

(WFE) instructions, or the return from interrupt sleep-on-exit feature

- NVIC that features:
  - 32 external interrupt inputs, each with four levels of priority
  - Dedicated Non-Maskable Interrupt (NMI) input.
  - Support for both level-sensitive and pulse-sensitive interrupt lines
  - Wake-up Interrupt Controller (WIC), providing ultra-low power sleep mode support.
- Debug support
  - Four hardware breakpoints.
  - Two watchpoints.
  - Program Counter Sampling Register (PCSR) for non-intrusive code profiling.
  - Single step and vector catch capabilities.
- Bus interfaces:
  - Single 32-bit AMBA-3 AHB-Lite system interface that provides simple integration to all system peripherals and memory.
  - Single 32-bit slave port that supports the DAP (Debug Access Port).

#### 5.2 System Manager

#### 5.2.1 Overview

System management includes these following sections:

- System Resets
- System Memory Map
- System management registers for Part Number ID, chip reset and on-chip controllers reset , multi-functional pin control
- System Timer (SysTick)
- Nested Vectored Interrupt Controller (NVIC)
- System Control registers

#### 5.2.2 System Reset

The system reset can be issued by one of the below listed events. For these reset event flags can be read by RSTSRC register.

- The Power-On Reset
- The low level on the /RESET pin
- Watchdog Time Out Reset
- Low Voltage Reset
- Brown-Out Detector Reset
- CPU Reset
- System Reset

System Reset and Power-On Reset all reset the whole chip including all peripherals. The difference between System Reset and Power-On Reset is external crystal circuit and ISPCON.BS bit. System Reset doesn't reset external crystal circuit and ISPCON.BS bit, but Power-On Reset does.

#### 5.2.3 System Power Distribution

In this chip, the power distribution is divided into three segments.

- Analog power from AV<sub>DD</sub> and AV<sub>SS</sub> provides the power for analog components operation.
- Digital power from V<sub>DD</sub> and V<sub>SS</sub> supplies the power to the internal regulator which provides a fixed 2.5 V power for digital operation and I/O pins.
- USB transceiver power from V<sub>BUS</sub> offers the power for operating the USB transceiver. (For NuMicro<sup>™</sup> NUC140 only)

The outputs of internal voltage regulators, LDO and  $V_{DD33}$ , require an external capacitor which should be located close to the corresponding pin. Analog power (AV<sub>DD</sub>) should be the same voltage level of the digital power (V<sub>DD</sub>). Figure 5-2 shows the power distribution of NuMicro<sup>TM</sup> NUC140 and Figure 5-3 shows the power distribution of NuMicro<sup>TM</sup> NUC130.

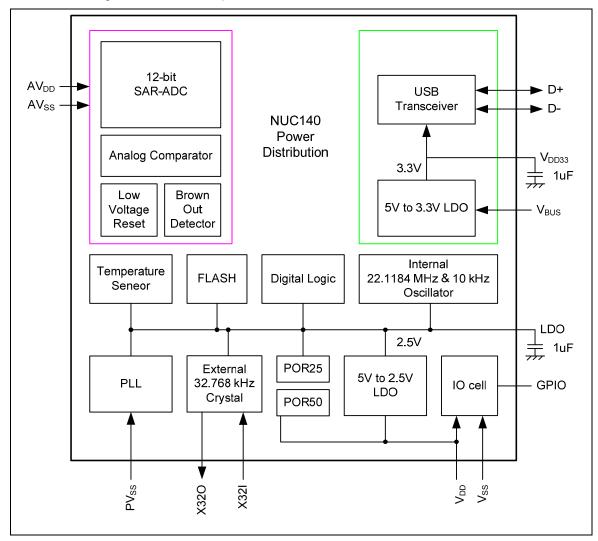

Figure 5-2 NuMicro™ NUC140 Power Distribution Diagram

#### NuMicro™ NUC130/NUC140 Technical Reference Manual

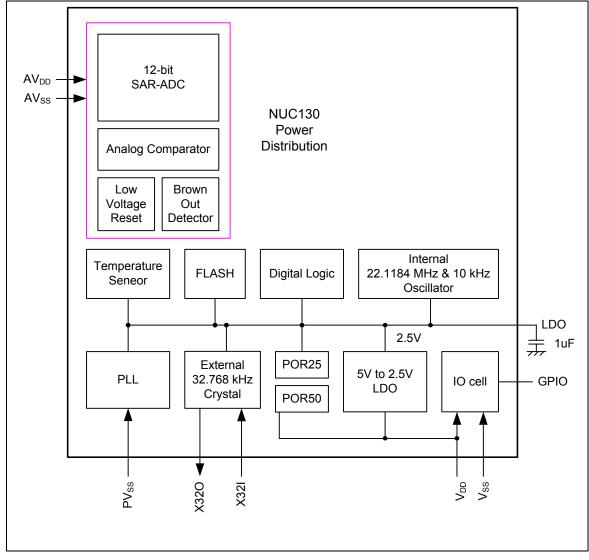

Figure 5-3 NuMicro™ NUC130 Power Distribution Diagram

#### 5.2.4 System Memory Map

NuMicro<sup>™</sup> NUC100 Series provides 4G-byte addressing space. The memory locations assigned to each on-chip controllers are shown in the following table. The detailed register definition, memory space, and programming detailed will be described in the following sections for each on-chip peripherals. NuMicro<sup>™</sup> NUC100 Series only supports little-endian data format.

Address Space	Token	Controllers
Flash and SRAM Memory Spa	се	
0x0000_0000 – 0x0001_FFFF	FLASH_BA	FLASH Memory Space (128KB)
0x2000_0000 – 0x2000_3FFF	SRAM_BA	SRAM Memory Space (16KB)
0x6000_0000 – 0x6001_FFFF	EXTMEM_BA	External Memory Space (128KB)
AHB Controllers Space (0x500	00_0000 – 0x501	IF_FFFF)
0x5000_0000 – 0x5000_01FF	GCR_BA	System Global Control Registers
0x5000_0200 – 0x5000_02FF	CLK_BA	Clock Control Registers
0x5000_0300 – 0x5000_03FF	INT_BA	Interrupt Multiplexer Control Registers
0x5000_4000 – 0x5000_7FFF	GPIO_BA	GPIO Control Registers
0x5000_8000 – 0x5000_BFFF	PDMA_BA	Peripheral DMA Control Registers
0x5000_C000 – 0x5000_FFFF	FMC_BA	Flash Memory Control Registers
0x5001_0000 – 0x5001_03FF	EBI_BA	External Bus Interface Control Registers
APB1 Controllers Space (0x40	000_0000 ~ 0x40	DOF_FFFF)
0x4000_4000 – 0x4000_7FFF	WDT_BA	Watchdog Timer Control Registers
0x4000_8000 – 0x4000_BFFF	RTC_BA	Real Time Clock (RTC) Control Register
0x4001_0000 – 0x4001_3FFF	TMR01_BA	Timer0/Timer1 Control Registers
0x4002_0000 – 0x4002_3FFF	I2C0_BA	I <sup>2</sup> C0 Interface Control Registers
0x4003_0000 – 0x4003_3FFF	SPI0_BA	SPI0 with master/slave function Control Registers
0x4003_4000 – 0x4003_7FFF	SPI1_BA	SPI1 with master/slave function Control Registers
0x4004_0000 – 0x4004_3FFF	PWMA_BA	PWM0/1/2/3 Control Registers
0x4005_0000 – 0x4005_3FFF	UART0_BA	UART0 Control Registers
0x4006_0000 – 0x4006_3FFF	USBD_BA	USB 2.0 FS device Controller Registers

## nuvoTon

Address Space	Token	Controllers
0x400D_0000 – 0x400D_3FFF	ACMP_BA	Analog Comparator Control Registers
0x400E_0000 - 0x400E_FFFF	ADC_BA	Analog-Digital-Converter (ADC) Control Registers
APB2 Controllers Space (0x40	10_0000 ~ 0x40	)1F_FFFF)
0x4010_0000 – 0x4010_3FFF	PS2_BA	PS/2 Interface Control Registers
0x4011_0000 – 0x4011_3FFF	TMR23_BA	Timer2/Timer3 Control Registers
0x4012_0000 – 0x4012_3FFF	I2C1_BA	I <sup>2</sup> C1 Interface Control Registers
0x4013_0000 – 0x4013_3FFF	SPI2_BA	SPI2 with master/slave function Control Registers
0x4013_4000 – 0x4013_7FFF	SPI3_BA	SPI3 with master/slave function Control Registers
0x4014_0000 – 0x4014_3FFF	PWMB_BA	PWM4/5/6/7 Control Registers
0x4015_0000 – 0x4015_3FFF	UART1_BA	UART1 Control Registers
0x4015_4000 – 0x4015_7FFF	UART2_BA	UART2 Control Registers
0x4018_0000 – 0x4018_3FFF	CAN0_BA	CAN0 Bus Control Registers
0x401A_0000 – 0x401A_3FFF	I2S_BA	I <sup>2</sup> S Interface Control Registers
System Controllers Space (0x	E000_E000 ~ 0x	E000_EFFF)
0xE000_E010 - 0xE000_E0FF	SCS_BA	System Timer Control Registers
0xE000_E100 - 0xE000_ECFF	SCS_BA	External Interrupt Controller Control Registers
0xE000_ED00 – 0xE000_ED8F	SCS_BA	System Control Registers

Bits	Descriptions	Descriptions					
[31:8]	Reserved	Reserved					
		The RSTS_CPU flag is set by hardware if software writes CPU_RST (IPRSTC1[1]) 1 to reset Cortex-M0 CPU kernel and Flash memory controller (FMC).					
[7]	RSTS_CPU	1 = The Cortex-M0 CPU kernel and FMC are reset by software setting CPU_RST to 1.					
		0 = No reset from CPU					
		Software can write 1 to clear this bit to zero.					
[6]	Reserved	Reserved					
		The RSTS_SYS flag is set by the "reset signal" from the Cortex_M0 kernel to indicate the previous reset source.					
[5]	RSTS_SYS	1 = The Cortex_M0 had issued the reset signal to reset the system by software writing 1 to bit SYSRESETREQ(AIRCR[2], Application Interrupt and Reset Control Register, address = 0xE000ED0C) in system control registers of Cortex_M0 kernel.					
		0 = No reset from Cortex_M0					
		Software can write 1 to clear this bit to zero.					
		The RSTS_BOD flag is set by the "reset signal" from the Brown-Out-Detector to indicate the previous reset source.					
[4]	RSTS_BOD	1 = The BOD had issued the reset signal to reset the system					
		0 = No reset from BOD					
		Software can write 1 to clear this bit to zero.					
[3]	RSTS_LVR	The RSTS_LVR flag is set by the "reset signal" from the Low-Voltage-Reset controller to indicate the previous reset source.					
		1 = The LVR controller had issued the reset signal to reset the system.					

### nuvoton

Bits	Descriptions					
		0 = No reset from LVR				
		Software can write 1 to clear this bit to zero.				
		The RSTS_WDT flag is set by the "reset signal" from the watchdog timer to indicate the previous reset source.				
[2]	RSTS_WDT	1 = The watchdog timer had issued the reset signal to reset the system.				
		0 = No reset from watchdog timer				
		Software can write 1 to clear this bit to zero.				
		The RSTS_RESET flag is set by the "reset signal" from the /RESET pin to indicate the previous reset source.				
[1]	RSTS_RESET	1 = The Pin /RESET had issued the reset signal to reset the system.				
		0 = No reset from /RESET pin				
		Software can write 1 to clear this bit to zero.				
		The RSTS_POR flag is set by the "reset signal" from the Power-On Reset (POR) controller or bit CHIP_RST (IPRSTC1[0]) to indicate the previous reset source.				
[0]	RSTS_POR	1 = The Power-On Reset (POR) or CHIP_RST had issued the reset signal to reset the system.				
		0 = No reset from POR or CHIP_RST				
		Software can write 1 to clear this bit to zero.				

#### Peripheral Reset Control Register1 (IPRSTC1)

Register	Offset	R/W	Description	Reset Value

			Rese	erved						
15	14	13	12	11	10	9	8			
	Reserved									
7	6	5	4	3	2	1	0			
LVR_EN	BOD_OUT	BOD_LPM	BOD_INTF	BOD_RSTEN	BOD	D_VL	BOD_EN			

Bits	Descriptions	Descriptions				
[31:8]	Reserved	Reserved				
		Low Voltage Reset Enable (write-protection bit)				
		The LVR function reset the chip when the input power voltage is lower than LVR circuit setting. LVR function is enabled in default.				
[7]	LVR_EN	1 = Enabled Low Voltage Reset function – After enabling the bit, the LVR function will be active with 100uS delay for LVR output stable. (Default).				
		0 = Disabled Low Voltage Reset function				
		This bit is the protected bit. It means programming this needs to write "59h", "16h", "88h" to address 0x5000_0100 to disable register protection. Reference the register REGWRPROT at address GCR_BA+0x100				
		Brown-Out Detector output status				
[6]	BOD_OUT	1 = Brown-Out Detector output status is 1. It means the detected voltage is lower than BOD_VL setting. If the BOD_EN is 0, BOD function disabled , this bit always responds 0				
		0 = Brown-Out Detector output status is 0. It means the detected voltage is higher than BOD_VL setting or BOD_EN is 0				
		Brown-Out Detector Low power Mode (write-protection bit)				
		1 = Enable the BOD low power mode				
[5]	BOD_LPM	0 = BOD operate in normal mode (default)				
		The BOD consumes about 100 uA in normal mode, the low power mode can reduce the current to about 1/10 but slow the BOD response.				
		This bit is the protected bit. It means programming this needs to write "59h", "16h",				

### nuvoton

Bits	Descriptions							
		"88h" to address 0x500 REGWRPROT at addres		protection. Reference the re-	gister			
		Brown-Out Detector Int	errupt Flag					
[4]	BOD_INTF	1 = When Brown-Out Detector detects the $V_{DD}$ is dropped down through the voltage of BOD_VL setting or the $V_{DD}$ is raised up through the voltage of BOD_VL setting, this bit is set to 1 and the Brown-Out interrupt is requested if Brown-Out interrupt is enabled.						
		0 = Brown-Out Detector through the voltage of B0		ge draft at $V_{DD}$ down through	or up			
		Software can write 1 to c	lear this bit to zero.					
		Brown-Out Reset Enab	le (write-protection bit)					
		1 = Enable the Brown-O	ut "RESET" function					
		function is enabled (BO		d (BOD_EN high) and BOD assert a signal to reset chip D_OUT high).				
		0 = Enable the Brown-O	ut "INTERRUPT" function					
[3]	BOD_RSTEN	While the BOD function is enabled (BOD_EN high) and BOD interrupt function is enabled (BOD_RSTEN low), BOD will assert an interrupt if BOD_OUT is high. BOD interrupt will keep till to the BOD_EN set to 0. BOD interrupt can be blocked by disabling the NVIC BOD interrupt or disabling BOD function (set BOD_EN low).						
		The default value is set by flash controller user configuration register config0 bit[20].						
		This bit is the protected bit. It means programming this needs to write "59h", "16h", "88h" to address 0x5000_0100 to disable register protection. Reference the register REGWRPROT at address GCR_BA+0x100.						
		Brown-Out Detector Threshold Voltage Selection (write-protection bits)						
		The default value is set by flash controller user configuration register config0 bit[22:21]						
		This bit is the protected bit. It means programming this needs to write "59h", "16h", "88h" to address 0x5000_0100 to disable register protection. Reference the register REGWRPROT at address GCR_BA+0x100.						
[2:1]	BOD VL	BOV_VL[1]	BOV_VL[0]	Brown-Out voltage				
		1	1	4.5 V				
		1	0	3.8 V				
		0	1	2.7 V				
		0	0	2.2 V				
		Brown-Out Detector En	able (write-protection bit)					
				iguration register config0 bit[23	3]			
		1 = Brown-Out Detector	function is enabled					
[0]	BOD_EN	0 = Brown-Out Detector	function is disabled					
		"88h" to address 0x500	This bit is the protected bit. It means programming this needs to write "59h", "16h", "88h" to address 0x5000_0100 to disable register protection. Reference the register REGWRPROT at address GCR_BA+0x100.					

#### Temperature Sensor Control Register (TEMPCR)

Register	Offset	R/W	Description	Reset Value
TEMPCR	GCR_BA+0x1C	R/W	Temperature Sensor Control Register	0x0000_0000

31	30	29	28	27	26	25	24			
	Reserved									
23	22	21	20	19	18	17	16			
			Rese	erved						
15	14	13	12	11	10	9	8			
			Rese	erved						
7	7 6 5 4 3 2 1									
Reserved							VTEMP_EN			

Bits	Descriptions	
[31:1]	Reserved	Reserved
		Temperature sensor Enable
		This bit is used to enable/disable temperature sensor function.
		1 = Enabled temperature sensor function
[0]	VTEMP_EN	0 = Disabled temperature sensor function (default)
		After this bit is set to 1, the value of temperature can get from ADC conversion result by ADC channel selecting channel 7 and alternative multiplexer channel selecting temperature sensor. Detail ADC conversion function please reference ADC function chapter.

## nuvoTon

#### Power-On-Reset Control Register (PORCR)

Register	Offset	R/W	Description	Reset Value
PORCR	GCR_BA+0x24	R/W	Power-On-Reset Controller Register	0x0000_00XX

31	30	29	28	27	26	25	24			
	Reserved									
23	22	21	20	19	18	17	16			
			Rese	erved						
15	14	13	12	11	10	9	8			
			POR_DIS_	CODE[15:8]						
7	6	5	4	3	2	1	0			
	POR_DIS_CODE[7:0]									

Bits	Descriptions					
[31:16]	Reserved	Reserved				
		The register is used for the Power-On-Reset enable control (write-protection bits)				
		When power on, the POR circuit generates a reset signal to reset the whole chip function, but noise on the power may cause the POR active again. User can disable internal POR circuit to avoid unpredictable noise to cause chip reset by writing 0x5AA5 to this field.				
[15:0]	POR_DIS_CODE	The POR function will be active again when this field is set to another value or chip is reset by other reset source, including:				
		/RESET, Watchdog, LVR reset, BOD reset, ICE reset command and the software-chip reset function				
		This bit is the protected bit. It means programming this needs to write "59h", "16h", "88h" to address 0x5000_0100 to disable register protection. Reference the register REGWRPROT at address GCR_BA+0x100.				

#### Multiple Function Pin GPIOA Control Register (GPA\_MFP)

#### Register Write-Protection Control Register (REGWRPROT)

Some of the system control registers need to be protected to avoid inadvertent write and disturb the chip operation. These system control registers are protected after the power on reset till user to disable register protection. For user to program these protected registers, a register protection disable sequence needs to be followed by a special programming. The register protection disable sequence is writing the data "59h", "16h" "88h" to the register REGWRPROT address at 0x5000\_0100 continuously. Any different data value, different sequence or any other write to other address during these three data writing will abort the whole sequence.

After the protection is disabled, user can check the protection disable bit at address 0x5000\_0100 bit0, 1 is protection disable, and 0 is protection enable. Then user can update the target protected register value and then write any data to the address "0x5000\_0100" to enable register protection.

This register is write for disable/enable register protection and read for the REGPROTDIS status

Register	Offset	R/W	Description	Reset Value
REGWRPROT	GCR_BA+0x100	R/W	Register Write-Protection Control Register	0x0000_0000

		FATCON: address 0x5000_C018

#### 5.2.6 System Timer (SysTick)

The Cortex-M0 includes an integrated system timer, SysTick. SysTick provides a simple, 24-bit clear-on-write, decrementing, wrap-on-zero counter with a flexible control mechanism. The counter can be used as a Real Time Operating System (RTOS) tick timer or as a simple counter.

When system timer is enabled, it will count down from the value in the SysTick Current Value Register (SYST\_CVR) to zero, and reload (wrap) to the value in the SysTick Reload Value Register (SYST\_RVR) on the next clock cycle, then decrement on subsequent clocks. When the counter transitions to zero, the COUNTFLAG status bit is set. The COUNTFLAG bit clears on reads.

The SYST\_CVR value is UNKNOWN on reset. Software should write to the register to clear it to zero before enabling the feature. This ensures the timer will count from the SYST\_RVR value rather than an arbitrary value when it is enabled.

If the SYST\_RVR is zero, the timer will be maintained with a current value of zero after it is reloaded with this value. This mechanism can be used to disable the feature independently from the timer enable bit.

For more detailed information, please refer to the documents "ARM<sup>®</sup> Cortex<sup>™</sup>-M0 Technical Reference Manual" and "ARM<sup>®</sup> v6-M Architecture Reference Manual".

#### 5.2.6.1 System Timer Control Register Map

			CURRE	NT [15:8]				
7	6	5	4	3	2	1	0	
	CURRENT[7:0]							

Bits	Descriptions	
[31:24]	Reserved	Reserved
[23:0]	CURRENT	Current counter value. This is the value of the counter at the time it is sampled. The counter does not provide read-modify-write protection. The register is write-clear. A software write of any value will clear the register to 0.

#### 5.2.7 Nested Vectored Interrupt Controller (NVIC)

Cortex-M0 provides an interrupt controller as an integral part of the exception mode, named as "Nested Vectored Interrupt Controller (NVIC)". It is closely coupled to the processor kernel and provides following features:

- Nested and Vectored interrupt support
- Automatic processor state saving and restoration
- Reduced and deterministic interrupt latency

The NVIC prioritizes and handles all supported exceptions. All exceptions are handled in "Handler Mode". This NVIC architecture supports 32 (IRQ[31:0]) discrete interrupts with 4 levels of priority. All of the interrupts and most of the system exceptions can be configured to different priority levels. When an interrupt occurs, the NVIC will compare the priority of the new interrupt to the current running one's priority. If the priority of the new interrupt is higher than the current one, the new interrupt handler will override the current handler.

When any interrupts is accepted, the starting address of the interrupt service routine (ISR) is fetched from a vector table in memory. There is no need to determine which interrupt is accepted and branch to the starting address of the correlated ISR by software. While the starting address is fetched, NVIC will also automatically save processor state including the registers "PC, PSR, LR, R0~R3, R12" to the stack. At the end of the ISR, the NVIC will restore the mentioned registers from stack and resume the normal execution. Thus it will take less and deterministic time to process the interrupt request.

The NVIC supports "Tail Chaining" which handles back-to-back interrupts efficiently without the overhead of states saving and restoration and therefore reduces delay time in switching to pending ISR at the end of current ISR. The NVIC also supports "Late Arrival" which improves the efficiency of concurrent ISRs. When a higher priority interrupt request occurs before the current ISR starts to execute (at the stage of state saving and starting address fetching), the NVIC will give priority to the higher one without delay penalty. Thus it advances the real-time capability.

For more detailed information, please refer to the documents "ARM<sup>®</sup> Cortex<sup>™</sup>-M0 Technical Reference Manual" and "ARM<sup>®</sup> v6-M Architecture Reference Manual".

#### 5.2.7.1 Exception Model and System Interrupt Map

Table 5-2 lists the exception model supported by NuMicro<sup>™</sup> NUC100 Series. Software can set four levels of priority on some of these exceptions as well as on all interrupts. The highest user-configurable priority is denoted as "0" and the lowest priority is denoted as "3". The default priority of all the user-configurable interrupts is "0". Note that priority "0" is treated as the fourth priority on the system, after three system exceptions "Reset", "NMI" and "Hard Fault".

Exception Name	Vector Number	Priority	
Reset	1	-3	
NMI	2	-2	
Hard Fault	3	-1	
Reserved	4 ~ 10	Reserved	
SVCall	11	Configurable	
Reserved	12 ~ 13	Reserved	
PendSV	14	Configurable	
SysTick	15	Configurable	
Interrupt (IRQ0 ~ IRQ31)	16 ~ 47	Configurable	

Table 5-2 Exception Model

Vector Number	Interrupt Number (Bit in Interrupt Registers)	Interrupt Name	Source IP	Interrupt description
0 ~ 15	-	-	-	System exceptions
16	0	BOD_OUT	Brown-Out	Brown-Out low voltage detected interrupt
17	1	WDT_INT	WDT	Watchdog Timer interrupt
18	2	EINT0	GPIO	External signal interrupt from PB.14 pin
19	3	EINT1	GPIO	External signal interrupt from PB.15 pin
20	4	GPAB_INT	GPIO	External signal interrupt from PA[15:0]/PB[13:0]
21	5	GPCDE_INT	GPIO	External interrupt from PC[15:0]/PD[15:0]/PE[15:0]
22	6	PWMA_INT	PWM0~3	PWM0, PWM1, PWM2 and PWM3 interrupt
23	7	PWMB_INT	PWM4~7	PWM4, PWM5, PWM6 and PWM7 interrupt
24	8	TMR0_INT	TMR0	Timer 0 interrupt
25	9	TMR1_INT	TMR1	Timer 1 interrupt

46	30	Reserved	Reserved	Reserved
47	31	RTC_INT	RTC	Real time clock interrupt

Table 5-3 System Interrupt Map

#### 5.2.7.2 Vector Table

When any interrupts is accepted, the processor will automatically fetch the starting address of the interrupt service routine (ISR) from a vector table in memory. For ARMv6-M, the vector table base address is fixed at 0x00000000. The vector table contains the initialization value for the stack pointer on reset, and the entry point addresses for all exception handlers. The vector number on previous page defines the order of entries in the vector table associated with exception handler entry as illustrated in previous section.

Vector Table Word Offset	Description
0	SP_main – The Main stack pointer
Vector Number	Exception Entry Pointer using that Vector Number

Table 5-4 Vector Table Format

#### 5.2.7.3 Operation Description

NVIC interrupts can be enabled and disabled by writing to their corresponding Interrupt Set-Enable or Interrupt Clear-Enable register bit-field. The registers use a write-1-to-enable and write-1-to-clear policy, both registers reading back the current enabled state of the corresponding interrupts. When an interrupt is disabled, interrupt assertion will cause the interrupt to become Pending, however, the interrupt will not activate. If an interrupt is Active when it is disabled, it remains in its Active state until cleared by reset or an exception return. Clearing the enable bit prevents new activations of the associated interrupt.

NVIC interrupts can be pended/un-pended using a complementary pair of registers to those used to enable/disable the interrupts, named the Set-Pending Register and Clear-Pending Register respectively. The registers use a write-1-to-enable and write-1-to-clear policy, both registers reading back the current pended state of the corresponding interrupts. The Clear-Pending Register has no effect on the execution status of an Active interrupt.

NVIC interrupts are prioritized by updating an 8-bit field within a 32-bit register (each register supporting four interrupts).

The general registers associated with the NVIC are all accessible from a block of memory in the System Control Space and will be described in next section.

### 5.2.7.4 NVIC Control Registers

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
SCS_BA = 0x	E000_E000			
NVIC_ISER	SCS_BA+0x100	R/W	IRQ0 ~ IRQ31 Set-Enable Control Register	0x0000_0000
NVIC_ICER	SCS_BA+0x180	R/W	IRQ0 ~ IRQ31 Clear-Enable Control Register	0x0000_0000
NVIC_ISPR	SCS_BA+0x200	R/W	IRQ0 ~ IRQ31 Set-Pending Control Register	0x0000_0000
NVIC_ICPR	SCS_BA+0x280	R/W	IRQ0 ~ IRQ31 Clear-Pending Control Register	0x0000_0000
NVIC_IPR0	SCS_BA+0x400	R/W	IRQ0 ~ IRQ3 Priority Control Register	0x0000_0000
NVIC_IPR1	SCS_BA+0x404	R/W	IRQ4 ~ IRQ7 Priority Control Register	0x0000_0000
NVIC_IPR2	SCS_BA+0x408	R/W	IRQ8 ~ IRQ11 Priority Control Register	0x0000_0000
NVIC_IPR3	SCS_BA+0x40C	R/W	IRQ12 ~ IRQ15 Priority Control Register	0x0000_0000
NVIC_IPR4	SCS_BA+0x410	R/W	IRQ16 ~ IRQ19 Priority Control Register	0x0000_0000
NVIC_IPR5	SCS_BA+0x414	R/W	IRQ20 ~ IRQ23 Priority Control Register	0x0000_0000
NVIC_IPR6	SCS_BA+0x418	R/W	IRQ24 ~ IRQ27 Priority Control Register	0x0000_0000
NVIC_IPR7	SCS_BA+0x41C	R/W	IRQ28 ~ IRQ31 Priority Control Register	0x0000_0000

# nuvoTon

#### IRQ0 ~ IRQ31 Set-Enable Control Register (NVIC\_ISER)

Register	Offset	R/W	Description	Reset Value
NVIC_ISER	SCS_BA+0x100	R/W	IRQ0 ~ IRQ31 Set-Enable Control Register	0x0000_0000

31	30	29	28	27	26	25	24		
	SETENA[31:24]								
23	22	21	20	19	18	17	16		
			SETENA	A [23:16]					
15	14	13	12	11	10	9	8		
			SETEN	A [15:8]					
7	6	5	4	3	2	1	0		
	SETENA[7:0]								

Bits	Descriptions	
		Enable one or more interrupts within a group of 32. Each bit represents an interrupt number from IRQ0 ~ IRQ31 (Vector number from 16 ~ 47).
[31:0] <b>SETENA</b>	Writing 1 will enable the associated interrupt.	
		Writing 0 has no effect.
		The register reads back with the current enable state.

# nuvoTon

#### IRQ0 ~ IRQ31 Clear-Enable Control Register (NVIC\_ICER)

Register	Offset	R/W	Description	Reset Value
NVIC_ICER	SCS_BA+0x180	R/W	IRQ0 ~ IRQ31 Clear-Enable Control Register	0x0000_0000

31	30	29	28	27	26	25	24		
	CLRENA[31:24]								
23	22	21	20	19	18	17	16		
			CLREN	A [23:16]					
15	14	13	12	11	10	9	8		
			CLREN	A [15:8]					
7	6	5	4	3	2	1	0		
	CLRENA[7:0]								

Bits	Descriptions	
		Disable one or more interrupts within a group of 32. Each bit represents an interrupt number from IRQ0 ~ IRQ31 (Vector number from 16 ~ 47).
[31:0] CLRENA	Writing 1 will disable the associated interrupt.	
		Writing 0 has no effect.
		The register reads back with the current enable state.

# nuvoTon

#### IRQ0 ~ IRQ31 Set-Pending Control Register (NVIC\_ISPR)

Register	Offset	R/W	Description	Reset Value
NVIC_ISPR	SCS_BA+0x200	R/W	IRQ0 ~ IRQ31 Set-Pending Control Register	0x0000_0000

31	30	29	28	27	26	25	24			
	SETPEND[31:24]									
23	22	21	20	19	18	17	16			
			SETPEN	D [23:16]						
15	14	13	12	11	10	9	8			
	SETPEND [15:8]									
7	7 6 5 4 3 2 1 0									
	SETPEND [7:0]									

Bits	Descriptions	
[31:0]	SETPEND	<ul> <li>Writing 1 to a bit to set pending state of the associated interrupt under software control.</li> <li>Each bit represents an interrupt number from IRQ0 ~ IRQ31 (Vector number from 16 ~ 47).</li> <li>Writing 0 has no effect.</li> <li>The register reads back with the current pending state.</li> </ul>

#### IRQ0 ~ IRQ31 Clear-Pending Control Register (NVIC\_ICPR)

Register	Offset	R/W	Description	Reset Value
NVIC_ICPR	SCS_BA+0x280	R/W	IRQ0 ~ IRQ31 Clear-Pending Control Register	0x0000_0000

31	30	29	28	27	26	25	24			
	CLRPEND [31:24]									
23	22	21	20	19	18	17	16			
			CLRPEN	D [23:16]						
15	14	13	12	11	10	9	8			
CLRPEND [15:8]										
7	7 6 5 4 3 2 1 0									
	CLRPEND [7:0]									

Bits	Descriptions	
[31:0] <b>C</b>		Writing 1 to a bit to remove the pending state of associated interrupt under software control. Each bit represents an interrupt number from IRQ0 ~ IRQ31 (Vector number from $16 \sim 47$ ).
		Writing 0 has no effect.
		The register reads back with the current pending state.

# nuvoTon

#### IRQ0 ~ IRQ3 Interrupt Priority Register (NVIC\_IPR0)

Register	ster Offset R/W		Description	Reset Value

#### 5.2.7.5 Interrupt Source Control Registers

Besides the interrupt control registers associated with the NVIC, NuMicro™ NUC100 Series also implement some specific control registers to facilitate the interrupt functions, including "interrupt source identification", "NMI source selection" and "interrupt test mode". They are described as below.

Register	Offset	R/W	Description	Reset Value
INT_BA = 0x50	000_0300			
IRQ0_SRC	INT_BA+0x00	R	IRQ0 (BOD) interrupt source identity	0xXXXX_XXXX
IRQ1_SRC	INT_BA+0x04	R	IRQ1 (WDT) interrupt source identity	0xXXXX_XXXX
IRQ2_SRC	INT_BA+0x08	R	IRQ2 (EINT0) interrupt source identity	0xXXXX_XXXX
IRQ3_SRC	INT_BA+0x0C	R	IRQ3 (EINT1) interrupt source identity	0xXXXX_XXXX
IRQ4_SRC	INT_BA+0x10	R	IRQ4 (GPA/B) interrupt source identity	0xXXXX_XXXX
IRQ5_SRC	INT_BA+0x14	R	IRQ5 (GPC/D/E) interrupt source identity	0xXXXX_XXXX
IRQ6_SRC	INT_BA+0x18	R	IRQ6 (PWMA) interrupt source identity	0xXXXX_XXXX
IRQ7_SRC	INT_BA+0x1C	R	IRQ7 (PWMB) interrupt source identity	0xXXXX_XXXX
IRQ8_SRC	INT_BA+0x20	R	IRQ8 (TMR0) interrupt source identity	0xXXXX_XXXX
IRQ9_SRC	INT_BA+0x24	R	IRQ9 (TMR1) interrupt source identity	0xXXXX_XXXX
IRQ10_SRC	INT_BA+0x28	R	IRQ10 (TMR2) interrupt source identity	0xXXXX_XXXX
IRQ11_SRC	INT_BA+0x2C	R	IRQ11 (TMR3) interrupt source identity	0xXXXX_XXXX
IRQ12_SRC	INT_BA+0x30	R	IRQ12 (URT0) interrupt source identity	0xXXXX_XXXX
IRQ13_SRC	INT_BA+0x34	R	IRQ13 (URT1) interrupt source identity	0xXXXX_XXXX
IRQ14_SRC	INT_BA+0x38	R	IRQ14 (SPI0) interrupt source identity	0xXXXX_XXXX
IRQ15_SRC	INT_BA+0x3C	R	IRQ15 (SPI1) interrupt source identity	0xXXXX_XXXX
IRQ16_SRC	INT_BA+0x40	R	IRQ16 (SPI2) interrupt source identity	0xXXXX_XXXX
IRQ17_SRC	INT_BA+0x44	R	IRQ17 (SPI3)) interrupt source identity	0xXXXX_XXXX
IRQ18_SRC	INT_BA+0x48	R	IRQ18 (I <sup>2</sup> C0) interrupt source identity	0xXXXX_XXXX
IRQ19_SRC	INT_BA+0x4C	R	IRQ19 (I <sup>2</sup> C1) interrupt source identity	0xXXXX_XXXX
IRQ20_SRC	INT_BA+0x50	R	IRQ20 (CAN0) interrupt source identity	0xXXXX_XXXX
IRQ21_SRC	INT_BA+0x54	R	IRQ21 (Reserved) interrupt source identity	0xXXXX_XXXX

#### R: read only, W: write only, R/W: both read and write

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

Register	Offset	R/W	Description	Reset Value
IRQ22_SRC	INT_BA+0x58	R	IRQ22 (Reserved) interrupt source identity	0xXXXX_XXXX

			MCU_IF	RQ[15:8]				
7	6	5	4	3	2	1	0	
	MCU_IRQ[7:0]							

Bits	Descriptions	
		MCU IRQ Source Register
		The MCU_IRQ collects all the interrupts from the peripherals and generates the synchronous interrupt to Cortex-M0. There are two modes to generate interrupt to Cortex-M0, the normal mode and test mode.
[31:0]	MCU_IRQ	The MCU_IRQ collects all interrupts from each peripheral and synchronizes them then interrupts the Cortex-M0.
		When the MCU_IRQ[n] is 0: Set MCU_IRQ[n] 1 will generate an interrupt to Cortex_M0 NVIC[n].
		When the MCU_IRQ[n] is 1 (mean an interrupt is assert), set 1 to the MCU_IRQ[n] will clear the interrupt and set MCU_IRQ[n] 0 : no any effect

#### 5.2.8 System Control Register

Cortex-M0 status and operating mode control are managed by System Control Registers. Including CPUID, Cortex-M0 interrupt priority and Cortex-M0power management can be controlled through these system control register

For more detailed information, please refer to the documents "ARM<sup>®</sup> Cortex™-M0 Technical Reference Manual" and "ARM<sup>®</sup> v6-M Architecture Reference Manual".

Register	Offset	R/W	Description	Reset Value

Reserved				VECTAC	TIVE[5:0]		

Bits	Descriptions	
		NMI set-pending bit
		Write:
		0 = no effect
		1 = changes NMI exception state to pending.
[31]	NMIPENDSET	Read:
[]		0 = NMI exception is not pending
		1 = NMI exception is pending.
		Because NMI is the highest-priority exception, normally the processor enters the NMI exception handler as soon as it detects a write of 1 to this bit. Entering the handler then clears this bit to 0. This means a read of this bit by the NMI exception handler returns 1 only if the NMI signal is reasserted while the processor is executing that handler.
[30:29]	Reserved	Reserved
		PendSV set-pending bit.
		Write:
		0 = no effect
[28]	PENDSVSET	1 = changes PendSV exception state to pending.
[20]	LINDSVSET	Read:
		0 = PendSV exception is not pending
		1 = PendSV exception is pending.
		Writing 1 to this bit is the only way to set the PendSV exception state to pending.
1071		PendSV clear-pending bit.
[27]	PENDSVCLR	Write:

Descriptions	Descriptions						
	0 = no effect						
	1 = removes the pending state from the PendSV exception.						
	This is a write only bit. When you want to clear PENDSV bit, you must "write 0 to PENDSVSET and write 1 to PENDSVCLR" at the same time.						
	SysTick exception set-pending bit.						
	Write:						
	0 = no effect						
PENDSTSET	1 = changes SysTick exception state to pending.						
	Read:						
	0 = SysTick exception is not pending						
	1 = SysTick exception is pending.						
	SysTick exception clear-pending bit.						
	Write:						
PENDSTCI R	0 = no effect						
	1 = removes the pending state from the SysTick exception.						
	This is a write only bit. When you want to clear PENDST bit, you must "write 0 to PENDSTSET and write 1 to PENDSTCLR" at the same time.						
Reserved	Reserved						
	If set, a pending exception will be serviced on exit from the debug halt state.						
ISKPREEMPI	This is a read only bit.						
	Interrupt pending flag, excluding NMI and Faults:						
	0 = interrupt not pending						
ISRPENDING	1 = interrupt pending.						
	This is a read only bit.

15	14	13	12	11	10	9	8		
	Reserved								
7	6	5	4	3	2	1	0		
Reserved			SEVONPEND	Reserved	SLEEPDEEP	SLEEPONEXI T	Reserved		

Bits	Descriptions	
[31:5]	Reserved	Reserved
		Send Event on Pending bit:
		0 = only enabled interrupts or events can wakeup the processor, disabled interrupts are excluded
[4]	SEVONPEND	1 = enabled events and all interrupts, including disabled interrupts, can wakeup the processor.
		When an event or interrupt enters pending state, the event signal wakes up the processor from WFE. If the processor is not waiting for an event, the event is registered and affects the next WFE.
		The processor also wakes up on execution of an SEV instruction or an external event.
[3]	Reserved	Reserved
		Controls whether the processor uses sleep or deep sleep as its low power mode:
[2]	SLEEPDEEP	0 = sleep
		1 = deep sleep
		Indicates sleep-on-exit when returning from Handler mode to Thread mode:
		0 = do not sleep when returning to Thread mode.
[1]	SLEEPONEXIT	1 = enter sleep, or deep sleep, on return from an ISR to Thread mode.
		Setting this bit to 1 enables an interrupt driven application to avoid returning to an empty main application.
[0]	Reserved	Reserved

#### 5.3 Clock Controller

#### 5.3.1 Overview

The clock controller generates the clocks for the whole chip, including system clocks and all peripheral clocks. The clock controller also implements the power control function with the individually clock ON/OFF control, clock source selection and a clock divider. The chip will not enter power down mode until CPU sets the power down enable bit (PWR\_DOWN\_EN) and Cortex-M0 core executes the WFI instruction. After that, chip enter power down mode and wait for wake-up interrupt source triggered to leave power down mode. In the power down mode, the clock controller turns off the external 4~24 MHz high speed crystal and internal 22.1184 MHz high speed oscillator to reduce the overall system power consumption.

### NuMicro™ NUC130/NUC140 Technical Reference Manual

## nuvoTon

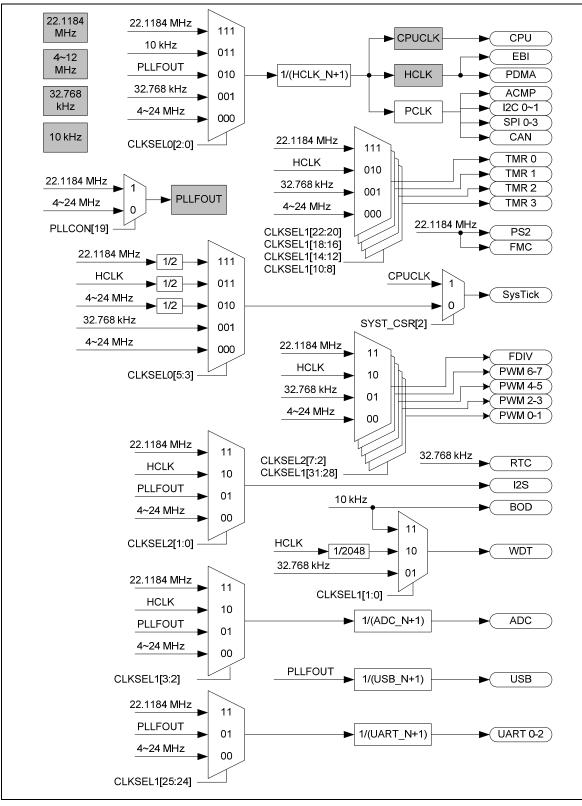

Figure 5-4 Clock generator global view diagram

#### 5.3.2 Clock Generator

The clock generator consists of 5 clock sources which are listed below:

- One external 32.768 kHz low speed crystal
- One external 4~24 MHz high speed crystal
- One programmable PLL FOUT(PLL source consists of external 4~24 MHz high speed crystal and internal 22.1184 MHz high speed oscillator)
- One internal 22.1184 MHz high speed oscillator
- One internal 10 kHz low speed oscillator

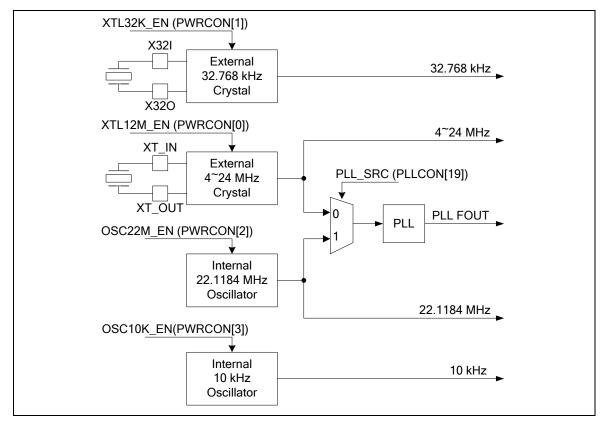

Figure 5-5 Clock generator block diagram

#### 5.3.3 System Clock and SysTick Clock

The system clock has 5 clock sources which were generated from clock generator block. The clock source switch depends on the register HCLK\_S (CLKSEL0[2:0]). The block diagram is showed in Figure 5-6.

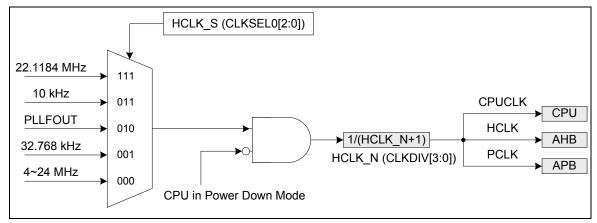

Figure 5-6 System Clock Block Diagram

The clock source of SysTick in Cortex-M0 core can use CPU clock or external clock (SYST\_CSR[2]). If using external clock, the SysTick clock (STCLK) has 5 clock sources. The clock source switch depends on the setting of the register STCLK\_S (CLKSEL0[5:3]). The block diagram is showed in Figure 5-7.

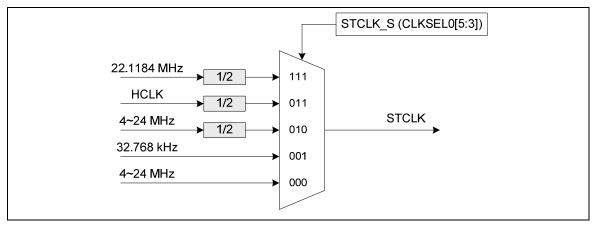

Figure 5-7 SysTick Clock Control Block Diagram

#### 5.3.4 Peripherals Clock

The peripherals clock had different clock source switch setting which depends on the different peripheral. Please refer the CLKSEL1 and CLKSEL2 register description in 5.3.7.

#### 5.3.5 Power Down Mode Clock

When chip enters into power down mode, system clocks, some clock sources, and some peripheral clocks will be disabled. Some clock sources and peripherals clock are still active in power down mode.

For theses clocks which still keep active list below:

- Clock Generator
  - Internal 10 kHz low speed oscillator clock
  - External 32.768 kHz low speed crystal clock
- Peripherals Clock (When these IP adopt external 32.768 kHz low speed crystal or 10 kHz low speed oscillator as clock source)

#### 5.3.6 Frequency Divider Output

This device is equipped a power-of-2 frequency divider which is composed by16 chained divideby-2 shift registers. One of the 16 shift register outputs selected by a sixteen to one multiplexer is reflected to CLKO function pin. Therefore there are 16 options of power-of-2 divided clocks with the frequency from  $F_{in}/2^{16}$  where Fin is input clock frequency to the clock divider.

The output formula is  $F_{out} = F_{in}/2^{(N+1)}$ , where  $F_{in}$  is the input clock frequency,  $F_{out}$  is the clock divider output frequency and N is the 4-bit value in FSEL (FRQDIV[3:0]).

When write 1 to DIVIDER\_EN (FRQDIV[4]), the chained counter starts to count. When write 0 to DIVIDER\_EN (FRQDIV[4]), the chained counter continuously runs till divided clock reaches low state and stay in low state.

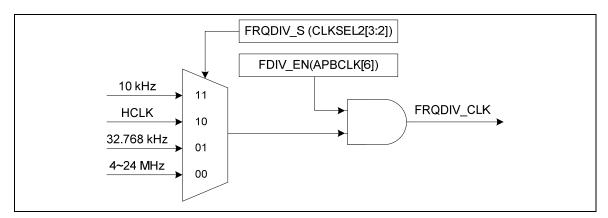

Figure 5-8 Clock Source of Frequency Divider

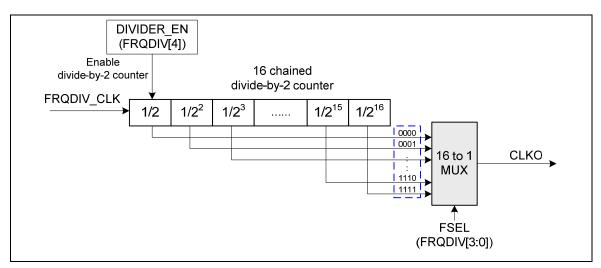

Figure 5-9 Block Diagram of Frequency Divider

Bits	Descriptions					
[31:9]	Reserved	Reserve				
		This Bit Control the Power Down Entry Condition (write-protection bit)				
[8]	PD_WAIT_CPU	1 = Chip enter power down mode when the both PD_WAIT_CPU and PWR_DOWN_EN bits are set to 1 and CPU run WFI instruction.				
		0 = Chip entry power down mode when the PWR_DOWN_EN bit is set to 1				
		System Power Down Enable Bit (write-protection bit)				
		When this bit is set to 1, the chip power down mode is enabled and chip power down behavior will depends on the PD_WAIT_CPU bit				
		(a) If the PD_WAIT_CPU is 0, then the chip enters power down mode immediately after the PWR_DOWN_EN bit set.				
[7]	PWR DOWN EN	(b) if the PD_WAIT_CPU is 1, then the chip keeps active till the CPU sleep mode is also active and then the chip enters power down mode				
[/]	FWR_DOWN_EN	When chip wakes up from power down mode, this bit is auto cleared. Users need to set this bit again for next power down.				
		When in power down mode, external 4~24 MHz high speed crystal and the internal 22.1184 MHz high speed oscillator will be disabled in this mode, but the external 32.768 kHz low speed crystal and internal 10 kHz low speed oscillator are not controlled by power down mode.				
		When in power down mode, the PLL and system clock are disabled, and ignored the clock source selection. The clocks of peripheral are not controlled by power down				

Bits	Descriptions						
		mode, if the peripheral clock source is from external 32.768 kHz low speed crystal or the internal 10 kHz low speed oscillator.					
		1 = Chip enter the power down mode instant or wait CPU sleep command WFI					
		0 = Chip operating normally or chip in idle mode because of WFI command					
 I		Power Down Mode Wake-up Interrupt Status					
		Set by "power down wake-up event", it indicates that resume from power down mode"					
[6]	PD_WU_STS	The flag is set if the GPIO, USB, UART, WDT, CAN, ACMP, BOD or RTC wake-up occurred					
		Write 1 to clear the bit to zero.					
		Note: This bit is working only if PD_WU_INT_EN (PWRCON[5]) set to 1.					
		Power Down Mode Wake-up Interrupt Enable (write-protection bit)					
		0 = Disable					
[5]	PD_WU_INT_EN	1 = Enable					
		The interrupt will occur when both PD_WU_STS and PD_WU_INT_EN are high.					
		Enable the Wake-up Delay Counter (write-protection bit)					
		When the chip wakes up from power down mode, the clock control will delay certain clock cycles to wait system clock stable.					
[4]	PD_WU_DLY	The delayed clock cycle is 4096 clock cycles when chip work at external 4~24 MHz high speed crystal, and 256 clock cycles when chip work at internal 22.1184 MHz high speed oscillator.					
		1 = Enable clock cycles delay					
		0 = Disable clock cycles delay					
		Internal 10 kHz Low Speed Oscillator Enable (write-protection bit)					
[3]	OSC10K_EN	1 = Enable internal 10 kHz low speed oscillator					
		0 = Disable internal 10 kHz low speed oscillator					
		Internal 22.1184 MHz High Speed Oscillator Enable (write-protection bit)					
[2]	OSC22M_EN	1 = Enable internal 22.1184 MHz high speed oscillator					
		0 = Disable internal 22.1184 MHz high speed oscillator					
		External 32.768 kHz Low Speed Crystal Enable (write-protection bit)					
[1]	XTL32K_EN	1 = Enable external 32.768 kHz low speed crystal (Normal operation)					
		0 = Disable external 32.768 kHz low speed crystal					
		External 4~24 MHz High Speed Crystal Enable (write-protection bit)					
[0]	XTL12M_EN	The bit default value is set by flash controller user configuration register config0 [26:24]. When the default clock source is from external 4~24 MHz high speed crystal, this bit is set to 1 automatically					
		1 = Enable external 4~24 MHz high speed crystal					

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

# nuvoTon

Register/Instruction Mode	PWR_DOWN_EN	PD_WAIT_CPU	CPU run WFI instruction	Clock Disable
Normal operation	0	0	NO	All clocks are disabled by control register
Idle mode (CPU entry sleep mode)	0	0	YES	Only CPU clock is disabled
Power down mode	1	0	NO	Most clocks are disabled except 10 kHz/32.768 kHz, only RTC/WDT/Timer/PWM peripheral clock are still enabled.
Power down mode (CPU entry deep sleep mode)	1	1	YES	Most clocks are disabled except 10 kHz/32.768 kHz, only RTC/WDT/Timer/PWM peripheral clock are still enabled.

Table 5-5 Power Down Mode Control Table

When chip enter power down mode, user can wake-up chip by some interrupt sources. User should enable related interrupt sources and NVIC IRQ enable bits (NVIC\_ISER) before set PWR\_DOWN\_EN bit in PWRCON[7] to ensure chip can enter power down and be wake-up successfully.

#### AHB Devices Clock Enable Control Register (AHBCLK)

These bits for this register are used to enable/disable clock for system clock PDMA clock and EBI clock.

Bits	Descriptions	
[8:0] <b>FB</b>	FB DV	PLL Feedback Divider Control Pins
		Refer to the formulas below the table.

### **Output Clock Frequency Setting**

$$FOUT = FIN \times \frac{NF}{NR} \times \frac{1}{NO}$$

Constraint:

1. 3.2MHz < FIN < 150MHz

$$2. 800 \text{ KHz} < \frac{\text{FIN}}{2*\text{NR}} < 8\text{MHz}$$

$$100 \, \textit{MHz} < \textit{FCO} = \textit{FIN} \times \frac{\textit{NF}}{\textit{NR}} < 200 \, \textit{MHz}$$

3. 120 MHz < FCO is preferred

Symbol	Description
FOUT	Output Clock Frequency
FIN	Input (Reference) Clock Frequency
NR	Input Divider (IN_DV + 2)
NF	Feedback Divider (FB_DV + 2)
NO	OUT_DV = "00" : NO = 1 OUT_DV = "01" : NO = 2 OUT_DV = "10" : NO = 2 OUT_DV = "11" : NO = 4

#### **Default Frequency Setting**

The default value : 0xC22E FIN = 12 MHz NR = (1+2) = 3 NF = (46+2) = 48 NO = 4 FOUT = 12/4 x 48 x 1/3 = 48 MHz

# nuvoTon

### Frequency Divider Control Register (FRQDIV)

[4]		Frequency Divider Enable Bit 0 = Disable Frequency Divider 1 = Enable Frequency Divider
[3:0]	FSEL	Divider Output Frequency Selection Bits The formula of output frequency is $F_{out} = F_{in}/2^{(N+1)}$ $F_{in}$ is the input clock frequency. $F_{out}$ is the frequency of divider output clock. N is the 4-bit value of FSEL[3:0].

### 5.4 USB Device Controller (USB)

### 5.4.1 Overview

There is one set of USB 2.0 full-speed device controller and transceiver in this device. It is compliant with USB 2.0 full-speed device specification and support control/bulk/interrupt/ isochronous transfer types.

In this device controller, there are two main interfaces: the APB bus and USB bus which comes from the USB PHY transceiver. For the APB bus, the CPU can program control registers through it. There are 512 bytes internal SRAM as data buffer in this controller. For IN or OUT transfer, it is necessary to write data to SRAM or read data from SRAM through the APB interface or SIE. Users need to set the effective starting address of SRAM for each endpoint buffer through "buffer segmentation register (USB\_BUFSEGx)".

There are 6 endpoints in this controller. Each of the endpoint can be configured as IN or OUT endpoint. All the operations including Control, Bulk, Interrupt and Isochronous transfer are implemented in this block. The block of ENDPOINT CONTROL is also used to manage the data sequential synchronization, endpoint states, current start address, transaction status, and data buffer status for each endpoint.

There are four different interrupt events in this controller. They are the wake-up function, device plug-in or plug-out event, USB events, like IN ACK, OUT ACK etc, and BUS events, like suspend and resume, etc. Any event will cause an interrupt, and users just need to check the related event flags in interrupt event status register (USB\_INTSTS) to acknowledge what kind of interrupt occurring, and then check the related USB Endpoint Status Register (USB\_EPSTS) to acknowledge what kind of event occurring in this endpoint.

A software-disable function is also supported for this USB controller. It is used to simulate the disconnection of this device from the host. If user enables DRVSE0 bit (USB\_DRVSE0), the USB controller will force the output of USB\_DP and USB\_DM to level low and its function is disabled. After disable the DRVSE0 bit, host will enumerate the USB device again.

Reference: Universal Serial Bus Specification Revision 1.1

### 5.4.2 Features

This Universal Serial Bus (USB) performs a serial interface with a single connector type for attaching all USB peripherals to the host system. Following is the feature listing of this USB.

- Compliant with USB 2.0 Full-Speed specification
- Provide 1 interrupt vector with 4 different interrupt events (WAKEUP, FLDET, USB and BUS)
- Support Control/Bulk/Interrupt/Isochronous transfer type
- Support suspend function when no bus activity existing for 3 ms
- Provide 6 endpoints for configurable Control/Bulk/Interrupt/Isochronous transfer types and maximum 512 bytes buffer size
- Provide remote wake-up capability

# nuvoTon

### 5.4.3 Block Diagram

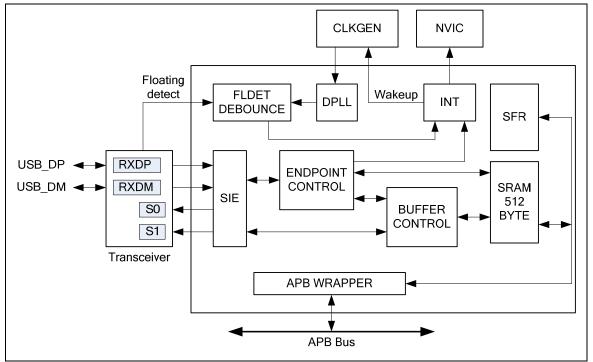

Figure 5-10 USB Block Diagram

### 5.4.4 Function Description

### 5.4.4.1 SIE (Serial Interface Engine)

The SIE is the front-end of the device controller and handles most of the USB packet protocol. The SIE typically comprehends signaling up to the transaction level. The functions that it handles could include:

- Packet recognition, transaction sequencing
- SOP, EOP, RESET, RESUME signal detection/generation
- Clock/Data separation
- NRZI Data encoding/decoding and bit-stuffing
- CRC generation and checking (for Token and Data)
- Packet ID (PID) generation and checking/ decoding
- Serial-Parallel/ Parallel-Serial conversion

### 5.4.4.2 Endpoint Control

There are 6 endpoints in this controller. Each of the endpoint can be configured as Control, Bulk, Interrupt, or Isochronous transfer type. All the operations including Control, Bulk, Interrupt and Isochronous transfer are implemented in this block. It is also used to manage the data sequential synchronization, endpoint state control, current endpoint start address, current transaction status, and data buffer status in each endpoint.

#### 5.4.4.3 Digital Phase Lock Loop

The bit rate of USB data is 12 MHz. The DPLL use the 48 MHz which comes from the clock controller to lock the input data RXDP and RXDM. The 12 MHz bit rate clock is also converted from DPLL.

#### 5.4.4.4 Floating De-bounce

A USB device may be plug-in or plug-out from the USB host. In order to monitor the state of a USB device when it is detached from the USB host, the device controller provides hardware debounce for USB floating detect interrupt to avoid bounce problems on USB plug-in or unplug. Floating detect interrupt appears about 10 ms later than USB plug-in or plug-out. A user can acknowledge USB plug-in/plug-out by reading register "USB\_FLDET". The flag in "FLDET" represents the current state on the bus without de-bounce. If the FLDET is 1, it means the controller has plug-in the USB. If the user polling this flag to check USB state, he/she must add software de-bounce if necessary.

# NUVOTON

#### 5.4.4.5 Interrupt

This USB provides 1 interrupt vector with 4 interrupt events (WAKEUP, FLDET, USB and BUS). The WAKEUP event is used to wake-up the system clock when the power down mode is enabled. (The power mode function is defined in system power down control register, PWRCON). The FLDET event is used for USB plug-in or unplug. The USB event notifies users of some USB requests, like IN ACK, OUT ACK etc., and the BUS event notifies users of some bus events, like suspend, resume, etc. User must set related bits in the interrupt enable register (USB INTEN) of USB Device Controller to enable USB interrupts.

Wake-up interrupt is only present when the chip entered power down mode and then wake-up event had happened. After the chip enters power down mode, any change on USB\_DP and USB DM can wake-up this chip (provided that USB wake-up function is enabled). If this change is not intentionally, no interrupt but wake-up interrupt will occur. After USB wake-up, this interrupt will occur when no other USB interrupt events are present for more than 20ms. The following figure is the control flow of wake-up interrupt.

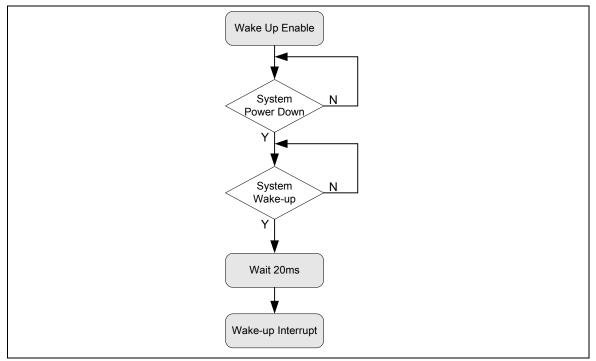

Figure 5-11 Wake-up Interrupt Operation Flow

USB interrupt is used to notify users of any USB event on the bus, and a user can read EPSTS (USB EPSTS[25:8]) and EPEVT5~0 (USB\_INTSTS[21:16]) to know what kind of request is to which endpoint and take necessary responses.

Same as USB interrupt, BUS interrupt notifies users of some bus events, like USB reset, suspend, time-out, and resume. A user can read USB ATTR to acknowledge bus events.

#### 5.4.4.6 Power Saving

USB turns off PHY transceiver automatically to save power while this chip enters power down Publication Release Date: Jan. 2, 2011 **Revision V2.02** 

mode. Furthermore, a user can write 0 into USB\_ATTR[4] to turn off PHY under special circumstances like suspend to save power.

#### 5.4.4.7 Buffer Control

There is 512 bytes SRAM in the controller and the 6 endpoints share this buffer. The user shall configure each endpoint's effective starting address in the buffer segmentation register before the USB function active. The BUFFER CONTROL block is used to control each endpoint's effective starting address and its SRAM size is defined in the MXPLD register.

Figure 5-12 depicts the starting address for each endpoint according the content of USB\_BUFSEGx and USB\_MXPLDx registers. If the USB\_BUFSEG0 is programmed as 0x08h and USB\_MXPLD0 is set as 0x40h, the SRAM size of endpoint 0 is start from USB\_BA+0x108h and end in USB\_BA+0x148h. (Note: the USB SRAM base is USB\_BA+0x100h).

	USB SRAM Start Address	USB SRAM = USB_BA + 0x0100h	
	Setup Token Buffer: 8 bytes		
BUFSEG0 = 0x008	EP0 SRAM Buffer: 64 bytes	EP0 SA = USB_BA + 0x0108h MXPLD0 = 0x40	
BUFSEG1 = 0x048	EP1 SRAM Buffer: 64 bytes	EP1 SA = USB_BA + 0x0148h MXPLD1 = 0x40	
BUFSEG2 = 0x088 {	EP2 SRAM Buffer	EP2 SA = USB_BA + 0x0188h	512 Bytes
BUFSEG3 = 0x100 {	EP3 SRAM Buffer	EP3 SA = USB_BA + 0x0200h	
	   	    ₽	

Figure 5-12 Endpoint SRAM Structure

#### 5.4.4.8 Handling Transactions with USB Device Peripheral

User can use interrupt or polling USB\_INTSTS to monitor the USB Transactions, when transactions occur, USB\_INTSTS will be set by hardware and send an interrupt request to CPU (if related interrupt enabled), or user can polling USB\_INTSTS to get these events without interrupt. The following is the control flow with interrupt enable.

When USB host has requested data from device controller, users need to prepare related data into the specified endpoint buffer in advance. After buffering the required data, users need to write the actual data length in the specified MAXPLD register. Once this register is written, the internal signal "In\_Rdy" will be asserted and the buffering data will be transmitted immediately after receiving associated IN token from Host. Note that after transferring the specified data, the signal "In\_Rdy" will de-assert automatically by hardware.

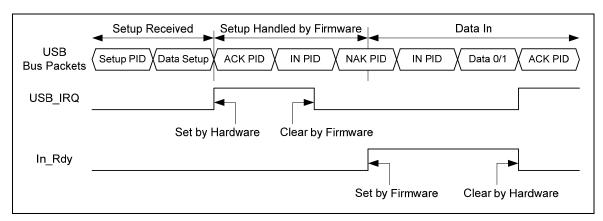

Figure 5-13 Setup Transaction followed by Data in Transaction

Alternatively, when USB host wants to transmit data to the OUT endpoint in the device controller, hardware will buffer these data to the specified endpoint buffer. After this transaction is completed, hardware will record the data length in related MAXPLD register and de-assert the signal "Out\_Rdy". This will avoid hardware accepting next transaction until users move out current data in the related endpoint buffer. Once users have processed this transaction, the related register "MAXPLD" needs to be written by firmware to assert the signal "Out\_Rdy" again to accept next transaction.

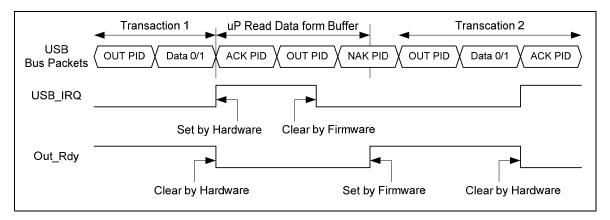

Figure 5-14 Data Out Transfer

### 5.4.5 Register and Memory Map

R: read only, W: write only, R/W: both read and write

		Maximal Payload
		It is used to define the data length which is transmitted to host (IN token) or the actual data length which is received from the host (OUT token). It also used to indicate that the endpoint is ready to be transmitted in IN token or received in OUT token.
		(1). When the register is written by CPU,
		For IN token, the value of MXPLD is used to define the data length to be transmitted and indicate the data buffer is ready.
[8:0]	MXPLD	For OUT token, it means that the controller is ready to receive data from the host and the value of MXPLD is the maximal data length comes from host.
		(2). When the register is read by CPU,
		For IN token, the value of MXPLD is indicated the data length be transmitted to host
		For OUT token, the value of MXPLD is indicated the actual data length receiving from host.
		Note that once MXPLD is written, the data packets will be transmitted/received immediately after IN/OUT token arrived.

### 5.5 General Purpose I/O (GPIO)

### 5.5.1 Overview

NuMicro<sup>™</sup> NUC130/NUC140 has up to 80 General Purpose I/O pins can be shared with other function pins; it depends on the chip configuration. These 80 pins are arranged in 5 ports named with GPIOA, GPIOB, GPIOC, GPIOD and GPIOE. Each port equips maximum 16 pins. Each one of the 80 pins is independent and has the corresponding register bits to control the pin mode function and data.

The I/O type of each of I/O pins can be configured by software individually as input, output, opendrain or quasi-bidirectional mode. After reset, the I/O type of all pins stay in quasi-bidirectional mode and port data register GPIOx\_DOUT[15:0] resets to 0x0000\_FFFF. Each I/O pin equips a very weakly individual pull-up resistor which is about 110 K $\Omega$ ~300 K $\Omega$  for V<sub>DD</sub> is from 5.0 V to 2.5 V.

### 5.5.2 Features

- Four I/O modes:
  - Quasi bi-direction
  - Push-Pull output
  - Open-Drain output
  - Input only with high impendence
- TTL/Schmitt trigger input selectable
- I/O pin can be configured as interrupt source with edge/level setting
- High driver and high sink IO mode support

### 5.5.3 Function Description

### 5.5.3.1 Input Mode Explanation

Set GPIOx\_PMD (PMDn[1:0]) to 00b the GPIOx port [n] pin is in Input mode and the I/O pin is in tri-state (high impedance) without output drive capability. The GPIOx\_PIN value reflects the status of the corresponding port pins.

### 5.5.3.2 Output Mode Explanation

Set GPIOx\_PMD (PMDn[1:0]) to 01b the GPIOx port [n] pin is in Output mode and the I/O pin supports digital output function with source/sink current capability. The bit value in the corresponding bit [n] of GPIOx\_DOUT is driven on the pin.

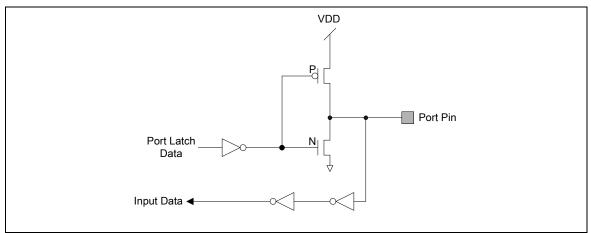

Figure 5-15 Push-Pull Output

### 5.5.3.3 Open-Drain Mode Explanation

Set GPIOx\_PMD (PMDn[1:0]) to 10b the GPIOx port [n] pin is in Open-Drain mode and the digital output function of I/O pin supports only sink current capability, an additional pull-up register is needed for driving high state. If the bit value in the corresponding bit [n] of GPIOx\_DOUT is 0, the pin drive a "low" output on the pin. If the bit value in the corresponding bit [n] of GPIOx\_DOUT is 1, the pin output drives high that is controlled by external pull high resistor.

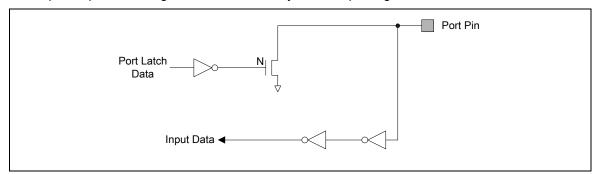

Figure 5-16 Open-Drain Output

### 5.5.3.4 Quasi-bidirectional Mode Explanation

Set GPIOx\_PMD (PMDn[1:0]) to 11b the GPIOx port [n] pin is in Quasi-bidirectional mode and the I/O pin supports digital output and input function at the same time but the source current is only up to hundreds uA. Before the digital input function is performed the corresponding bit in GPIOx\_DOUT must be set to 1. The quasi-bidirectional output is common on the 80C51 and most of its derivatives. If the bit value in the corresponding bit [n] of GPIOx\_DOUT is 0, the pin drive a "low" output on the pin. If the bit value in the corresponding bit [n] of GPIOx\_DOUT is 1, the pin will check the pin value. If pin value is high, no action takes. If pin state is low, then pin will drive strong high with 2 clock cycles on the pin and then disable the strong output drive and then the pin status is control by internal pull-up resistor. Note that the source current capability in quasibidirectional mode is only about 200 uA to 30 uA for V<sub>DD</sub> is form 5.0 V to 2.5 V.

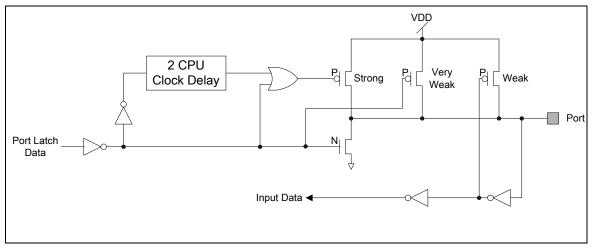

Figure 5-17 Quasi-bidirectional I/O Mode

#### 5.5.3.5 GPIO Interrupt and wakeup function

Each GPIO pin can be set as chip interrupt source by setting correlative GPIOx\_IEN bit and GPIOx\_IMD. There are four types of interrupt condition can be selected: low level trigger, high level trigger, falling edge trigger and rising edge trigger. For edge trigger condition, user can enable input signal de-bounce function to prevent unexpected interrupt happened which caused by noise. The de-bounce clock source and sampling cycle can be set through DEBOUNCE register.

The GPIO can also be the chip wakeup source when chip enter idle mode or power down mode. The setting of wakeup trigger condition is the same as GPIO interrupt trigger, but there are two things need to be noticed if using GPIO as chip wakeup source

#### 1. To ensure the I/O status before enter into power down mode

If using toggle GPIO to wakeup system, user must to make sure the I/O status before entering to idle mode or power down mode according to the relative wakeup settings.

For example, if configure the wakeup event occurred by I/O rising edge/high level trigger, user must make sure the I/O status of specified pin is at low level before entering to idle/power down mode; and if configure I/O falling edge/low level trigger to trigger a wakeup event, user must make sure the I/O status of specified pin is at high level before entering to power down mode.

#### 2. To disable the specified I/O de-bounce function if necessary

If the specified wakeup GPIO with input signal de-bounce function, we must disable de-bounce function before system enter into power down mode, otherwise system will encounter two GPIO interrupts when system wakeup (One is cause by wakeup function, the other one is caused by de-bounce function).

### 5.5.4 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

	DBEN[15:8]									
7	6	5	4	3	2	1	0			
	DBEN[7:0]									

Bits	Descriptions	
[31:16]	Reserved	Reserved
		Port [A/B/C/D/E] Input Signal De-bounce Enable
		DBEN[n]used to enable the de-bounce function for each corresponding bit. If the input signal pulse width can't be sampled by continuous two de-bounce sample cycle The input signal transition is seen as the signal bounce and will not trigger the interrupt. The de-bounce clock source is controlled by DBNCECON[4], one de-bounce sample cycle is controlled by DBNCECON[3:0]
[n]	DBEN[n]	1 = The bit[n] de-bounce function is enabled
		0 = The bit[n] de-bounce function is disabled
		The de-bounce function is valid for edge triggered interrupt. If the interrupt mode is level triggered, the de-bounce enable bit is ignored.
		Note: It is recommended setting this bit to '0' if GPIO is chosen as power down wakeup source. If set this bit to '1', will cause GPIO to produce interrupt twice. One is caused by wake up event, the other one is caused by delayed de-bounce result.

#### GPIO Port [A/B/C/D/E] Interrupt Mode Control (GPIOx \_IMD)

Register	Offset	R/W	Description	Reset Value

#### 5.6 I<sup>2</sup>C Serial Interface Controller (Master/Slave) (I<sup>2</sup>C)

#### 5.6.1 Overview

 $I^2C$  is a two-wire, bi-directional serial bus that provides a simple and efficient method of data exchange between devices. The  $I^2C$  standard is a true multi-master bus including collision detection and arbitration that prevents data corruption if two or more masters attempt to control the bus simultaneously.

Data is transferred between a Master and a Slave synchronously to SCL on the SDA line on a byte-by-byte basis. Each data byte is 8-bit long. There is one SCL clock pulse for each data bit with the MSB being transmitted first. An acknowledge bit follows each transferred byte. Each bit is sampled during the high period of SCL; therefore, the SDA line may be changed only during the low period of SCL and must be held stable during the high period of SCL. A transition on the SDA line while SCL is high is interpreted as a command (START or STOP). Please refer to the Figure 5-18 for more detail I<sup>2</sup>C BUS Timing.

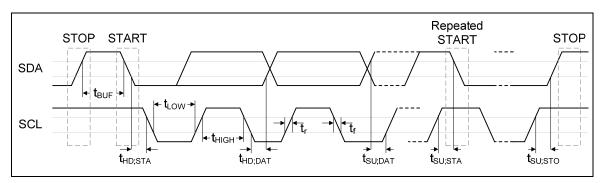

Figure 5-18 I<sup>2</sup>C Bus Timing

The device's on-chip I<sup>2</sup>C logic provides the serial interface that meets the I<sup>2</sup>C bus standard mode specification. The I<sup>2</sup>C port handles byte transfers autonomously. To enable this port, the bit ENS1 in I2CON should be set to '1'. The I<sup>2</sup>C H/W interfaces to the I<sup>2</sup>C bus via two pins: SDA and SCL. Pull up resistor is needed for I<sup>2</sup>C operation as these are open drain pins. When the I/O pins are used as I<sup>2</sup>C port, user must set the pins function to I<sup>2</sup>C in advance.

#### 5.6.2 Features

The  $I^2C$  bus uses two wires (SDA and SCL) to transfer information between devices connected to the bus. The main features of the bus are:

- Master/Slave mode
- Bidirectional data transfer between masters and slaves
- Multi-master bus (no central master)
- Arbitration between simultaneously transmitting masters without corruption of serial data on the bus
- Serial clock synchronization allows devices with different bit rates to communicate via one serial bus
- Serial clock synchronization can be used as a handshake mechanism to suspend and resume serial transfer
- Built-in a 14-bit time-out counter will request the I<sup>2</sup>C interrupt if the I<sup>2</sup>C bus hangs up and timer-out counter overflows.
- External pull-up are needed for high output
- Programmable clocks allow versatile rate control
- Supports 7-bit addressing mode
- I<sup>2</sup>C-bus controllers support multiple address recognition ( Four slave address with mask option)

#### 5.6.3 Function Description

#### 5.6.3.1 <sup>2</sup>C Protocol

Normally, a standard communication consists of four parts:

- 1) START or Repeated START signal generation
- 2) Slave address and R/W bit transfer
- 3) Data transfer
- 4) STOP signal generation

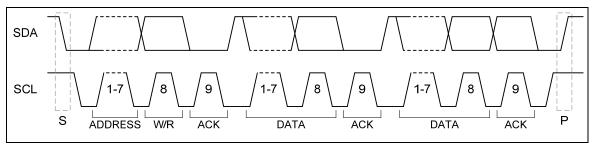

Figure 5-19 I<sup>2</sup>C Protocol

#### 5.6.3.2 Data transfer on the l<sup>2</sup>C-bus

**Error! Reference source not found.** shows a master transmits data to slave. A master addresses a slave with a 7-bit address and 1-bit write index to denote master wants to transmit data to slave. The master keep transmitting data after slave returns acknowledge to master.

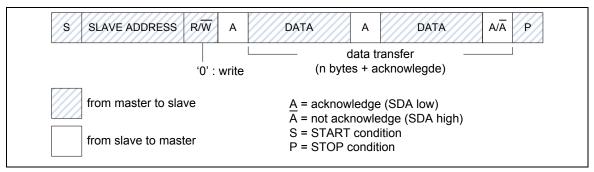

Figure 5-20 Master Transmits Data to Slave

**Error! Reference source not found.** shows a master read data from slave. A master addresses a slave with a 7-bit address and 1-bit read index to denote master wants to read data from slave. The slave will start transmitting data after slave returns acknowledge to master.

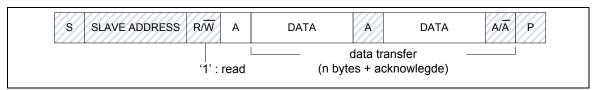

Figure 5-21 Master Reads Data from Slave

#### 5.6.3.3 START or Repeated START signal

When the bus is free/idle, meaning no master device is engaging the bus (both SCL and SDA lines are high), a master can initiate a transfer by sending a START signal. A START signal, usually referred to as the S-bit, is defined as a HIGH to LOW transition on the SDA line while SCL is HIGH. The START signal denotes the beginning of a new data transfer.

A Repeated START (Sr) is no STOP signal between two START signals. The master uses this method to communicate with another slave or the same slave in a different transfer direction (e.g. from writing to a device to reading from a device) without releasing the bus.

#### STOP signal

The master can terminate the communication by generating a STOP signal. A STOP signal, usually referred to as the P-bit, is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH.

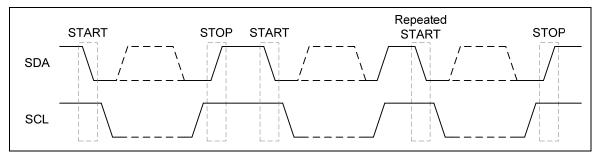

Figure 5-22 START and STOP condition

#### 5.6.3.4 Slave Address Transfer

The first byte of data transferred by the master immediately after the START signal is the slave address. This is a 7-bit calling address followed by a RW bit. The RW bit signals the slave the data transfer direction. No two slaves in the system can have the same address. Only the slave with an address that matches the one transmitted by the master will respond by returning an acknowledge bit by pulling the SDA low at the 9th SCL clock cycle.

#### 5.6.3.5 Data Transfer

Once successful slave addressing has been achieved, the data transfer can proceed on a byteby-byte basis in the direction specified by the RW bit sent by the master. Each transferred byte is followed by an acknowledge bit on the 9th SCL clock cycle. If the slave signals a Not Acknowledge (NACK), the master can generate a STOP signal to abort the data transfer or generate a Repeated START signal and start a new transfer cycle.

If the master, as the receiving device, does Not Acknowledge (NACK) the slave, the slave releases the SDA line for the master to generate a STOP or Repeated START signal.

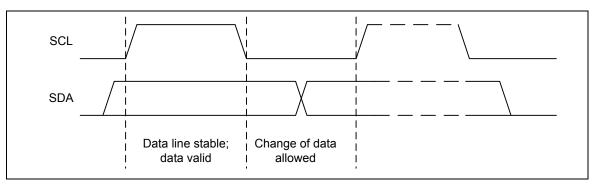

Figure 5-23 Bit Transfer on the  $I^2C$  bus

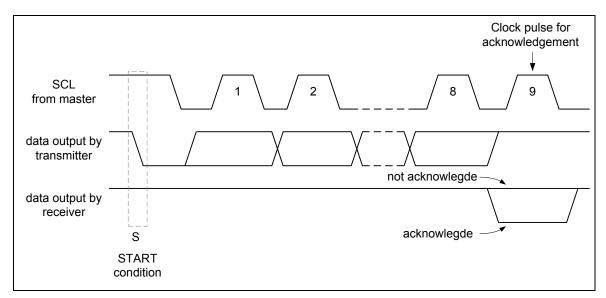

Figure 5-24 Acknowledge on the  $I^2C$  bus

#### 5.6.4 **Protocol Registers**

The CPU interfaces to the I<sup>2</sup>C port through the following thirteen special function registers: I2CON (control register), I2CSTATUS (status register), I2CDAT (data register), I2CADDRn (address registers, n=0~3), I2CADMn (address mask registers, n=0~3), I2CLK (clock rate register) and I2CTOC (Time-out counter register). All bit 31~ bit 8 of these I<sup>2</sup>C special function registers are reserved. These bits do not have any functions and are all zero if read back.

When  $I^2C$  port is enabled by setting ENS1 (I2CON [6]) to high, the internal states will be controlled by I2CON and  $I^2C$  logic hardware. Once a new status code is generated and stored in I2CSTATUS, the  $I^2C$  Interrupt Flag bit SI (I2CON [3]) will be set automatically. If the Enable Interrupt bit EI (I2CON [7]) is set high at this time, the  $I^2C$  interrupt will be generated. The bit field I2CSTATUS[7:3] stores the internal state code, the lowest 3 bits of I2CSTATUS are always zero and the content keeps stable until SI is cleared by software. The base address is 4002\_0000 and 4012\_0000.

#### 5.6.4.1 Address Registers (I2CADDR)

 $I^2C$  port is equipped with four slave address registers I2CADDRn (n=0~3). The contents of the register are irrelevant when  $I^2C$  is in master mode. In the slave mode, the bit field I2CADDRn[7:1] must be loaded with the chip's own slave address. The  $I^2C$  hardware will react if the contents of I2CADDRn are matched with the received slave address.

The I<sup>2</sup>C ports support the "General Call" function. If the GC bit (I2CADDRn [0]) is set the I<sup>2</sup>C port hardware will respond to General Call address (00H). Clear GC bit to disable general call function.

When GC bit is set and the I<sup>2</sup>C is in Slave mode, it can receive the general call address by 00H after Master send general call address to I<sup>2</sup>C bus, then it will follow status of GC mode.

 $I^2C$  bus controllers support multiple address recognition with four address mask registers I2CADMn (n=0~3). When the bit in the address mask register is set to one, it means the received corresponding address bit is don't-care. If the bit is set to zero, that means the received corresponding register bit should be exact the same as address register.

#### 5.6.4.2 Data Register (I2CDAT)

This register contains a byte of serial data to be transmitted or a byte which just has been received. The CPU can read from or write to this 8-bit (I2CDAT [7:0]) directly while it is not in the process of shifting a byte. when  $I^2C$  is in a defined state and the serial interrupt flag (SI) is set. Data in I2CDAT [7:0] remains stable as long as SI bit is set. While data is being shifted out, data on the bus is simultaneously being shifted in; I2CDAT [7:0] always contains the last data byte present on the bus. Thus, in the event of arbitration lost, the transition from master transmitter to slave receiver is made with the correct data in I2CDAT [7:0].

I2CDAT [7:0] and the acknowledge bit form a 9-bit shift register, the acknowledge bit is controlled by the I<sup>2</sup>C hardware and cannot be accessed by the CPU. Serial data is shifted through the acknowledge bit into I2CDAT [7:0] on the rising edges of serial clock pulses on the SCL line. When a byte has been shifted into I2CDAT [7:0], the serial data is available in I2CDAT [7:0], and the acknowledge bit (ACK or NACK) is returned by the control logic during the ninth clock pulse. Serial data is shifted out from I2CDAT [7:0] on the falling edges of SCL clock pulses, and is shifted into I2CDAT [7:0] on the rising edges of SCL clock pulses.

I2C Data Register:

shifting direction							

Figure 5-25 I<sup>2</sup>C Data Shifting Direction

#### 5.6.4.3 Control Register (I2CON)

The CPU can read from and write to this 8-bit field of I2CON [7:0] directly. Two bits are affected by hardware: the SI bit is set when the  $I^2$ C hardware requests a serial interrupt, and the STO bit is cleared when a STOP condition is present on the bus. The STO bit is also cleared when ENS1 = 0.

- El Enable Interrupt.
- ENS1 Set to enable I<sup>2</sup>C serial function controller. When ENS1=1 the I<sup>2</sup>C serial function enables. The Multi Function pin function of SDA and SCL must be set to I<sup>2</sup>C function.
- STA I<sup>2</sup>C START Control Bit. Setting STA to logic 1 to enter master mode, the I<sup>2</sup>C hardware sends a START or repeat START condition to bus when the bus is free.
- STO I<sup>2</sup>C STOP Control Bit. In master mode, setting STO to transmit a STOP condition to bus then I<sup>2</sup>C hardware will check the bus condition if a STOP condition is detected this flag will be cleared by hardware automatically. In a slave mode, setting STO resets I<sup>2</sup>C hardware to the defined "not addressed" slave mode. This means it is NO LONGER in the slave receiver mode to receive data from the master transmit device.
- SI I<sup>2</sup>C Interrupt Flag. When a new I<sup>2</sup>C state is present in the I2CSTATUS register, the SI flag is set by hardware, and if bit EI (I2CON [7]) is set, the I<sup>2</sup>C interrupt is requested. SI must be cleared by software. Clear SI is by writing 1 to this bit. All states are listed in section 5.6.6
- AA Assert Acknowledge Control Bit. When AA=1 prior to address or data received, an acknowledged (low level to SDA) will be returned during the acknowledge clock pulse on the SCL line when 1.) A slave is acknowledging the address sent from master, 2.) The receiver devices are acknowledging the data sent by transmitter. When AA=0 prior to

address or data received, a Not acknowledged (high level to SDA) will be returned during the acknowledge clock pulse on the SCL line.

#### 5.6.4.4 Status Register (I2CSTATUS)

I2CSTATUS [7:0] is an 8-bit read-only register. The three least significant bits are always 0. The bit field I2CSTATUS [7:3] contain the status code. There are 26 possible status codes, All states are listed in section 5.6.6. When I2CSTATUS [7:0] contains F8H, no serial interrupt is requested. All other I2CSTATUS [7:3] values correspond to defined I<sup>2</sup>C states. When each of these states is entered, a status interrupt is requested (SI = 1). A valid status code is present in I2CSTATUS[7:3] one cycle after SI is set by hardware and is still present one cycle after SI has been reset by software.

In addition, state 00H stands for a Bus Error. A Bus Error occurs when a START or STOP condition is present at an illegal position in the format frame. Examples of illegal positions are during the serial transfer of an address byte, a data byte or an acknowledge bit. To recover  $I^2C$  from bus error, STO should be set and SI should be clear to enter not addressed slave mode. Then clear STO to release bus and to wait new communication.  $I^2C$  bus can not recognize stop condition during this action when bus error occurs.

Master mod	le	Slave Mod	Slave Mode						
STATUS	Description	STATUS	Description						
0x08	Start	0xA0	Slave Transmit Repeat Start or Stop						
0x10	Master Repeat Start	0xA8	Slave Transmit Address ACK

0xF8	Bus Released	I							
υλγο	Note: Status "0xF8" exists in both master/slave modes, and it won't raise interrupt.								

#### Table 5-6 I<sup>2</sup>C Status Code Description Table

#### 5.6.4.5 <sup>2</sup>C Clock Baud Rate Bits (I2CLK)

The data baud rate of  $I^2C$  is determines by I2CLK [7:0] register when  $I^2C$  is in a master mode. It is not important when  $I^2C$  is in a slave mode. In the slave modes,  $I^2C$  will automatically synchronize with any clock frequency from master  $I^2C$  device.

The data baud rate of  $I^2C$  setting is Data Baud Rate of  $I^2C$  = (system clock) / (4x (I2CLK [7:0] +1)). If system clock = 16 MHz, the I2CLK [7:0] = 40 (28H), so data baud rate of  $I^2C$  = 16 MHz/ (4x (40 +1)) = 97.5 Kbits/sec.

#### 5.6.4.6 The $l^2$ C Time-out Counter Register (I2CTOC)

There is a 14-bit time-out counter which can be used to deal with the  $l^2C$  bus hang-up. If the timeout counter is enabled, the counter starts up counting until it overflows (TIF=1) and generates  $l^2C$ interrupt to CPU or stops counting by clearing ENTI to 0. When time-out counter is enabled, setting flag SI to high will reset counter and re-start up counting after SI is cleared. If  $l^2C$  bus hangs up, it causes the I2CSTATUS and flag SI are not updated for a period, the 14-bit time-out counter may overflow and acknowledge CPU the  $l^2C$  interrupt. Refer to the Figure 5-26 for the 14bit time-out counter. User may write 1 to clear TIF to zero.

[0]	Reserved	Reserved				

#### 5.6.7 Modes of Operation

The on-chip I<sup>2</sup>C ports support five operation modes, Master transmitter, Master receiver, Slave transmitter, Slave receiver, and GC call.

In a given application,  $I^2C$  port may operate as a master or as a slave. In the slave mode, the  $I^2C$  port hardware looks for its own slave address and the general call address. If one of these addresses is detected, and if the slave is willing to receive or transmit data from/to master(by setting the AA bit), acknowledge pulse will be transmitted out on the 9th clock, hence an interrupt is requested on both master and slave devices if interrupt is enabled. When the microcontroller wishes to become the bus master, the hardware waits until the bus is free before the master mode is entered so that a possible slave action didn't be interrupted. If bus arbitration is lost in the master mode,  $I^2C$  port switches to the slave mode immediately and can detect its own slave address in the same serial transfer.

Bits STA, STO and AA in I2CON register will determine the next state of the  $I^2$ C hardware after SI flag is cleared. Upon completion of the new action, a new status code will be updated and the SI flag will be set. If the  $I^2$ C interrupt control bit EI (I2CON [7]) is set, appropriate action or software branch of the new status code can be performed in the Interrupt service routine.

In the following description of five operation modes, detailed data flow is represented. The legend for those data flow figures is shown in Figure 5-27

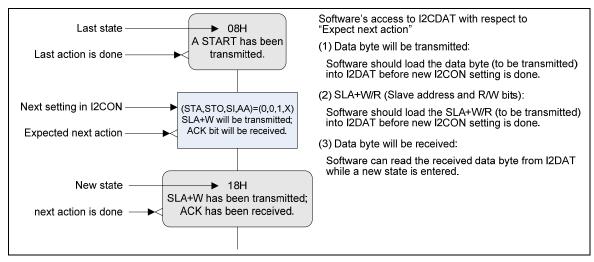

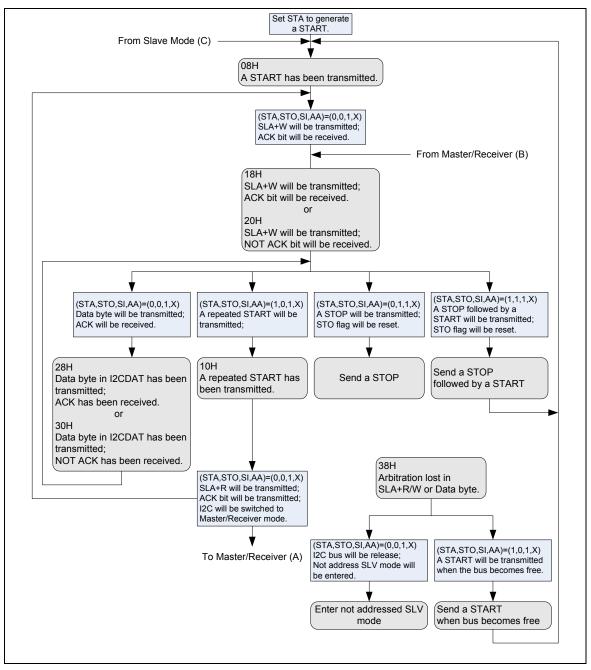

Figure 5-27 Legend for the following five figures

#### 5.6.7.1 Master Transmitter Mode

As shown in Figure 5-28, in master transmitter mode, serial data output through SDA while SCL outputs the serial clock. The first byte transmitted contains the slave address of the receiving device (7-bit) and the data direction bit. In this case the data direction bit (R/W) will be logic 0, and it is represented by "W" in the Figure 5-20. Thus the first byte transmitted is SLA+W. Serial data is transmitted 8-bit at a time. After each byte is transmitted, an acknowledge bit is received. START and STOP conditions are output to indicate the beginning and the end of a serial transfer.

#### 5.6.7.2 Master Receiver Mode

As shown in Figure 5-29, in this case the data direction bit (R/W) will be logic 1, and it is represented by "R" in the Figure 5-21. Thus the first byte transmitted is SLA+R. Serial data is received via SDA while SCL outputs the serial clock. Serial data is received 8-bit at a time. After each byte is received, an acknowledge bit is transmitted. START and STOP conditions are output to indicate the beginning and end of a serial transfer.

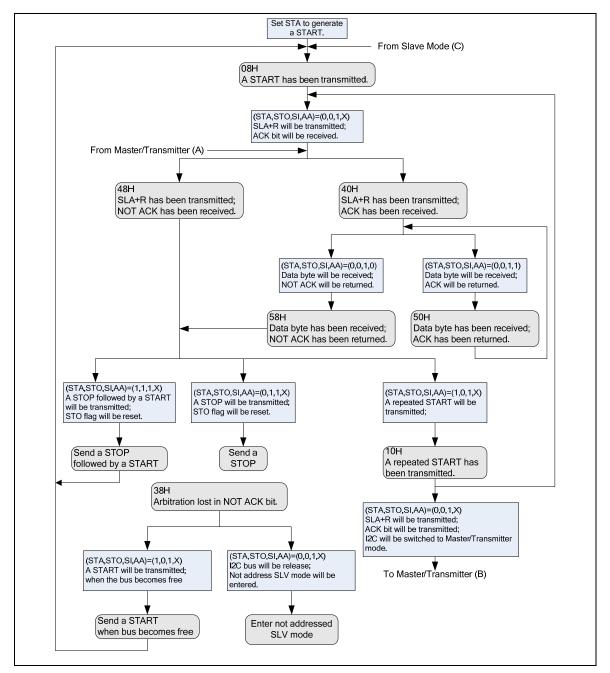

Figure 5-29 Master Receiver Mode

#### 5.6.7.3 Slave Receiver Mode

As shown in Figure 5-30, serial data and the serial clock are received through SDA and SCL. After each byte is received, an acknowledge bit is transmitted. START and STOP conditions are recognized as the beginning and end of a serial transfer. Address recognition is performed by hardware after reception of the slave address and direction bit.

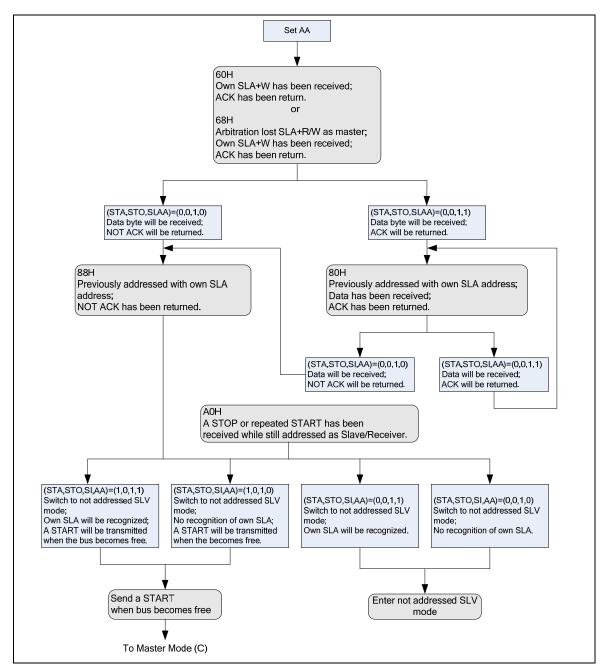

Figure 5-30 Slave Receiver Mode

#### 5.6.7.4 Slave Transmitter Mode

As shown in Figure 5-31, the first byte is received and handled as in the slave receiver mode. However, in this mode, the direction bit will indicate that the transfer direction is reversed. Serial data is transmitted via SDA while the serial clock is input through SCL. START and STOP conditions are recognized as the beginning and end of a serial transfer.

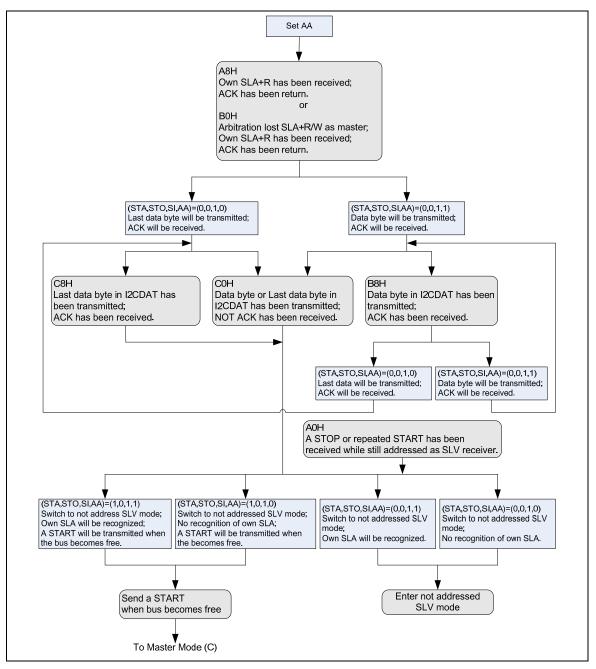

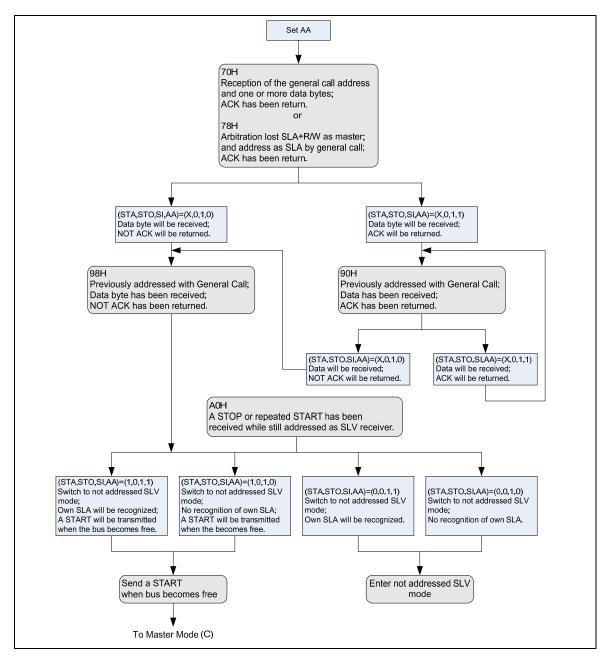

Figure 5-31 Slave Transmitter Mode

#### 5.6.7.5 General Call (GC) Mode

As shown in Figure 5-32, if the GC bit (I2CADDRn [0]) is set, the  $I^2C$  port hardware will respond to General Call address (00H). Clear GC bit to disable general call function. When GC bit is set and the  $I^2C$  is in Slave mode, it can receive the general call address by 00H after Master send general call address to  $I^2C$  bus, then it will follow status of GC mode. Serial data and the serial clock are received through SDA and SCL. After each byte is received, an acknowledge bit is transmitted. START and STOP conditions are recognized as the beginning and end of a serial transfer. Address recognition is performed by hardware after reception of the slave address and direction bit.

Publication Release Date: Jan. 2, 2011 Revision V2.02

### 5.7 **PWM Generator and Capture Timer (PWM)**

#### 5.7.1 Overview

NuMicro<sup>™</sup> NUC130/NUC140 has 2 sets of PWM group supports total 4 sets of PWM Generators which can be configured as 8 independent PWM outputs, PWM0~PWM7, or as 4 complementary PWM pairs, (PWM0, PWM1), (PWM2, PWM3), (PWM4, PWM5) and (PWM6, PWM7) with 4 programmable dead-zone generators.

Each PWM Generator has one 8-bit prescaler, one clock divider with 5 divided frequencies (1, 1/2, 1/4, 1/8, 1/16), two PWM Timers including two clock selectors, two 16-bit PWM downcounters for PWM period control, two 16-bit comparators for PWM duty control and one deadzone generator. The 4 sets of PWM Generators provide eight independent PWM interrupt flags which are set by hardware when the corresponding PWM period down counter reaches zero. Each PWM interrupt source with its corresponding enable bit can cause CPU to request PWM interrupt. The PWM generators can be configured as one-shot mode to produce only one PWM cycle signal or auto-reload mode to output PWM waveform continuously.

When PCR.DZEN01 is set, PWM0 and PWM1 perform complementary PWM paired function; the paired PWM period, duty and dead-time are determined by PWM0 timer and Dead-zone generator 0. Similarly, the complementary PWM pairs of (PWM2, PWM3), (PWM4, PWM5) and (PWM6, PWM7) are controlled by PWM2, PWM4 and PWM6 timers and Dead-zone generator 2, 4 and 6, respectively. Refer to Figure 5-33 to Figure 5-40 for the architecture of PWM Timers.

To prevent PWM driving output pin with unsteady waveform, the 16-bit period down counter and 16-bit comparator are implemented with double buffer. When user writes data to counter/comparator buffer registers the updated value will be load into the 16-bit down counter/ comparator at the time down counter reaching zero. The double buffering feature avoids glitch at PWM outputs.

When the 16-bit period down counter reaches zero, the interrupt request is generated. If PWMtimer is set as auto-reload mode, when the down counter reaches zero, it is reloaded with PWM Counter Register (CNRx) automatically then start decreasing, repeatedly. If the PWM-timer is set as one-shot mode, the down counter will stop and generate one interrupt request when it reaches zero.

The value of PWM counter comparator is used for pulse high width modulation. The counter control logic changes the output to high level when down-counter value matches the value of compare register.

The alternate feature of the PWM-timer is digital input Capture function. If Capture function is enabled the PWM output pin is switched as capture input mode. The Capture0 and PWM0 share one timer which is included in PWM0 and the Capture1 and PWM1 share PWM1 timer, and etc. Therefore user must setup the PWM-timer before enable Capture feature. After capture feature is enabled, the capture always latched PWM-counter to Capture Rising Latch Register (CRLR) when input channel has a rising transition and latched PWM-counter to Capture Falling Latch Register (CFLR) when input channel has a falling transition. Capture channel 0 interrupt is programmable by setting CCR0.CRL\_IE0[1] (Rising latch Interrupt enable) and CCR0.CFL\_IE0[2]] (Falling latch Interrupt enable) to decide the condition of interrupt occur. Capture channel 1 has the same feature by setting CCR0.CRL\_IE1[17] and CCR0.CFL\_IE1[18]. And capture channel 2 to channel 3 on each group have the same feature by setting the corresponding control bits in CCR2. For each group, whenever Capture issues Interrupt 0/1/2/3, the PWM counter 0/1/2/3 will be reload at this moment.

The maximum captured frequency that PWM can capture is confined by the capture interrupt

latency. When capture interrupt occurred, software will do at least three steps, they are: Read PIIR to get interrupt source and Read CRLRx/CFLRx(x=0~3) to get capture value and finally write 1 to clear PIIR to zero. If interrupt latency will take time T0 to finish, the capture signal mustn't transition during this interval (T0). In this case, the maximum capture frequency will be 1/T0. For example:

HCLK = 50 MHz, PWM\_CLK = 25 MHz, Interrupt latency is 900 ns

So the maximum capture frequency will is 1/900ns  $\approx$  1000 kHz

### 5.7.2 Features

5.7.2.1 PWM function features:

- PWM group has two PWM generators. Each PWM generator supports one 8-bit prescaler, one clock divider, two PWM-timers (down counter), one dead-zone generator and two PWM outputs.
- Up to 16-bit resolution
- PWM Interrupt request synchronized with PWM period
- One-shot or Auto-reload mode PWM
- Up to 2 PWM group (PWMA/PWMB) to support 8 PWM channels or 4 PWM paired channels
- 5.7.2.2 Capture Function Features:
  - Timing control logic shared with PWM Generators
  - Support 8 Capture input channels shared with 8 PWM output channels
  - Each channel supports one rising latch register (CRLR), one falling latch register (CFLR) and Capture interrupt flag (CAPIFx)

### 5.7.3 Block Diagram

The Figure 5-33 to Figure 5-40 illustrate the architecture of PWM in pair (PWM-Timer 0/1 are in one pair and PWM-Timer 2/3 are in another one, and so on.).

### 5.7.4 Function Description

### 5.7.4.1 PWM-Timer Operation

The PWM period and duty control are configured by PWM down-counter register (CNR) and PWM comparator register (CMR). The PWM-timer timing operation is shown in Figure 5-42. The pulse width modulation follows the formula as below and the legend of PWM-Timer Comparator is shown as Figure 5-41. Note that the corresponding GPIO pins must be configured as PWM function (enable POE and disable CAPENR) for the corresponding PWM channel.

- PWM frequency = PWMxy\_CLK/[(prescale+1)\*(clock divider)\*(CNR+1)]; where xy, could be 01, 23, 45 or 67, depends on selected PWM channel.
- Duty ratio = (CMR+1)/(CNR+1)
- CMR >= CNR: PWM output is always high
- CMR < CNR: PWM low width= (CNR-CMR) unit[1]; PWM high width = (CMR+1) unit
- CMR = 0: PWM low width = (CNR) unit; PWM high width = 1 unit

Note: [1] Unit = one PWM clock cycle.

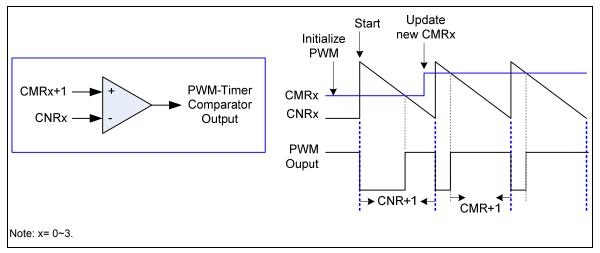

Figure 5-41 Legend of Internal Comparator Output of PWM-Timer

### NuMicro™ NUC130/NUC140 Technical Reference Manual

## nuvoTon

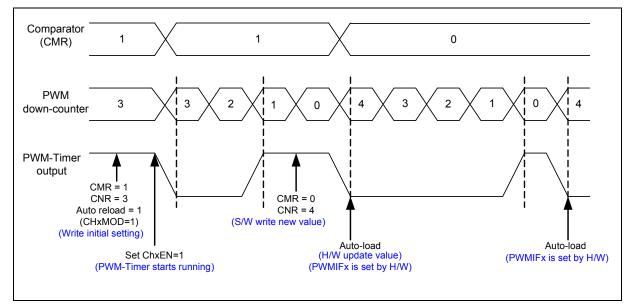

Figure 5-42 PWM-Timer Operation Timing

#### 5.7.4.2 PWM Double Buffering, Auto-reload and One-shot Operation

PWM Timers have double buffering function the reload value is updated at the start of next period without affecting current timer operation. The PWM counter value can be written into CNRx and current PWM counter value can be read from PDRx.

PWM0 will operate at one-shot mode if CH0MOD bit is set to 0, and operate at auto-reload mode if CH0MOD bit is set to 1. It is recommend that switch PWM0 operating mode before set CH0EN bit to 1 to enable PWM0 counter start running because the content of CNR0 and CMR0 will be cleared to zero to reset the PWM0 period and duty setting when PWM0 operating mode is changed. As PWM0 operate at one-shot mode, CMR0 and CNR0 should be written first and then set CH0EN bit to 1 to enable PWM0 counter start running. After PWM0 counter down count from CNR0 value to zero, CNR0 and CMR0 will be cleared to zero by hardware and PWM counter will be held. Software need to write new CMR0 and CNR0 value to set next one-shot period and duty. When re-start next one-shot operation, the CMR0 should be written first because PWM0 counter will auto re-start counting when CNR0 is written an non-zero value. As PWM0 operate at auto-reload mode, CMR0 and CNR0 should be written first because PWM0 counter will auto re-start running. The value of CNR0 will reload to PWM0 counter when it down count reaches zero. If CNR0 is set to zero, PWM0 counter will be held. PWM1~PWM7 performs the same function as PWM0.

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

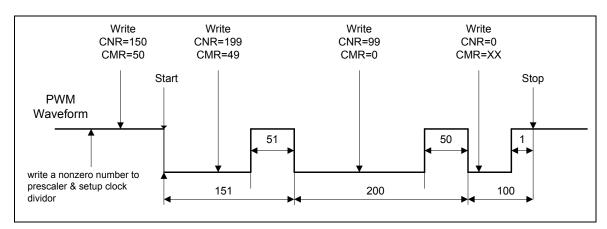

Figure 5-43 PWM Double Buffering Illustration

### 5.7.4.3 Modulate Duty Ratio

The double buffering function allows CMRx written at any point in current cycle. The loaded value will take effect from next cycle.

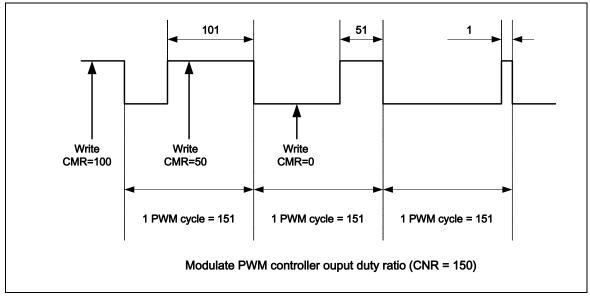

Figure 5-44 PWM Controller Output Duty Ratio

### 5.7.4.4 Dead-Zone Generator

PWM controller is implemented with Dead Zone generator. They are built for power device protection. This function generates a programmable time gap to delay PWM rising output. User can program PPRx.DZI to determine the Dead Zone interval.

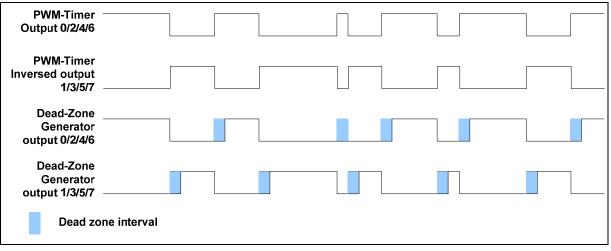

Figure 5-45 Paired-PWM Output with Dead Zone Generation Operation

#### 5.7.4.5 Capture Operation

The Capture 0 and PWM 0 share one timer that included in PWM 0; and the Capture 1 and PWM 1 share another timer, and etc. The capture always latches PWM-counter to CRLRx when input channel has a rising transition and latches PWM-counter to CFLRx when input channel has a falling transition. Capture channel 0 interrupt is programmable by setting CCR0[1] (Rising latch Interrupt enable) and CCR0[2] (Falling latch Interrupt enable) to decide the condition of interrupt occur. Capture channel 1 has the same feature by setting CCR0[17] and CCR0[18], and etc. Whenever the Capture controller issues a capture interrupt, the corresponding PWM counter will be reloaded with CNRx at this moment. Note that the corresponding GPIO pins must be configured as capture function (disable POE and enable CAPENR) for the corresponding capture channel.

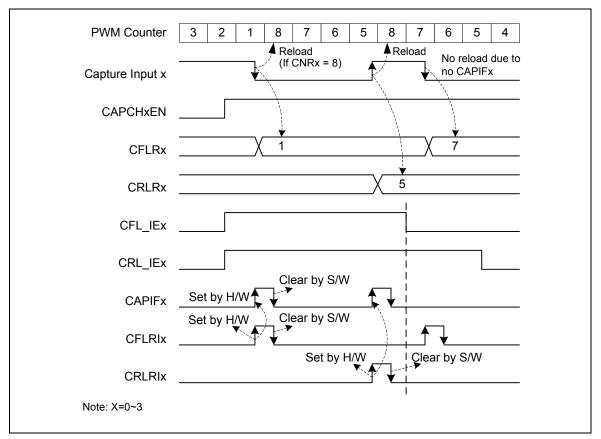

Figure 5-46 Capture Operation Timing

At this case, the CNR is 8:

- 1. The PWM counter will be reloaded with CNRx when a capture interrupt flag (CAPIFx) is set.
- 2. The channel low pulse width is (CNR + 1 CRLR).
- 3. The channel high pulse width is (CNR + 1 CFLR).

#### 5.7.4.6 PWM-Timer Interrupt Architecture

There are eight PWM interrupts, PWM0\_INT~PWM7\_INT, which are divided into PWMA\_INT and PWMB\_INT for Advanced Interrupt Controller (AIC). PWM 0 and Capture 0 share one interrupt, PWM1 and Capture 1 share the same interrupt and so on. Therefore, PWM function and Capture function in the same channel cannot be used at the same time. Figure 5-47 and Figure 5-48 demonstrates the architecture of PWM-Timer interrupts.

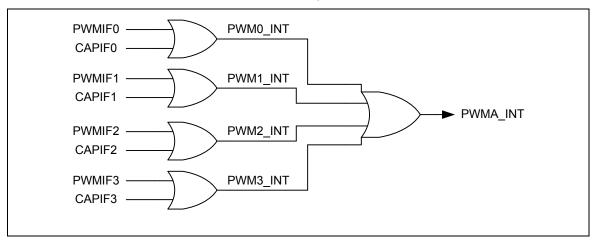

Figure 5-47 PWM Group A PWM-Timer Interrupt Architecture Diagram

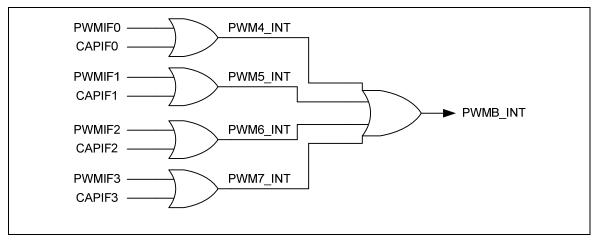

Figure 5-48 PWM Group B PWM-Timer Interrupt Architecture Diagram

### NuMicro™ NUC130/NUC140 Technical Reference Manual

# nuvoTon

#### 5.7.4.7 PWM-Timer Start Procedure

The following procedure is recommended for starting a PWM drive.

- 1. Setup clock source divider select register (CSR)
- 2. Setup prescaler (PPR)
- 3. Setup inverter on/off, dead zone generator on/off, auto-reload/one-shot mode and Stop PWM-timer (PCR)
- 4. Setup comparator register (CMR) for setting PWM duty.
- 5. Setup PWM down-counter register (CNR) for setting PWM period.
- 6. Setup interrupt enable register (PIER) (option)
- 7. Setup corresponding GPIO pins as PWM function (enable POE and disable CAPENR) for the corresponding PWM channel.
- 8. Enable PWM timer start running (Set CHxEN = 1 in PCR)

#### 5.7.4.8 PWM-Timer Re-Start Procedure in Single-shot mode

After PWM waveform generated once in PWM one-shot mode, PWM-Timer will stop automatically. The following procedure is recommended for re-starting PWM single-shot waveform.

- 1. Setup comparator register (CMR) for setting PWM duty.
- 2. Setup PWM down-counter register (CNR) for setting PWM period. After setup CNR, PWM wave will be generated.

#### 5.7.4.9 PWM-Timer Stop Procedure

#### Method 1:

Set 16-bit down counter (CNR) as 0, and monitor PDR (current value of 16-bit down-counter). When PDR reaches to 0, disable PWM-Timer (CHxEN in PCR). *(Recommended)* 

### Method 2:

Set 16-bit down counter (CNR) as 0. When interrupt request happened, disable PWM-Timer (CHxEN in PCR). *(Recommended)* 

#### Method 3:

#### Disable PWM-Timer directly ((CHxEN in PCR). (Not recommended)

The reason why method 3 is not recommended is that disable CHxEN will immediately stop PWM output signal and lead to change the duty of the PWM output, this may cause damage to the control circuit of motor

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

# nuvoTon

#### 5.7.4.10 Capture Start Procedure

- 1. Setup clock source divider select register (CSR)
- 2. Setup prescaler (PPR)
- 3. Setup channel enabled, rising/falling interrupt enable and input signal inverter on/off (CCR0, CCR2)
- 4. Setup auto-reload mode, Edge-aligned type and Stop PWM-timer (PCR)
- 5. Setup PWM down-counter (CNR)
- 6. Enable PWM timer start running (Set CHxEN = 1 in PCR)
- 7. Setup corresponding GPIO pins as capture function (disable POE and enable CAPENR) for the corresponding PWM channel.

CFLRI0	CRLRI0	Reserved	CAPIF0	CAPCH0EN	CFL_IE0	CRL_IE0	INV0

Bits	Descriptions	
[31:24]	Reserved	Reserved
		CFLR1 Latched Indicator Bit
[23]	CFLRI1	When PWM group input channel 1 has a falling transition, CFLR1 was latched with the value of PWM down-counter and this bit is set by hardware.
		Software can write 0 to clear this bit to zero if BCn bit is 0, and can write 1 to clear this bit to zero if BCn bit is 1.
		CRLR1 Latched Indicator Bit
[22]	CRLRI1	When PWM group input channel 1 has a rising transition, CRLR1 was latched with the value of PWM down-counter and this bit is set by hardware.
		Software can write 0 to clear this bit to zero if BCn bit is 0, and can write 1 to clear this bit to zero if BCn bit is 1.
[5]	Reserved	Reserved
		Channel 1 Capture Interrupt Indication Flag
[20]	CAPIF1	If PWM group channel 1 rising latch interrupt is enabled (CRL_IE1=1), a rising transition occurs at PWM group channel 1 will result in CAPIF1 to high; Similarly, a falling transition will cause CAPIF1 to be set high if PWM group channel 1 falling latch interrupt is enabled (CFL_IE1=1).
		Write 1 to clear this bit to zero
		Channel 1 Capture Function Enable
		1 = Enable capture function on PWM group channel 1
[19]	CAPCH1EN	0 = Disable capture function on PWM group channel 1
		When Enable, Capture latched the PWM-counter and saved to CRLR (Rising latch) and CFLR (Falling latch).

Bits	Descriptions	
		When Disable, Capture does not update CRLR and CFLR, and disable PWM group channel 1 Interrupt.
	CFL_IE1	Channel 1 Falling Latch Interrupt Enable
l		1 = Enable falling latch interrupt
[18]		0 = Disable falling latch interrupt
		When Enable, if Capture detects PWM group channel 1 has falling transition, Capture issues an Interrupt.
	CRL_IE1	Channel 1 Rising Latch Interrupt Enable
		1 = Enable rising latch interrupt
[17]		0 = Disable rising latch interrupt
		When Enable, if Capture detects PWM group channel 1 has rising transition, Capture issues an Interrupt.
		Channel 1 Inverter Enable
[16]	INV1	1 = Inverter enable. Reverse the input signal from GPIO before fed to Capture timer
		0 = Inverter disable
[15:8]	Reserved	Reserved
	CFLRIO	CFLR0 Latched Indicator Bit
[7]		When PWM group input channel 0 has a falling transition, CFLR0 was latched with the value of PWM down-counter and this bit is set by hardware.
		Software can write 0 to clear this bit to zero if BCn bit is 0, and can write 1 to clear this bit to zero if BCn bit is 1.
	CRLRIO	CRLR0 Latched Indicator Bit
[6]		When PWM group input channel 0 has a rising transition, CRLR0 was latched with the value of PWM down-counter and this bit is set by hardware.
		Software can write 0 to clear this bit to zero if BCn bit is 0, and can write 1 to clear this bit to zero if BCn bit is 1.
[5]	Reserved	Reserved
	CAPIFO	Channel 0 Capture Interrupt Indication Flag
[4]		If PWM group channel 0 rising latch interrupt is enabled (CRL_IE0=1), a rising transition occurs at PWM group channel 0 will result in CAPIF0 to high; Similarly, a falling transition will cause CAPIF0 to be set high if PWM group channel 0 falling latch interrupt is enabled (CFL_IE0=1).
		Write 1 to clear this bit to zero
		Channel 0 Capture Function Enable
		1 = Enable capture function on PWM group channel 0.
	CAPCH0EN	0 = Disable capture function on PWM group channel 0
[3]		When Enable, Capture latched the PWM-counter value and saved to CRLR (Rising latch) and CFLR (Falling latch).
		When Disable, Capture does not update CRLR and CFLR, and disable PWM group channel 0 Interrupt.
	CFL_IE0	Channel 0 Falling Latch Interrupt Enable
[2]		

Bits	Descriptions	
		0 = Disable falling latch interrupt When Enable, if Capture detects PWM group channel 0 has falling transition, Capture issues an Interrupt.
[1]	CRL_IE0	Channel 0 Rising Latch Interrupt Enable 1 = Enable rising latch interrupt 0 = Disable rising latch interrupt When Enable, if Capture detects PWM group channel 0 has rising transition, Capture issues an Interrupt.
[0]	INVO	Channel 0 Inverter Enable 1 = Inverter enable. Reverse the input signal from GPIO before fed to Capture timer 0 = Inverter disable

[3]		0 = Disable PWM channel 3 output to pin
		Note: The corresponding GPIO pin also must be switched to PWM function
		Channel 2 Output Enable Register
[2]	POE2	1 = Enable PWM channel 2 output to pin
[2]	FUEZ	0 = Disable PWM channel 2 output to pin
		Note: The corresponding GPIO pin also must be switched to PWM function
		Channel 1 Output Enable Register
[1]	POE1	1 = Enable PWM channel 1 output to pin
[']	FUEI	0 = Disable PWM channel 1 output to pin
		Note: The corresponding GPIO pin also must be switched to PWM function
		Channel 0 Output Enable Register
[0]		1 = Enable PWM channel 0 output to pin
[0]		0 = Disable PWM channel 0 output to pin
		Note: The corresponding GPIO pin also must be switched to PWM function

### 5.8 Real Time Clock (RTC)

### 5.8.1 Overview

Real Time Clock (RTC) controller provides user the real time and calendar message. The clock source of RTC is from an external 32.768 kHz low speed crystal connected at pins X321 and X320 (reference to pin descriptions) or from an external 32.768 kHz low speed oscillator output fed at pin X321. The RTC controller provides the time message (second, minute, hour) in Time Loading Register (TLR) as well as calendar message (day, month, year) in Calendar Loading Register (CLR). The data message is expressed in BCD format. It also offers alarm function that user can preset the alarm time in Time Alarm Register (TAR) and alarm calendar in Calendar Alarm Register (CAR).

The RTC controller supports periodic Time Tick and Alarm Match interrupts. The periodic interrupt has 8 period options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second which are selected by TTR (TTR[2:0]). When RTC counter in TLR and CLR is equal to alarm setting time registers TAR and CAR, the alarm interrupt flag (RIIR.AIF) is set and the alarm interrupt is requested if the alarm interrupt is enabled (RIER.AIER=1). Both RTC Time Tick and Alarm Match can cause chip wake-up from power down mode if wake-up function is enabled (TWKE (TTR[3])=1).

### 5.8.2 Features

- There is a time counter (second, minute, hour) and calendar counter (day, month, year) for user to check the time
- Alarm register (second, minute, hour, day, month, year)
- 12-hour or 24-hour mode is selectable
- Leap year compensation automatically
- Day of week counter
- Frequency compensate register (FCR)
- All time and calendar message is expressed in BCD code
- Support periodic time tick interrupt with 8 period options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second
- Support RTC Time Tick and Alarm Match interrupt
- Support wake-up chip from power down mode

### 5.8.3 Block Diagram

The block diagram of Real Time Clock is depicted as following:

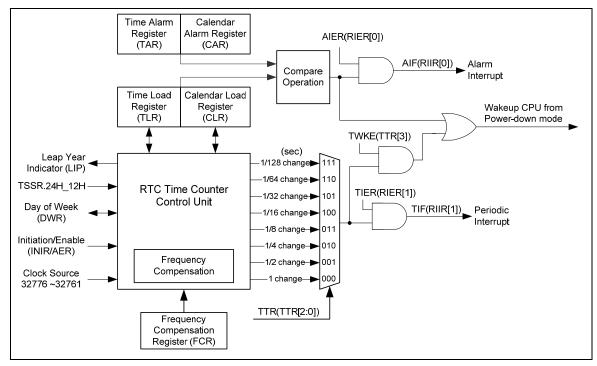

Figure 5-49 RTC Block Diagram

### 5.8.4 Function Description

#### 5.8.4.1 Access to RTC register

Due to clock difference between RTC clock and system clock, when user write new data to any one of the registers, the register will not be updated until 2 RTC clocks later (60us).

In addition, user must be aware that RTC controller does not check whether loaded data is out of bounds or not. RTC does not check rationality between DWR and CLR either.

#### 5.8.4.2 RTC Initiation

When RTC block is power on, RTC is at reset state. User has to write a number (0xa5eb1357) to INIR to make RTC leaving reset state. Once the INIR is written as 0xa5eb1357, the RTC will be in un-reset state permanently.

5.8.4.3 RTC Read/Write Enable

Register AER bit 15~0 is served as RTC read/write password to protect RTC registers. AER bit 15~0 has to be set as 0xA965 to enable access restriction. Once it is set, it will take effect at least 1024 RTC clocks (about 30ms). Programmer can read RTC enabled status flag in AER.ENF to check whether if RTC controller starts operating or not.

#### 5.8.4.4 Frequency Compensation

The RTC clock source may not precise to exactly 32768 Hz and the RTC register (FCR) allows software to make digital compensation to the RTC source clock if the frequency of RTC source clock is in the range from 32761 Hz to 32776 Hz. Following are the compensation examples for higher or lower frequency clock input.

#### Example 1:

Frequency counter measurement : 32773.65 Hz ( > 32768 Hz)

Integer part: 32773 => 0x8005

FCR.Integer = 0x05 - 0x01 + 0x08 = 0x0c

Fraction part: 0.65 x 60 = 39 => 0x27

FCR.Fraction = 0x27

#### Example 2

Frequency counter measurement : 32765.27 Hz (  $\leq$  32768 Hz) Integer part: 32765 => 0x7FFD FCR.Integer = 0x0D - 0x01 - 0x08 = 0x04 Fraction part: 0.27 x 60 = 16.2=> 0x10 FCR.Fraction = 0x10

#### 5.8.4.5 Time and Calendar counter

TLR and CLR are used to load the time and calendar. TAR and CAR are used for alarm. They are all represented by BCD.

5.8.4.6 12/24 hour Time Scale Selection

The 12/24 hour time scale selection depends on TSSR bit 0.

#### 5.8.4.7 Day of the week counter

The RTC controller provides day of week in Day of the Week Register (DWR). The value is defined from 0 to 6 to represent Sunday to Saturday respectively.

#### 5.8.4.8 Periodic Time Tick Interrupt

The periodic interrupt has 8 period option 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second which are selected by TTR.TTR[2:0]. When periodic time tick interrupt is enabled by setting RIER.TIER to 1, the Periodic Time Tick Interrupt is requested periodically in the period selected by TTR register.

#### 5.8.4.9 Alarm interrupt

When RTC counter in TLR and CLR is equal to alarm setting time TAR and CAR the alarm interrupt flag (RIIR.AIF) is set and the alarm interrupt is requested if the alarm interrupt is enabled (RIER.AIER=1).

#### 5.8.4.10 Application note:

- 1. TAR, CAR, TLR and CLR registers are all BCD counter.
- 2. Programmer has to make sure that the loaded values are reasonable. For example, Load CLR as 201a (year), 13 (month), 00 (day), or CLR does not match with DWR, etc.
- 3. Reset state :

Register	Reset State
AER	0
CLR	05/1/1 (year/month/day)
TLR	00:00:00 (hour : minute : second)
CAR	00/00/00 (year/month/day)
TAR	00:00:00 (hour : minute : second)
TSSR	1 (24 hr mode)
DWR	6 (Saturday)
RIER	0
RIIR	0
LIR	0
TTR	0

4. In CLR and CAR, only 2 BCD digits are used to express "year". We assume 2 BCD digits of xY denote 20xY, but not 19xY or 21xY.

### 5.8.5 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
RTC_BA = 0	)x4000_8000		·

### 5.9 Serial Peripheral Interface (SPI)

#### 5.9.1 Overview

The Serial Peripheral Interface (SPI) is a synchronous serial data communication protocol which operates in full duplex mode. Devices communicate in master/slave mode with 4-wire bi-direction interface. The NuMicro<sup>™</sup> NUC130/NUC140 contains up to four sets of SPI controller performing a serial-to-parallel conversion on data received from a peripheral device, and a parallel-to-serial conversion on data transmitted to a peripheral device. Each set of SPI controller can be set as a master, it also can be configured as a slave device controlled by an off-chip master device.

This controller supports a variable serial clock for special application and it also supports 2-bit transfer mode to connect 2 off-chip slave devices at the same time. The SPI controller also supports PDMA function to access the data buffer.

#### 5.9.2 Features

- Up to four sets of SPI controller
- Support master or slave mode operation
- Support 1-bit or 2-bit transfer mode
- Configurable bit length up to 32-bit of a transfer word and configurable word numbers up to 2 of a transaction, so the maximum bit length is 64-bit for each data transfer
- Provide burst mode operation, transmit/receive can be transferred up to two times word transaction in one transfer
- Support MSB or LSB first transfer
- 2 device/slave select lines in master mode, but 1 device/slave select line in slave mode
- Support byte reorder function
- Support byte or word suspend mode
- Variable output serial clock frequency in master mode
- Support two programmable serial clock frequencies in master mode
- Support two channel PDMA request, one for transmitter and another for receiver
- Support three wire, no slave select signal, bi-direction interface
- The SPI clock rate can be configured to equal the system clock rate

### 5.9.3 Block Diagram

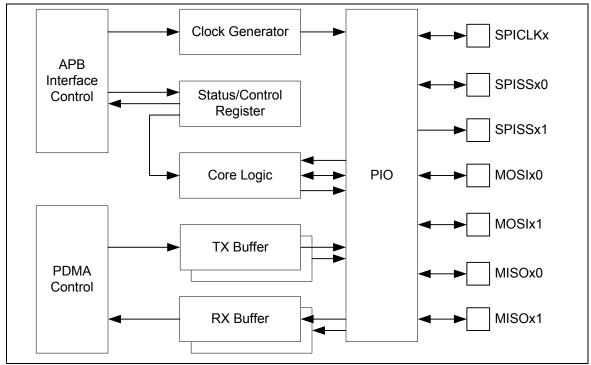

Figure 5-50 SPI Block Diagram

### 5.9.4 Function Description

#### Master/Slave Mode

This SPI controller can be set as master or slave mode by setting the SLAVE bit (SPI\_CNTRL[18]) to communicate with the off-chip SPI slave or master device. The application block diagrams in master and slave mode are shown as below.

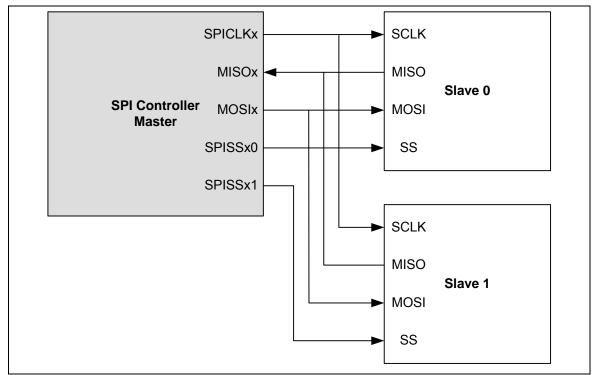

Figure 5-51 SPI Master Mode Application Block Diagram

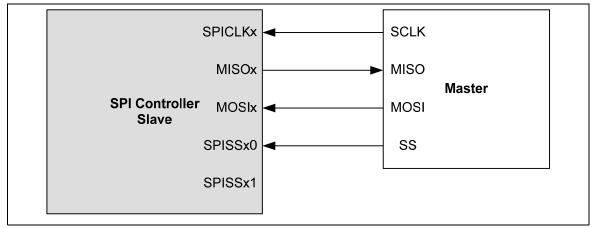

Figure 5-52 SPI Slave Mode Application Block Diagram

#### Slave Select

In master mode, this SPI controller can drive up to two off-chip slave devices through the slave select output pins SPISSx0 and SPISSx1. In slave mode, the off-chip master device drives the slave select signal from the SPISSx0 input port to this SPI controller. In master/slave mode, the active state of slave select signal can be programmed to low active or high active in SS\_LVL bit (SPI\_SSR[2]), and the SS\_LTRIG bit (SPI\_SSR[4]) defines the slave select signal SPISSx0/1 is level trigger or edge trigger. The selection of trigger condition depends on what type of peripheral slave/master device is connected.

In slave mode, if the SS\_LTRIG bit is configured as level trigger, the LTRIG\_FLAG bit (SPI\_SSR[5]) is used to indicate if both the received number and received bits met the requirement which defines in TX\_NUM and TX\_BIT\_LEN among one transaction done (the transaction done means the slave select has deactivated or the SPI controller has finished one data transfer.)

#### Level-trigger / Edge-trigger

In slave mode, the slave select signal can be configured as level-trigger or edge-trigger. In edgetrigger, the data transfer starts from an active edge and ends on an inactive edge. If master does not send an inactive edge to slave, the transfer procedure will not be completed and the interrupt flag of slave will not be set. In level-trigger, the following two conditions will terminate the transfer procedure and the interrupt flag of slave will be set. The first condition is that if the number of transferred bits matches the settings of TX\_NUM and TX\_BIT\_LEN, the interrupt flag of slave will be set. The second condition, if master set the slave select pin to inactive level during the transfer is in progress, it will force slave device to terminate the current transfer no matter how many bits have been transferred and the interrupt flag will be set. User can read the status of LTRIG\_FLAG bit to check if the data has been completely transferred.

#### Automatic Slave Select

In master mode, if the bit AUTOSS (SPI\_SSR[3]) is set, the slave select signals will be generated automatically and output to SPISSx0 and SPISSx1 pins according to SSR[0] (SPI\_SSR[0]) and SSR[1] (SPI\_SSR[1]) whether be enabled or not. It means that the slave select signals, which are selected in SSR[1:0], will be asserted by the SPI controller when transmit/receive is started by setting the GO\_BUSY bit (SPI\_CNTRL[0]) and will be de-asserted after the data transfer is finished. If the AUTOSS bit is cleared, the slave select output signals will be asserted/de-asserted by manual setting/clearing the related bits of SPI\_SSR[1:0]. The active state of the slave select output signals is specified in SS\_LVL bit (SPI\_SSR[2]).

#### Serial Clock

In master mode, set the DIVIDER1 bits (SPI\_DIVIDER[15:0]) to program the output frequency of serial clock to the SPICLK output port. It also supports a variable serial clock if the VARCLK\_EN bit (SPI\_CTL[23]) is enabled. In this case, the output frequency of serial clock can be programmed as one of the two different frequencies which depend on the value of DIVIDER1 (SPI\_DIVIDER[15:0]) and DIVIDER2 (SPI\_DIVIDER[31:16]). The serial clock rate of each cycle is depended on the setting of the SPI\_VARCLK register.

In slave mode, the off-chip master device drives the serial clock through the SPICLK input port to this SPI controller.

#### Variable Serial Clock Frequency

In master mode, the output of serial clock can be programmed as variable frequency pattern if the Variable Clock Enable bit VARCLK\_EN (SPI\_CNTRL[23]) is enabled. The frequency pattern format is defined in VARCLK (SPI\_VARCLK[31:0]) register. If the bit content of VARCLK is '0' the output frequency is according with the DIVIDER (SPI\_DIVIDER[15:0]) and if the bit content of VARCLK is '1', the output frequency is according to the DIVIDER2 (SPI\_DIVIDER[31:16]). Figure 5-53 is the timing relationship among the serial clock (SPICLK), the VARCLK, the DIVIDER and the DIVIDER2 registers. A two-bit combination in the VARCLK defines one clock cycle. The bit field VARCLK[31:30] defines the first clock cycle of SPICLK. The bit field VARCLK[29:28] defines the second clock cycle of SPICLK and so on. The clock source selections are defined in VARCLK and it must be set 1 cycle before the next clock option. For example, if there are 5 CLK1 cycle in SPICLK, the VARCLK shall set 9 '0' in the MSB of VARCLK. The 10th shall be set as '1' in order to switch the next clock source is CLK2. Note that when enable the VARCLK\_EN bit, the setting of TX\_BIT\_LEN must be programmed as 0x10 (16-bit mode only).

SPICLK	
VARCLK	0000000011111111111110000111
CLK1 (DIVIDER)	
CLK2 (DIVIDER2)	

Figure 5-53 Variable Serial Clock Frequency

### **Clock Polarity**

The CLKP bit (SPI\_CTL[11]) defines the serial clock idle state. If CLKP = 1, the output SPICLK is idle at high state, otherwise it is at low state if CLKP = 0.

### **Transmit/Receive Bit Length**

The bit length of a transaction word is defined in TX\_BIT\_LEN bit field (SPI\_CNTRL[7:3]). It can be configured up to 32-bit length in a transaction word for transmitting and receiving.

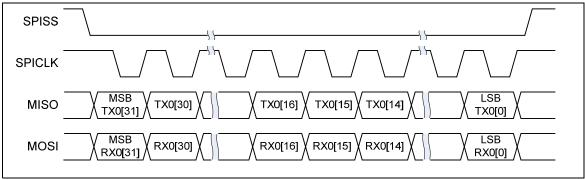

Figure 5-54 32-Bit in one Transaction

#### **Burst Mode**

SPI controller can switch to burst mode by setting TX\_NUM bit field (SPI\_CNTRL[9:8]) to 0x01. In burst mode, SPI can transmit/receive two transactions in one transfer. The SPI burst mode waveform is showed below:

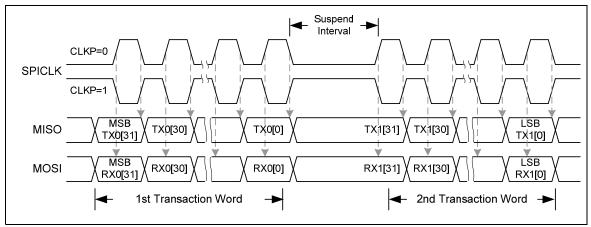

Figure 5-55 Two Transactions in One Transfer (Burst Mode)

#### LSB First

The LSB bit (SPI\_CNTRL[10]) defines the data transmission either from LSB or MSB firstly to start to transmit/receive data.

### Transmit Edge

The TX\_NEG bit (SPI\_CNTRL[2]) defines the data transmitted out either at negative edge or at positive edge of serial clock SPICLK.

### **Receive Edge**

The Rx\_NEG bit (SPI\_CNTRL[1]) defines the data received in either at negative edge or at positive edge of serial clock SPICLK.

Note: the settings of TX\_NEG and RX\_NEG are mutual exclusive. In other words, don't transmit and receive data at the same clock edge.

### Word Suspend

These four bits field of SP\_CYCLE (SPI\_CNTRL[15:12]) provide a configurable suspend interval  $2 \sim 17$  serial clock periods between two successive transaction words in master mode. The suspend interval is from the last falling clock edge of the preceding transaction word to the first rising clock edge of the following transaction word if CLKP = 0. If CLKP = 1, the interval is from the rising clock edge of the preceding transaction word to the falling clock edge of the following transaction word to the falling clock edge of the following transaction word to the falling clock edge of the following transaction word to the falling clock edge of the following transaction word. The default value of SP\_CYCLE is 0x0 (2 serial clock cycles), but set these bits field has no any effects on data transaction process if TX\_NUM = 0x00.

#### **Byte Reorder**

When the transfer is set as MSB first (LSB = 0) and the REORDER is enabled, the data stored in the TX buffer and RX buffer will be rearranged in the order as [BYTE0, BYTE1, BYTE2, BYTE3] in TX\_BIT\_LEN = 32-bit mode, and the sequence of transmitted/received data will be BYTE0, BYTE1, BYTE2, and then BYTE3. If the TX\_BIT\_LEN is set as 24-bit mode, the data in TX buffer and RX buffer will be rearranged as [unknown byte, BYTE0, BYTE1, BYTE2]. The SPI controller will transmit/received data with the sequence of BYTE0, BYTE1 and then BYTE2. Each byte will be transmitted/received with MSB first. The rule of 16-bit mode is the same as above. Byte reorder function is only available when TX\_BIT\_LEN is configured as 16, 24, and 32 bits.

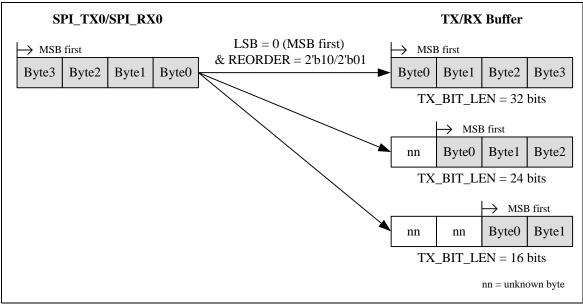

Figure 5-56 Byte Reorder

### nuvoton

#### **Byte Suspend**

In master mode, if SPI\_CNTRL[19] is set to 1, the hardware will insert a suspend interval  $2 \sim 17$  serial clock periods between two successive bytes in a transaction word. Both settings of byte suspend and word suspend are configured in SP\_CYCLE. Note that when enable the byte suspend function, the setting of TX\_BIT\_LEN must be programmed as 0x00 only (32-bit per transaction word).

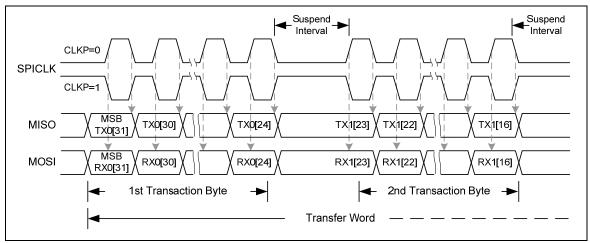

Figure 5-57 Timing Waveform for Byte Suspend

REORDER	Description
00	Disable both byte reorder function and byte suspend interval.
01	Enable byte reorder function and insert a byte suspend internal (2~17 SPICLK) among each byte. The setting of TX_BIT_LEN must be configured as 0x00 ( 32 bits/ word)
10	Enable byte reorder function but disable byte suspend function
11	Disable byte reorder function, but insert a suspend interval (2~17 SPICLK) among each byte. The setting of TX_BIT_LEN must be configured as 0x00 ( 32 bits/ word)

 Table 5-7 Byte Order and Byte Suspend Conditions

### No Slave Select Mode (3-WIRE Mode)

This is used to ignore the slave select signal in slave mode. The SPI controller can work on no slave select mode (3-WIRE mode) interface including SPICLK, SPI\_MISO, and SPI\_MOSI when it is set as a slave device. When the NOSLVSEL bit is set as 1, the controller will start to transmit/receive data after the GO\_BUSY bit is set to 1 and the serial clock appears. In no slave select signal mode, the SS\_LTRIG, SPI\_SSR[4], shall be set as 1.

#### Interrupt

Each SPI controller can generates an individual interrupt when data transfer is finished and the respective interrupt event flag IF (SPI\_CNTRL[16]) will be set. The interrupt event flag will generates an interrupt to CPU if the interrupt enable bit IE (SPI\_CNTRL[17]) is set. The interrupt event flag **IF** can be cleared only by writing 1 to it.

In 3-WIRE mode, the interrupt flag in SLV\_START\_INTSTS will be set when the transfer has start and there is also interrupt event when the received data meet the required bits which define in TX\_BIT\_LEN and TX\_NUM. If the received bits are less than the requirement and there is no more serial clock input over the time period which is defined by the user in slave mode with no slave select, the user can set the SLV\_ABORT bit to force the current transfer done and then the user can get a transfer done interrupt event.

#### Two Bit Transfer Mode

This SPI controller also supports two-bit transfer mode when set the TWOB bit (SPI\_CNTRL[22]) to 1. When the TWOB bit is enabled, it can transmit and receives two-bit serial data simultaneously.

For example, in master mode, the data stored at SPI\_TX0 register and SPI\_TX1 register will be transmitted through the MOSIx0 pin and MOSIx1 pin respectively. In the meanwhile, the SPI\_RX0 register and SPI\_RX1 register will store the data received from MISOx0 pin and MISOx1 pin respectively.

In slave mode, the data stored at SPI\_TX0 register and SPI\_TX1 register will be transmitted through the MISOx0 pin and MISOx1 pin respectively. In the meanwhile, the SPI\_RX0 register and SPI\_RX1 register will store the data received from MOSIx0 pin and MOSIx1 pin respectively.

Note that when enable the TWOB bit, the setting of TX\_NUM must be programmed as 0x00 only.

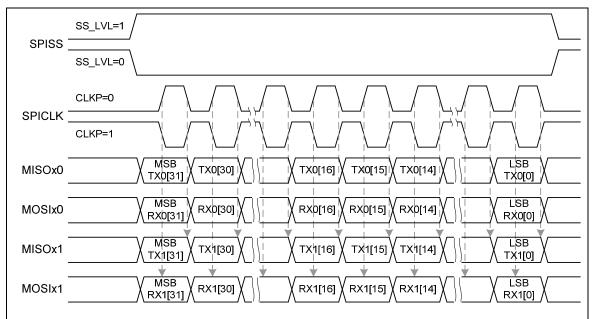

Figure 5-58 Two Bits Transfer Mode (slave mode)

### 5.9.5 Timing Diagram

The active state of slave select signal can be defined by the settings of SS\_LVL bit (SPI\_SSR[2]) and SS\_LTRIG bit (SPI\_SSR[4]). The serial clock (SPICLK) idle state can be configured as high state or low state by setting the CLKP bit (SPI\_CNTRL[11]). It also provides the bit length of a transaction word in TX\_BIT\_LEN (SPI\_CNTRL[7:3]), the transfer number in TX\_NUM (SPI\_CNTRL[8]), and transmit/receive data from MSB or LSB first in LSB bit (SPI\_CNTRL[10]). Users also can select which edge of serial clock to transmit/receive data in TX\_NEG/RX\_NEG (SPI\_CNTRL[2:1]) registers. Four SPI timing diagrams for master/slave operations and the related settings are shown as below.

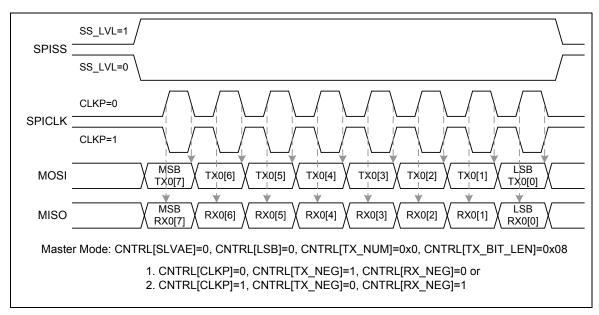

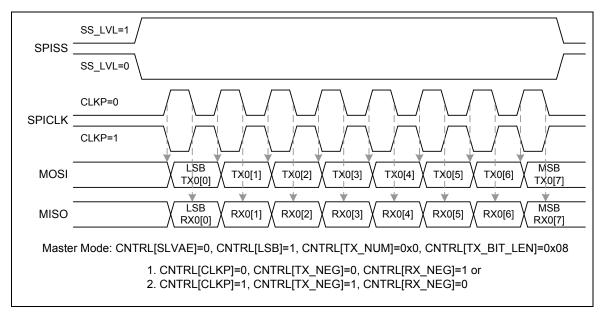

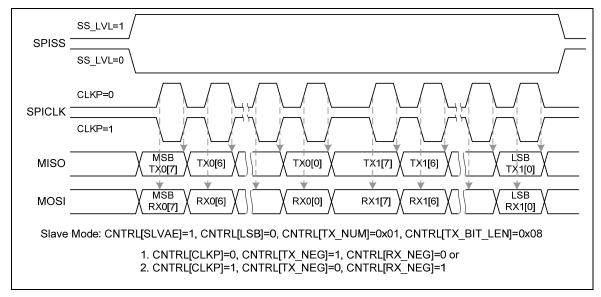

Figure 5-59 SPI Timing in Master Mode

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

## nuvoTon

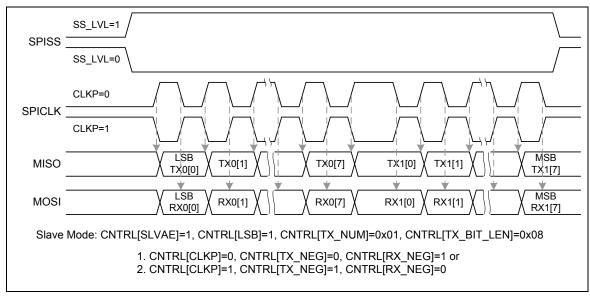

Figure 5-62 SPI Timing in Slave Mode (Alternate Phase of SPICLK)

### 5.9.6 Programming Examples

**Example 1**, SPI controller is set as a master to access an off-chip slave device with following specifications:

- Data bit is latched on positive edge of serial clock
- Data bit is driven on negative edge of serial clock
- Data is transferred from MSB first
- SPICLK is idle at low state
- Only one byte of data to be transmitted/received in a transaction
- Use the first SPI slave select pin to connect with an off-chip slave device. Slave select signal is active low

The operation flow is as follows.

- 1) Set the DIVIDER (SPI\_DIVIDER [15:0]) register to determine the output frequency of serial clock.
- 2) Write the SPI\_SSR register a proper value for the related settings of master mode
  - 1. Disable the <u>Automatic Slave Select</u> bit AUTOSS(SPI\_SSR[3] = 0)
    - Select low level trigger output of slave select signal in the <u>Slave Select Active Level</u> bit SS\_LVL (SPI\_SSR[2] = 0)
  - 2. Select slave select signal to be output active at the IO pin by setting the <u>Slave Select</u> <u>Register</u> bits SSR[0] (SPI\_SSR[0]) to active the off-chip slave devices
- 3) Write the related settings into the SPI\_CNTRL register to control this SPI master actions
  - 1. Set this SPI controller as master device in SLAVE bit (SPI\_CNTRL[18] = 0)

- 2. Force the serial clock idle state at low in CLKP bit (SPI\_CNTRL[11] = 0)
- Select data transmitted at negative edge of serial clock in TX\_NEG bit (SPI\_CNTRL[2] = 1)
- 4. Select data latched at positive edge of serial clock in RX\_NEG bit (SPI\_CNTRL[1] = 0)
- 5. Set the bit length of word transfer as 8-bit in TX\_BIT\_LEN bit field (SPI\_CNTRL[7:3] = 0x08)
- 6. Set only one time of word transfer in TX\_NUM (SPI\_CNTRL[9:8] = 0x0)
- 7. Set MSB transfer first in MSB bit (SPI\_CNTRL[10] = 0), and don't care the SP\_CYCLE bit field (SPI\_CNTRL[15:12]) due to it's not in burst mode in this case
- 4) If this SPI master will transmits (writes) one byte data to the off-chip slave device, write the byte data that will be transmitted into the TX0[7:0] (SPI\_TX0[7:0]) register.
- 5) If this SPI master just only receives (reads) one byte data from the off-chip slave device, you don't need to care what data will be transmitted and just write 0xFF into the SPI\_TX0[7:0] register.
- 6) Enable the GO\_BUSY bit (SPI\_CNTRL [0] = 1) to start the data transfer at the SPI interface.
- 7) Waiting for SPI interrupt occurred (if the Interrupt Enable IE bit is set) or just polling the GO\_BUSY bit till it is cleared to 0 by hardware automatically.
- 8) Read out the received one byte data from RX0 [7:0] (SPI\_RX0[7:0]) register.
- 9) Go to 4) to continue another data transfer or set SSR [0] to 0 to inactivate the off-chip slave devices.

**Example 2**, The SPI controller is set as a slave device and connects with an off-chip master device. The off-chip master device communicates with the on-chip SPI slave controller through the SPI interface with the following specifications:

- Data bit is latched on positive edge of serial clock
- Data bit is driven on negative edge of serial clock
- Data is transferred from LSB first
- SPICLK is idle at high state
- Only one byte of data to be transmitted/received in a transaction
- Slave select signal is high level trigger

The operation flow is as follows.

1) Write the SPI\_SSR register a proper value for the related settings of slave mode

Select high level and level trigger for the input of slave select signal by setting the Slave Select Active Level bit SS\_LVL (SPI\_SSR[2] = 1) and the Slave Select Level Trigger bit SS\_LTRIG (SPI\_SSR[4] = 1).

- 2) Write the related settings into the SPI\_CNTRL register to control this SPI slave actions
  - 1. Set this SPI controller as slave device in SLAVE bit (SPI\_CNTRL[18] = 1)
  - 2. Select the serial clock idle state at high in CLKP bit (SPI\_CNTRL[11] = 1)
  - 3. Select data transmitted at negative edge of serial clock in TX\_NEG bit (SPI\_CNTRL[2] =

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

## nuvoTon

1)

- 4. Select data latched at positive edge of serial clock in RX\_NEG bit (SPI\_CNTRL[1] = 0)
- 5. Set the bit length of word transfer as 8-bit in TX\_BIT\_LEN bit field (SPI\_CNTRL[7:3] = 0x08)
- 6. Set only one time of word transfer in TX\_NUM (SPI\_CNTRL[9:8] = 0x0)
- 7. Set LSB transfer first in LSB bit (SPI\_CNTRL[10] = 1), and don't care the SP\_CYCLE bit field (SPI\_CNTRL[15:12]) due to not burst mode in this case.
- 3) If this SPI slave will transmits (be read) one byte data to the off-chip master device, write the byte data that will be transmitted into the TX0 [7:0] (SPI\_TX0[7:0]) register.
- 4) If this SPI slave just only receives (be written) one byte data from the off-chip master device, you don't care what data will be transmitted and just write 0xFF into the SPI\_TX0[7:0] register.
- 5) Enable the GO\_BUSY bit (SPI\_CNTRL[0] = 1) to wait for the slave select trigger input and serial clock input from the off-chip master device to start the data transfer at the SPI interface.
- 6) Waiting for SPI interrupt occurred (if the Interrupt Enable IE bit is set), or just polling the GO\_BUSY bit till it is cleared to 0 by hardware automatically.
- 7) Read out the received one byte data from RX[7:0] (SPI\_RX0[7:0]) register.

Go to 3) to continue another data transfer or disable the GO\_BUSY bit to stop data transfer.

### 5.9.7 Register Map

R: read only, W: write only, R/W: both read and write

		<ol> <li>Byte reorder function is only available if TX_BIT_LEN is defined as 16, 24, and 32 bits.</li> </ol>
		<ol> <li>In slave mode with level-trigger configuration, if the byte suspend function is enabled, the slave select pin must be kept at active state during the successive four bytes transfer.</li> </ol>
		Slave Mode Enable Bit
[18]	SLAVE	1 = Slave mode
		0 = Master mode
		Interrupt Enable
[17]	IE	1 = Enable SPI Interrupt
		0 = Disable SPI Interrupt
		Interrupt Flag
		1 = It indicates that the transfer is done.
[16]	IF	0 = It indicates that the transfer dose not finish yet.
		Note: This bit will be cleared by writing 1 to itself.
		Suspend Interval (Master Only)
		These four bits provide configurable suspend interval between two successive transmit/receive transaction in a transfer. The suspend interval is from the last falling clock edge of the current transaction to the first rising clock edge of the successive transaction if CLKP = 0. If CLKP = 1, the interval is from the rising clock edge to the falling clock edge. The default value is 0x0. When TX_NUM = 00b, setting this field has no effect on transfer. The desired suspend interval is obtained according to the following equation:
		For byte suspend interval and burst mode suspend interval:
		(SP_CYCLE[3:0] + 2) * period of SPICLK + 1 system clock cycle
[15:12]	SP_CYCLE	Ex:
[10.12]	00. 011	SP_CYCLE = 0x0 2 SPICLK clock cycle + 1 system clock cycle
		SP_CYCLE = 0x1 3 SPICLK clock cycle + 1 system clock cycle
		SP_CYCLE = 0xE 16 SPICLK clock cycle + 1 system clock cycle
		SP_CYCLE = 0xF 17 SPICLK clock cycle + 1 system clock cycle
		If the SPI clock rate equals system clock rate, that is to say, the DIV_ONE feature is enabled, the burst mode suspend interval period is
		(SP_CYCLE[3:0] * 2 + 3.5) * period of system clock
[11]		Clock Polarity
	CLKP	1 = SPICLK idle high
		0 = SPICLK idle low
		LSB First
[10]	LSB	1 = The LSB is sent first on the line (bit 0 of SPI_TX0/1), and the first bit received from the line will be put in the LSB position in the RX register (bit 0 of SPI_RX0/1).

Bits	Descriptions	
		0 = The MSB is transmitted/received first (which bit in SPI_TX0/1 and SPI_RX0/1 register that is depends on the TX_BIT_LEN field).
		Numbers of Transmit/Receive Word
		This field specifies how many transmit/receive word numbers should be executed in one transfer.
		00 = Only one transmit/receive word will be executed in one transfer.
[9:8]	TX_NUM	01 = Two successive transmit/receive words will be executed in one transfer. (burst mode)
		10 = Reserved.
		11 = Reserved.
		Note: in slave mode with level-trigger configuration, if TX_NUM is set to 01, the slave select pin must be kept at active state during the successive data transfer.
		Transmit Bit Length
		This field specifies how many bits can be transmitted / received in one transaction. The minimum bit length is 8 bits and can up to 32 bits.
[7:3]	TX_BIT_LEN	TX_BIT_LEN = 0x08 8 bits
		TX_BIT_LEN = 0x1F 31 bits
		TX_BIT_LEN = 0x00 32 bits
		Transmit At Negative Edge
[2]	TX_NEG	1 = The transmitted data output signal is changed at the falling edge of SPICLK
		0 = The transmitted data output signal is changed at the rising edge of SPICLK
		Receive At Negative Edge
[1]	RX_NEG	1 = The received data input signal is latched at the falling edge of SPICLK
		0 = The received data input signal is latched at the rising edge of SPICLK
		Go and Busy Status
		<ul><li>1 = In master mode, writing 1 to this bit to start the SPI data transfer; in slave mode, writing 1 to this bit indicates that the slave is ready to communicate with a master.</li></ul>
[0]	GO_BUSY	0 = Writing 0 to this bit to stop data transfer if SPI is transferring.
		During the data transfer, this bit keeps the value of 1. As the transfer is finished, this bit will be cleared automatically.
		Note: All registers should be set before writing 1 to this GO_BUSY bit.

#### SPI Divider Register (SPI\_DIVIDER)

Register	Offset	R/W	Description	Reset Value
SPI_DIVIDER	SPIx_BA+0x04	R/W	Clock Divider Register (Master Only)	0x0000_0000

31	30	29	28	27	26	25	24
			DIVIDE	R2[15:8]			
23	22	21	20	19	18	17	16
			DIVIDE	R2[7:0]			
15	14	13	12	11	10	9	8
			DIVIDE	R[15:8]			
7	6	5	4	3	2	1	0
	DIVIDER[7:0]						

Bits	Descriptions	
		Clock Divider 2 (master only)
		The value in this field is the 2 <sup>nd</sup> frequency divider for generating the serial clock on the output SPICLK. The desired frequency is obtained according to the following equation:
[31:16]	DIVIDER2	$f_{sclk} = \frac{f_{pclk}}{(DIVIDER2 + 1)*2}$
		If VARCLK_EN is cleared to 0, this setting is unmeaning.
		Clock Divider 1 (master only)
		The value in this field is the frequency divider for generating the serial clock on the output SPICLK. The desired frequency is obtained according to the following equation:
[15:0]	DIVIDER	$f_{sclk} = \frac{f_{pclk}}{(DIVIDER+1)*2}$
		In slave mode, the period of SPI clock driven by a master shall equal or over 5 times the period of PCLK. In other words, the maximum frequency of SPI clock is the fifth of the frequency of slave's PCLK.

#### SPI Slave Select Register (SPI\_SSR)

Register	Offset	R/W	Description	Reset Value
SPI_SSR	SPI0_BA+0x08	R/W	Slave Select Register	0x0000_0000

31	30	29	28	27	26	25	24
			Rese	erved			
23	22	21	20	19	18	17	16
			Rese	erved			
15	14	13	12	11	10	9	8
			Rese	erved			
7	6	5	4	3	2	1	0
Rese	erved	LTRIG_FLAG	SS_LTRIG	AUTOSS	SS_LVL	S	SR

Bits	Descriptions	
[31:6]	Reserved	Reserved
		Level Trigger Accomplish Flag
		When the SS_LTRIG bit is set in slave mode, this bit can be read to indicate the received bit number is met the requirement or not.
[5]	LTRIG_FLAG	1 = The transaction number and the transferred bit length met the specified requirements which defined in TX_NUM and TX_BIT_LEN.
		0 = The transaction number or the transferred bit length of one transaction doesn't meet the specified requirements.
		Note: This bit is READ only
		Slave Select Level Trigger Enable Bit (Slave only)
[4]	SS_LTRIG	1 = The slave select signal will be level-trigger. It depends on SS_LVL to decide the signal is active low or active high.
		0 = The input slave select signal is edge-trigger. This is the default value. It depends on SS_LVL to decide the signal is active at falling-edge or rising-edge
		Automatic Slave Select Enable Bit (Master only)
[3]	AUTOSS	1 = If this bit is set, SPISSx0/1 signals will be generated automatically. It means that device/slave select signal, which is set in SSR[1:0], will be asserted by the SPI controller when transmit/receive is started by setting GO_BUSY, and will be de- asserted after each transmit/receive is finished.
		0 = If this bit is cleared, slave select signals will be asserted/de-asserted by setting /clearing related bits in SSR[1:0].
		Slave Select Active Level
101	SS_LVL	It defines the active status of slave select signal (SPISSx0/1).
[2]	33_LVL	1 = The slave select signal SPISSx0/1 is active at high-level/rising-edge.
		0 = The slave select signal SPISSx0/1 is active at low-level/falling-edge.
[1:0]	SSR	Slave Select Control Bits (Master only)

Bits	Descriptions	
		If AUTOSS bit is cleared, writing 1 to any bit location of this field sets the proper SPISSx0/1 line to an active state and writing 0 sets the line back to inactive state. If AUTOSS bit is set, writing 0 to any bit location of this field will keep the corresponding SPISSx0/1 line at inactive state; writing 1 to any bit location of this field will select the corresponding SPISSx0/1 line to be automatically driven to active state for the duration of the transmit/receive, and will be driven to inactive state for the rest of the time. The active state of SPISSx0/1 is specified in SS_LVL. Note: SPISSx0 is also defined as slave select input in slave mode.

	TX[15:8]									
7	6	5	4	3	2	1	0			
	TX[7:0]									

Bits	Descriptions				
		Data Transmit Register			
		The Data Transmit Registers hold the data to be transmitted in the next transfer. Vabits depend on the transmit bit length field in the CNTRL register.			
[31:0]		For example, if TX_BIT_LEN is set to 0x08 and the TX_NUM is set to 0x0, the bit TX0[7:0] will be transmitted in next transfer. If TX_BIT_LEN is set to 0x00 and TX_NUM is set to 0x1, the SPI controller will perform two 32-bit transmit/receive successive using the same setting. The transmission sequence is TX0[31:0] first and then TX1[31:0].			

#### SPI Variable Clock Pattern Register (SPI\_VARCLK)

Register	Offset	R/W	Description	Reset Value
SPI_VARCLK	SPIx_BA+0x34	R/W	Variable Clock Pattern Register	0x007F_FF87

	Reserved								

Bits	Descriptions	
[31:12]	Reserved	Reserved
[11]	SLV_START_INTSTS	<ul> <li>Slave 3-Wire Mode Start Interrupt Status</li> <li>It is used to dedicate that the transfer has start in slave mode with no slave select.</li> <li>1 = It indicates that the transfer start in slave mode with no slave select. It is auto clear by transfer done or writing one clear.</li> <li>0 = It indicates that the slave start transfer no active.</li> </ul>
[10]	SSTA_INTEN	<ul> <li>Slave 3-Wire Mode Start Interrupt Enable</li> <li>It is used to enable interrupt when the transfer has start in slave mode with no slave select. If there is no transfer done interrupt over the time period which is defined by user after the transfer start, the user can set the SLV_ABORT bit to force the transfer done.</li> <li>1 = Enable the transaction start interrupt. It is clear by the current transfer done or the SLV_START_INTSTS bit be clear (write one clear).</li> <li>0 = Disable the transfer start interrupt.</li> </ul>
[9]	SLV_ABORT	Slave 3-Wire Mode Abort Control Bit In normal operation, there is interrupt event when the received data meet the required bits which define in TX_BIT_LEN and TX_NUM. If the received bits are less than the requirement and there is no more serial clock input over the one transfer time in slave mode with no slave select, the user can set this bit to force the current transfer done and then the user can get a transfer done interrupt event. Note: It is auto clear to 0 by hardware when the abort event is active.

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

Bits	Descriptions	
		Slave 3-Wire Mode Enable Bit
		This is used to ignore the slave select signal in slave mode. The SPI controller can work on 3 wire interface including SPICLK, SPI_MISO, and SPI_MOSI when it is set as a slave device.
[8]	NOSLVSEL	0 = The controller is 4-wire bi-direction interface.
[0]		1 = The controller is 3-wire bi-direction interface in slave mode. When this bit is set as 1, the controller start to transmit/receive data after the GO_BUSY bit active and the serial clock input.
		Note: In no slave select signal mode, the SS_LTRIG, SPI_SSR[4], shall be set as 1.
[7:1]	Reserved	Reserved
		SPI Clock Divider Control
		0 = The SPI clock rate is determined by the setting of SPI_DIVIDER register.
		1 = Enable the DIV_ONE feature. The SPI clock rate equals the system clock rate.
[0]	DIV_ONE	Note:
		<ol> <li>When this bit is set to 1, both the REORDER field and the VARCLK_EN field must be configured as 0. In other words, the byte-reorder function, byte suspend function and variable clock function must be disable.</li> </ol>
		2. When this bit is set to 1, the TX_BIT_LEN can't be set as 1.

### 5.10 Timer Controller (TMR)

#### 5.10.1 Overview

The timer controller includes four 32-bit timers, TIMER0~TIMER3, which allows user to easily implement a timer control for applications. The timer can perform functions like frequency measurement, event counting, interval measurement, clock generation, delay timing, and so on. The timer can generate an interrupt signal upon timeout, or provide the current value during operation.

#### 5.10.2 Features

- 4 sets of 32-bit timers with 24-bit up-timer and one 8-bit pre-scale counter
- Independent clock source for each timer
- Provides one-shot, periodic, toggle and continuous counting operation modes
- Time out period = (Period of timer clock input) \* (8-bit pre-scale counter + 1) \* (24-bit TCMP)
- Maximum counting cycle time =  $(1 / T MHz) * (2^8) * (2^{24})$ , T is the period of timer clock
- 24-bit timer value is readable through TDR (Timer Data Register)
- Support event counting function to count the event from external pin
- Support input capture function to capture or reset counter value

### 5.10.3 Block Diagram

Each channel is equipped with an 8-bit pre-scale counter, a 24-bit up-timer, a 24-bit compare register and an interrupt request signal. Refer to Figure 5-63 for the timer controller block diagram. There are four options of clock sources for each channel. Figure 5-64 illustrates the clock source control function. Software can program the 8-bit pre-scale counter to decide the clock period to 24-bit up timer.

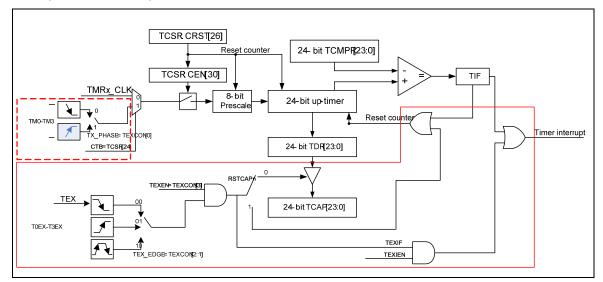

Figure 5-63 Timer Controller Block Diagram

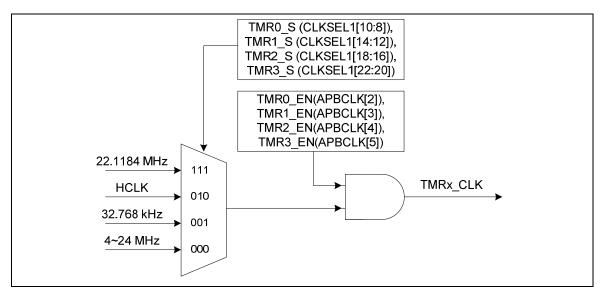

Figure 5-64 Clock Source of Timer Controller

#### 5.10.4 Function Description

Timer controller provides one-shot, period, toggle and continuous counting operation modes. It also provides the event counting function to count the event from external pin and input capture function to capture or reset timer counter value. Each operating function mode is shown as following:

#### 5.10.4.1 One – Shot Mode

If timer is operated at one-shot mode and CEN (TCSR[30] timer enable bit) is set to 1, the timer counter starts up counting. Once the timer counter value reaches timer compare register (TCMPR) value, if IE (TCSR[29] interrupt enable bit) is set to 1, then the timer interrupt flag is set and the interrupt signal is generated and sent to NVIC to inform CPU. It indicates that the timer counting overflow happens. If IE (TCSR[29] interrupt enable bit) is set to 0, no interrupt signal is generated. In this operating mode, once the timer counter value reaches timer compare register (TCMPR) value, the timer counter value goes back to counting initial value and CEN (timer enable bit) is cleared to 0 by timer controller. Timer counting operation stops, once the timer counter value reaches timer operates timer counter value reaches timer counter value function only one time after programming the timer compare register (TCMPR) value and CEN (timer enable bit) is set to 1. So, this operating mode is called One-Shot mode.

#### 5.10.4.2 Periodic Mode

If timer is operated at period mode and CEN (TCSR[30] timer enable bit) is set to 1, the timer counter starts up counting. Once the timer counter value reaches timer compare register (TCMPR) value, if IE (TCSR[29] interrupt enable bit) is set to 1, then the timer interrupt flag is set and the interrupt signal is generated and sent to NVIC to inform CPU. It indicates that the timer counting overflow happens. If IE (TCSR[29] interrupt enable bit) is set to 0, no interrupt signal is generated. In this operating mode, once the timer counter value reaches timer compare register (TCMPR) value, the timer counter value goes back to counting initial value and CEN is kept at 1 (counting enable continuously). The timer counter operates up counting again. If the interrupt flag is cleared by software, once the timer counter value reaches timer compare register (TCMPR) value and IE (interrupt enable bit) is set to 1'b1, then the timer interrupt flag is set and the interrupt signal is generated and sent to NVIC to inform CPU again. That is to say, timer operates timer counting and compares with TCMPR value function periodically. The timer counting operation doesn't stop until the CEN is set to 0. The interrupt signal is also generated periodically. So, this operating mode is called Periodic mode.

#### 5.10.4.3 Toggle Mode

If timer is operated at toggle mode and CEN (TCSR[30] timer enable bit) is set to 1, the timer counter starts up counting. Once the timer counter value reaches timer compare register (TCMPR) value, if IE (TCSR[29] interrupt enable bit) is set to 1, then the timer interrupt flag is set and the interrupt signal is generated and sent to NVIC to inform CPU. It indicates that the timer counting overflow happens. The associated toggle output (tout) signal is set to 1. In this operating mode, once the timer counter value reaches timer compare register (TCMPR) value, the timer counter value goes back to counting initial value and CEN is kept at 1 (counting enable continuously). The timer counter operates up counting again. If the interrupt flag is cleared by software, once the timer counter value reaches timer compare register (TCMPR) value and IE (interrupt enable bit) is set to 1, then the timer interrupt flag is set and the interrupt signal is generated and sent to NVIC to inform CPU again. The associated toggle output (tout) signal is set to 0. The timer counting operation doesn't stop until the CEN is set to 0. Thus, the toggle output (tout) signal is called Toggle mode.

#### 5.10.4.4 Continuous Counting Mode

If the timer is operated at continuous counting mode and CEN (TCSR[30] timer enable bit) is set to 1, the associated interrupt signal is generated depending on TDR = TCMPR if IE (TCSR[29] interrupt enable bit) is enabled. User can change different TCMPR value immediately without disabling timer counting and restarting timer counting. For example, TCMPR is set as 80, first. (The TCMPR should be less than  $2^{24}$  and be greater than 1). The timer generates the interrupt if IE is enabled and TIF (timer interrupt flag) will set to 1 then the interrupt signal is generated and sent to NVIC to inform CPU when TDR value is equal to 80. But the CEN is kept at 1 (counting enable continuously) and TDR value will not goes back to 0, it continues to count 81, 82, 83,... to  $2^{24}$  -1, 0, 1, 2, 3, ... to  $2^{24}$  -1 again and again. Next, if user programs TCMPR as 200 and the TIF is cleared to 0, then timer interrupt occurred and TIF is set to 1, then the interrupt signal is generated and sent to NVIC to inform CPU again when TDR value reaches to 200. At last, user programs TCMPR as 500 and clears TIF to 0 again, then timer interrupt occurred and TIF sets to 1 then the interrupt signal is generated and sent to NVIC to inform CPU when TDR value reaches to 500. From application view, the interrupt is generated depending on TCMPR. In this mode, the timer counting is continuous. So, this operation mode is called as continuous counting mode.

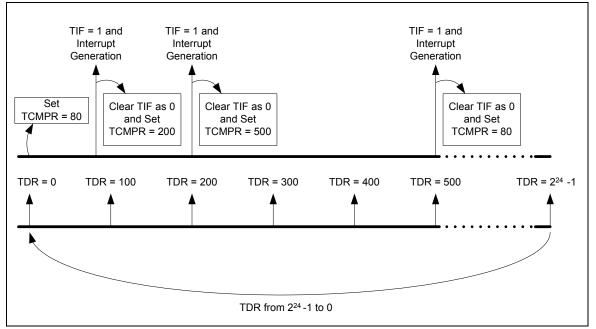

Figure 5-65 Continuous Counting Mode

#### 5.10.4.5 Event Counting Function

It also provides an application which can count the event from TM0~TM3 pins. It is called as event counting function. In event counting function, the clock source of timer controller, TMRx\_CLK, in Figure 5-65 should be set as HCLK. It provides TM0~TM3 enabled or disabled de-bounce function by TEXCONx[7] and TM0~TM3 falling or rising phase counting setting by TEXCONx[0]. And, the event count source operating frequency should be less than 1/3 HCLK frequency if disable counting de-bounce or less than 1/8 HCLK frequency if enable counting de-bounce. Otherwise, the returned TDR value is incorrect.

#### 5.10.4.6 Input Capture Function

It also provides input capture function to capture or reset timer counter value. If TEXEN (Timer External Pin Enable) is set to 1 and RSTCAPSEL is set to 0, the timer counter value (TDR) will be captured into TCAP register when TEX (Timer External Pin) pin trigger condition occurred. There are four TEX sources form specified pins, T0EX~T3EX pins. If TEXEN is set to 1 and RSTCAPSEL is set to 1, the TDR will be reset to 0 when TEX pin trigger condition happened. The TEX trigger edge can choose by TEX\_EDGE. When TEX trigger occurred, TEXIF (Timer External Interrupt Flag) is set to 1, and if enabled TEXIEN (Timer External Interrupt Enable Bit) to 1, the interrupt signal is generated then sent to NVIC to inform CPU. It also provides T0EX~T3EX enabled or disabled capture de-bounce function by TEXCONx[6]. And, the TEX source operating frequency should be less than 1/3 HCLK frequency if disable TEX de-bounce or less than 1/8 HCLK frequency.

### 5.10.5 Register Map

R: read only, W: write only, R/W: both read and write

Bits	Descriptions	
[31:24]	Reserved	Reserved
		Timer Compared Value
		TCMP is a 24-bit compared register. When the internal 24-bit up-timer counts and its value is equal to TCMP value, a Timer Interrupt is requested if the timer interrupt is enabled with TCSR.IE[29]=1. The TCMP value defines the timer counting cycle time.
[23:0]	тсмр	Time out period = (Period of timer clock input) * (8-bit PRESCALE + 1) * (24-bit TCMP)
[=0.0]		Note1: Never write 0x0 or 0x1 in TCMP, or the core will run into unknown state.
		Note2: When timer is operating at continuous counting mode, the 24-bit up-timer will count continuously if software writes a new value into TCMP. If timer is operating at other modes, the 24-bit up-timer will restart counting and using newest TCMP value to be the compared value if software writes a new value into TCMP.

	Reserved						
7	6	5	4	3	2	1	0
Reserved					TEXIF		

Bits	Descriptions	
[31:1]	Reserved	Reserved
[0] <b>TEXIF</b>		Timer External Interrupt Flag
		This bit indicates the external interrupt status of Timer.
		This bit is set by hardware when TEXEN (TEXCON[3]) is to 1, and the transition on the TEX pins associated with TEX_EDGE (TEXCON[2:1]) setting is occurred. It is cleared by writing 1 to this bit.
		For example, while TEXEN = 1, and TEX_EDGE = 00, a 1 to 0 transition on the TEX pin causes the TEXIF to be set.

### 5.11 Watchdog Timer (WDT)

#### 5.11.1 Overview

The purpose of Watchdog Timer is to perform a system reset when system runs into an unknown state. This prevents system from hanging for an infinite period of time. Besides, this Watchdog Timer supports another function to wake-up chip from power down mode. The watchdog timer includes an 18-bit free running counter with programmable time-out intervals. Table 5-8 show the watchdog timeout interval selection and Figure 5-64 shows the timing of watchdog interrupt signal and reset signal.

Setting WTE (WDTCR [7]) enables the watchdog timer and the WDT counter starts counting up. When the counter reaches the selected time-out interval, Watchdog timer interrupt flag WTIF will be set immediately to request a WDT interrupt if the watchdog timer interrupt enable bit WTIE is set, in the meanwhile, a specified delay time (1024 \* T<sub>WDT</sub>) follows the time-out event. User must set WTR (WDTCR [0]) (Watchdog timer reset) high to reset the 18-bit WDT counter to avoid chip from Watchdog timer reset before the delay time expires. WTR bit is cleared automatically by hardware after WDT counter is reset. There are eight time-out intervals with specific delay time which are selected by Watchdog timer interval select bits WTIS (WDTCR [10:8]). If the WDT counter has not been cleared after the specific delay time expires, the watchdog timer will set Watchdog Timer Reset Flag (WTRF) high and reset chip. This reset will last 63 WDT clocks (T<sub>PST</sub>) then chip restarts executing program from reset vector (0x0000 0000). WTRF will not be cleared by Watchdog reset. User may poll WTRF by software to recognize the reset source. WDT also provides wake-up function. When chip is powered down and the Watchdog Timer Wake-up Function Enable bit (WDTR[4]) is set, if the WDT counter reaches the specific time interval defined by WTIS (WDTCR [10:8]), the chip is waken up from power down state. First example, if WTIS is set as 000, the specific time interval for chip to wake up from power down state is  $2^4$  \* T<sub>WDT</sub>. When power down command is set by software, then, chip enters power down state. After 2<sup>4</sup> \* T<sub>WDT</sub> time is elapsed, chip is waken up from power down state. Second example, if WTIS (WDTCR [10:8]) is set as 111, the specific time interval for chip to wake up from power down state is 2<sup>18</sup> \* T<sub>WDT</sub>. If power down command is set by software, then, chip enters power down state. After 2<sup>18</sup> \* T<sub>WDT</sub> time is elapsed, chip is waken up from power down state. Notice if WTRE (WDTCR [1]) is set to 1, after chip is waken up, software should clear the Watchdog Timer counter by setting WTR(WDTCR [0]) to 1 as soon as possible. Otherwise, if the Watchdog Timer counter is not cleared by setting WTR (WDTCR [0]) to 1 before time starting from waking up to software clearing Watchdog Timer counter is over 1024 \* T<sub>WDT</sub>, the chip is reset by Watchdog Timer.

WTIS	Timeout Interval Selection T <sub>TIS</sub>	Interrupt Period T <sub>INT</sub>	WTR Timeout startingInterval (WDT_CLK=10 kHz) MIN. T <sub>WTR</sub> ~ Max. T <sub>WTR</sub>
000	2 <sup>4</sup> * T <sub>WDT</sub>	1024 * T <sub>WDT</sub>	1.6 ms ~ 104 ms
001	2 <sup>6</sup> * T <sub>WDT</sub>	1024 * T <sub>WDT</sub>	6.4 ms ~ 108.8 ms
010	2 <sup>8</sup> * T <sub>WDT</sub>	1024 * T <sub>WDT</sub>	25.6 ms ~ 128 ms
011	2 <sup>10</sup> * T <sub>WDT</sub>	1024 * T <sub>WDT</sub>	102.4 ms ~ 204.8 ms
100	2 <sup>12</sup> * T <sub>WDT</sub>	1024 * T <sub>WDT</sub>	409.6 ms ~ 512 ms
101	2 <sup>14</sup> * T <sub>WDT</sub>	1024 * T <sub>WDT</sub>	1.6384 s ~ 1.7408 s
110	2 <sup>16</sup> * T <sub>WDT</sub>	1024 * T <sub>WDT</sub>	6.5536 s ~ 6.656 s
111	2 <sup>18</sup> * T <sub>WDT</sub>	1024 * T <sub>WDT</sub>	26.2144 s ~ 26.3168 s

Table 5-8 Watchdog Timeout Interval Selection

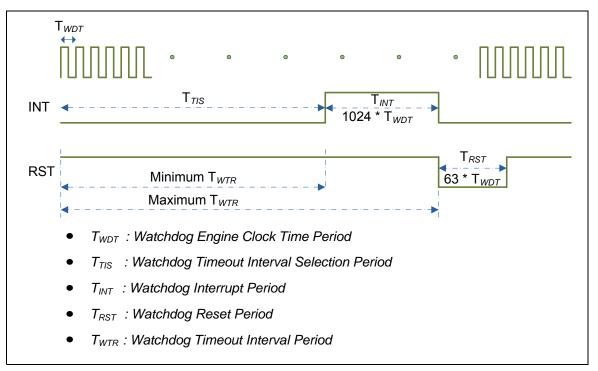

Figure 5-66 Timing of Interrupt and Reset Signal

### 5.11.2 Features

- 18-bit free running counter to avoid chip from Watchdog timer reset before the delay time expires.
- Selectable time-out interval (2<sup>4</sup> ~ 2<sup>18</sup>) and the time out interval is 104 ms ~ 26.3168 s (if WDT\_CLK = 10 kHz).
- Reset period = (1 / 10 kHz) \* 63, if WDT\_CLK = 10 kHz.

### 5.11.3 Block Diagram

The Watchdog Timer clock control and block diagram are shown as following.

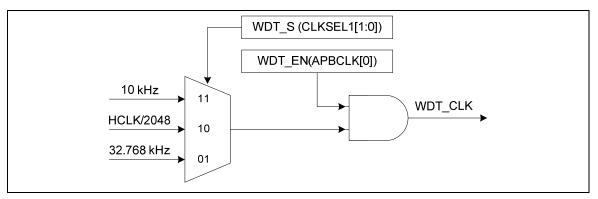

Figure 5-67 Watchdog Timer Clock Control

		Watchdog Timer Enable (write-protection bit)						
[7]	WTE	0 = Disable the Watchdog timer (This action will reset the internal counter)						
		1 = Enable the Watchdog timer						
		Watchdog Timer Interrupt Enable (write-protection bit)						
[6]	WTIE	0 = Disable the Watchdog timer interrupt						
		1 = Enable the Watchdog timer interrupt						
		Watchdog Timer Wake-up Flag						
		If Watchdog timer causes chip wakes up from power down mode, this bit will be						
[5]	WTWKF	set to high. It must be cleared by software with a write 1 to this bit.						
		0 = Watchdog timer does not cause chip wake-up.						
		1 = Chip wake-up from idle or power down mode by Watchdog timeout.						
		Watchdog Timer Wake-up Function Enable bit (write-protection bit)						
		0 = Disable Watchdog timer Wake-up chip function.						
[4]	WTWKE	1 = Enable the Wake-up function that Watchdog timer timeout can wake-up chip						
		from power down mode.						
		Note: Chip can wake-up by WDT only if WDT clock source select RC10K						
		Watchdog Timer Interrupt Flag						
		If the Watchdog timer interrupt is enabled, then the hardware will set this bit to						
[3]	WTIF	indicate that the Watchdog timer interrupt has occurred.						
[-]		0 = Watchdog timer interrupt did not occur						
		1 = Watchdog timer interrupt occurs						
		Note: This bit is cleared by writing 1 to this bit.						
		Watchdog Timer Reset Flag						
		When the Watchdog timer initiates a reset, the hardware will set this bit. This flag						
		can be read by software to determine the source of reset. Software is responsible						
[2]	WTRF	to clear it manually by writing 1 to it. If WTRE is disabled, then the Watchdog timer has no effect on this bit.						
		0 = Watchdog timer reset did not occur						
		1 = Watchdog timer reset occurs						
		Note: This bit is cleared by writing 1 to this bit.						
		Watchdog Timer Reset Enable (write-protection bit)						
		Setting this bit will enable the Watchdog timer reset function.						
[1]	WTRE	0 = Disable Watchdog timer reset function						
		1 = Enable Watchdog timer reset function						
		Clear Watchdog Timer (write-protection bit)						
		Set this bit will clear the Watchdog timer.						
[0]	WTR	0 = Writing 0 to this bit has no effect						
r-1								
		1 = Reset the contents of the Watchdog timer Note: This bit will be auto cleared by hardware						

#### 5.12 UART Interface Controller (UART)

NuMicro<sup>™</sup> NUC130/NUC140 provides up to three channels of Universal Asynchronous Receiver/Transmitters (UART). UART0 supports High Speed UART and UART1~2 perform Normal Speed UART, besides, only UART0 and UART1 support flow control function.

#### 5.12.1 Overview

The Universal Asynchronous Receiver/Transmitter (UART) performs a serial-to-parallel conversion on data received from the peripheral, and a parallel-to-serial conversion on data transmitted from the CPU. The UART controller also supports IrDA SIR Function, LIN master/slave mode function and RS-485 mode functions. Each UART channel supports seven types of interrupts including transmitter FIFO empty interrupt (INT\_THRE), receiver threshold level reaching interrupt (INT\_RDA), line status interrupt (parity error or framing error or break interrupt) (INT\_RLS), receiver buffer time out interrupt (INT\_TOUT), MODEM/Wake-up status interrupt (INT\_MODEM), Buffer error interrupt (INT\_BUF\_ERR) and LIN receiver break field detected interrupt (INT\_LIN\_RX\_BREAK). Interrupts of UART0 and UART2 share the interrupt number 12 (vector number is 28); Interrupt number 13 (vector number is 29) only supports UART1 interrupt. Refer to Nested Vectored Interrupt Controller chapter for System Interrupt Map.

The UART0 is built-in with a 64-byte transmitter FIFO (TX\_FIFO) and a 64-byte receiver FIFO (RX\_FIFO) that reduces the number of interrupts presented to the CPU and the UART1~2 are equipped 16-byte transmitter FIFO (TX\_FIFO) and 16-byte receiver FIFO (RX\_FIFO). The CPU can read the status of the UART at any time during the operation. The reported status information includes the type and condition of the transfer operations being performed by the UART, as well as 4 error conditions (parity error, framing error, break interrupt and buffer error) probably occur while receiving data. The UART includes a programmable baud rate generator that is capable of dividing clock input by divisors to produce the serial clock that transmitter and receiver need. The baud rate equation is Baud Rate = UART\_CLK / M \* [BRD + 2], where M and BRD are defined in Baud Rate Divider Register (UA\_BAUD). Table 5-9 lists the equations in the various conditions and Table 5-10 list the UART baud rate setting table.

Mode	DIV_X_EN	DIV_X_ONE	Divider X	BRD	Baud rate equation
0	0	0	В	А	UART_CLK / [16 * (A+2)]
1	1	0	В	А	UART_CLK / [(B+1) * (A+2)] , B must >= 8
2	1	1	Don't care	А	UART_CLK / (A+2), A must >=3

Table 5-10 UART Baud Rate Setting Table

The UART0 and UART1 controllers support auto-flow control function that uses two low-level signals, /CTS (clear-to-send) and /RTS (request-to-send), to control the flow of data transfer between the UART and external devices (ex: Modem). When auto-flow is enabled, the UART is not allowed to receive data until the UART asserts /RTS to external device. When the number of bytes in the RX FIFO equals the value of RTS\_TRI\_LEV (UA\_FCR [19:16]), the /RTS is deasserted. The UART sends data out when UART controller detects /CTS is asserted from external device. If a valid asserted /CTS is not detected the UART controller will not send data out.

The UART controllers also provides Serial IrDA (SIR, Serial Infrared) function (User must set IrDA\_EN (UA\_FUN\_SEL [1]) to enable IrDA function). The SIR specification defines a short-range infrared asynchronous serial transmission mode with one start bit, 8 data bits, and 1 stop bit. The maximum data rate is 115.2 Kbps (half duplex). The IrDA SIR block contains an IrDA SIR Protocol encoder/decoder. The IrDA SIR protocol is half-duplex only. So it cannot transmit and receive data at the same time. The IrDA SIR physical layer specifies a minimum 10ms transfer delay between transmission and reception. This delay feature must be implemented by software.

The alternate function of UART controllers is LIN (Local Interconnect Network) function. The LIN mode is selected by setting the UA\_FUN\_SEL[1:0] to '01'. In LIN mode, one start bit and 8-bit data format with 1-bit stop bit are required in accordance with the LIN standard.

For NuMicro<sup>™</sup> NUC100 Series, another alternate function of UART controllers is RS-485 9-bit mode function, and direction control provided by RTS pin or can program GPIO (PB.2 for RTS0 and PB.6 for RTS1) to implement the function by software. The RS-485 mode is selected by setting the UA\_FUN\_SEL register to select RS-485 function. The RS-485 driver control is implemented using the RTS control signal from an asynchronous serial port to enable the RS-485 driver. In RS-485 mode, many characteristics of the RX and TX are same as UART.

# nuvoTon

#### 5.12.2 Features

- Full duplex, asynchronous communications
- Separate receive / transmit 64/16/16 bytes (UART0/UART1/UART2) entry FIFO for data payloads
- Support hardware auto flow control/flow control function (CTS, RTS) and programmable RTS flow control trigger level (UART0 and UART1 support)
- Programmable receiver buffer trigger level
- Support programmable baud-rate generator for each channel individually
- Support CTS wake-up function (UART0 and UART1 support)
- Support 7-bit receiver buffer time out detection function
- UART0/UART1 can be served by the DMA controller
- Programmable transmitting data delay time between the last stop and the next start bit by setting UA\_TOR [DLY] register
- Support break error, frame error, parity error and receive / transmit buffer overflow detect function
- Fully programmable serial-interface characteristics
  - Programmable number of data bit, 5-, 6-, 7-, 8-bit character
  - Programmable parity bit, even, odd, no parity or stick parity bit generation and detection
  - Programmable stop bit, 1, 1.5, or 2 stop bit generation
- Support IrDA SIR function mode
  - Support for 3-/16-bit duration for normal mode
- Support LIN function mode
  - Support LIN master/slave mode
  - Support programmable break generation function for transmitter
  - Support break detect function for receiver
- Support RS-485 function mode.
  - Support RS-485 9-bit mode
  - Support hardware or software direct enable control provided by RTS pin

#### 5.12.3 Block Diagram

The UART clock control and block diagram are shown as Figure 5-67 and Figure 5-68.

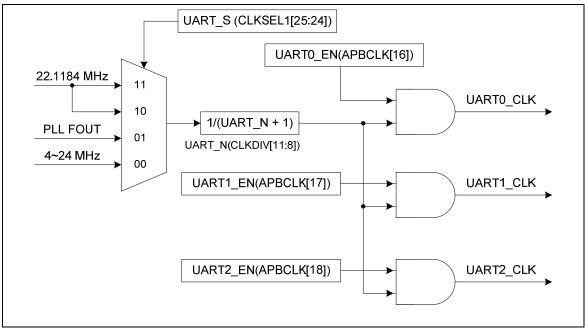

Figure 5-69 UART Clock Control Diagram

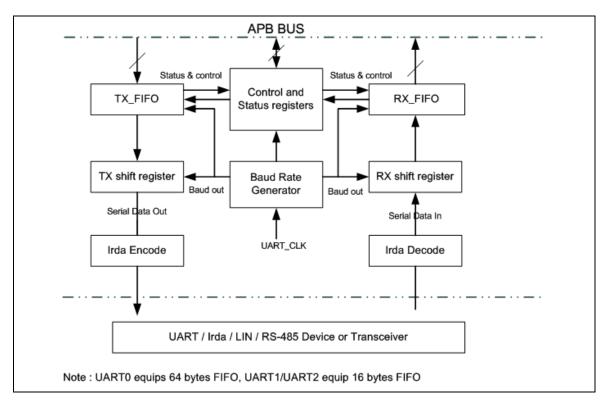

Figure 5-70 UART Block Diagram

#### TX\_FIFO

The transmitter is buffered with a 64/16 byte FIFO to reduce the number of interrupts presented to the CPU.

#### **RX\_FIFO**

The receiver is buffered with a 64/16 byte FIFO (plus three error bits per byte) to reduce the number of interrupts presented to the CPU.

#### **TX shift Register**

This block is the shifting the transmitting data out serially control block.

#### **RX shift Register**

This block is the shifting the receiving data in serially control block.

#### Modem Control Register

This register controls the interface to the MODEM or data set (or a peripheral device emulating a MODEM).

#### **Baud Rate Generator**

Divide the external clock by the divisor to get the desired baud rate clock. Refer to baud rate equation.

#### IrDA Encode

This block is IrDA encode control block.

#### IrDA Decode

This block is IrDA decode control block.

#### **Control and Status Register**

This field is register set that including the FIFO control registers (UA\_FCR), FIFO status registers (UA\_FSR), and line control register (UA\_LCR) for transmitter and receiver. The time out control register (UA\_TOR) identifies the condition of time out interrupt. This register set also includes the interrupt enable register (UA\_IER) and interrupt status register (UA\_ISR) to enable or disable the responding interrupt and to identify the occurrence of the responding interrupt. There are seven types of interrupts, transmitter FIFO empty interrupt(INT\_THRE), receiver threshold level reaching interrupt (INT\_RDA), line status interrupt (parity error or framing error or break interrupt) (INT\_RLS) , time out interrupt (INT\_TOUT), MODEM/Wake-up status interrupt (INT\_MODEM), Buffer error interrupt (INT\_BUF\_ERR) and LIN receiver break field detected interrupt (INT\_LIN\_RX\_BREAK).

The following diagram demonstrates the auto-flow control block diagram.

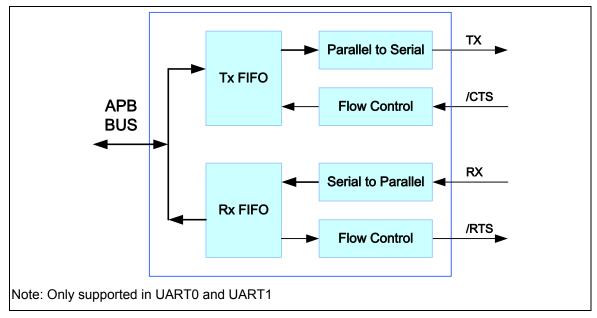

Figure 5-71 Auto Flow Control Block Diagram

### NuMicro™ NUC130/NUC140 Technical Reference Manual

# nuvoTon

#### 5.12.4 IrDA Mode

The UART supports IrDA SIR (Serial Infrared) Transmit Encoder and Receive Decoder, and IrDA mode is selected by setting the IrDA\_EN bit in UA\_FUN\_SEL register.

When in IrDA mode, the UA\_BAUD [DIV\_X\_EN] register must disable.

Baud Rate = Clock / (16 \* BRD), where BRD is Baud Rate Divider in UA\_BAUD register.

The following diagram demonstrates the IrDA control block diagram.

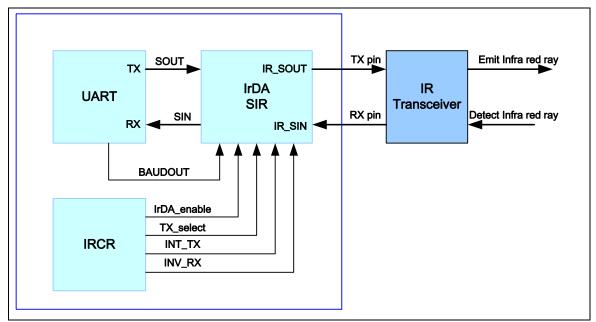

Figure 5-72 IrDA Block Diagram

#### 5.12.4.1 IrDA SIR Transmit Encoder

The IrDA SIR Transmit Encoder modulate Non-Return-to Zero (NRZ) transmit bit stream output from UART. The IrDA SIR physical layer specifies use of Return-to-Zero, Inverted (RZI) modulation scheme which represent logic 0 as an infra light pulse. The modulated output pulse stream is transmitted to an external output driver and infrared Light Emitting Diode.

In normal mode, the transmitted pulse width is specified as 3/16 period of baud rate.

#### 5.12.4.2 IrDA SIR Receive Decoder

The IrDA SIR Receive Decoder demodulates the return-to-zero bit stream from the input detector and outputs the NRZ serial bits stream to the UART received data input. The decoder input is normally high in the idle state. (Because of this, IRCR bit 6 should be set as 1 by default)

A start bit is detected when the decoder input is LOW

#### 5.12.4.3 IrDA SIR Operation

The IrDA SIR Encoder/decoder provides functionality which converts between UART data stream and half duplex serial SIR interface. The following diagram is IrDA encoder/decoder waveform:

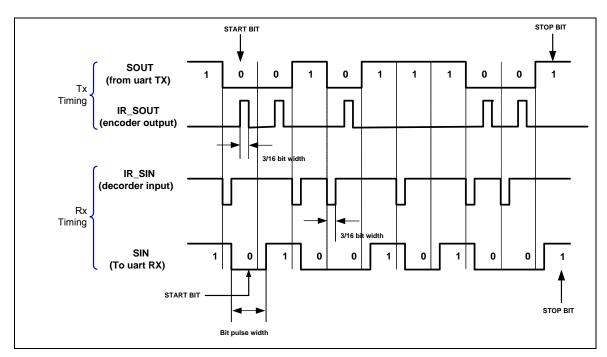

Figure 5-73 IrDA TX/RX Timing Diagram

#### 5.12.5 LIN (Local Interconnection Network) mode

The UART supports LIN function, and LIN mode is selected by setting the UA\_FUN\_SEL[1:0] to '01'. In LIN mode, each byte field is initialed by a start bit with value zero (dominant), followed by 8 data bits (LSB is first) and ended by 1 stop bit with value one (recessive) in accordance with the LIN standard. The following diagram is the structure of LIN function mode:

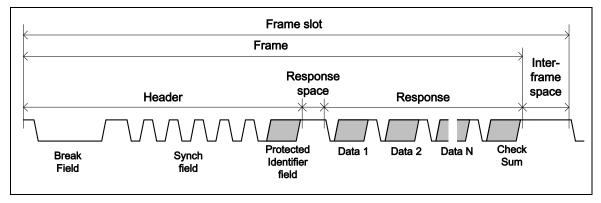

Figure 5-74 Structure of LIN Frame

The program flow of LIN Bus Transmit transfer (TX) is shown as following

- 1. Setting the UA\_FUN\_SEL[1:0] to '01' to enable LIN Bus mode.
- 2. Fill UA\_LIN\_BKFL in UA\_LIN\_BCNT to choose break field length. (The break field length is UA\_LIN\_BKFL + 2).
- 3. Setting the LIN\_TX\_EN bit in UA\_LIN\_BCNT register to start transmission (When break filed operation is finished, LIN\_TX\_EN will be cleared automatically).
- 4. Fill 0x55 to UA\_THR to request synch field transmission.
- 5. Request Identifier Field transmission by writing the protected identifier value in the UA\_THR
- 6. When the STOP bit of the last byte THR has been sent to bus, hardware will set flag TE\_FLAG in UA\_FSR to 1.
- 7. Fill N bytes data and Checksum to UA\_THR then repeat step 5 and 6 to transmit the data.

The program flow of LIN Bus Receiver transfer (RX) is show as following

- 1. Setting the UA\_FUN\_SEL[1:0] to '01' to enable LIN Bus mode.
- 2. Setting the LIN\_RX\_EN bit in UA\_LIN\_BCNT register to enable LIN RX mode.
- Waiting for the flag LIN\_RX\_BREAK\_IF in UA\_ISR to check RX received Break field or not.
- 4. Waiting for the flag RDA\_IF in UA\_ISR and read back the UR\_RBR register.

#### 5.12.6 RS-485 function mode

The UART support **RS-485 9-bit mode function**. The RS-485 mode is selected by setting the UA\_FUN\_SEL register to select RS-485 function. The RS-485 driver control is implemented using the RTS control signal from an asynchronous serial port to enable the RS-485 driver. In RS-485 mode, many characteristics of the RX and TX are same as UART.

When in RS-485 mode, the controller can configuration of it as an RS-485 addressable slave and the RS-485 master transmitter will identify an address character by setting the parity (9<sup>th</sup> bit) to 1. For data characters, the parity is set to 0. Software can use UA\_LCR register to control the 9-th bit (When the PBE, EPE and SPE are set, the 9-th bit is transmitted 0 and when PBE and SPE are set and EPE is cleared, the 9-th bit is transmitted 1). The Controller support three operation mode that is RS-485 Normal Multidrop Operation Mode (NMM), RS-485 Auto Address Detection Operation Mode (AAD) and RS-485 Auto Direction Control Operation Mode (AUD), software can choose any operation mode by programming UA\_RS-485\_CSR register, and software can driving the transfer delay time between the last stop bit leaving the TX-FIFO and the de-assertion of by setting UA\_TOR [DLY] register.

#### RS-485 Normal Multidrop Operation Mode (NMM)

In RS-485 Normal Multidrop operation mode, in first, software must decided the data which before the address byte be detected will be stored in RX-FIFO or not. If software want to ignore any data before address byte detected, the flow is set UART\_FCR[RS485\_RX\_DIS] then enable UA\_RS-485[RS485\_NMM] and the receiver will ignore any data until an address byte is detected (bit9 =1) and the address byte data will be stored in the RX-FIFO. If software wants to receive any data before address byte detected, the flow is disable UART\_FCR [RS485\_RX\_DIS] then enable UA\_RS-485[RS485\_NMM] and the receiver will received any data. If an address byte is detected (bit9 =1), it will generator an interrupt to CPU and software can decide whether enable or disable receiver to accept the following data byte by setting UA\_RS-485\_CSR [RX\_DIS]. If the receiver is be enabled, all received byte data will be ignore until the next address byte be detected. If software disable receiver by setting UA\_RS-485\_CSR [RX\_DIS] register, when a next address byte be detected. If software disable receiver by setting UA\_RS-485\_CSR [RX\_DIS] bit and the address byte data will be stored in the RX-FIFO.

RS-485 Auto Address Detection Operation Mode (AAD)

In RS-485 Auto Address Detection Operation Mode, the receiver will ignore any data until an address byte is detected (bit9 =1) and the address byte data match the UA\_RS-485[ADDR\_MATCH] value. The address byte data will be stored in the RX-FIFO. The all received byte data will be accepted and stored in the RX-FIFO until and address byte data not match the UA\_RS-485[ADDR\_MATCH] value.

#### RS-485 Auto Direction Mode (AUD)

Another option function of RS-485 controllers is **RS-485 auto direction control function**. The RS-485 driver control is implemented using the RTS control signal from an asynchronous serial port to enable the RS-485 driver. The RTS line is connected to the RS-485 driver enable such that setting the RTS line to high (logic 1) enables the RS-485 driver. Setting the RTS line to low (logic 0) puts the driver into the tri-state condition. User can setting LEV\_RTS in UA\_MCR register to change the RTS driving level.

Program Sequence example:

- 1. Program FUN\_SEL in UA\_FUN\_SEL to select RS-485 function.
- 2. Program the RX\_DIS bit in UA\_FCR register to determine enable or disable RS-485 receiver
- 3. Program the RS-485\_NMM or RS-485\_AAD mode.
- 4. If the RS-485\_AAD mode is selected, the ADDR\_MATCH is programmed for auto address match value.
- 5. Determine auto direction control by programming RS-485\_AUD.

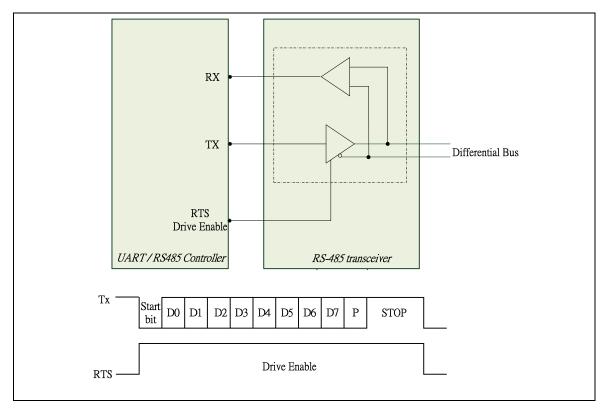

Figure 5-75 Structure of RS-485 Frame

7	6	5	4	3	2	1	0
Reserved	BIF	FEF	PEF	RS485_ADD_ DETF	- Reserved RX_OVE		RX_OVER_IF

Bits	Descriptions	
[31:29]	Reserved	Reserved
		Transmitter Empty Flag (Read Only)
[28]	TE_FLAG	Bit is set by hardware when TX FIFO (UA_THR) is empty and the STOP bit of the last byte has been transmitted.
		Bit is cleared automatically when TX FIFO is not empty or the last byte transmission has not completed.
[27:25]	Reserved	Reserved
		TX Overflow Error Interrupt Flag (Read Only)
[24]	TX_OVER_IF	If TX FIFO (UA_THR) is full, an additional write to UA_THR will cause this bit to logic 1.
		Note: This bit is read only, but can be cleared by writing '1' to it.
		Transmitter FIFO Full (Read Only)
[23]	TX FULL	This bit indicates TX FIFO full or not.
[]		This bit is set when the number of usage in TX FIFO Buffer is equal to 64/16/16(UART0/UART1/UART2), otherwise is cleared by hardware.
		Transmitter FIFO Empty (Read Only)
10.01		This bit indicates TX FIFO empty or not.
[22]	TX_EMPTY	When the last byte of TX FIFO has been transferred to Transmitter Shift Register, hardware sets this bit high. It will be cleared when writing data into THR (TX FIFO not empty).
[21:16]	TX_POINTER	TX FIFO Pointer (Read Only)

Bits	Descriptions	
		This field indicates the TX FIFO Buffer Pointer. When CPU writes one byte into UA_THR, TX_POINTER increases one. When one byte of TX FIFO is transferred to Transmitter Shift Register, TX_POINTER decreases one.
		The Maximum value shows in TX_POINTER is 63/15/15 (UART0/UART1/UART2). When the using level of TX FIFO Buffer equal to 64/16/16, the TX_FULL bit is set to 1 and TX_POINTER will show 0. As one byte of TX FIFO is transferred to Transmitter Shift Register, the TX_FULL bit is clear to 0 and TX_POINTER will show 63/15/15 (UART0/UART1/UART2).
		Receiver FIFO Full (Read Only)
[15]	RX_FULL	This bit initiates RX FIFO full or not.
		This bit is set when the number of usage in RX FIFO Buffer is equal to 64/16/16(UART0/UART1/UART2), otherwise is cleared by hardware.
		Receiver FIFO Empty (Read Only)
[14]	RX_EMPTY	This bit initiate RX FIFO empty or not.
		When the last byte of RX FIFO has been read by CPU, hardware sets this bit high. It will be cleared when UART receives any new data.
		RX FIFO Pointer (Read Only)
		This field indicates the RX FIFO Buffer Pointer. When UART receives one byte from external device, RX_POINTER increases one. When one byte of RX FIFO is read by CPU, RX_POINTER decreases one.
[13:8]	RX_POINTER	The Maximum value shows in RX_POINTER is 63/15/15 (UART0/UART1/UART2). When the using level of RX FIFO Buffer equal to 64/16/16, the RX_FULL bit is set to 1 and RX_POINTER will show 0. As one byte of RX FIFO is read by CPU, the RX_FULL bit is clear to 0 and RX_POINTER will show 63/15/15 (UART0/UART1/UART2).
[7]	Reserved	Reserved
		Break Interrupt Flag (Read Only)
[6]	BIF	This bit is set to a logic 1 whenever the received data input(RX) is held in the "spacing state" (logic 0) for longer than a full word transmission time (that is, the total time of "start bit" + data bits + parity + stop bits) and is reset whenever the CPU writes 1 to this bit.
		Note: This bit is read only, but can be cleared by writing '1' to it.
		Framing Error Flag (Read Only)
[5]	FEF	This bit is set to logic 1 whenever the received character does not have a valid "stop bit" (that is, the stop bit following the last data bit or parity bit is detected as a logic 0), and is reset whenever the CPU writes 1 to this bit.
		Note: This bit is read only, but can be cleared by writing '1' to it.
		Parity Error Flag (Read Only)
[4]	PEF	This bit is set to logic 1 whenever the received character does not have a valid "parity bit", and is reset whenever the CPU writes 1 to this bit.
		Note: This bit is read only, but can be cleared by writing '1' to it.
		RS-485 Address Byte Detection Flag (Read Only)
[3]	RS485_ADD_DETF	This bit is set to logic 1 and set UA_ALT_CSR [RS-485_ADD_EN] whenever in RS- 485 mode the receiver detect any address byte received address byte character (bit9 = '1') bit", and it is reset whenever the CPU writes 1 to this bit.
		Note: This field is used for RS-485 function mode.
		Note: This bit is read only, but can be cleared by writing '1' to it.

Bits	Descriptions				
[2:1]	Reserved Reserved				
		RX Overflow Error IF (Read Only)			
		This bit is set when RX FIFO overflow.			
[0]	RX_OVER_IF	If the number of bytes of received data is greater than RX_FIFO (UA_RBR) size, 64/16 bytes of UART0/UART1, this bit will be set.			
		Note: This bit is read only, but can be cleared by writing '1' to it.

		0 = No RLS interrupt is generated in DMA mode				

Bits	Descriptions	ptions					
[25:22]	Reserved	Reserved					
		In DMA Mode, Buffer Error Interrupt Flag (Read Only)					
[21]	HW_BUF_ERR_I F	This bit is set when the TX or RX FIFO overflows (TX_OVER_IF or RX_OVER_IF is set). When BUF_ERR_IF is set, the transfer maybe is not correct. If UA_IER [BUF_ERR_IEN] is enabled, the buffer error interrupt will be generated.					
		Note: This bit is cleared when both TX_OVER_IF and RX_OVER_IF are cleared.					
		In DMA Mode, Time Out Interrupt Flag (Read Only)					
[20]	HW_TOUT_IF	This bit is set when the RX FIFO is not empty and no activities occurred in the RX FIFO and the time out counter equal to TOIC. If UA_IER [TOUT_IEN] is enabled, the Tout interrupt will be generated.					
		Note: This bit is read only and user can read UA_RBR (RX is in active) to clear it.					
		In DMA Mode, MODEM Interrupt Flag (Read Only) (not available in UART2 channel)					
[19]	HW_MODEM_IF	This bit is set when the CTS pin has state change (DCTSF=1). If UA_IER [MODEM_IEN] is enabled, the Modem interrupt will be generated.					
		Note: This bit is read only and reset to 0 when bit DCTSF is cleared by a write 1 on DCTSF.					
		In DMA Mode, Receive Line Status Flag (Read Only)					
[18]	HW_RLS_IF	This bit is set when the RX receive data have parity error, framing error or break error (at least one of 3 bits, BIF, FEF and PEF, is set). If UA_IER [RLS_IEN] is enabled, the RLS interrupt will be generated.					
		Note: When in RS-485 function mode, this field include "receiver detect any address byte received address byte character (bit9 = '1') bit".					
		Note: This bit is read only and reset to 0 when all bits of BIF, FEF and PEF are cleared.					
[17:16]	Reserved	Reserved					
		LIN Bus RX Break Field Detected Interrupt Indicator (Read Only)					
[15]	LIN_RX_BREAK_	This bit is set if LIN_RX_BRK_IEN and LIN_RX_BREAK_IF are both set to 1.					
[15]	INT	1 = The LIN RX Break interrupt is generated					
		0 = No LIN RX Break interrupt is generated					
[14]	Reserved	Reserved					
		Buffer Error Interrupt Indicator (Read Only)					
		This bit is set if BUF_ERR_IEN and BUF_ERR_IF are both set to 1.					
[13]	BUF_ERR_INT	1 = The buffer error interrupt is generated					
		0 = No buffer error interrupt is generated					
		Time Out Interrupt Indicator (Read Only)					
14.01		This bit is set if TOUT_IEN and TOUT_IF are both set to 1.					
[12]	TOUT_INT	1 = The Tout interrupt is generated					
		0 = No Tout interrupt is generated					
		MODEM Status Interrupt Indicator (Read Only). (not available in UART2 channel)					
[11]	MODEM_INT	This bit is set if MODEM_IEN and MODEM_IF are both set to 1.					
_		1 = The Modem interrupt is generated					

Bits	Descriptions	Descriptions					
		0 = No Modem interrupt is generated					
		Receive Line Status Interrupt Indicator (Read Only).					
[10]		This bit is set if RLS_IEN and RLS_IF are both set to 1.					
[10]	RLS_INT	1 = The RLS interrupt is generated					
		0 = No RLS interrupt is generated					
		Transmit Holding Register Empty Interrupt Indicator (Read Only).					
101		This bit is set if THRE_IEN and THRE_IF are both set to 1.					
[9]	THRE_INT	1 = The THRE interrupt is generated					
		0 = No THRE interrupt is generated					
		Receive Data Available Interrupt Indicator (Read Only).					
101	RDA_INT	This bit is set if RDA_IEN and RDA_IF are both set to 1.					
[8]	KDA_INT	1 = The RDA interrupt is generated					
		0 = No RDA interrupt is generated					
		LIN Bus RX Break Field Detected Flag (Read Only)					
[7]	LIN_RX_BREAK_ IF	This bit is set when RX received LIN Break Field. If UA_IER [LIN_RX_BRK_IEN] is enabled the LIN RX Break interrupt will be generated.					
		Note: This bit is read only, but can be cleared by writing '1' to it.					
[6]	Reserved	Reserved					
		Buffer Error Interrupt Flag (Read Only)					
[5]	BUF_ERR_IF	This bit is set when the TX or RX FIFO overflows or Break Interrupt Flag or Parity E Flag or Frame Error Flag (TX_OVER_IF or RX_OVER_IF or BIF or PEF or FEF) is When BUF_ERR_IF is set, the transfer is not correct. If UA_IER [BUF_ERR_IEN enabled, the buffer error interrupt will be generated.					
		Time Out Interrupt Flag (Read Only)					
[4]	TOUT_IF	This bit is set when the RX FIFO is not empty and no activities occurred in the RX FIFO and the time out counter equal to TOIC. If UA_IER [TOUT_IEN] is enabled, the Tout interrupt will be generated.					
		Note: This bit is read only and user can read UA_RBR (RX is in active) to clear it.					
		MODEM Interrupt Flag (Read Only) (not available in UART2 channel)					
[3]	MODEM_IF	This bit is set when the CTS pin has state change (DCTSF=1). If UA_IER [MODEM_IEN] is enabled, the Modem interrupt will be generated.					
		Note: This bit is read only and reset to 0 when bit DCTSF is cleared by a write 1 on DCTSF.					
		Receive Line Interrupt Flag (Read Only).					
[2]	RLS IF	This bit is set when the RX receive data have parity error, framing error or break error (at least one of 3 bits, BIF, FEF and PEF, is set). If UA_IER [RLS_IEN] is enabled, the RLS interrupt will be generated.					
		Note: When in RS-485 function mode, this field include "receiver detect any address byte received address byte character (bit9 = '1') bit".					
		Note: This bit is read only and reset to 0 when all bits of BIF, FEF and PEF are cleared.					
[1]	THRE_IF	Transmit Holding Register Empty Interrupt Flag (Read Only).					
[']		This bit is set when the last data of TX FIFO is transferred to Transmitter Shift Register.					

Bits	Descriptions	
		If UA_IER [THRE_IEN] is enabled, the THRE interrupt will be generated.
		Note: This bit is read only and it will be cleared when writing data into THR (TX FIFO not empty).
		Receive Data Available Interrupt Flag (Read Only).
[0]	RDA_IF	When the number of bytes in the RX FIFO equals the RFITL then the RDA_IF will be set. If UA_IER [RDA_IEN] is enabled, the RDA interrupt will be generated.
		Note: This bit is read only and it will be cleared when the number of unread bytes of RX FIFO drops below the threshold level (RFITL).

TOIC									

Bits	Descriptions						
[31:16]	Reserved	Reserved					
[15:8]	DLY	TX Delay time value         This field is use to programming the transfer delay time between the last stop bit and next start bit.         TX         Byte (i)         DLY         Start					
[7:0]	TOIC	<b>Time Out Interrupt Comparator</b> The time out counter resets and starts counting (the counting clock = baud rate) whenever the RX FIFO receives a new data word. Once the content of time out counter (TOUT_CNT) is equal to that of time out interrupt comparator (TOIC), a receiver time out interrupt (INT_TOUT) is generated if UA_IER [RTO_IEN]. A new incoming data word or RX FIFO empty clears INT_TOUT. In order to avoid receiver time out interrupt generation immediately during one character is being received, TOIC value should be set between 40 and 255. So, for example, if TOIC is set with 40, the time out interrupt is generated after four characters are not received when 1 stop bit and no parity check is set for UART transfer.

#### 5.13 Controller Area Network (CAN)

#### 5.13.1 Overview

The C\_CAN consists of the CAN Core, Message RAM, Message Handler, Control Registers and Module Interface (Refer Figure 5-76). The CAN Core performs communication according to the CAN protocol version 2.0 part A and B. The bit rate can be programmed to values up to 1MBit/s. For the connection to the physical layer, additional transceiver hardware is required.

For communication on a CAN network, individual Message Objects are configured. The Message Objects and Identifier Masks for acceptance filtering of received messages are stored in the Message RAM. All functions concerning the handling of messages are implemented in the Message Handler. These functions include acceptance filtering, the transfer of messages between the CAN Core and the Message RAM, and the handling of transmission requests as well as the generation of the module interrupt.

The register set of the C\_CAN can be accessed directly by the software through the module interface. These registers are used to control/configure the CAN Core and the Message Handler and to access the Message RAM.

#### 5.13.2 Features

- Supports CAN protocol version 2.0 part A and B.
- Bit rates up to 1 MBit/s.
- 32 Message Objects.
- Each Message Object has its own identifier mask.
- Programmable FIFO mode (concatenation of Message Objects).
- Maskable interrupt.
- Disabled Automatic Re-transmission mode for Time Triggered CAN applications.
- Programmable loop-back mode for self-test operation.
- 16-bit module interfaces to the AMBA APB bus.
- Support wake-up function

## nuvoTon

#### 5.13.3 Block Diagram

The C\_CAN interfaces with the AMBA APB bus. Figure 5-76 shows the block diagram of the C\_CAN.

#### CAN Core

CAN Protocol Controller and Rx/Tx Shift Register for serial/parallel conversion of messages.

#### Message RAM

Stores Message Objects and Identifier Masks

#### Registers

All registers used to control and to configure the C\_CAN.

#### Message Handler

State Machine that controls the data transfer between the Rx/Tx Shift Register of the CAN Core and the Message RAM as well as the generation of interrupts as programmed in the Control and Configuration Registers.

#### Module Interface

C\_CAN interfaces to the AMBA APB 16-bit bus from ARM.

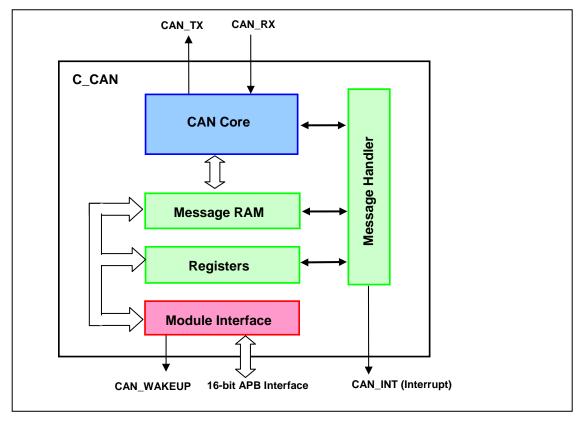

Figure 5-76 CAN Peripheral Block Diagram

#### 5.13.4 Functional Description

5.13.4.1 Software Initialization

The software initialization is started by setting the **Init** bit in the CAN Control Register, either by a software or a hardware reset, or by going to *Bus\_Off* state.

While the **Init** bit is set, all messages transfer to and from the CAN bus are stopped and the status of the **CAN\_TX** output pin is recessive (HIGH). The Error Management Logic (EML) counters are unchanged. Setting the **Init** bit does not change any configuration register.

To initialize the CAN Controller, software has to set up the Bit Timing Register and each Message Object. If a Message Object is not required, the corresponding **MsgVal** bit should be cleared. Otherwise, the entire Message Object has to be initialized.

Access to the Bit Timing Register and to the Baud Rate Prescaler Extension Register for configuring bit timing is enabled when both the **Init** and **CCE** bits in the CAN Control Register are set.

Resetting the Init bit (by software only) finishes the software initialization. Later, the Bit Stream Processor (BSP) (see Section 5.13.6.10: Configuring the Bit Timing) synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits ( $\equiv$  Bus Idle) before it can take part in bus activities and start the message transfer.

The initialization of the Message Objects is independent of Init and can be done on the fly, but the Message Objects should all be configured to particular identifiers or set to not valid before the BSP starts the message transfer.

To change the configuration of a Message Object during normal operation, the software has to start by resetting the corresponding **MsgVal** bit. When the configuration is completed, **MsgVal** is set again.

#### 5.13.4.2 CAN Message Transfer

Once the C\_CAN is initialized and Init bit is reset to zero, the C\_CAN Core synchronizes itself to the CAN bus and starts the message transfer.

Received messages are stored in their appropriate Message Objects if they pass the Message Handler's acceptance filtering. The whole message including all arbitration bits, DLC and eight data bytes are stored in the Message Object. If the Identifier Mask is used, the arbitration bits which are masked to "don't care" may be overwritten in the Message Object.

Software can read or write each message any time through the Interface Registers and the Message Handler guarantees data consistency in case of concurrent accesses.

Messages to be transmitted are updated by the application software. If a permanent Message Object (arbitration and control bits are set during configuration) exists for the message, only the data bytes are updated and the **TxRqst** bit with **NewDat** bit are set to start the transmission. If several transmit messages are assigned to the same Message Object (when the number of Message Objects is not sufficient), the whole Message Object has to be configured before the transmission of this message is requested.

The transmission of any number of Message Objects may be requested at the same time. Message objects are transmitted subsequently according to their internal priority. Messages may be updated or set to not valid any time, even when their requested transmission is still pending. The old data will be discarded when a message is updated before its pending transmission has started.

Depending on the configuration of the Message Object, the transmission of a message may be requested autonomously by the reception of a remote frame with a matching identifier.

#### 5.13.4.3 Disabled Automatic Retransmission

In accordance with the CAN Specification (see ISO11898, 6.3.3 Recovery Management), the C\_CAN provides means for automatic retransmission of frames that have lost arbitration or have been disturbed by errors during transmission. The frame transmission service will not be confirmed to the user before the transmission is successfully completed. This means that, by default, automatic retransmission is enabled. It can be disabled to enable the C\_CAN to work within a Time Triggered CAN (TTCAN, see ISO11898-1) environment.

The Disabled Automatic Retransmission mode is enabled by setting the Disable Automatic Retransmission (**DAR**) bit in the CAN Control Register to one. In this operation mode, the programmer has to consider the different behavior of bits TxRqst and NewDat in the Control Registers of the Message Buffers:

• When a transmission starts, bit TxRqst of the respective Message Buffer is cleared, while bit NewDat remains set.

- When the transmission completed successfully, bit NewDat is cleared.
- When a transmission fails (lost arbitration or error), bit NewDat remains set.
- To restart the transmission, the software should set the bit TxRqst again.

#### 5.13.5 Test Mode

Test Mode is entered by setting the **Test** bit in the CAN Control Register. In Test Mode, bits **Tx1**, **Tx0**, **LBack**, **Silent** and **Basic** in the Test Register are writeable. Bit **Rx** monitors the state of the **CAN\_RX** pin and therefore is only readable. All Test Register functions are disabled when the Test bit is cleared.

#### 5.13.5.1 Silent Mode

The CAN Core can be set in Silent Mode by programming the **Silent** bit in the Test Register to one. In Silent Mode, the C\_CAN is able to receive valid data frames and valid remote frames, but it sends only recessive bits on the CAN bus and it cannot start a transmission. If the CAN Core is required to send a dominant bit (ACK bit, Error Frames), the bit is rerouted internally so that the CAN Core monitors this dominant bit, although the CAN bus may remain in recessive state. The Silent Mode can be used to analysis the traffic on a CAN bus without affecting it by the transmission of *dominant* bits. Figure 5-77 shows the connection of signals **CAN\_TX** and **CAN\_RX** to the CAN Core in Silent Mode.

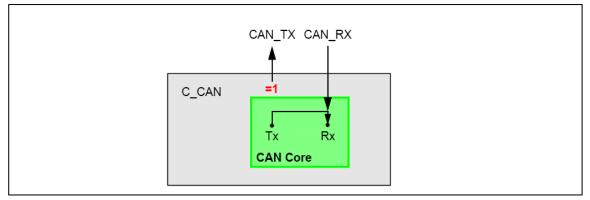

Figure 5-77 CAN Core in Silent Mode

#### 5.13.5.2 Loop Back Mode

The CAN Core can be set in Loop Back Mode by programming the Test Register bit **LBack** to one. In Loop Back Mode, the CAN Core treats its own transmitted messages as received messages and stores them into a Receive Buffer (if they pass acceptance filtering).Figure 5-78 shows the connection of signals, **CAN\_TX** and **CAN\_RX**, to the CAN Core in Loop Back Mode.

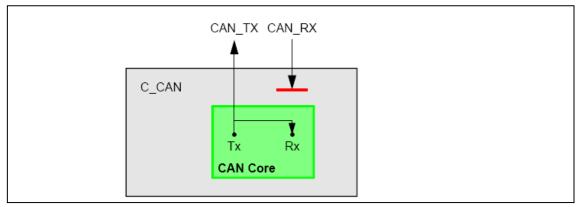

Figure 5-78 CAN Core in Loop Back Mode

This mode is provided for self-test functions. To be independent from external stimulation, the CAN Core ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/ remote frame) in Loop Back Mode. In this mode, the CAN Core performs an internal feedback from its Tx output to its Rx input. The actual value of the **CAN\_RX** input pin is disregarded by the CAN Core. The transmitted messages can be monitored on the **CAN\_TX** pin.

#### 5.13.5.3 Loop Back Combined with Silent Mode

It is also possible to combine Loop Back Mode and Silent Mode by programming bits **LBack** and **Silent** to one at the same time. This mode can be used for a "Hot Selftest", which means that C\_CAN can be tested without affecting a running CAN system connected to the **CAN\_TX** and **CAN\_RX** pins. In this mode, the **CAN\_RX** pin is disconnected from the CAN Core and the **CAN\_TX** pin is held recessive. Figure 5-79 shows the connection of signals **CAN\_TX** and **CAN\_RX** to the CAN Core in case of the combination of Loop Back Mode with Silent Mode.

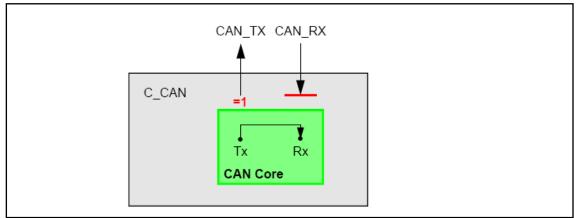

Figure 5-79 CAN Core in Loop Back Mode Combined with Silent Mode

#### 5.13.5.4 Basic Mode

The CAN Core can be set in Basic Mode by programming the Test Register bit  $\ensuremath{\textbf{Basic}}$  to one. In

this mode, the C\_CAN runs without the Message RAM.

The IF1 Registers are used as Transmit Buffer. The transmission of the contents of the IF1 Registers are requested by writing the Busy bit of the IF1 Command Request Register to one. The IF1 Registers are locked while the **Busy** bit is set. The Busy bit indicates that the transmission is pending.

As soon the CAN bus is idle, the IF1 Registers are loaded into the shift register of the CAN Core and the transmission is started. When the transmission has been completed, the **Busy** bit is reset and the locked IF1 Registers are released.

A pending transmission can be aborted at any time by resetting the **Busy** bit in the IF1 Command Request Register while the IF1 Registers are locked. If the software has reset the Busy bit, a possible retransmission in case of lost arbitration or in case of an error is disabled.

The IF2 Registers are used as a Receive Buffer. After the reception of a message the contents of the shift register is stored into the IF2 Registers, without any acceptance filtering.

Additionally, the actual contents of the shift register can be monitored during the message transfer. Each time a read Message Object is initiated by writing the **Busy** bit of the IF2 Command Request Register to one, the contents of the shift register are stored into the IF2 Registers.

In Basic Mode, the evaluation of all Message Object related control and status bits and the control bits of the IFn Command Mask Registers are turned off. The message number of the Command request registers is not evaluated. The **NewDat** and **MsgLst** bits in the IF2 Message Control Register retain their function, **DLC3-0** indicates the received DLC, and the other control bits are read as '0'.

#### 5.13.5.5 Software Control of CAN\_TX Pin

Four output functions are available for the CAN transmit pin, **CAN\_TX**. In addition to its default function (serial data output), the CAN transmit pin can drive the CAN Sample Point signal to monitor CAN\_Core's bit timing and it can drive constant dominant or recessive values. The latter two functions, combined with the readable CAN receive pin **CAN\_RX**, can be used to check the physical layer of the CAN bus.

The output mode for the **CAN\_TX** pin is selected by programming the **Tx1** and **Tx0** bits of the CAN Test Register.

The three test functions of the **CAN\_TX** pin interfere with all CAN protocol functions. **CAN\_TX** must be left in its default function when CAN message transfer or any of the test modes (Loop Back Mode, Silent Mode, or Basic Mode) are selected.

#### 5.13.6 CAN Communications

#### 5.13.6.1 Managing Message Objects

The configuration of the Message Objects in the Message RAM (with the exception of the bits he CAN Control Regist **MsgVal**, **NewDat**, **IntPnd**, and **TxRqst**) will not be affected by resetting the chip. All the Message Objects must be initialized by the application software or they must be "not valid" (**MsgVal** = '0') and the bit timing must be configured before the application software clears the Init bit in ter.

The configuration of a Message Object is done by programming Mask, Arbitration, Control and Data fields of one of the two interface registers to the desired values. By writing to the corresponding IFn Command Request Register, the IFn Message Buffer Registers are loaded into the addressed Message Object in the Message RAM.

When the Init bit in the CAN Control Register is cleared, the CAN Protocol Controller state

machine of the CAN\_Core and the state machine of the Message Handler control the internal data flow of the C\_CAN. Received messages that pass the acceptance filtering are stored into the Message RAM, messages with pending transmission request are loaded into the CAN\_Core's Shift Register and are transmitted through the CAN bus.

The application software reads received messages and updates messages to be transmitted through the IFn Interface Registers. Depending on the configuration, the application software is interrupted on certain CAN message and CAN error events.

#### 5.13.6.2 Message Handler State Machine

The Message Handler controls the data transfer between the Rx/Tx Shift Register of the CAN Core, the Message RAM and the IFn Registers.

The Message Handler FSM controls the following functions:

- Data Transfer from IFn Registers to the Message RAM
- Data Transfer from Message RAM to the IFn Registers
- Data Transfer from Shift Register to the Message RAM
- Data Transfer from Message RAM to Shift Register
- · Data Transfer from Shift Register to the Acceptance Filtering unit
- Scanning of Message RAM for a matching Message Object
- Handling of TxRqst flags
- Handling of interrupts.

#### 5.13.6.2.1 Data Transfer from/to Message RAM

When the application software initiates a data transfer between the IFn Registers and Message RAM, the Message Handler sets the Busy bit in the respective Command Request Register (CAN\_IFn\_CRR) to '1'. After the transfer has completed, the Busy bit is again cleared (see Figure 5-80).

The respective Command Mask Register specifies whether a complete Message Object or only parts of it will be transferred. Due to the structure of the Message RAM, it is not possible to write single bits/bytes of one Message Object. It is always necessary to write a complete Message Object into the Message RAM. Therefore, the data transfer from the IFn Registers to the Message RAM requires a read-modify-write cycle. First, those parts of the Message Object that are not to be changed are read from the Message RAM and then the complete contents of the Message Buffer Registers are written into the Message Object.

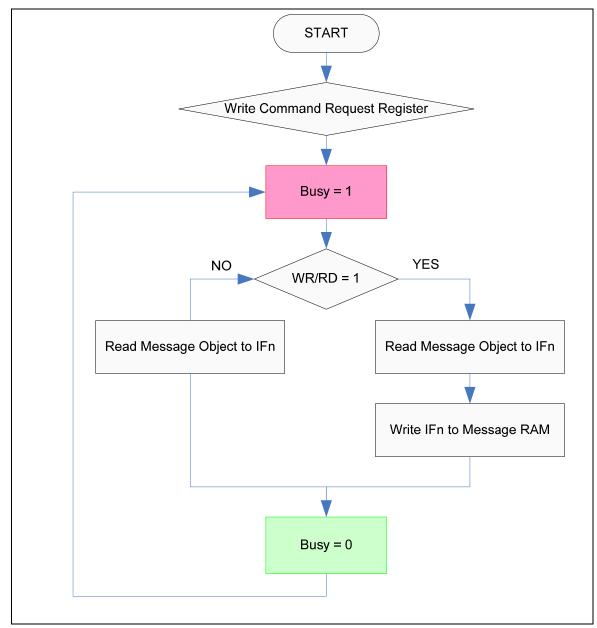

Figure 5-80 Data transfer between IFn Registers and Message

After a partial write of a Message Object, the Message Buffer Registers that are not selected in the Command Mask Register will set the actual contents of the selected Message Object.

After a partial read of a Message Object, the Message Buffer Registers that are not selected in the Command Mask Register will be left unchanged.

#### 5.13.6.2.2 Message Transmission

If the shift register of the CAN Core cell is ready for loading and if there is no data transfer between the IFn Registers and Message RAM, the **MsgVal** bits in the Message Valid Register and **TxRqst** bits in the Transmission Request Register are evaluated. The valid Message Object

with the highest priority pending transmission request is loaded into the shift register by the Message Handler and the transmission is started. The **NewDat** bit of the Message Object is reset.

After a successful transmission and also if no new data was written to the Message Object (**NewDat** = '0') since the start of the transmission, the **TxRqst** bit of the Message Control register (CAN\_IFn\_MCR) will be reset. If TxIE bit of the Message Control register (CAN\_IFn\_MCR) is set, **IntPnd** bit of the Interrupt Identifier register will be set after a successful transmission. If the C\_CAN has lost the arbitration or if an error occurred during the transmission, the message will be retransmitted as soon as the CAN bus is free again. Meanwhile, if the transmission of a message with higher priority has been requested, the messages will be transmitted in the order of their priority.

#### 5.13.6.2.3 Acceptance Filtering of Received Messages

When the arbitration and control field (Identifier + IDE + RTR + DLC) of an incoming message is completely shifted into the Rx/Tx Shift Register of the CAN Core, the Message Handler FSM starts the scanning of the Message RAM for a matching valid Message Object.

To scan the Message RAM for a matching Message Object, the Acceptance Filtering unit is loaded with the arbitration bits from the CAN Core shift register. The arbitration and mask fields (including **MsgVal**, **UMask**, **NewDat**, and **EoB**) of Message Object 1 are then loaded into the Acceptance Filtering unit and compared with the arbitration field from the shift register. This is repeated with each following Message Object until a matching Message Object is found or until the end of the Message RAM is reached.

If a match occurs, the scan is stopped and the Message Handler FSM proceeds depending on the type of frame (Data Frame or Remote Frame) received.

#### **Reception of Data Frame**

The Message Handler FSM stores the message from the CAN Core shift register into the respective Message Object in the Message RAM. Not only the data bytes, but all arbitration bits and the Data Length Code are stored into the corresponding Message Object. This is done to keep the data bytes connected with the identifier even if arbitration mask registers are used.

The **NewDat** bit is set to indicate that new data (not yet seen by the software) has been received. The application software should reset **NewDat** bit when the Message Object has been read. If at the time of reception, the **NewDat** bit was already set, **MsgLst** is set to indicate that the previous data (supposedly not seen by the software) is lost. If the **RxIE** bit is set, the **IntPnd** bit is set, causing the Interrupt Register to point to this Message Object.

The **TxRqst** bit of this Message Object is reset to prevent the transmission of a Remote Frame, while the requested Data Frame has just been received.

#### **Reception of Remote Frame**

When a Remote Frame is received, three different configurations of the matching Message Object have to be considered:

1) Dir = '1' (direction = transmit), **RmtEn** = '1', **UMask** = '1' or'0'

At the reception of a matching Remote Frame, the TxRqst bit of this Message Object is set. The rest of the Message Object remains unchanged.

2) Dir = '1' (direction = transmit), RmtEn = '0', UMask ='0'

At the reception of a matching Remote Frame, the TxRqst bit of this Message Object remains

unchanged; the Remote Frame is ignored.

3) Dir = '1' (direction = transmit), **RmtEn** = '0', **UMask** ='1'

At the reception of a matching Remote Frame, the **TxRqst** bit of this Message Object is reset. The arbitration and control field (Identifier + IDE + RTR + DLC) from the shift register is stored in the Message Object of the Message RAM and the **NewDat** bit of this Message Object is set. The data field of the Message Object remains unchanged; the Remote Frame is treated similar to a received Data Frame.

#### 5.13.6.2.4 Receive/Transmit Priority

The receive/transmit priority for the Message Objects is attached to the message number. Message Object 1 has the highest priority, while Message Object 32 has the lowest priority. If more than one transmission request is pending, they are serviced due to the priority of the corresponding Message Object

#### 5.13.6.3 Configuring a Transmit Object

Table 5-14 shows how a Transmit Object should be initialized.

Ms	Arb	Data	Mask	EoB	Dir	NewDat	MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
1	appl.	appl.	appl.	1	1	0	0	0	appl.	0	appl.	0

Table 5-14 Initialization of a Transmit Object

Note: appl. = application software.

The Arbitration Register values (**ID28-0** and **Xtd** bit) are provided by the application. They define the identifier and type of the outgoing message. If an 11-bit Identifier ("Standard Frame") is used, it is programmed to ID28 - ID18. The ID17 - ID0 can then be disregarded.

If the **TxIE** bit is set, the **IntPnd** bit will be set after a successful transmission of the Message Object.

If the **RmtEn** bit is set, a matching received Remote Frame will cause the **TxRqst** bit to be set; the Remote Frame will autonomously be answered by a Data Frame.

The Data Register values (**DLC3-0**, **Data0-7**) are provided by the application, **TxRqst** and **RmtEn** may not be set before the data is valid.

The Mask Registers (**Msk28-0**, **UMask**, **MXtd**, and **MDir** bits) may be used (**UMask=**'1') to allow groups of Remote Frames with similar identifiers to set the **TxRqst** bit. The Dir bit should not be masked.

#### 5.13.6.4 Updating a Transmit Object

The software may update the data bytes of a Transmit Object any time through the IFn Interface registers, neither **MsgVal** nor **TxRqst** have to be reset before the update.

Even if only a part of the data bytes are to be updated, all four bytes of the corresponding IFn Data A Register or IFn Data B Register have to be valid before the contents of that register are

transferred to the Message Object. Either the application software has to write all four bytes into the IFn Data Register or the Message Object is transferred to the IFn Data Register before the software writes the new data bytes.

When only the (eight) data bytes are updated, first 0x0087 is written to the Command Mask Register and then the number of the Message Object is written to the Command Request Register, concurrently updating the data bytes and setting **TxRqst**.

To prevent the reset of **TxRqst** at the end of a transmission that may already be in progress while the data is updated, **NewDat** has to be set together with **TxRqst**.

When **NewDat** is set together with **TxRqst**, **NewDat** will be reset as soon as the new transmission has started.

#### 5.13.6.5 Configuring a Receive Object

Table 5-15 shows how a Receive Object should be initialized.

MsgVal	Arb	Data	Mask	EoB	Dir	NewDat	MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
1	appl.	appl.	appl.	1	0	0	0	appl.	0	0	0	0

Table 5-15 Initialization of a Receive Object

The Arbitration Registers values **(ID28-0** and **Xtd** bit) are provided by the application. They define the identifier and type of accepted received messages. If an 11-bit Identifier ("Standard Frame") is used, it is programmed to ID28 - ID18. Then ID17 - ID0 can be disregarded. When a Data Frame with an 11-bit Identifier is received, ID17 - ID0 will be set to '0'.

If the **RxIE** bit is set, the **IntPnd** bit will be set when a received Data Frame is accepted and stored in the Message Object.

The Data Length Code (DLC3-0) is provided by the application. When the Message Handler stores a Data Frame in the Message Object, it will store the received Data Length Code and eight data bytes. If the Data Length Code is less than 8, the remaining bytes of the Message Object will be overwritten by unspecified values.

The Mask Registers (Msk28-0, **UMask**, **MXtd**, and **MDir** bits) may be used (**UMask**='1') to allow groups of Data Frames with similar identifiers to be accepted. The Dir bit should not be masked in typical applications.

#### 5.13.6.6 Handling Received Messages

The application software may read a received message any time through the IFn Interface registers. The data consistency is guaranteed by the Message Handler state machine.

Typically, the software will write first 0x007F to the Command Mask Register and then the number of the Message Object to the Command Request Register. This combination will transfer the whole received message from the Message RAM into the Message Buffer Register. Additionally, the bits **NewDat** and **IntPnd** are cleared in the Message RAM (not in the Message Buffer).

## ηυνοΤοη

If the Message Object uses masks for acceptance filtering, the arbitration bits shows which of the matching messages have been received.

The actual value of **NewDat** shows whether a new message has been received since the last time this Message Object was read. The actual value of **MsgLst** shows whether more than one message has been received since the last time this Message Object was read. **MsgLst** will not be automatically reset.

By means of a Remote Frame, the software may request another CAN node to provide new data for a receive object. Setting the **TxRqst** bit of a receive object will cause the transmission of a Remote Frame with the receive object's identifier. This Remote Frame triggers the other CAN node to start the transmission of the matching Data Frame. If the matching Data Frame is received before the Remote Frame could be transmitted, the **TxRqst** bit is automatically reset.

#### 5.13.6.7 Configuring a FIFO Buffer

With the exception of the EoB bit, the configuration of Receive Objects belonging to a FIFO Buffer is the same as the configuration of a (single) Receive Object, see Section 5.13.6.5: Configuring a Receive Object.

To concatenate two or more Message Objects into a FIFO Buffer, the identifiers and masks (if used) of these Message Objects have to be programmed to matching values. Due to the implicit priority of the Message Objects, the Message Object with the lowest number will be the first Message Object of the FIFO Buffer. The **EoB** bit of all Message Objects of a FIFO Buffer except the last have to be programmed to zero. The **EoB** bits of the last Message Object of a FIFO Buffer is set to one, configuring it as the End of the Block.

#### 5.13.6.8 Receiving Messages with FIFO Buffers

Received messages with identifiers matching to a FIFO Buffer are stored into a Message Object of this FIFO Buffer starting with the Message Object with the lowest message number.

When a message is stored into a Message Object of a FIFO Buffer, the **NewDat** bit of this Message Object is set. By setting **NewDat** while **EoB** is zero, the Message Object is locked for further write access by the Message Handler until the application software has written the NewDat bit back to zero.

Messages are stored into a FIFO Buffer until the last Message Object of this FIFO Buffer is reached. If none of the preceding Message Objects is released by writing **NewDat** to zero, all further messages for this FIFO Buffer will be written into the last Message Object of the FIFO Buffer and therefore overwrite previous messages.

#### 5.13.6.8.1 Reading from a FIFO Buffer

When the application software transfers the contents of a Message Object to the IFn Message Buffer register by writing its number to the IFn Command Request Register, the corresponding Command Mask Register should be programmed in such a way that bits **NewDat** and **IntPnd** are reset to zero (**TxRqst/NewDat** = '1' and **CIrIntPnd** = '1'). The values of these bits in the Message Control Register always reflect the status before resetting the bits.

To assure the correct function of a FIFO Buffer, the application software should read the Message Objects starting at the FIFO Object with the lowest message number.

Figure 5-81 shows how a set of Message Objects which are concatenated to a FIFO Buffer can be handled by the application software.

## nuvoton

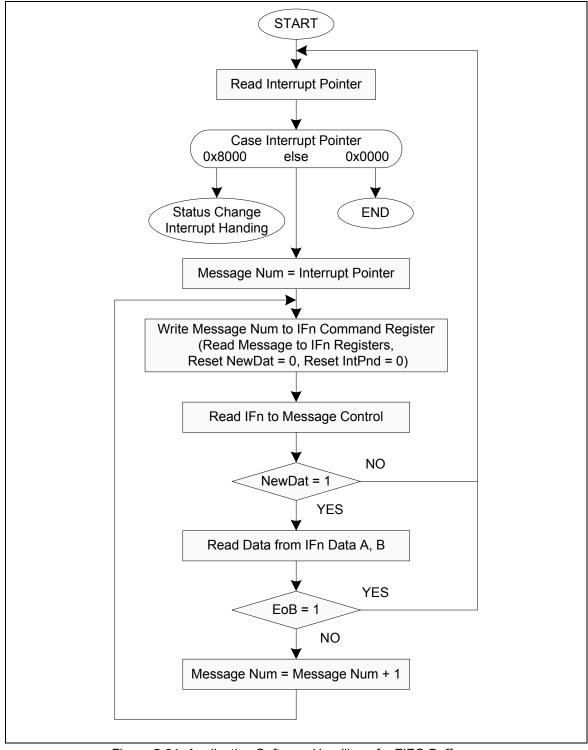

Figure 5-81 Application Software Handling of a FIFO Buffer

#### 5.13.6.9 Handling Interrupts

If several interrupts are pending, the CAN Interrupt Register will point to the pending interrupt with the highest priority, disregarding their chronological order. An interrupt remains pending until the application software has cleared it.

The Status Interrupt has the highest priority. Among the message interrupts, interrupt priority of the Message Object decreases with increasing message number.

A message interrupt is cleared by clearing the **IntPnd** bit of the Message Object. The Status Interrupt is cleared by reading the Status Register.

The interrupt identifier, **IntId**, in the Interrupt Register, indicates the cause of the interrupt. When no interrupt is pending, the register will hold the value zero. If the value of the Interrupt Register is different from zero, then there is an interrupt pending and, if IE is set, the CAN\_INT interrupt signal is active. The interrupt remains active until the Interrupt Register is back to value zero (the cause of the interrupt is reset) or until IE is reset.

The value 0x8000 indicates that an interrupt is pending because the CAN Core has updated (not necessarily changed) the Status Register (Error Interrupt or Status Interrupt). This interrupt has the highest priority. The application software can update (reset) the status bits **RxOk**, **TxOk** and LEC, but a write access of the software to the Status Register can never generate or reset an interrupt.

All other values indicate that the source of the interrupt is one of the Message Objects. **Intld** points to the pending message interrupt with the highest interrupt priority.

The application software controls whether a change of the Status Register may cause an interrupt (bits EIE and SIE in the CAN Control Register) and whether the interrupt line becomes active when the Interrupt Register is different from zero (bit IE in the CAN Control Register). The Interrupt Register will be updated even when IE is reset.

The application software has two possibilities to follow the source of a message interrupt. First, it can follow the **Intld** in the Interrupt Register and second it can poll the Interrupt Pending Register.

An interrupt service routine that is reading the message that is the source of the interrupt may read the message and reset the Message Object's **IntPnd** at the same time (bit **CIrIntPnd** in the Command Mask Register). When **IntPnd** is cleared, the Interrupt Register will point to the next Message Object with a pending interrupt.

#### 5.13.6.10 Configuring the Bit Timing

Even if minor errors in the configuration of the CAN bit timing do not result in immediate failure, the performance of a CAN network can be reduced significantly.

In many cases, the CAN bit synchronization will amend a faulty configuration of the CAN bit timing to such a degree that only occasionally an error frame is generated. However, in the case of arbitration, when two or more CAN nodes simultaneously try to transmit a frame, a misplaced sample point may cause one of the transmitters to become error passive.

The analysis of such sporadic errors requires a detailed knowledge of the CAN bit synchronization inside a CAN node and interaction of the CAN nodes on the CAN bus.

#### 5.13.6.10.1 Bit Time and Bit Rate

CAN supports bit rates in the range of lower than 1 kBit/s up to 1000 kBit/s. Each member of the CAN network has its own clock generator, usually a quartz oscillator. The timing parameter of the

### ηυνοτοη

bit time (i.e. the reciprocal of the bit rate) can be configured individually for each CAN node, creating a common bit rate even though the oscillator periods of the CAN nodes (fosc) may be different.

The frequencies of these oscillators are not absolutely stable, small variations are caused by changes in temperature or voltage and by deteriorating components. As long as the variations remain inside a specific oscillator tolerance range (df), the CAN nodes are able to compensate for the different bit rates by re-synchronizing to the bit stream.

According to the CAN specification, the bit time is divided into four segments (see Figure 5-82). The Synchronization Segment, the Propagation Time Segment, the Phase Buffer Segment 1 and the Phase Buffer Segment 2. Each segment consists of a specific, programmable number of time quanta (see Table 5-16). The length of the time quantum (tq), which is the basic time unit of the bit time, is defined by the CAN controller's APB clock fAPB and the BRP bit of the Bit Timing Register (CAN\_BTR): tq = BRP / fAPB.

The Synchronization Segment, Sync\_Seg, is that part of the bit time where edges of the CAN bus level are expected to occur. The distance between an edge that occurs outside of Sync\_Seg, and the Sync\_Seg is called the phase error of that edge. The Propagation Time Segment, Prop\_Seg, is intended to compensate for the physical delay times within the CAN network. The Phase Buffer Segments Phase\_Seg1 and Phase\_Seg2 surround the Sample Point. The (Re-)Synchronization Jump Width (SJW) defines how far a re-synchronization may move the Sample Point inside the limits defined by the Phase Buffer Segments to compensate for edge phase errors.

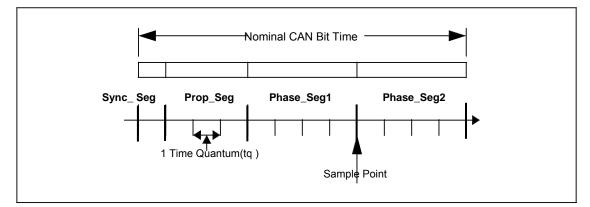

Figure 5-82 Bit Timing

## nuvoTon

Parameter	Range	Remark
BRP	[1 32]	defines the length of the time quantum tq
Sync_Seg	1 tq	fixed length, synchronization of bus input to APB clock
Prop_Seg	[1 8] tq	compensates for the physical delay times
Phase_Seg1	[18] tq	may be lengthened temporarily by synchronization
Phase_Seg2	[1 8] tq	may be shortened temporarily by synchronization
SJW	[1 4] tq	may not be longer than either Phase Buffer Segment
This table descri	ibes the minimur	n programmable ranges required by the CAN protocol

Table 5-16 CAN Bit Time Parameters

A given bit rate may be met by different bit time configurations, but for the proper function of the CAN network the physical delay times and the oscillator's tolerance range have to be considered.

#### 5.13.6.10.2 Propagation Time Segment

This part of the bit time is used to compensate physical delay times within the network. These delay times consist of the signal propagation time on the bus and the internal delay time of the CAN nodes.

Any CAN node synchronized to the bit stream on the CAN bus will be out of phase with the transmitter of that bit stream, caused by the signal propagation time between the two nodes. The CAN protocol's non-destructive bitwise arbitration and the dominant acknowledge bit provided by receivers of CAN messages requires that a CAN node transmitting a bit stream must also be able to receive dominant bits transmitted by other CAN nodes that are synchronized to that bit stream. The example in Figure 5-83 shows the phase shift and propagation times between two CAN nodes.

### NuMicro™ NUC130/NUC140 Technical Reference Manual

## nuvoTon

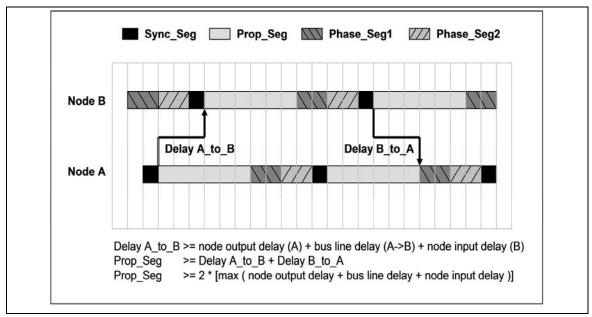

Figure 5-83 Propagation Time Segment

In this example, both nodes A and B are transmitters, performing an arbitration for the CAN bus. Node A has sent its Start of Frame bit less than one bit time earlier than node B, therefore node B has synchronized itself to the received edge from recessive to dominant. Since node B has received this edge delay (A\_to\_B) after it has been transmitted, B's bit timing segments are shifted with respect to A. Node B sends an identifier with higher priority and so it will win the arbitration at a specific identifier bit when it transmits a dominant bit while node A transmits a recessive bit. The dominant bit transmitted by node B will arrive at node A after the delay (B\_to\_A).

Due to oscillator tolerances, the actual position of node A's Sample Point can be anywhere inside the nominal range of node A's Phase Buffer Segments, so the bit transmitted by node B must arrive at node A before the start of Phase\_Seg1. This condition defines the length of Prop\_Seg.

If the edge from recessive to dominant transmitted by node B arrives at node A after the start of Phase\_Seg1, it can happen that node A samples a recessive bit instead of a dominant bit, resulting in a bit error and the destruction of the current frame by an error flag.

The error occurs only when two nodes arbitrate for the CAN bus that have oscillators of opposite ends of the tolerance range and that are separated by a long bus line. This is an example of a minor error in the bit timing configuration (Prop\_Seg to short) that causes sporadic bus errors.

Some CAN implementations provide an optional 3 Sample Mode but the C\_CAN does not. In this mode, the CAN bus input signal passes a digital low-pass filter, using three samples and a majority logic to determine the valid bit value. This results in an additional input delay of 1 tq, requiring a longer Prop\_Seg.

#### 5.13.6.10.3 Phase Buffer Segments and Synchronization

The Phase Buffer Segments (Phase\_Seg1 and Phase\_Seg2) and the Synchronization Jump Width (SJW) are used to compensate for the oscillator tolerance. The Phase Buffer Segments may be lengthened or shortened by synchronization.

Synchronizations occur on edges from recessive to dominant, their purpose is to control the distance between edges and Sample Points.

Edges are detected by sampling the actual bus level in each time quantum and comparing it with the bus level at the previous Sample Point. A synchronization may be done only if a recessive bit was sampled at the previous Sample Point and if the bus level at the actual time quantum is dominant.

An edge is synchronous if it occurs inside of Sync\_Seg, otherwise the distance between edge and the end of Sync\_Seg is the edge phase error, measured in time quanta. If the edge occurs before Sync\_Seg, the phase error is negative, else it is positive.

Two types of synchronization exist, Hard Synchronization and Re-synchronization.

A Hard Synchronization is done once at the start of a frame and inside a frame only when Resynchronizations occur.

#### • Hard Synchronization

nuvoton

After a hard synchronization, the bit time is restarted with the end of Sync\_Seg, regardless of the edge phase error. Thus hard synchronization forces the edge, which has caused the hard synchronization to lie within the synchronization segment of the restarted bit time.

#### Bit Re-synchronization

Re-synchronization leads to a shortening or lengthening of the bit time such that the position of the sample point is shifted with regard to the edge.

When the phase error of the edge which causes Re-synchronization is positive, Phase\_Seg1 is lengthened. If the magnitude of the phase error is less than SJW, Phase\_Seg1 is lengthened by the magnitude of the phase error, else it is lengthened by SJW.

When the phase error of the edge, which causes Re-synchronization is negative, Phase\_Seg2 is shortened. If the magnitude of the phase error is less than SJW, Phase\_Seg2 is shortened by the magnitude of the phase error, else it is shortened by SJW.

When the magnitude of the phase error of the edge is less than or equal to the programmed value of SJW, the results of Hard Synchronization and Re-synchronization are the same. If the magnitude of the phase error is larger than SJW, the Re-synchronization cannot compensate the phase error completely, an error (phase error - SJW) remains.

Only one synchronization may be done between two Sample Points. The Synchronizations maintain a minimum distance between edges and Sample Points, giving the bus level time to stabilize and filtering out spikes that are shorter than (Prop\_Seg + Phase\_Seg1).

Apart from noise spikes, most synchronizations are caused by arbitration. All nodes synchronize "hard" on the edge transmitted by the "leading" transceiver that started transmitting first, but due to propagation delay times, they cannot become ideally synchronized. The "leading" transmitter does not necessarily win the arbitration, therefore the receivers have to synchronize themselves to different transmitters that subsequently "take the lead" and that are differently synchronized to the previously "leading" transmitter. The same happens at the acknowledge field, where the transmitter and some of the receivers will have to synchronize to that receiver that "takes the lead" in the transmission of the dominant acknowledge bit.

Synchronizations after the end of the arbitration will be caused by oscillator tolerance, when the differences in the oscillator's clock periods of transmitter and receivers sum up during the time between synchronizations (at most ten bits). These summarized differences may not be longer

than the SJW, limiting the oscillator's tolerance range.

The examples in Figure 5-84 show how the Phase Buffer Segments are used to compensate for phase errors. There are three drawings of each two consecutive bit timings. The upper drawing shows the synchronization on a "late" edge, the lower drawing shows the synchronization on an "early" edge, and the middle drawing is the reference without synchronization.

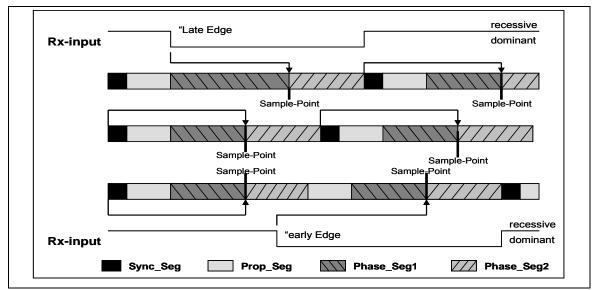

Figure 5-84 Synchronization on "late" and "early" Edges

In the first example an edge from recessive to dominant occurs at the end of Prop\_Seg. The edge is "late" since it occurs after the Sync\_Seg. Reacting to the "late" edge, Phase\_Seg1 is lengthened so that the distance from the edge to the Sample Point is the same as it would have been from the Sync\_Seg to the Sample Point if no edge had occurred. The phase error of this "late" edge is less than SJW, so it is fully compensated and the edge from dominant to recessive at the end of the bit, which is one nominal bit time long, occurs in the Sync\_Seg.

In the second example an edge from recessive to dominant occurs during Phase\_Seg2. The edge is "early" since it occurs before a Sync\_Seg. Reacting to the "early" edge, Phase\_Seg2 is shortened and Sync\_Seg is omitted, so that the distance from the edge to the Sample Point is the same as it would have been from an Sync\_Seg to the Sample Point if no edge had occurred. As in the previous example, the magnitude of this "early" edge's phase error is less than SJW, so it is fully compensated.

The Phase Buffer Segments are lengthened or shortened temporarily only; at the next bit time, the segments return to their nominal programmed values.

In these examples, the bit timing is seen from the point of view of the CAN implementation's state machine, where the bit time starts and ends at the Sample Points. The state machine omits Sync\_Seg when synchronising on an "early" edge because it cannot subsequently redefine that time quantum of Phase\_Seg2 where the edge occurs to be the Sync\_Seg.

The examples in Figure 5-85 show how short dominant noise spikes are filtered by synchronisations. In both examples the spike starts at the end of Prop\_Seg and has the length of (Prop\_Seg + Phase\_Seg1).

In the first example, the Synchronisation Jump Width is greater than or equal to the phase error of the spike's edge from recessive to dominant. Therefore the Sample Point is shifted after the end of

the spike; a recessive bus level is sampled.

In the second example, SJW is shorter than the phase error, so the Sample Point cannot be shifted far enough; the dominant spike is sampled as actual bus level.

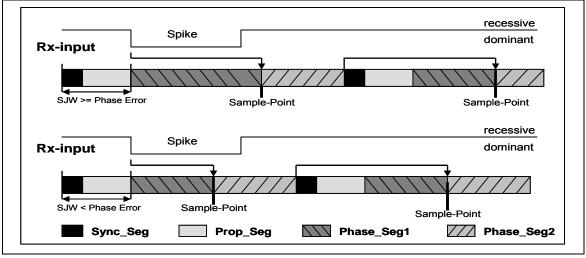

Figure 5-85 Filtering of Short Dominant Spikes

#### 5.13.6.10.4 Oscillator Tolerance Range

The oscillator tolerance range was increased when the CAN protocol was developed from version 1.1 to version 1.2 (version 1.0 was never implemented in silicon). The option to synchronize on edges from dominant to recessive became obsolete, only edges from recessive to dominant are considered for synchronization. The protocol update to version 2.0 (A and B) had no influence on the oscillator tolerance.

The tolerance range df for an oscillator frequency f<sub>OSC</sub> around the nominal frequency f<sub>nom</sub> is:

 $(1 - df) \bullet f_{nom} \le f_{OSC} \le (1 + df) \bullet f_{nom}$ 

It depends on the proportions of Phase\_Seg1, Phase\_Seg2, SJW, and the bit time. The maximum tolerance df is the defined by two conditions (both shall be met):

Error! Objects cannot be created from editing field codes.

Error! Objects cannot be created from editing field codes.

Note: These conditions base on the APB cock = f osc.

It has to be considered that SJW may not be larger than the smaller of the Phase Buffer Segments and that the Propagation Time Segment limits that part of the bit time that may be used for the Phase Buffer Segments.

The combination Prop\_Seg = 1 and Phase\_Seg1 = Phase\_Seg2 = SJW = 4 allows the largest possible oscillator tolerance of 1.58%. This combination with a Propagation Time Segment of

only 10% of the bit time is not suitable for short bit times; it can be used for bit rates of up to 125 kBit/s (bit time = 8  $\mu$ s) with a bus length of 40 m.

#### 5.13.6.10.5 Configuring the CAN Protocol Controller

In most CAN implementations and also in the C\_CAN, the bit timing configuration is programmed in two register bytes. The sum of Prop\_Seg and Phase\_Seg1 (as TSEG1) is combined with Phase\_Seg2 (as TSEG2) in one byte, SJW and BRP are combined in the other byte.

In these bit timing registers, the four components TSEG1, TSEG2, SJW, and BRP have to be programmed to a numerical value that is one less than its functional value. Therefore, instead of values in the range of [1..n], values in the range of [0..n-1] are programmed. That way, e.g. SJW (functional range of [1..4]) is represented by only two bits.

Therefore the length of the bit time is (programmed values) [TSEG1 + TSEG2 + 3]  $t_q$  or (functional values) [Sync\_Seg + Prop\_Seg + Phase\_Seg1 + Phase\_Seg2]  $t_q$ .

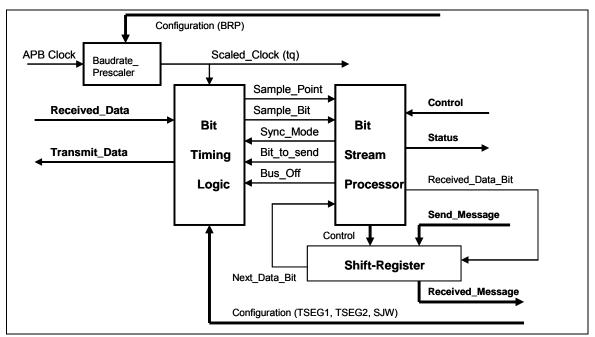

Figure 5-86 Structure of the CAN Core's CAN Protocol Controller

The data in the bit timing registers is the configuration input of the CAN protocol controller. The Baud Rate Prescaler (configured by BRP) defines the length of the time quantum, the basic time unit of the bit time; the Bit Timing Logic (configured by TSEG1, TSEG2, and SJW) defines the number of time quanta in the bit time.

The processing of the bit time, the calculation of the position of the Sample Point, and occasional synchronizations are controlled by the BTL (Bit Timing Logic) state machine, which is evaluated once each time quantum. The rest of the CAN protocol controller, the BSP (Bit Stream Processor) state machine is evaluated once each bit time, at the Sample Point.

The Shift Register sends the messages serially and parallelizes received messages. Its loading and shifting is controlled by the BSP.

The BSP translates messages into frames and vice versa. It generates and discards the enclosing fixed format bits, inserts and extracts stuff bits, calculates and checks the CRC code, performs the error management, and decides which type of synchronization is to be used. It is evaluated at the Sample Point and processes the sampled bus input bit. The time that is needed to calculate the next bit to be sent after the Sample point (e.g. data bit, CRC bit, stuff bit, error flag, or idle) is called the Information Processing Time (IPT).

The IPT is application specific but may not be longer than 2  $t_q$ ; the IPT for the C\_CAN is 0  $t_q$ . Its length is the lower limit of the programmed length of Phase\_Seg2. In case of a synchronization, Phase\_Seg2 may be shortened to a value less than IPT, which does not affect bus timing.

#### 5.13.6.10.6 Calculating Bit Timing Parameters

Usually, the calculation of the bit timing configuration starts with a desired bit rate or bit time. The resulting bit time (1/bit rate) must be an integer multiple of the APB clock period.

The bit time may consist of 4 to 25 time quanta, the length of the time quantum  $t_q$  is defined by the Baud Rate Prescaler with  $t_q$  = (Baud Rate Prescaler)/ $f_{apb_clk}$ . Several combinations may lead to the desired bit time, allowing iterations of the following steps.

First part of the bit time to be defined is the Prop\_Seg. Its length depends on the delay times measured in the APB clock. A maximum bus length as well as a maximum node delay has to be defined for expandible CAN bus systems. The resulting time for Prop\_Seg is converted into time quanta (rounded up to the nearest integer multiple of  $t_q$ ).

The Sync\_Seg is 1  $t_q$  long (fixed), leaving (bit time – Prop\_Seg – 1)  $t_q$  for the two Phase Buffer Segments. If the number of remaining  $t_q$  is even, the Phase Buffer Segments have the same length, Phase\_Seg2 = Phase\_Seg1, else Phase\_Seg2 = Phase\_Seg1 + 1.

The minimum nominal length of Phase\_Seg2 has to be regarded as well. Phase\_Seg2 may not be shorter than the IPT of the CAN controller, which, depending on the actual implementation, is in the range of [0..2]  $t_{\rm g}$ .

The length of the Synchronization Jump Width is set to its maximum value, which is the minimum of 4 and Phase\_Seg1.

The oscillator tolerance range necessary for the resulting configuration is calculated by the formulas given in Section 5.13.6.10.4: Oscillator Tolerance Range

If more than one configuration is possible, that configuration allowing the highest oscillator tolerance range should be chosen.

CAN nodes with different system clocks require different configurations to come to the same bit rate. The calculation of the propagation time in the CAN network, based on the nodes with the longest delay times, is done once for the whole network.

The oscillator tolerance range of the CAN systems is limited by that node with the lowest tolerance range.

The calculation may show that bus length or bit rate have to be decreased or that the stability of the oscillator frequency has to be increased in order to find a protocol compliant configuration of the CAN bit timing. The resulting configuration is written into the Bit Timing Register: (Phase\_Seg2-1) & (Phase\_Seg1+Prop\_Seg-1) & (SynchronisationJumpWidth-1)&(Prescaler-1)

### Example for Bit Timing at High Baud rate

In this example, the frequency of APB\_CLK is 10 MHz, BRP is 0, the bit rate is 1 MBit/s.

Т <sub>q</sub>	100	ns	= t <sub>APB_CLK</sub>
delay of bus driver	50	ns	
delay of receiver circuit	30	ns	
delay of bus line (40m)	220	ns	
t <sub>Prop</sub>	600	ns	$= 6 \cdot t_q$
t <sub>SJW</sub>	100	ns	= 1 • t <sub>q</sub>
t <sub>TSeg1</sub>	700	ns	$= t_{Prop} + t_{SJW}$
t <sub>TSeg2</sub>	200	ns	= Information Processing Time + $1 \cdot t_q$
tSync-Seg	100	ns	= 1 • tq
bit time	1000	ns	= $t_{Sync-Seg}$ + $t_{TSeg1}$ + $t_{TSeg2}$
tolerance for APB_CLK	0.39	%	$= \frac{Min(PB1, PB2)}{2 \times 13 \times (bit \ time - PB2))}$

codes.

Error! Objects cannot be created from editing field

In this example ,the concatenated bit time parameters are  $(2-1)_3 \& (7-1)_4 \& (1-1)_2 \& (1-1)_6$ , the Bit Timing Register is programmed to= 0x1600.

### Example for Bit Timing at Low Baudrate

In this example, the frequency of APB\_CLK is 2 MHz, BRP is 1, the bit rate is 100 KBit/s.

tq	1	$\mu s = 2 \cdot t_{APB\_CLK}$
delay of bus driver	200	ns
delay of receiver circuit	80	ns
delay of bus line (40m)	220	ns
t <sub>Prop</sub>	1	$\mu s = 1 \cdot t_q$
t <sub>SJW</sub>	4	$\mu s = 4 \cdot t_q$
t <sub>TSeg1</sub>	5	$\mu s = t_{Prop} + t_{SJW}$
t <sub>TSeg2</sub>	4	$\mu s$ = Information Processing Time + 3 • $t_q$
t <sub>Sync-Seg</sub>	1	$\mu s = 1 \cdot t_q$
bit time	10	$\mu s = t_{Sync-Seg} + t_{TSeg1} + t_{TSeg2}$
tolerance for APB_CLK	1.58	$\% = \frac{Min(PB1, PB2)}{2 \times 13 \times (bit \ time - PB2))}$

codes.

In this example, the concatenated bit time parameters are  $(4-1)_3 \& (5-1)_4 \& (4-1)_2 \& (2-1)_6$ , the Bit Timing Register is programmed to= 0x34C1.

Error! Objects cannot be created from editing field

#### 5.13.7 Register Description

The C\_CAN allocates an address space of 256 bytes. The registers are organized as 16-bit registers.

The two sets of interface registers (IF1 and IF2) control the software access to the Message RAM. They buffer the data to be transferred to and from the RAM, avoiding conflicts between software accesses and message reception/transmission.

#### 5.13.8 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
CAN0_BA = 0x4018	_0000			
CAN_CON	CAN0_BA+0x00	R/W	Control Register	0x0000_0001
CAN_STATUS	CAN0_BA+0x04	R/W	Status Register	0x0000_0000

Note: 1. 0x00 & 0br0000000, where r signifies the actual value of the CAN\_RX

- 2. IFn: The two sets of Message Interface Registers IF1 and IF2, have identical function
- 3. An/Bn: The two sets of data registers A1, A2 and B1, B2.

#### 5.13.9 CAN Interface Reset State

After the hardware reset, the C\_CAN registers hold the reset values given in the register descriptions in <u>CAN register map</u>.

Additionally the *busoff* state is reset and the output CAN\_TX is set to recessive (HIGH). The value 0x0001 (Init = '1') in the CAN Control Register enables the software initialization. The C\_CAN does not influence the CAN bus until the application software resets the Init bit to '0'.

The data stored in the Message RAM is not affected by a hardware reset. After powering on, the contents of the Message RAM are undefined.

### CAN Control Register (CAN\_CON)

Register	Offset	R/W	Description	Reset Value
CAN_CON	CAN0_BA+0x00	R/W	CAN Control Register	0x0000_0000

31	30	29	28	27	26	25	24			
	Reserved									
23	22	21	20	19	18	17	16			
	Reserved									
15	14	13	12	11	10	9	8			
	Reserved									
7	6	5	4	3	2	1	0			
Test	CCE	DAR	Reserved	EIE	SIE	IE	Init			

Bits	Descriptions	
		Reserved
[31:8]	Reserved	There are reserved bits.
		These bits are always read as '0' and must always be written with '0'
		Test Mode Enable
[7]	Test	1 = Test Mode.
		0 = Normal Operation.
		Configuration Change Enable
[6]	CCE	1 = Write access to the Bit Timing Register (CAN_BTIME & CAN_BRP) allowed. (while Init bit =1).
		0 = No write access to the Bit Timing Register.
		Disable Automatic Re-transmission
[5]	DAR	1 = Automatic Retransmission disabled.
		0 = Automatic Retransmission of disturbed messages enabled.
[4]	Reserved	Reserved
[4]	Reserved	This is a reserved bit. This bit is always read as '0' and must always be written with '0'.
		Error Interrupt Enable
[3]	EIE	1 = Enabled - A change in the bits BOff or EWarn in the Status Register will generate an interrupt.
		0 = Disabled - No Error Status Interrupt will be generated.
		Status Change Interrupt Enable
[2]	SIE	1 = Enabled - An interrupt will be generated when a message transfer is successfully completed or a CAN bus error is detected.

Bits	Descriptions	
		0 = Disabled - No Status Change Interrupt will be generated.
		Module Interrupt Enable
[1]	IE	1 = Enabled.
		0 = Disabled.
		Init Initialization
[0]	Init	1 = Initialization is started.
		0 = Normal Operation.

Note: The busoff recovery sequence (see CAN Specification Rev. 2.0) cannot be shortened by setting or resetting the Init bit. If the device goes in the busoff state, it will set Init of its own accord, stopping all bus activities. Once Init has been cleared by the CPU, the device will then wait for 129 occurrences of Bus Idle (129 \* 11 consecutive recessive bits) before resuming normal operations. At the end of the busoff recovery sequence, the Error Management Counters will be reset.

During the waiting time after resetting Init, each time a sequence of 11 recessive bits has been monitored, a Bit0Error code is written to the Status Register, enabling the CPU to readily check up whether the CAN bus is stuck at dominant or continuously disturbed and to monitor the proceeding of the busoff recovery sequence.

### CAN Status Register (CAN\_STATUS)

Register	Offset	R/W	Description	Reset Value
CAN_STATUS	CAN_STATUS CAN0_BA+0x04 R/W		CAN Status Register	0x0000_0000

31	30	29	28	27	26	25	24			
	Reserved									
23	22	21	20	19	18	17	16			
	Reserved									
15	14	13	12	11	10	9	8			
	Reserved									
7	6	5	4	3	2	1	0			
BOFF	EWarn	EPass	RxOK	ТхОК	LEC					

Bits	Descriptions					
[24.0]	Reserved	Reserved				
[31:8]	Reserved	This is a reserved bit. This bit is always read as '0' and must always be written with '0'.				
		Busoff Status (Read Only)				
[7]	BOff	1 = The CAN module is in busoff state.				
		0 = The CAN module is not in busoff state.				
		Error Warning Status (Read Only)				
[6]	EWarn	1 = At least one of the error counters in the EML has reached the error warning limit of 96.				
		0 = Both error counters are below the error warning limit of 96.				
		Error Passive (Read Only)				
[5]	EPass	1 = The CAN Core is in the error passive state as defined in the CAN Specification.				
		0 = The CAN Core is error active.				
		Received a Message Successfully				
[4]	RxOK	<ul><li>1 = A message has been successfully received since this bit was last reset by the CPU (independent of the result of acceptance filtering).</li></ul>				
		0 = No message has been successfully received since this bit was last reset by the CPU. This bit is never reset by the CAN Core.				
		Transmitted a Message Successfully				
[3]	ТхОК	1 = Since this bit was last reset by the CPU, a message has been successfully (error free and acknowledged by at least one other node) transmitted.				
		0 = Since this bit was reset by the CPU, no message has been successfully transmitted. This bit is never reset by the CAN Core.				
		Last Error Code (Type of the last error to occur on the CAN bus)				
		The LEC field holds a code, which indicates the type of the last error to occur on the				
[2:0]	LEC	CAN bus. This field will be cleared to '0' when a message has been transferred				
		(reception or transmission) without error. The unused code '7' may be written by the CPU				
		to check for updates. Table 5-18 describes the error codes.				

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

## nuvoTon

Error Code	Meanings
0	No Error
1	Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed.
2	Form Error: A fixed format part of a received frame has the wrong format.
3	AckError: The message this CAN Core transmitted was not acknowledged by another node.
4	Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.
5	Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), though the device wanted to send a dominant level (data or identifier bit logical value '0'), but the monitored Bus value was recessive. During busoff recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceedings of the busoff recovery sequence (indicating the bus is not stuck at <i>dominant</i> or continuously disturbed).
6	CRCError: The CRC check sum was incorrect in the message received, the CRC received for an incoming message does not match with the calculated CRC for the received data.
7	Unused: When the LEC shows the value '7', no CAN bus event was detected since the CPU wrote this value to the LEC.

#### Table 5-18 Error Codes

### Status Interrupts

A Status Interrupt is generated by bits **BOff** and **EWarn** (Error Interrupt) or by **RxOk**, **TxOk**, and **LEC** (Status Change Interrupt) assumed that the corresponding enable bits in the CAN Control Register are set. A change of bit **EPass** or a write to **RxOk**, **TxOk**, or **LEC** will never generate a Status Interrupt.

Reading the Status Register will clear the Status Interrupt value (8000h) in the Interrupt Register, if it is pending.

RP				REC[6:0]						
7	6	5	4	3	2	1	0			
	TEC[7:0]									

Bits	Descriptions	
[31:16]	Reserved	Reserved
		This is a reserved bit. This bit is always read as '0' and must always be written with '0'.
		Receive Error Passive
[15]	RP	1 = The Receive Error Counter has reached the error passive level as defined in the CAN Specification.
		0 = The Receive Error Counter is below the error passive level.
[14:8]	REC	Receive Error Counter
[14.0]	NLO	Actual state of the Receive Error Counter. Values between 0 and 127.
[7:0]	TEC	Transmit Error Counter
[, .0]		Actual state of the Transmit Error Counter. Values between 0 and 255.

### Bit Timing Register (CAN\_BTIME)

Register	Offset	R/W	Description	Reset Value
CAN_BTIME	CAN0_BA+0x0C	R/W	Bit Timing Register	0x0000_2301

31	30	29	28	27	26	25	24		
	Reserved								
23	22	21	20	19	18	17	16		
	Reserved								
15	14	13	12	11	10	9	8		
Reserved		TSeg2		TSeg1					
7	6	5	4	3	2	1	0		
SJW			BF	RP					

Bits	Descriptions				
[31:15]	Reserved	Reserved			
[00]		This is a reserved bit. This bit is always read as '0' and must always be written with '0'.			
		Time Segment After sample Point			
[14:12] <b>TSeg2</b>		0x0-0x7: Valid values for TSeg2 are [0 7]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.			
		Time Segment before the sample Point Minus Sync_seg			
[11:8] <b>TS</b>	TSeg1	0x01-0x0F: valid values for TSeg1 are [1 15]. The actual interpretation by the hardware of this value is such that one more than the value programmed is used.			
		(Re)Synchronization Jump Width			
[7:6]	SJW	<i>0x0-0x3:</i> Valid programmed values are [0 3]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.			
		Baud Rate Prescaler			
[5:0] <b>BRP</b>		0x01-0x3F: The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Baud Rate Prescaler are [ 0 63 ]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.			

Note With a module clock APB\_CLK of 8 MHz, the reset value of 0x2301 configures the C\_CAN for a bit rate of 500 kBit/s. The registers are only writable if bits CCE and Init in the CAN Control Register are set.

### Interrupt Identify Register (CAN\_IIDR)

Register	Offset	R/W	Description	Reset Value
CAN_IIDR	CAN0_BA+0x10	R	Interrupt Identifier Registers	0x0000_0000

31	30	29	28	27	26	25	24		
	Reserved								
23	22	21	20	19	18	17	16		
	Reserved								
15	14	13	12	11	10	9	8		
	Intld[15:8]								
7	6	5	4	3	2	1	0		
	Intld[7:0]								

Bits	Descriptions	
		Interrupt Identifier (Indicates the source of the interrupt. Ref. Table 5-19)
[15:0]	Intid	If several interrupts are pending, the CAN Interrupt Register will point to the pending interrupt with the highest priority, disregarding their chronological order. An interrupt remains pending until the application software has cleared it. If <b>IntId</b> is different from 0x0000 and IE is set, the IRQ interrupt signal to the EIC is active. The interrupt remains active until <b>IntId</b> is back to value 0x0000 (the cause of the interrupt is reset) or until <b>IE</b> is reset.
		The Status Interrupt has the highest priority. Among the message interrupts, the Message Object's interrupt priority decreases with increasing message number.
		A message interrupt is cleared by clearing the Message Object's <b>IntPnd</b> bit. The Status Interrupt is cleared by reading the Status Register.

Intid Value	Meanings
0x0000	No Interrupt is Pending
0x0001-0x0020	Number of Message Object which caused the interrupt.
0x0021-0x7FFF	Unused
0x8000	Status Interrupt
0x8001-0xFFFF	Unused

Table 5-19 Source of Interrupts

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

### Test Register (CAN\_TEST)

Register	Offset	R/W	Description	Reset Value
CAN_TEST	CAN0_BA+0x14	R/W	Test Register	0x0000_00x0

31	30	29	28	27	26	25	24		
	Reserved								
23	22	21	20	19	18	17	16		
	Reserved								
15	14	13	12	11	10	9	8		
	Reserved								
7	6	5	4	3	2	1	0		
Rx	Tx[1:0]		LBack	Silent	Basic	R	es		

Bits	Descriptions	
		Reserved
[31:8]	Reserved	There are reserved bits. These bits are always read as '0' and must always be written with '0'.
		Monitors the actual value of CAN_RX Pin (Read Only)
[7]	Rx	1 = The CAN bus is recessive (CAN_RX = '1').
		0 = The CAN bus is dominant (CAN_RX = '0').
		Tx[1:0]: Control of CAN_TX pin
		00 = Reset value, CAN_TX is controlled by the CAN Core
[6:5]	Tx[1:0]	01 = Sample Point can be monitored at CAN_TX pin
		10 = CAN_TX pin drives a dominant ('0') value.
		11 = CAN_TX pin drives a recessive ('1') value.
		Loop Back Mode
[4]	LBack	1 = Loop Back Mode is enabled.
		0 = Loop Back Mode is disabled.
		Silent Mode
[3]	Silent	1 = The module is in Silent Mode.
		0 = Normal operation.
		Basic Mode
[2]	Basic	1= IF1 Registers used as Tx Buffer, IF2 Registers used as Rx Buffer.
		0 = Basic Mode disabled.
[1:0]	Res	Reserved

Bits	Descriptions	
		There are reserved bits.
		These bits are always read as '0' and must always be written with '0'.

Reset value: 0000 0000 R000 0000 b (R:current value of RX pin)

Write access to the Test Register is enabled by setting the Test bit in the CAN Control Register. The different test functions may be combined, but  $Tx[1-0] \neq$  "00" disturbs message transfer.

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

	Reserved								
15	14	13	12	11	10	9	8		
	Reserved								
7	6	5	4	3	2	1	0		
	Reserved			BRPE					

Bits	Descriptions	
		Reserved
[31:4]	Reserved	There are reserved bits. These bits are always read as '0' and must always be written with '0'.
		BRPE: Baud Rate Prescaler Extension
[3:0]	BRPE	0x00-0x0F: By programming <b>BRPE</b> , the Baud Rate Prescaler can be extended to values up to 1023. The actual interpretation by the hardware is that one more than the value programmed by <b>BRPE</b> (MSBs) and <b>BTIME</b> (LSBs) is used.

#### Message Interface Register Sets

There are two sets of Interface Registers, which are used to control the CPU access to the Message RAM. The Interface Registers avoid conflict between the CPU accesses to the Message RAM and CAN message reception and transmission by buffering the data to be transferred. A complete Message Object or parts of the Message Object may be transferred between the Message RAM and the IF*n* Message Buffer registers in one single transfer.

The function of the two interface register sets is identical except for the Basic test mode. They can be used the way one set of registers is used for data transfer to the Message RAM while the other set of registers is used for the data transfer from the Message RAM, allowing both processes to be interrupted by each other. Table 5-20 (IF1 and IF2 Message Interface Register Set) provides an overview of the two Interface Register sets.

Each set of Interface Registers consists of Message Buffer Registers controlled by their own Command Registers. The Command Mask Register specifies the direction of the data transfer and which parts of a Message Object will be transferred. The Command Request Register is used to select a Message Object in the Message RAM as target or source for the transfer and to start the action specified in the Command Mask Register.

Address	IF1 Register Set	Address	IF2 Register Set
CAN0_BA+0x20	IF1 Command Request	CAN0_BA+0x80	IF2 Command Request
CAN0_BA+0x24	IF1 Command Mask	CAN0_BA+0x84	IF2 Command Mask

Busy				Res			
7	6	5	4	3	2	1	0
R		Message Number					

Bits	Descriptions	Descriptions					
		Busy Flag					
[15]	Busy	<ol> <li>Writing to the IFn Command Request Register is in progress. This bit can only be read by the software.</li> </ol>					
		0 = Read/write action has finished.					
		Reserved					
[14:6]	14:6] Reserved	There are reserved bits. These bits are always read as '0' and must always be written with '0'.					
		Message Number					
		0x01-0x20: Valid Message Number, the Message Object in the Message					
[5:0]	Message Number	RAM is selected for data transfer.					
		0x00: Not a valid Message Number, interpreted as 0x20.					
		0x21-0x3F: Not a valid Message Number, interpreted as 0x01-0x1F.					

A message transfer is started as soon as the application software has written the message number to the Command Request Register. With this write operation, the Busy bit is automatically set to notify the CPU that a transfer is in progress. After a waiting time of 3 to 6 APB\_CLK periods, the transfer between the Interface Register and the Message RAM is completed. The Busy bit is cleared.

Note: When a Message Number that is not valid is written into the Command Request Register, the Message Number will be transformed into a valid value and that Message Object will be transferred.

### IFn Command Mask Register (CAN\_IFn\_CMASK)

The control bits of the IF*n* Command Mask Register specify the transfer direction and select which of the IF*n* Message Buffer Registers are source or target of the data transfer.

Register	Offset	R/W	Description	Reset Value
CAN_IFn_CMASK	CAN0_BA+0x24/0x84	R/W	IFn Command Mask Register	0x0000_0000

Bits	Descriptions	
		Reserved
[31:8]	Reserved	There are reserved bits. These bits are always read as '0' and must always be written with '0'.
		Write / Read
[7]	WR/RD	1 = Write: Transfer data from the selected Message Buffer Registers to the Message Object addressed by the Command Request Register.
		0 = Read: Transfer data from the Message Object addressed by the Command Request Register into the selected Message Buffer Registers.
		Access Mask Bits
		Direction = Write
		1 = Transfer Identifier Mask + MDir + MXtd to Message Object.
[6]	Mask	0: = Mask bits unchanged.
		Direction = Read
		1 = Transfer Identifier Mask + MDir + MXtd to IFn Message Buffer Register.
		0 = Mask bits unchanged.
		Access Arbitration Bits
		Direction = Write
		1 = Transfer Identifier + Dir + Xtd + MsgVal to Message Object
[5]	Arb	0 = Arbitration bits unchanged.
		Direction = Read
		1 = Transfer Identifier + Dir + Xtd + MsgVal to IFn Message Buffer Register.
		0 = Arbitration bits unchanged.

Bits	Descriptions						
		Control Access Control Bits					
		Direction = Write					
		1 = Transfer Control Bits to Message Object.					
[4]	Control	0 = Control Bits unchanged					
		Direction = Read					
		1 = Transfer Control Bits to IFn Message Buffer Register.					
		0 = Control Bits unchanged.					
		Clear Interrupt Pending Bit					
		Direction = Write					
[3]	CirintPnd	When writing to a Message Object, this bit is ignored.					
[0]		Direction = Read					
		1 = Clear IntPnd bit in the Message Object.					
		0 = IntPnd bit remains unchanged.					
		Access Transmission Request Bit when Direction = Write					
		1 = Set TxRqst bit.					
		0 = TxRqst bit unchanged.					
[2]		Note: If a transmission is requested by programming bit <b>TxRqst/NewDat</b> in the IFn Command Mask Register, bit TxRqst in the IFn Message Control Register will be ignored.					
[2]	TxRqst/NewDat	Access New Data Bit when Direction = Read					
		1 = Clear <b>NewDat</b> bit in the Message Object					
		0 = <b>NewDat</b> bit remains unchanged.					
		Note : A read access to a Message Object can be combined with the reset of the control bits <b>IntPnd</b> and <b>NewDat</b> . The values of these bits transferred to the IFn Message Control Register always reflect the status before resetting these bits.					
		Access Data Bytes [3:0]					
		Direction = Write					
		1 = Transfer Data Bytes [3:0] to Message Object

[31:16]	Reserved NewDat	Reserved         There are reserved bits. These bits are always read as '0' and must always be written with '0'.         New Data
[31:16]		'0'. New Data
	NewDet	
	NewDet	
[15]	NewDat	1 = The Message Handler or the application software has written new data into the data portion of this Message Object.
		0 = No new data has been written into the data portion of this Message Object by the Message Handler since last time this flag was cleared by the application software.
		Message Lost (only valid for Message Objects with direction = receive)
[14]	MsgLst	<ol> <li>The Message Handler stored a new message into this object when NewDat was still set, the CPU has lost a message.</li> </ol>
		0 = No message lost since last time this bit was reset by the CPU.
		Interrupt Pending
[13]	IntPnd	1 = This message object is the source of an interrupt. The Interrupt Identifier in the Interrupt Register will point to this message object if there is no other interrupt source with higher priority.
		0 = This message object is not the source of an interrupt.
		Use Acceptance Mask
		1 = Use Mask (Msk28-0, MXtd, and MDir) for acceptance filtering.
[12]	UMask	0 = Mask ignored.
		<b>Note</b> : If the <b>UMask</b> bit is set to one, the Message Object's mask bits have to be programmed during initialization of the Message Object before <b>MsgVal</b> is set to one.
		Transmit Interrupt Enable
[11]	TxIE	1 = IntPnd will be set after a successful transmission of a frame.
		0 = IntPnd will be left unchanged after the successful transmission of a frame.
[10]	RxIE	Receive Interrupt Enable

Bits	Descriptions	
		1 = IntPnd will be set after a successful reception of a frame.
		0 = IntPnd will be left unchanged after a successful reception of a frame.
		Remote Enable
[9]	RmtEn	1 = At the reception of a Remote Frame, <b>TxRqst</b> is set.
		0 = At the reception of a Remote Frame, <b>TxRqst</b> is left unchanged.
		Transmit Request
[8]	TxRqst	1 = The transmission of this Message Object is requested and is not yet done.
		0 = This Message Object is not waiting for transmission.
		End of Buffer
		1 = Single Message Object or last Message Object of a FIFO Buffer.
[7]	ЕоВ	0 = Message Object belongs to a FIFO Buffer and is not the last Message Object of that FIFO Buffer.
		Note: This bit is used to concatenate two or more Message Objects (up to 32) to build a FIFO Buffer. For single Message Objects (not belonging to a FIFO Buffer), this bit must always be set to one.
		Reserved
[6:4]	Reserved	There are reserved bits. These bits are always read as '0' and must always be written with '0'.
		Data Length Code
		0-8: Data Frame has 0-8 data bytes.
		9-15: Data Frame has 8 data bytes
		<b>Note</b> : The Data Length Code of a Message Object must be defined the same as in all the corresponding objects with the same identifier at other nodes. When the Message Handler stores a data frame, it will write the DLC to the value given by the received message.
		Data 0: 1st data byte of a CAN Data Frame
		Data 1: 2nd data byte of a CAN Data Frame
		Data 2: 3rd data byte of a CAN Data Frame
[3:0]	DLC	Data 3: 4th data byte of a CAN Data Frame
		Data 4: 5th data byte of a CAN Data Frame
		Data 5: 6th data byte of a CAN Data Frame
		Data 6: 7th data byte of a CAN Data Frame
		Data 7 : 8th data byte of a CAN Data Frame
		<b>Note</b> : The <b>Data 0</b> Byte is the first data byte shifted into the shift register of the CAN Core during a reception while the <b>Data 7</b> byte is the last. When the Message Handler stores a Data Frame, it will write all the eight data bytes into a Message Object. If the Data Length Code is less than 8, the remaining bytes of the Message Object will be overwritten by <b>unspecified values</b> .

	Data(7)										
7	6	5	4	3	2	1	0				
	Data(6)										

Bits	Descriptions	escriptions					
[31:16] Reserved		Reserved					
		There are reserved bits. These bits are always read as '0' and must always be written with '0'.					
[15:8]	Data (7)	Data byte 7					
[10.0]	Dulu (1)	8th data byte of CAN Data Frame.					
[7:0]	Data (6)	Data byte 6					
[1.0]	(-)	7th data byte of CAN Data Frame.					

In a CAN Data Frame, Data(0) is the first, Data(7) is the last byte to be transmitted or received. In CAN's serial bit stream, the MSB of each byte will be transmitted first.

#### Message Object in the Message Memory

There are 32 Message Objects in the Message RAM. To avoid conflicts between application software access to the Message RAM and CAN message reception and transmission, the CPU cannot directly access the Message Objects, these accesses are handled through the IF*n* Interface Registers. Table 5-21 provides an overview of the structures of a Message Object.

	Message Object											
UMask	Msk [28:0]	MXtd	MDir	EoB	New	vDat	MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
MsgVal	ID [28:0]	Xtd	Dir	DLC [3:0]	Data0	Data1	Data2	Data3	Data4	Data5	Data6	Data7

Table 5-21	Structure	of a Messa	age Object ir	n the Message	Memory
	onaotaro	01 0 100000	ago objoot ii	n ano moodugo	womeny

The Arbitration Registers **ID28-0**, **Xtd**, and **Dir** are used to define the identifier and type of outgoing messages and are used (together with the mask registers **Msk28-0**, **MXtd**, and **MDir**) for acceptance filtering of incoming messages. A received message is stored in the valid Message Object with matching identifier and Direction = *receive* (Data Frame) or Direction = *transmit* (Remote Frame). Extended frames can be stored only in Message Objects with **Xtd** = one, standard frames in Message Objects with **Xtd** = zero. If a received message (Data Frame or Remote Frame) matches with more than one valid Message Object, it is stored into that with the lowest message number.

### Message Handler Registers

All Message Handler registers are read-only. Their contents (**TxRqst**, **NewDat**, **IntPnd**, and **MsgVal** bits of each Message Object and the Interrupt Identifier) are status information provided by the Message Handler FSM.

### Transmission Request Register 1 (CAN\_TXREQ1)

These registers hold the **TxRqst** bits of the 32 Message Objects. By reading the **TxRqst** bits, the software can check which Message Object in a Transmission Request is pending. The **TxRqst** bit of a specific Message Object can be set/reset by the application software through the IFn Message Interface Registers or by the Message Handler after reception of a Remote Frame or after a successful transmission.

Register	Offset	R/W	Description	Reset Value

		Transmission Request Bits 32-17 (of all Message Objects)					
[15:0]	TxRqst 32-17	1 = The transmission of this Message Object is requested and is not yet done.					
[10.0]		0 = This Message Object is not waiting for transmission.					
		These bits are read only.					

#### New Data Register 1 (CAN\_NDAT1)

These registers hold the **NewDat** bits of the 32 Message Objects. By reading out the **NewDat** bits, the software can check for which Message Object the data portion was updated. The **NewDat** bit of a specific Message Object can be set/reset by the software through the IFn Message Interface Registers or by the Message Handler after reception of a Data Frame or after a successful transmission.

Register	Offset	R/W	Description	Reset Value

		New Data Bits 32-17 (of all Message Objects)
[15:0]	NewData 32-17	1 = The Message Handler or the application software has written new data into the data portion of this Message Object.
		0 = No new data has been written into the data portion of this Message Object by the Message Handler since the last time this flag was cleared by the application software.

#### Interrupt Pending Register 1 (CAN\_IPND1)

These registers contain the **IntPnd** bits of the 32 Message Objects. By reading the **IntPnd** bits, the software can check for which Message Object an interrupt is pending. The **IntPnd** bit of a specific Message Object can be set/reset by the application software through the IFn Message Interface Registers or by the Message Handler after reception or after a successful transmission of a frame. This will also affect the value of **IntId** in the Interrupt Register.

Re	egister	Offset	R/W	Description	Reset Value
C	AN_IPND1	CAN0_BA+0x140	R	Interrupt Pending Register 1	0x0000_0000

31	30	29	28	27	26	25	24

Reserved						WAKUP_STS	

Bits	Descriptions					
		Reserved				
[31:1]	[31:1] Reserved	There are reserved bits. These bits are always read as '0' and must always be written with '0'.				
		Wake Up Status				
[0]	WAKUP STS	1 = Wake-up event is occurred.				
	_	0 = No wake-up event is occurred.				
		Note: The bit can be written '0' to clear.				

### 5.14 PS/2 Device Controller (PS2D)

### 5.14.1 Overview

PS/2 device controller provides basic timing control for PS/2 communication. All communication between the device and the host is managed through the CLK and DATA pins. Unlike PS/2 keyboard or mouse device controller, the received/transmit code needs to be translated as meaningful code by firmware. The device controller generates the CLK signal after receiving a request to send, but host has ultimate control over communication. DATA sent from the host to the device is read on the rising edge and DATA sent from device to the host is change after rising edge. A 16 bytes FIFO is used to reduce CPU intervention. S/W can select 1 to 16 bytes for a continuous transmission.

### 5.14.2 Features

- Host communication inhibit and request to send detection
- Reception frame error detection
- Programmable 1 to 16 bytes transmit buffer to reduce CPU intervention
- Double buffer for data reception
- S/W override bus

### 5.14.3 Block Diagram

The PS/2 device controller consists of APB interface and timing control logic for DATA and CLK lines.

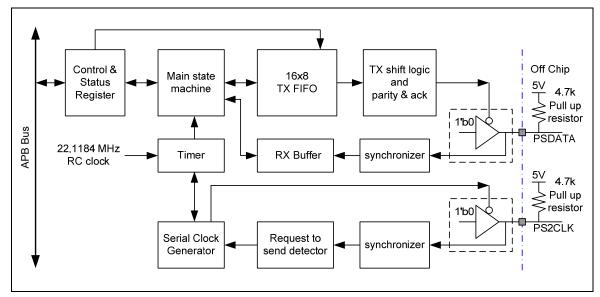

Figure 5-87 PS/2 Device Block Diagram

#### 5.14.4 Functional Description

#### 5.14.4.1 Communication

The PS/2 device implements a bidirectional synchronous serial protocol. The bus is "Idle" when both lines are high (open-collector). This is the only state where the device is allowed start to transmit DATA. The host has ultimate control over the bus and may inhibit communication at any time by pulling the CLK line low.

The CLK signal is generated by PS/2 device. If the host wants to send DATA, it must first inhibit communication from the device by pulling CLK low. The host then pulls DATA low and releases CLK. This is the "Request-to-Send" state and signals the device to start generating CLK pulses.

DATA	CLK	Bus State
High	High	ldle
High	Low	Communication Inhibit
Low	High	Host Request to Send

All data is transmitted one byte at a time and each byte is sent in a frame consisting of 11 or 12 bits. These bits are:

- 1 start bit. This is always 0
- 8 DATA bits, least significant bit first
- 1 parity bit (odd parity)
- 1 stop bit. This is always 1
- 1 acknowledge bit (host-to-device communication only)

The parity bit is set if there is an even number of 1's in the data bits and cleared to 0 if there is an odd number of 1's in the data bits. The number of 1's in the data bits plus the parity bit always add up to an odd number set to 1. This is used for error detection. The device must check this bit and if incorrect it should respond as if it had received an invalid command.

The host may inhibit communication at any time by pulling the CLK line low for at least 100 microseconds. If a transmission is inhibited before the 11th clock pulse, the device must abort the current transmission and prepare to retransmit the current data when host releases Clock. In order to reserve enough time for s/w to decode host command, the transmit logic is blocked by RXINT bit, S/W must clear RXINT bit to start retransmit. S/W can write CLRFIFO to 1 to reset FIFO pointer if need.

#### **Device**-to-Host

The device uses a serial protocol with 11-bit frames. These bits are:

- 1 start bit. This is always 0
- 8 DATA bits, least significant bit first
- 1 parity bit (odd parity)
- 1 stop bit. This is always 1

The device writes a bit on the DATA line when CLK is high, and it is read by the host when CLK is

## ηυνοΤοη

low. Figure 5-88 in the following illustrate this.

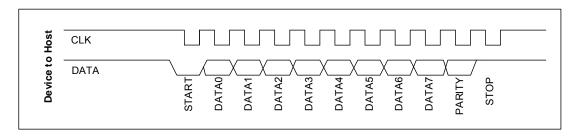

Figure 5-88 Data Format of Device-to-Host

### Host-to-Device:

First of all, the PS/2 device always generates the CLK signal. If the host wants to send DATA, it must first put the CLK and DATA lines in a "Request-to-send" state as follows:

- Inhibit communication by pulling CLK low for at least 100 microseconds
- Apply "Request-to-send" by pulling DATA low, then release CLK

The device should check for this state at intervals not to exceed 10 milliseconds. When the device detects this state, it will begin generating CLK signals and CLK in eight DATA bits and one stop bit. The host changes the DATA line only when the CLK line is low, and DATA is read by the device when CLK is high.

After the stop bit is received, the device will acknowledge the received byte by bringing the DATA line low and generating one last CLK pulse. If the host does not release the DATA line after the 11th CLK pulse, the device will continue to generate CLK pulses until the DATA line is released.

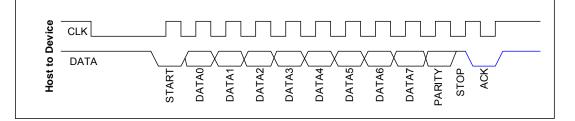

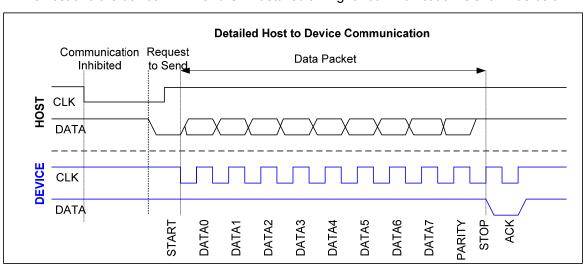

Figure 5-89 Data Format of Host-to-Device

The host and the device DATA and CLK detailed timing for communication is shown as below:

5.14.4.2 PS/2 Bus Timing Specification

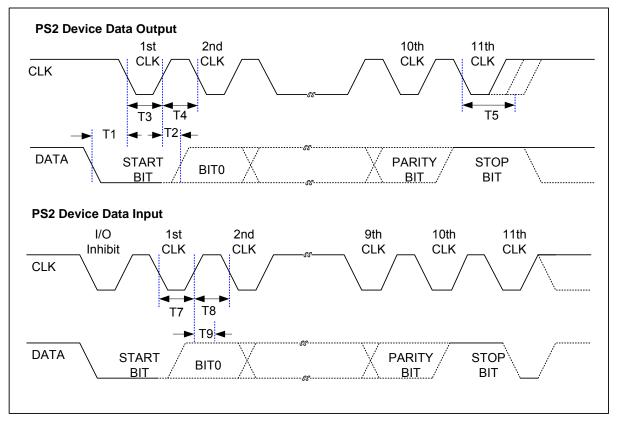

Figure 5-91 PS/2 Bus Timing

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

Symbol	Timing Parameter	MIN.	Max
T1	DATA transition to the falling edge of CLK	5us	25us
T2	Rising edge of CLK to DATA transition	5us	T4-5us
Т3	Duration of CLK inactive	30us	50us
T4	Duration of CLK active	30us	50us
Т5	Time to auxiliary device inhibit after 11 <sup>th</sup> clock to ensure auxiliary device does not start another transmission	>0	50us
Т7	Duration of CLK inactive	30us	50us
Т8	Duration of CLK active	30us	50us
Т9	Time from inactive to active CLK transition, use to time auxiliary device sample DATA	5us	25us

#### 5.14.4.3 TX FIFO Operation

Writing PS2TXDATA0 register starts device to host communication. S/W is required to define TXFIFO depth before writing transmission data to TX FIFO. 1st START bit is sent to PS/2 bus 100us after S/W writes TX FIFO, if there is more than 4 bytes data need to be sent, S/W can write residual data to PS2TXDATA1-3 before 4th byte transmit complete. A time delay 100us is added between two consecutive bytes.

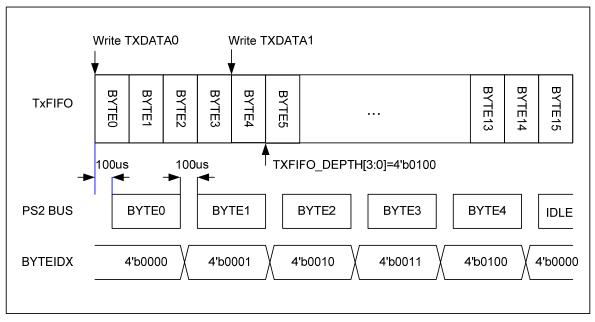

Figure 5-92 PS/2 Data Format

Bits	Descriptions	
		1 = Data in PS2RXDATA register is overwritten by new received data
		0 = No overwrite
		Write 1 to clear this bit.
		Transmit Busy
		This bit indicates that the PS/2 device is currently sending data.
[5]	TXBUSY	1 = Currently sending data
		0 = Idle
		Read only bit.
		Receive Busy
		This bit indicates that the PS/2 device is currently receiving data.
[4]	RXBUSY	1 = Currently receiving data
		0 = Idle
		Read only bit.
		Received Parity
[3]	RXPARITY	This bit reflects the parity bit for the last received data byte (odd parity).
		Read only bit.
		Frame Error
[2]	FRAMERR	For host to device communication, if STOP bit (logic 1) is not received it is a frame error. If frame error occurs, DATA line may keep at low state after 12th clock. At this moment, S/W overrides PS2CLK to send clock till PS2DATA release to high state. After that, device sends a "Resend" command to host.
		1 = Frame error occur
		0 = No frame error
		Write 1 to clear this bit.
[1]	PS2DATA	DATA Pin State
[1]	FOZDATA	This bit reflects the status of the PS2DATA line after synchronizing and sampling.
101	PS2CLK	CLK Pin State
[0]	FJZGLK	This bit reflects the status of the PS2CLK line after synchronizing.

[0]	RXINT	Receive Interrupt This bit is set to 1 when acknowledge bit is sent for Host to device communication. Interrupt occurs if RXINTEN bit is set to 1. 1 = Receive interrupt occurs 0 = No interrupt Write 1 to clear this bit to 0.

### 5.15 I<sup>2</sup>S Controller (I<sup>2</sup>S)

### 5.15.1 Overview

The I<sup>2</sup>S controller consists of IIS protocol to interface with external audio CODEC. Two 8 word deep FIFO for read path and write path respectively and is capable of handling 8 ~ 32 bit word sizes. DMA controller handles the data movement between FIFO and memory.

### 5.15.2 Features

- I<sup>2</sup>S can operate as either master or slave
- Capable of handling 8-, 16-, 24- and 32-bit word sizes
- Mono and stereo audio data supported
- I<sup>2</sup>S and MSB justified data format supported
- Two 8 word FIFO data buffers are provided, one for transmit and one for receive
- Generates interrupt requests when buffer levels cross a programmable boundary
- Two DMA requests, one for transmit and one for receive

### 5.15.6 Register Description

### I<sup>2</sup>S Control Register (I2SCON)

Register	Offset	R/W	Description	Reset Value
I2SCON	I2S_BA+0x00	R/W	I <sup>2</sup> S Control Register	0x0000_0000

31	30	29	28	27	26	25	24						
	Reserved												
23	22	21	20	19	18	17	16						
Reserved	Reserved	RXDMA	TXDMA	CLR_RXFIFO	CLR_TXFIFO	LCHZCEN	RCHZCEN						
15	14	13	12	11	10	9	8						
MCLKEN		RXTH[2:0]			TXTH[2:0]		SLAVE						
7	6	5 4		3	2	1	0						
FORMAT	MONO	WORD	WIDTH	MUTE	RXEN	TXEN	I2SEN						

Bits	Descriptions	Descriptions					
[31:22]	Reserved	Reserved					
		Enable Receive DMA					
[21]	RXDMA	When RX DMA is enabled, ${\rm I}^2 S$ requests DMA to transfer data from receive FIFO to SRAM if FIFO is not empty.					
		1 = Enable RX DMA					
		0 = Disable RX DMA					
		Enable Transmit DMA					
[20]	TXDMA	When TX DMA is enables, $I^2S$ request DMA to transfer data from SRAM to transmit FIFO if FIFO is not full.					
		1 = Enable TX DMA					
		0 = Disable TX DMA					
		Clear Receive FIFO					
[19]	CLR_RXFIFO	Write 1 to clear receive FIFO, internal pointer is reset to FIFO start point, and RXFIFO_LEVEL[3:0] returns to zero and receive FIFO becomes empty.					
		This bit is cleared by hardware automatically, read it return zero.					
		Clear Transmit FIFO					
[18]	CLR_TXFIFO	Write 1 to clear transmit FIFO, internal pointer is reset to FIFO start point, and TXFIFO_LEVEL[3:0] returns to zero and transmit FIFO becomes empty but data in transmit FIFO is not changed.					
		This bit is clear by hardware automatically, read it return zero.					

Bits	Descriptions						
		Left channel zero cross detect enable					
[17]	LCHZCEN	If this bit is set to 1, when left channel data sign bit change or next shift data bits are all zero then LZCF flag in I2SSTATUS register is set to 1.					
		1 = Enable left channel zero cross detect					
		0 = Disable left channel zero cross detect					
		Right channel zero cross detect enable					
[16]	RCHZCEN	If this bit is set to 1, when right channel data sign bit change or next shift data bits are all zero then RZCF flag in I2SSTATUS register is set to 1.					
-		1 = Enable right channel zero cross detect					
		0 = Disable right channel zero cross detect					
		Master clock enable					
[15]	MCLKEN	If NuMicro™ NUC100 series, external crystal clock is frequency 2*N*256fs then software can program MCLK_DIV[2:0] in I2SCLKDIV register to get 256fs clock to audio codec chip.					
		1 = Enable master clock					
		0 = Disable master clock					
		Receive FIFO threshold level					
		When received data word(s) in buffer is equal or higher than threshold level then RXTHF flag is set.					
		000 = 1 word data in receive FIFO					
		001 = 2 word data in receive FIFO					
[14:12]	RXTH[2:0]	010 = 3 word data in receive FIFO					
		011 = 4 word data in receive FIFO					
		100 = 5 word data in receive FIFO					
		101 = 6 word data in receive FIFO					
		110 = 7 word data in receive FIFO					
		111 = 8 word data in receive FIFO					
		Transmit FIFO threshold level					
		If remain data word (32 bits) in transmit FIFO is the same or less than threshold level then TXTHF flag is set.					
		000 = 0 word data in transmit FIFO					
		001 = 1 word data in transmit FIFO					
[11:9]	TXTH[2:0]	010 = 2 words data in transmit FIFO					
		011 = 3 words data in transmit FIFO					
		100 = 4 words data in transmit FIFO					
		101 = 5 words data in transmit FIFO					
		110 = 6 words data in transmit FIFO					
		111 = 7 words data in transmit FIFO					

Bits	Descriptions	
		Slave mode
[8]	SLAVE	I <sup>2</sup> S can operate as master or slave. For master mode, I2S_BCLK and I2S_LRCLK pins are output mode and send bit clock from NuMicro™ NUC100 series to Audio CODEC chip. In slave mode, I2S_BCLK and I2S_LRCLK pins are input mode and I2S_BCLK and I2S_LRCLK signals are received from outer Audio CODEC chip.
		1 = Slave mode
		0 = Master mode
		Data format
[7]	FORMAT	1 = MSB justified data format
		0 = I <sup>2</sup> S data format
		Monaural data
		1 = Data is monaural format
[6]	MONO	0 = Data is stereo format
		Note: when chip record data, only right channel data will be save if monaural format is select.
		Word width
		00 = data is 8-bit
[5:4]	WORDWIDTH	01 = data is 16-bit
		10 = data is 24-bit
		11 = data is 32-bit
		Transmit mute enable
[3]	MUTE	1= Transmit channel zero
		0 = Transmit data is shifted from buffer
		Receive enable
[2]	RXEN	1 = Enable data receive
		0 = Disable data receive
		Transmit enable
[1]	TXEN	1 = Enable data transmit
		0 = Disable data transmit
		Enable I <sup>2</sup> S controller
[0]	I2SEN	1 = Enable
		0 = Disable

### I<sup>2</sup>S Clock Divider (I2SCLKDIV)

		1000 = 8 words in receive FIFO
		Left channel zero cross flag
		It indicates left channel next sample data sign bit is changed or all data bits are zero.
[23]	LZCF	1 = Left channel zero cross is detected
		0 = No zero cross
		Software can write 1 to clear this bit to zero
		Right channel zero cross flag
		0001 = 1 word in transmit FIFO            1000 = 8 words in transmit FIFO <b>Receive FIFO level</b> These bits indicate word number in receive FIFO         0000 = No data         0001 = 1 word in receive FIFO            1000 = 8 words in receive FIFO            1000 = 8 words in receive FIFO         Left channel zero cross flag         It indicates left channel next sample data sign bit is changed or all data bits are ze         1 = Left channel zero cross is detected         0 = No zero cross         Software can write 1 to clear this bit to zero
[22]	RZCF	1 = Right channel zero cross is detected
		0 = No zero cross
		Software can write 1 to clear this bit to zero

Bits	Descriptions				
		Transmit Busy			
10.41	TYPUOY	This bit is clear to 0 when all data in transmit FIFO and shift buffer is shifted out. And set to 1 when 1st data is load to shift buffer.			
[21]	TXBUSY	1 = Transmit shift buffer is busy			
		0 = Transmit shift buffer is empty			
		This bit is read only.			
		Transmit FIFO empty			
		This bit reflect data word number in transmit FIFO is zero			
[20]	TXEMPTY	1 = Empty			
		0 = Not empty			
		This bit is read only.			
		Transmit FIFO full			
		This bit reflect data word number in transmit FIFO is 8			
[19]	TXFULL	1 = Full.			
		0 = Not full.			
		This bit is read only			
		Transmit FIFO threshold flag			
[18]	TXTHF	When data word(s) in transmit FIFO is equal or lower than threshold value set in TXTH[2:0] the TXTHF bit becomes to 1. It keeps at 1 till TXFIFO_LEVEL[3:0] is higher than TXTH[1:0] after software write TXFIFO register.			
[10]		1 = Data word(s) in FIFO is equal or lower than threshold level			
		0 = Data word(s) in FIFO is higher than threshold level			
		This bit is read only			
		Transmit FIFO overflow flag			
		Write data to transmit FIFO when it is full and this bit set to 1			
[17]	TXOVF	1 = Overflow			
		0 = No overflow			
		Software can write 1 to clear this bit to zero			
		Transmit FIFO underflow flag			
		When transmit FIFO is empty and shift logic hardware read data from data FIFO causes this set to 1.			
[16]	TXUDF	1 = Underflow			
		0 = No underflow			
		Software can write 1 to clear this bit to zero			
[15:13]	Reserved	Reserved			
		Receive FIFO empty			
		This bit reflects data words number in receive FIFO is zero			
[12]	RXEMPTY	1 = Empty			
		0 = Not empty			
		This bit is read only.

Bits	Descriptions	Descriptions				
[31:0]	RXFIFO	Receive FIFO register I <sup>2</sup> S contains 8 words (8x32 bit) data buffer for data receive. Read this register to get data in FIFO. The remaining data word number is indicated by RX_LEVEL[3:0] in I2SSTATUS register.				

### 5.16 Analog-to-Digital Converter (ADC)

#### 5.16.1 Overview

NuMicro<sup>™</sup> NUC100 Series contains one 12-bit successive approximation analog-to-digital converters (SAR A/D converter) with 8 input channels. The A/D converter supports three operation modes: single, single-cycle scan and continuous scan mode. The A/D converters can be started by software and external STADC pin.

#### 5.16.2 Features

- Analog input voltage range: 0~V<sub>REF</sub>
- 12-bit resolution and 10-bit accuracy is guaranteed
- Up to 8 single-end analog input channels or 4 differential analog input channels
- Maximum ADC clock frequency is 16 MHz
- Up to 700K SPS conversion rate
- Three operating modes
  - Single mode: A/D conversion is performed one time on a specified channel
  - Single-cycle scan mode: A/D conversion is performed one cycle on all specified channels with the sequence from the lowest numbered channel to the highest numbered channel
  - Continuous scan mode: A/D converter continuously performs Single-cycle scan mode until software stops A/D conversion
- An A/D conversion can be started by
  - Software write 1 to ADST bit
  - External pin STADC
- Conversion results are held in data registers for each channel with valid and overrun indicators
- Conversion result can be compared with specify value and user can select whether to generate an interrupt when conversion result is equal to the compare register setting
- Channel 7 supports 3 input sources: external analog voltage, internal bandgap voltage, and internal temperature sensor output
- Support Self-calibration to minimize conversion error

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

# nuvoTon

### 5.16.3 Block Diagram

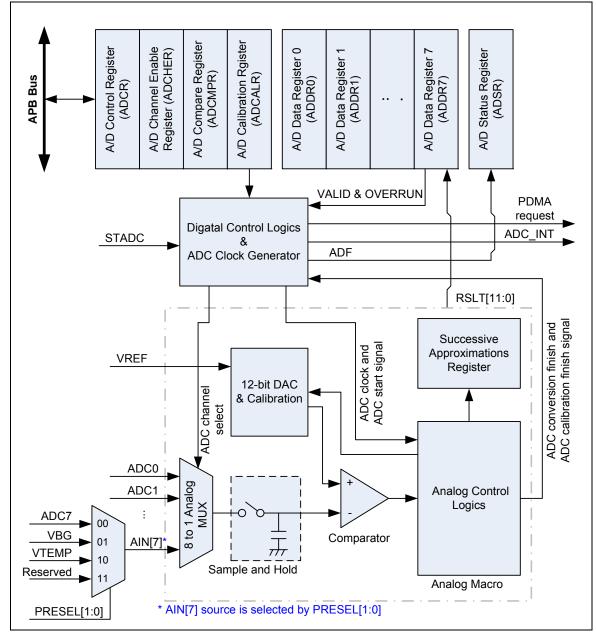

Figure 5-98 ADC Controller Block Diagram

#### 5.16.4 Functional Description

The A/D converter operates by successive approximation with 12-bit resolution. This A/D converter equips with self calibration function to minimize conversion error, user can write 1 to CALEN bit in ADCALR register to enable calibration function, while internal calibration is finished the CAL\_DONE bit will be set to 1 by hardware. The ADC has three operation modes: single mode, single-cycle scan mode and continuous scan mode. When changing the operating mode or analog input channel, in order to prevent incorrect operation, software must clear ADST bit to 0 in ADCR register.

#### 5.16.4.1 Self-Calibration

When chip power on or switch ADC input type between single-end input and differential input, it needs to do ADC self calibration to minimize the conversion error. User can write 1 to CALEN bit of ADCALR register to start the self calibration. It needs 127 ADC clocks to complete the calibration and the CAL\_DONE bit will be set to 1 by hardware. The detail timing is shown as below:

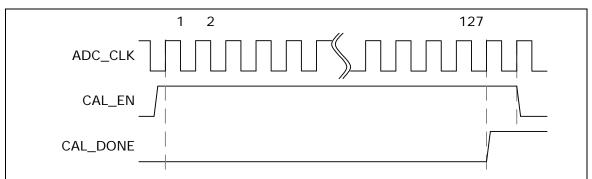

Figure 5-99 ADC Converter Self-Calibration Timing Diagram

#### 5.16.4.2 ADC Clock Generator

The maximum sampling rate is up to 700K SPS. The ADC engine has four clock sources selected by 2-bit ADC\_S (CLKSEL1[3:2]), the ADC clock frequency is divided by an 8-bit prescaler with the formula:

The ADC clock frequency = (ADC clock source frequency) / (ADC\_N+1);

where the 8-bit ADC\_N is located in register CLKDIV[23:16].

If the clock source is from HCLK, the ADC\_N can't be 0.

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

## nuvoTon

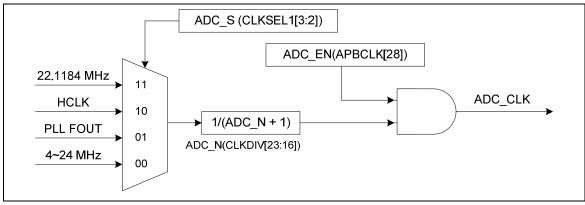

Figure 5-100 ADC Clock Control

#### 5.16.4.3 Single Mode

In single mode, A/D conversion is performed only once on the specified single channel. The operations are as follows:

- 1. A/D conversion will be started when the ADST bit of ADCR is set to 1 by software or external trigger input.
- 2. When A/D conversion is finished, the result is stored in the A/D data register corresponding to the channel.
- 3. The ADF bit of ADSR register will be set to 1. If the ADIE bit of ADCR register is set to 1, the ADC interrupt will be asserted.
- 4. The ADST bit remains 1 during A/D conversion. When A/D conversion ends, the ADST bit is automatically cleared to 0 and the A/D converter enters idle state. Note that, after clearing the ADST bit, the ADST bit must be kept at 0 at least one ADC clock period before setting it to 1 again. If not, the A/D converter may not work.

Note: If software enables more than one channel in single mode, the channel with the lowest number will be selected and the other enabled channels will be ignored.

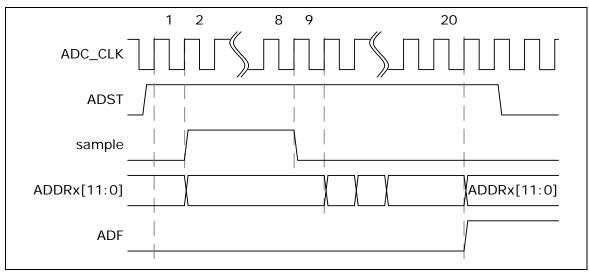

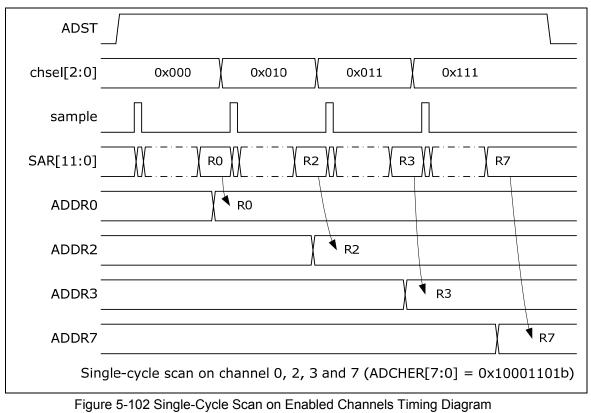

Figure 5-101 Single Mode Conversion Timing Diagram

#### 5.16.4.4 Single-Cycle Scan Mode

In single-cycle scan mode, A/D conversion will sample and convert the specified channels once in the sequence from the lowest number enabled channel to the highest number enabled channel.

- 1. When the ADST bit of ADCR is set to 1 by software or external trigger input, A/D conversion starts on the channel with the lowest number.
- 2. When A/D conversion for each enabled channel is completed, the result is sequentially transferred to the A/D data register corresponding to each channel.
- 3. When the conversions of all the enabled channels are completed, the ADF bit in ADSR is set to 1. If the ADC interrupt function is enabled, the ADC interrupt occurs.
- 4. After A/D conversion ends, the ADST bit is automatically cleared to 0 and the A/D converter enters idle state. If ADST is cleared to 0 before all enabled ADC channels conversion done, ADC controller will finish current conversion and the result of the lowest enabled ADC channel will become unpredictable. Note that, after clearing the ADST bit to 0, the ADST bit must be kept at 0 at least one ADC clock period before setting it to 1 again. If not, the A/D converter may not work.

An example timing diagram for single-cycle scan on enabled channels (0, 2, 3 and 7) is shown as below:

#### 5.16.4.5 Continuous Scan Mode

In continuous scan mode, A/D conversion is performed sequentially on the specified channels that enabled by CHEN bits in ADCHER register (maximum 8 channels for ADC). The operations are as follows:

- 1. When the ADST bit in ADCR is set to 1 by software or external trigger input, A/D conversion starts on the channel with the lowest number.
- 2. When A/D conversion for each enabled channel is completed, the result of each enabled channel is stored in the A/D data register corresponding to each enabled channel.
- 3. When A/D converter completes the conversions of all enabled channels sequentially, the ADF bit (ADSR[0]) will be set to 1. If the ADC interrupt function is enabled, the ADC interrupt occurs. The conversion of the enabled channel with the lowest number will start again if software has not cleared the ADST bit.
- 4. As long as the ADST bit remains at 1, the step 2 ~ 3 will be repeated. When ADST is cleared to 0, ADC controller will finish current conversion and the result of the lowest enabled ADC channel will become unpredictable.

An example timing diagram for continuous scan on enabled channels (0, 2, 3 and 7) is shown as below:

ADST					Soft	ware cle	ear ADST	
- chsel[2:0] -	0×000 ( 0×	(010) (0x011)	0x111	0x000	0x010	0x011	0x111	0x000
sample								
- ADDR0 -	X			X				
ADDR2 -					X			
ADDR3						X		
ADDR7								
Continuous scan on channel 0, 2, 3 and 7 (ADCHER[7:0] = $0 \times 10001101b$ )								

Figure 5-103 Continuous Scan on Enabled Channels Timing Diagram

#### 5.16.4.6 External trigger Input Sampling and A/D Conversion Time

In single-cycle scan mode, A/D conversion can be triggered by external pin request. When the ADCR.TRGEN is set to high to enable ADC external trigger function, setting the TRGS[1:0] bits to 00b is to select external trigger input from the STADC pin. Software can set TRGCOND[1:0] to select trigger condition is falling/rising edge or low/high level. If level trigger condition is selected, the STADC pin must be kept at defined state at least 8 PCLKs. The ADST bit will be set to 1 at the 9th PCLK and start to conversion. Conversion is continuous if external trigger input is kept at active state in level trigger mode. It is stopped only when external condition trigger condition disappears. If edge trigger condition is selected, the high and low state must be kept at least 4 PLCKs. Pulse that is shorter than this specification will be ignored.

#### 5.16.4.7 Conversion Result Monitor by Compare Function

ADC controller provide two sets of compare register ADCMPR0 and ADCMPR1, to monitor maximum two specified channels conversion result from A/D conversion controller, refer to Figure 5-104. Software can select which channel to be monitored by set CMPCH(ADCMPRx[5:0]) and CMPCOND bit is used to check conversion result is less than specify value or greater than (equal to) value specified in CMPD[11:0]. When the conversion of the channel specified by CMPCH is completed, the comparing action will be triggered one time automatically. When the compare result meets the setting, compare match counter will increase 1, otherwise, the compare match counter will be clear to 0. When counter value reach the setting of (CMPMATCNT+1) then CMPF bit will be set to 1, if CMPIE bit is set then an ADC\_INT interrupt request is generated. Software can use it to monitor the external analog input pin voltage transition in scan mode without imposing a load on software. Detail logics diagram is shown as below:

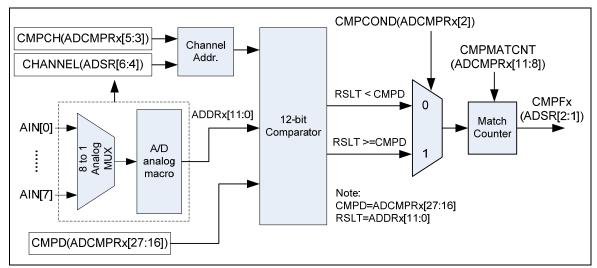

Figure 5-104 A/D Conversion Result Monitor Logics Diagram

#### 5.16.4.8 Interrupt Sources

There are three interrupt sources of ADC interrupt. When an ADC operation mode finishes its conversion, the A/D conversion end flag, ADF, will be set to 1. The CMPF0 and CMPF1 are the compare flags of compare function. When the conversion result meets the settings of ADCMPR0/1, the corresponding flag will be set to 1. When one of the flags, ADF, CMPF0 and CMPF1, is set to 1 and the corresponding interrupt enable bit, ADIE of ADCR and CMPIE of ADCMPR0/1, is set to 1, the ADC interrupt will be asserted. Software can clear the flag to revoke the interrupt request.

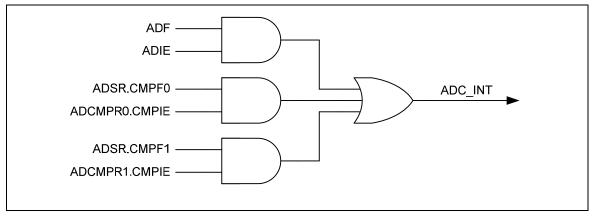

Figure 5-105 A/D Controller Interrupt

#### 5.16.4.9 Peripheral DMA Request

When A/D conversion is finished, the conversion result will be loaded into ADDR register and VALID bit will be set to 1. If the PTEN bit of ADCR is set, ADC controller will generate a request to PDMA. User can use PDMA to transfer the conversion results to a user-specified memory space without CPU's intervention. The source address of PDMA operation is fixed at ADPDMA, no matter what channels was selected. When PDMA is transferring the conversion result, ADC will continue converting the next selected channel if the operation mode of ADC is single scan mode or continuous scan mode. User can monitor current PDMA transfer data through reading ADPDMA register. If ADC completes the conversion of a selected channel and the last conversion result of the same channel has not been transferred by PDMA, OVERUN bit of the corresponding channel will be set and the last ADC conversion result will be overwrite by the new ADC conversion result. PDMA will transfer the latest data of selected channels to the user-specified destination address.

Rese	Reserved CMPCH				CMPCOND	CMPIE	CMPEN	

Bits	Descriptions	
[31:28]	Reserved	Reserved
		Comparison Data
		The 12-bit data is used to compare with conversion result of specified channel.
[27:16]	CMPD	When DMOF bit is set to 0, ADC comparator compares CMPD with conversion result with unsigned format. CMPD should be filled in unsigned format.
		When DMOF bit is set to 1, ADC comparator compares CMPD with conversion result with 2'complement format. CMPD should be filled in 2'complement format.
[15:12]	Reserved	Reserved
		Compare Match Count
[11:8]	CMPMATCNT	When the specified A/D channel analog conversion result matches the compare condition defined by CMPCOND[2], the internal match counter will increase 1. When the internal counter reaches the value to (CMPMATCNT +1), the CMPFx bit will be set.
[7:6]	Reserved	Reserved
		Compare Channel Selection
		000 = Channel 0 conversion result is selected to be compared
		001 = Channel 1 conversion result is selected to be compared
		010 = Channel 2 conversion result is selected to be compared
[5:3]	СМРСН	011 = Channel 3 conversion result is selected to be compared
		100 = Channel 4 conversion result is selected to be compared
		101 = Channel 5 conversion result is selected to be compared
		110 = Channel 6 conversion result is selected to be compared
		111 = Channel 7 conversion result is selected to be compared

Bits	Descriptions	
		Compare Condition
[2]	CMPCOND	1 = Set the compare condition as that when a 12-bit A/D conversion result is greater or equal to the 12-bit CMPD (ADCMPRx[27:16]), the internal match counter will increase one.
[2]	CMFCOND	0 = Set the compare condition as that when a 12-bit A/D conversion result is less than the 12-bit CMPD (ADCMPRx[27:16]), the internal match counter will increase one.
		Note: When the internal counter reaches the value to (CMPMATCNT +1), the CMPFx bit will be set.
		Compare Interrupt Enable
		1 = Enable compare function interrupt
[1]	CMPIE	0 = Disable compare function interrupt
		If the compare function is enabled and the compare condition matches the setting of CMPCOND and CMPMATCNT, CMPF bit will be asserted, in the meanwhile, if CMPIE is set to 1, a compare interrupt request is generated.
		Compare Enable
		1 = Enable compare function
[0]	CMPEN	0 = Disable compare function
		Set this bit to 1 to enable ADC controller to compare CMPD[11:0] with specified channel conversion result when converted data is loaded into ADDR register.

#### A/D Status Register (ADSR)

Register	Offset	R/W	Description	Reset Value
ADSR	ADC_BA+0x30	R/W	ADC Status Register	0x0000_0000

Bits	Descriptions	
[31:24]	Reserved	Reserved
		Over Run flag
[23:16]	OVERRUN	It is a mirror to OVERRUN bit in ADDRx
		It is read only.
		Data Valid flag
[15:8]	VALID	It is a mirror of VALID bit in ADDRx
		It is read only.
[7]	Reserved	Reserved
		Current Conversion Channel
[6:4]	CHANNEL	This field reflects current conversion channel when BUSY=1. When BUSY=0, it shows number of the next converted channel.
		It is read only.
		BUSY/IDLE
		1 = A/D converter is busy at conversion.
[3]	BUSY	0 = A/D converter is in idle state.
		This bit is mirror of as ADST bit in ADCR.
		It is read only.
		Compare Flag
[2]	CMPF1	When the selected channel A/D conversion result meets setting condition in ADCMPR1 then this bit is set to 1. And it is cleared by writing 1 to self.
		1 = Conversion result in ADDR meets ADCMPR1 setting
		0 = Conversion result in ADDR does not meet ADCMPR1 setting

Bits	Descriptions	
		Compare Flag
[1]	CMPF0	When the selected channel A/D conversion result meets setting condition in ADCMPR0 then this bit is set to 1. And it is cleared by writing 1 to self.
		1 = Conversion result in ADDR meets ADCMPR0 setting
		0 = Conversion result in ADDR does not meet ADCMPR0 setting
		A/D Conversion End Flag
		A status flag that indicates the end of A/D conversion.
[0]	ADF	ADF is set to 1 at these two conditions:
[0]	ADF	1. When A/D conversion ends in single mode
		2. When A/D conversion ends on all specified channels in scan mode
		This flag can be cleared by writing 1 to self.

#### A/D Calibration Register (ADCALR)

Register	Offset	R/W	Description	Reset Value

### 5.17 Analog Comparator (CMP)

### 5.17.1 Overview

NuMicro<sup>™</sup> NUC100 Series contains two comparators. The comparators can be used in a number of different configurations. The comparator output is a logical one when positive input greater than negative input, otherwise the output is a zero. Each comparator can be configured to cause an interrupt when the comparator output value changes. The block diagram is shown in Figure 5-108.

### 5.17.2 Features

- Analog input voltage range: 0~5.0 V
- Hysteresis function supported
- Two analog comparators with optional internal reference voltage input at negative end
- One interrupt vector for both comparators

### 5.17.3 Block Diagram

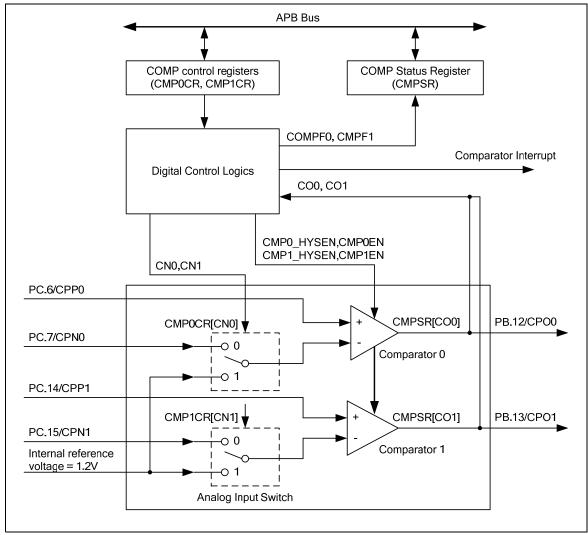

Figure 5-108 Analog Comparator Block Diagram

#### 5.17.4 Functional Description

5.17.4.1 Interrupt Sources

The output of comparators are sampled by PCLK and reflected at CO1 and CO2 of CMPSR register. If CMP0IE/CMP1IE of CMP0CR/CMP1CR is set to 1, the comparator interrupt will be enabled. As the output state of comparator is changed, the comparator interrupt will be asserted and the corresponding flag, CMPF0 or CMPF1, will be set. Software can clear the flag to 0 by writing 1 to it.

[1]	CMPF1	Comparator1 Flag This bit is set by hardware whenever the comparator1 output changes state. This will cause an interrupt if CMP1IE set. Write 1 to clear this bit to zero.
[0]	CMPF0	<b>Comparator0 Flag</b> This bit is set by hardware whenever the comparator0 output changes state. This will cause an interrupt if CMP0IE set. Write 1 to clear this bit to zero.

### 5.18 PDMA Controller (PDMA)

#### 5.18.1 Overview

NuMicro<sup>™</sup> NUC130/NUC140 contains a peripheral direct memory access (PDMA) controller that transfers data to and from memory or transfer data to and from APB devices. The PDMA has nine channels of DMA (Peripheral-to-Memory or Memory-to-Peripheral or Memory-to-Memory). For each PDMA channel (PDMA CH0~CH8), there is one word buffer as transfer buffer between the Peripherals APB devices and Memory.

Software can stop the PDMA operation by disable PDMA [PDMACEN]. The CPU can recognize the completion of a PDMA operation by software polling or when it receives an internal PDMA interrupt. The PDMA controller can increase source or destination address or fixed them as well.

Notice: The partial of NuMicro™ NUC130/NUC140 only has 1 PDMA channel (channel 0).

#### 5.18.2 Features

- Support nine DMA channels. Each channel can support a unidirectional transfer
- AMBA AHB master/slave interface compatible, for data transfer and register read/write
- Support source and destination address increased mode or fixed mode
- Hardware channel priority. DMA channel 0 has the highest priority and channel 8 has the lowest priority

5.18.3 Block Diagram

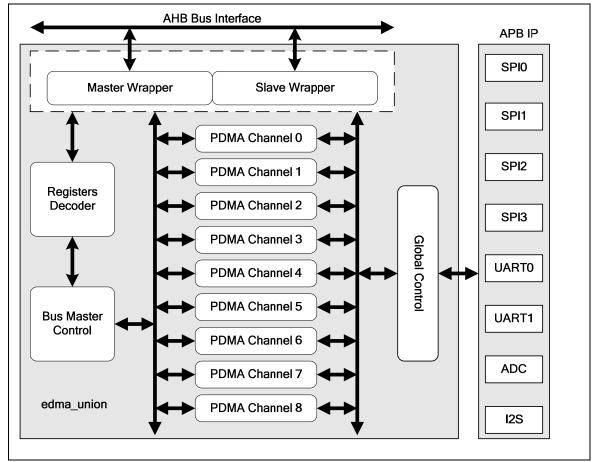

Figure 5-110 PDMA Controller Block Diagram

#### 5.18.4 Function Description

The PDMA controller has nine channels of DMA associated with Peripheral-to-Memory to-Peripheral or Memory-to-Memory. For each PDMA channel, there is one word memory as transfer buffer between the Peripherals APB IP and Memory.

The CPU can recognize the completion of a PDMA operation by software polling or when it receives an internal PDMA interrupt. As to the source and destination address, the PDMA controller has two modes: increased and fixed.

Every PDMA default channel behavior is not pre-defined, so users must configure the channel service settings of PDMA\_PDSSR0, PDMA\_PDSSR1 and PDMA\_PDSSR2 before start the related PDMA channel.

Software must enable DMA channel PDMA [PDMACEN] and then write a valid source address to the PDMA\_SARx register, a destination address to the PDMA\_DARx register, and a transfer count to the PDMA\_BCRx register. Next, trigger the DMA\_CSRx PDMA [TRIG\_EN]. PDMA will continue the transfer until PDMA\_CBCRx comes down to zero, If an error occurs during the PDMA operation, the channel stops unless software clears the error condition and sets the PDMA\_CSRx [SW\_RST] to reset the PDMA channel and set PDMA\_CSRx [PDMACEN] and [TRIG\_EN] bits field to start again.

In PDMA (Peripheral-to-Memory or Memory-to-Peripheral) mode, DMA can transfer data between the Peripherals APB IP (ex: UART, SPI, ADC....) and Memory.

### 5.18.5 Register Map

R: read only, W: write only, R/W: both read and write

15	14	13	12	11	10	9	8			
	Reserved									
7	6	5	4	3	2	1	0			
DAD_SEL SAD_SEL			_SEL	MODE	E_SEL	SW_RST	PDMACEN			

Bits	Descriptions	
[31:24]	Reserved	Reserved
		Trigger Enable
		1 = Enable PDMA data read or write transfer.
[23]	TRIG EN	0 = No effect.
[]		Note: When PDMA transfer completed, this bit will be cleared automatically.
		If the bus error occurs, all PDMA transfer will be stopped. Software must reset all PDMA channel, and then trigger again.
[22:21]	Reserved	Reserved

Bits	Descriptions						
		Peripheral transfer Width Select					
		00 = One word (32-bit) is transferred for every PDMA operation.					
		01 = One byte (8-bit) is transferred for every PDMA operation.					
[20:19]	APB_TWS	10 = One half-word (16-bit) is transferred for every PDMA operation.					
		11 = Reserved.					
		Note: This field is meaningful only when MODE_SEL is Peripheral to Memory mode (Peripheral-to-Memory) or Memory to Peripheral mode (Memory-to-Peripheral).					
[18:8]	Reserved	Reserved					
		Transfer Destination Address Direction Select					
		00 = Transfer Destination address is increasing successively.					
[7:6]	DAD_SEL	01 = Reserved.					
		10 = Transfer Destination address is fixed (This feature can be used when data where transferred from multiple sources to a single destination).					
		11 = Reserved.					
		Transfer Source Address Direction Select					
		00 = Transfer Source address is increasing successively.					
[5:4]	SAD_SEL	01 = Reserved.					
		10 = Transfer Source address is fixed (This feature can be used when data where transferred from a single source to multiple destinations).					
		11 = Reserved.					
		PDMA Mode Select					
[2.0]	MODE SEL	00 = Memory to Memory mode (Memory-to-Memory).					
[3:2]	MODE_SEL	01 = Peripheral to Memory mode (Peripheral-to-Memory).					
		10 = Memory to Peripheral mode (Memory-to-Peripheral).					
		Software Engine Reset					
[4]		0 = Writing 0 to this bit has no effect.					
[1]	SW_RST	1 = Writing 1 to this bit will reset the internal state machine, pointers and internal buffer. The contents of control register will not be cleared. This bit will auto clear after few clock cycles.					
		PDMA Channel Enable					
[0]	PDMACEN	Setting this bit to 1 enables PDMA's operation. If this bit is cleared, PDMA will ignore all PDMA request and force Bus Master into IDLE state.					
		Note: SW_RST(PDMA_CSRx[1], x= 0~8) will clear this bit					

### PDMA Transfer Source Address Register (PDMA\_SARx)

Register	Offset	R/W	Description	Reset Value
PDMA_SAR0	PDMA_BA_ch0+0x04	R/W	PDMA Transfer Source Address Register CH0	0x0000_0000

### 5.19 External Bus Interface (EBI)

#### 5.19.1 Overview

The NuMicro<sup>™</sup> NUC130/NUC140 LQFP-64 and LQFP-100 package equips an external bus interface (EBI) for external device used.

To save the connections between external device and this chip, EBI support address bus and data bus multiplex mode. And, address latch enable (ALE) signal supported differentiate the address and data cycle.

#### 5.19.2 Features

External Bus Interface has the following functions:

- External devices with max. 64K-byte size (8-bit data width)/128K-byte (16-bit data width) supported
- Variable external bus base clock (MCLK) supported
- 8-bit or 16-bit data width supported
- Variable data access time (tACC), address latch enable time (tALE) and address hold time (tAHD) supported
- Address bus and data bus multiplex mode supported to save the address pins
- Configurable idle cycle supported for different access condition: Write command finish (W2X), Read-to-Read (R2R)

### 5.19.3 Block Diagram

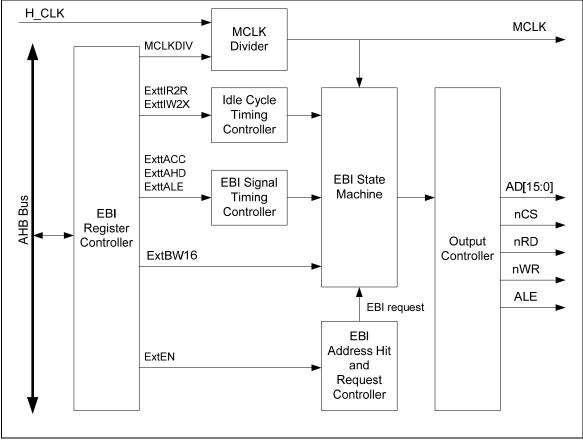

Figure 5-111 EBI Block Diagram

### 5.19.4 Function Description

#### 5.19.4.1 EBI Area and Address Hit

EBI mapping address is located at  $0x6000_{-}0000 \sim 0x6001_{-}FFFF$  and the total memory space is 128Kbyte. When system request address hit EBI's memory space, the corresponding EBI chip select signal is assert and EBI state machine operates.

For an 8-bit device (64Kbyte), EBI mapped this 64Kbyte device to 0x6000\_0000 ~ 0x6000\_FFFF and 0x6001\_0000 ~ 0x6001\_FFFF simultaneously.

#### 5.19.4.2 EBI Data Width Connection

EBI support device whose address bus and data bus are multiplexed. For the external device with separated address and data bus, the connection to device needs additional logic to latch the address. In this case, pin ALE is connected to the latch device to latch the address value. Pin AD is the input of the latch device, and the output of the latch device is connected to the address of external device. For 16-bit device, the AD [15:0] shared by address and 16-bit data. For 8-bit device, only AD [7:0] shared by address and 8-bit data, AD [15:8] is dedicated for address and could be connected to 8-bit device directly.

For 8-bit data width, chip system address bit [15:0] is used as the device's address [15:0]. For 16bit data width, chip system address bit [16:1] is used as the device's address [15:0] and chip system address bit [0] is useless.

EBI bit width	System address (AHBADR)	EBI address (AD)	
8-bit	AHBADR[15:0]	AD[15:0]	
16-bit	AHBADR[16:1]	AD[15:0]	

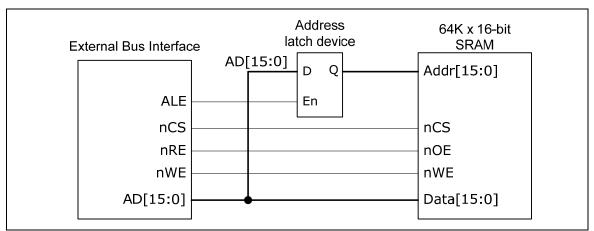

Figure 5-112 Connection of 16-bit EBI Data Width with 16-bit Device

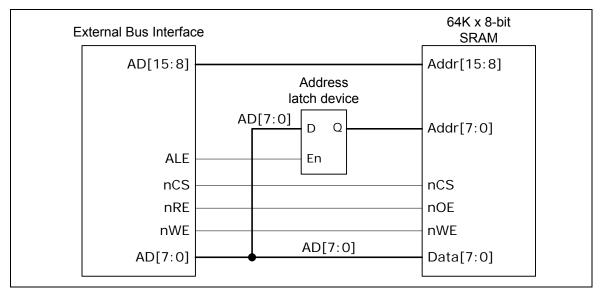

Figure 5-113 Connection of 8-bit EBI Data Width with 8-bit Device

When system access data width is lager than EBI data width, EBI controller will finish a system access command by operating EBI access more than once. For example, if system requests a 32-bit data through EBI device, EBI controller will operate accessing four times when setting EBI data width with 8-bit.

#### 5.19.4.3 EBI Operating Control

#### MCLK Control

In the chip, all EBI signals will be synchronized by MCLK when EBI is operating. When chip connects to the external device with slower operating frequency, the MCLK can divide most to HCLK/32 by setting MCLKDIV of register EBICON. Therefore, chip can suitable for a wide frequency range of EBI device. If MCLK is set to HCLK/1, EBI signals are synchronized by positive edge of MCLK, else by negative edge of MCLK.

#### **Operation and Access Timing Control**

In the start of access, chip select (nCS) asserts to low and wait one MCLK for address setup time (tASU) for address stable. Then ALE asserts to high after address is stable and keeps for a period of time (tALE) for address latch. After latch address, ALE asserts to low and wait one MCLK for latch hold time (tLHD) and another one MCLK cycle (tA2D) that is inserted behind address hold time to be the bus turn-around time for address change to data. Then nRD asserts to low when read access or nWR asserts to low when write access. Then nRD or nWR asserts to high after keeps access time (tACC) for reading output stable or writing finish. After that, EBI signals keep for data access hold time (tAHD) and chip select asserts to high, address is released by current access control.

EBI controller provides a flexible timing control for different external device. In EBI timing control, tASU, tLHD and tA2D are fixed to 1 MCLK cycle, tAHD can modulate to 1~8 MCLK cycles by setting ExttAHD of register EXTIME, tACC can modulate to 1~32 MCLK cycles by setting ExttACC of register EXTIME, and tALE can modulate to 1~8 MCLK cycles by setting tALE of register EBICON.

Parameter	Value	Unit	Description	
tASU	1	MCLK	Address Latch Setup Time.	
tALE	1~8	MCLK	ALE High Period. Controlled by ExttALE of EBICON.	
tLHD	1	MCLK	Address Latch Hold Time.	
tA2D	1	MCLK	Address To Data Delay (Bus Turn-Around Time).	
tACC	1 ~ 32	MCLK	Data Access Time. Controlled by ExttACC of EXTIME.	
tAHD	1~8	MCLK	Data Access Hold Time. Controlled by ExttAHD of EXTIME.	
IDLE	0~15	MCLK	Idle Cycle. Controlled by ExtIR2R and ExtIW2X of EXTIME.	

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

# nuvoTon

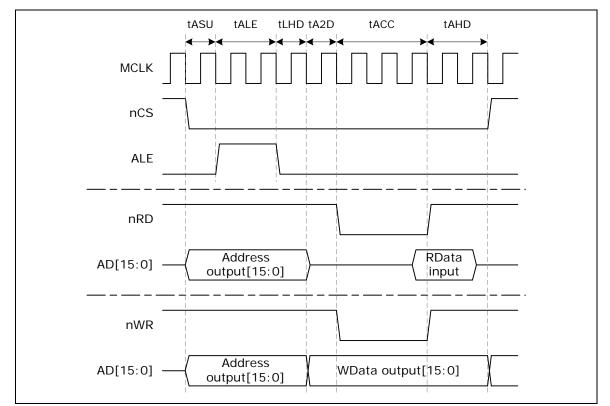

Figure 5-114 Timing Control Waveform for 16-bit Data Width

Figure 5-114 is an example of setting 16-bit data width. In this example, AD bus is used for being address[15:0] and data[15:0]. When ALE assert to high, AD is address output. After address is latched, ALE asserts to low and the AD bus change to high impedance to wait device output data in read access operation, or it is used for being write data output.

### NuMicro<sup>™</sup> NUC130/NUC140 Technical Reference Manual

# nuvoTon

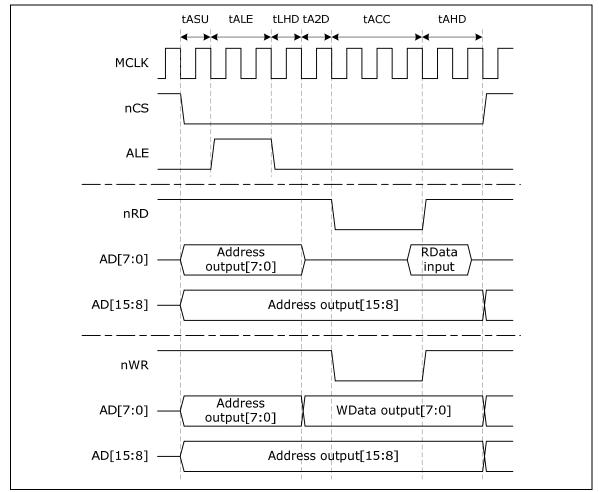

Figure 5-115 Timing Control Waveform for 8-bit Data Width

Figure 5-115 is an example of setting 8-bit data width. The difference between 8-bit and 16-bit data width is AD[15:8]. In 8-bit data width setting, AD[15:8] always be Address[15:8] output so that external latch need only 8-bit width.

#### Insert Idle Cycle

When EBI accessing continuously, there may occur bus conflict if the device access time is much slow with system operating. EBI controller supply additional idle cycle to solve this problem. During idle cycle, all control signals of EBI are inactive. Figure 5-116 show idle cycle as below:

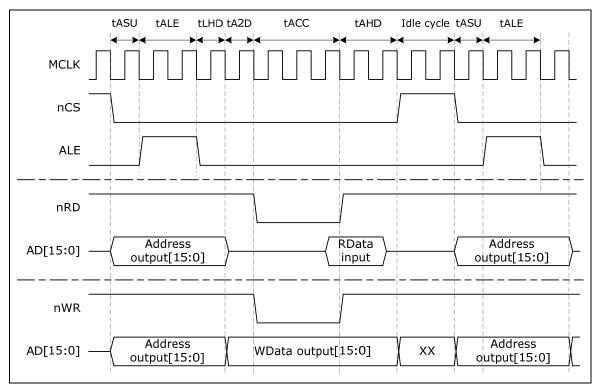

Figure 5-116 Timing Control Waveform for Insert Idle Cycle

There are two conditions that EBI can insert idle cycle by timing control:

- 1. After write access
- 2. After read access and before next read access

By setting ExtIW2X, and ExtIR2R of register EXTIME, the time of idle cycle can be specified from 0~15 MCLK.

### 6 FLASH MEMORY CONTROLLER (FMC)

### 6.1 Overview

NuMicro<sup>™</sup> NUC100 Series equips with 128/64/32K bytes on chip embedded Flash for application program memory (APROM) that can be updated through ISP procedure. In System Programming (ISP) function enables user to update program memory when chip is soldered on PCB. After chip power on, Cortex-M0 CPU fetches code from APROM or LDROM decided by boot select (CBS) in Config0. By the way, NuMicro<sup>™</sup> NUC100 Series also provides additional DATA Flash for user, to store some application dependent data before chip power off. For 128K bytes APROM device, the data flash is shared with original 128K program memory and its start address is configurable and defined by user application request in Config1. For 64K/32K bytes APROM device, the data flash is fixed at 4K.

### 6.2 Features

- Run up to 50 MHz with zero wait state for continuous address read access
- 128/64/32KB application program memory (APROM)
- 4KB in system programming (ISP) loader program memory (LDROM)
- Configurable or fixed 4KB data flash with 512 bytes page erase unit
- Programmable data flash start address for 128K APROM device
- In System Program (ISP) to update on chip Flash

### 6.3 Block Diagram

The flash memory controller consist of AHB slave interface, ISP control logic, writer interface and flash macro interface timing control logic. The block diagram of flash memory controller is shown as following:

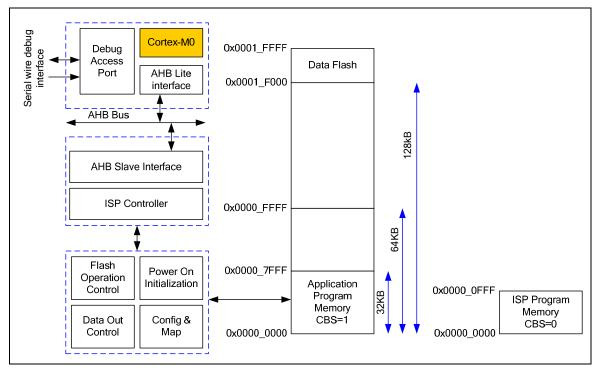

Figure 6-1 Flash Memory Control Block Diagram

### 6.4 Flash Memory Organization

NuMicro<sup>™</sup> NUC100 Series flash memory consists of Program memory (128/64/32KB), data flash, ISP loader program memory, user configuration. User configuration block provides several bytes to control system logic, like flash security lock, boot select, Brown-Out voltage level, data flash base address, ..., and so on. It works like a fuse for power on setting. It is loaded from flash memory to its corresponding control registers during chip power on. User can set these bits according to application request by writer before chip is mounted on PCB. The data flash start address and its size can defined by user depends on application in 128KB APROM device. For 64/32KB APROM devices, its size is 4KB and start address is fixed at 0x0001\_F000.

Block Name	Size	Start Address	End Address
AP-ROM	32/64/(128-0.5*N) KB	0x0000_0000	0x0000_7FFF (32KB) 0x0000_FFFF (64KB) DFBADR-1 (128KB if DFEN=0)
Reserved for future use	896KB	0x0002_0000	0x000F_FFFF
Data Flash	4/4/0.5*N KB	0x0001_F000 DFBADR	0x0001_FFFF
LD-ROM	4 KB	0x0010_0000	0x0010_0FFF
User Configuration	2 words	0x0030_0000	0x0030_0004

### 6.5 Boot Selection

NuMicro<sup>™</sup> NUC100 Series provides in system programming (ISP) feature to enable user to update program memory when chip is mounted on PCB. A dedicated 4KB program memory is used to store ISP firmware. Users can select to start program fetch from APROM or LDROM by (CBS) in Config0.

### 6.6 Data Flash

NuMicro<sup>™</sup> NUC100 Series provides data flash for user to store data. It is read/write through ISP procedure. The size of each erase unit is 512 bytes. When a word will be changed, all 128 words need to be copied to another page or SRAM in advance. For 128KB APROM device, the data flash and application program share the same 128KB memory, if DFEN bit in Config0 is enabled, the data flash base address is defined by DFBADR and application program memory size is (128-0.5\*N)KB and data flash size is 0.5\*N KB. For 64/32KB APROM devices, data flash size is 4KB and start address is fixed at 0x0001\_F000.

Bits	Descriptions	
[31:20]	Reserved	Reserved (It is mandatory to program 0x00 to these Reserved bits)
[19:0]		<b>Data Flash Base Address</b> (This register is work only for 128KB APROM device) For 128KB APROM device, its data flash base address is defined by user. Since on chip flash erase unit is 512 bytes, it is mandatory to keep bit 8-0 as 0. This configuration is only valid for 128KB flash device.

### 6.8 In System Program (ISP)

The program memory and data flash supports both in hardware programming and in system programming (ISP). Hardware programming mode uses gang-writers to reduce programming costs and time to market while the products enter into the mass production state. However, if the product is just under development or the end product needs firmware updating in the hand of an end user, the hardware programming mode will make repeated programming difficult and inconvenient. ISP method makes it easy and possible. NuMicro™ NUC100 Series supports ISP mode allowing a device to be reprogrammed under software control. Furthermore, the capability to update the application firmware makes wide range of applications possible.

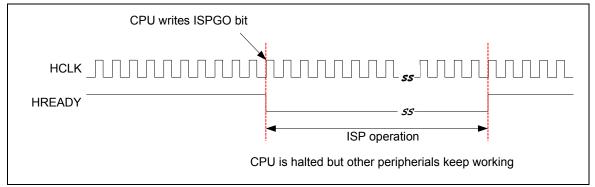

ISP is performed without removing the microcontroller from the system. Various interfaces enable LDROM firmware to get new program code easily. The most common method to perform ISP is via UART along with the firmware in LDROM. General speaking, PC transfers the new APROM code through serial port. Then LDROM firmware receives it and re-programs into APROM through ISP commands. Nuvoton provides ISP firmware and PC application program for NuMicro<sup>™</sup> NUC100 Series. It makes users quite easy perform ISP through Nuvoton ISP tool.

### 6.8.1 ISP Procedure

NuMicro<sup>™</sup> NUC100 Series supports booting from APROM or LDROM initially defined by user configuration bit (CBS). If user wants to update application program in APROM, he can write BS=1 and starts software reset to make chip boot from LDROM. The first step to start ISP function is write ISPEN bit to 1. S/W is required to write REGWRPROT register in Global Control Register (GCR, 0x5000\_0100) with 0x59, 0x16 and 0x88 before writing ISPCON register. This procedure is used to protect flash memory from destroying owning to unintended write during power on/off duration.

Several error conditions are checked after software writes ISPGO bit. If error condition occurs, ISP operation is not been started and ISP fail flag will be set instead of. ISPFF flag is cleared by s/w, it will not be over written in next ISP operation. The next ISP procedure can be started even ISPFF bit keeps at 1. It is recommended that s/w to check ISPFF bit and clear it after each ISP operation if it is set to 1.

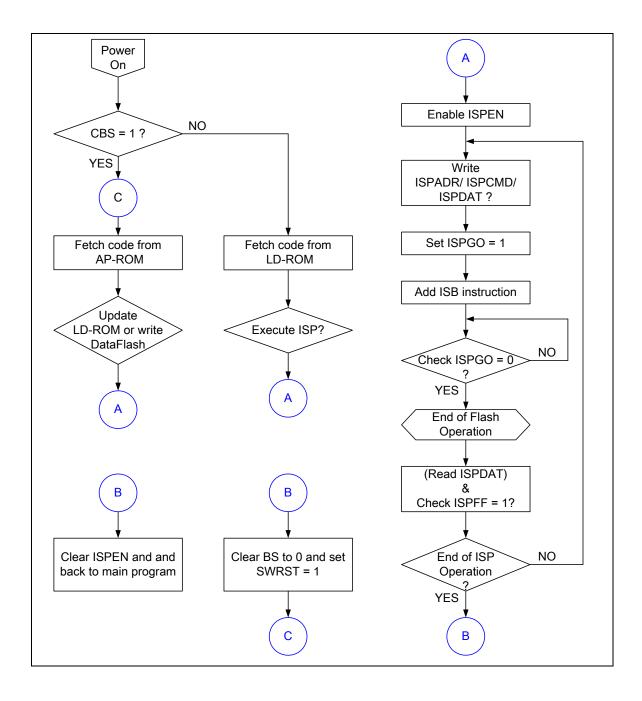

When ISPGO bit is set, CPU will wait for ISP operation finish, during this period; peripheral still keeps working as usual. If any interrupt request occur, CPU will not service it till ISP operation finish. When ISP operation is finished, the ISPGO bit will be cleared by hardware automatically. User can know if ISP operation is finished by checking this bit. User should add ISB instruction next to the instruction which set 1 to ISPGO bit to ensure correct execution of the instructions following ISP operation.

Note that NuMicro<sup>™</sup> NUC100 Series allows user to update CONFIG value by ISP.

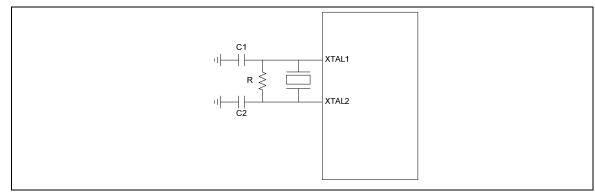

Figure 7-1 Typical Crystal Application Circuit

### 7.3.3 External 32.768 kHz Low Speed Crystal

PARAMETER	CONDITION	MIN.	TYP.	MAX.	UNIT
Input clock frequency	External crystal	-	32.768	-	kHz
Temperature	-	-40	-	85	°C
V <sub>DD</sub>	-	2.5	-	5.5	V

### 7.3.4 Internal 22.1184 MHz High Speed Oscillator

PARAMETER	CONDITION	MIN.	TYP.	MAX.	UNIT
Supply voltage <sup>[1]</sup>	-	2.5	-	5.5	V
Center Frequency	-	-	22.1184	-	MHz
	+25℃; V <sub>DD</sub> =5 V	-1	-	+1	%
Calibrated Internal Oscillator Frequency	-40°C~+85°C; V <sub>DD</sub> =2.5 V~5.5 V	-3	-	+3	%
Operation Current	V <sub>DD</sub> =5 V	-	500	-	uA

### 7.3.5 Internal 10 kHz Low Speed Oscillator

PARAMETER	CONDITION	MIN.	TYP.	MAX.	UNIT
Supply voltage <sup>[1]</sup>	-	2.5	-	5.5	V
Center Frequency	-	-	10	-	kHz
	+25℃; V <sub>DD</sub> =5 V	-30	-	+30	%
Calibrated Internal Oscillator Frequency	-40℃~+85℃; V <sub>DD</sub> =2.5 V~5.5 V	-50	-	+50	%

Note: Internal operation voltage comes from LDO.

### 7.4 Analog Characteristics

#### 7.4.1 Specification of 12-bit SARADC

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
-	Resolution	-	-	12	Bit
DNL	Differential nonlinearity error	-	±3	-	LSB
INL	Integral nonlinearity error	-	±4	-	LSB
EO	Offset error	-	±1	10	LSB
EG	Gain error (Transfer gain)	-	1	1.005	-
-	Monotonic	C	Guarantee	d	
FADC	ADC clock frequency (AV <sub>DD</sub> =5V/3V)	-	-	16/8	MHz
FS	Sample rate	-	-	700	K SPS
V <sub>DDA</sub>	Supply voltage	3	-	5.5	V
I <sub>DD</sub>	Supply current (Avg.)	-	0.5	-	mA
I <sub>DDA</sub>		-	1.5	-	mA
V <sub>REF</sub>	Reference voltage	-	$V_{\text{DDA}}$	-	V
I <sub>REF</sub>	Reference current (Avg.)	-	1	-	mA
V <sub>IN</sub>	Input voltage	0	-	$V_{REF}$	V

#### 7.4.2 Specification of LDO and Power management

PARAMETER	MIN.	TYP.	MAX.	UNIT	NOTE
Input Voltage	2.7	5	5.5	V	$V_{DD}$ input voltage
Output Voltage	-10%	2.5	+10%	V	V <sub>DD</sub> > 2.7 V
Temperature	-40	25	85	°C	
Сbр	-	1	-	uF	Resr=10hm

Note:

1. It is recommended that a 10uF or higher capacitor and a 100nF bypass capacitor are connected between  $V_{DD}$  and the closest  $V_{SS}$  pin of the device.

2. For ensuring power stability, a 1uF or higher capacitor must be connected between LDO pin and the closest  $V_{\rm SS}$  pin of the device.

### 7.4.3 Specification of Low Voltage Reset

nuvoTon

PARAMETER	CONDITION	MIN.	TYP.	MAX.	UNIT
Operation voltage	-	1.7	-	5.5	V
Quiescent current	V <sub>DD</sub> =5.5 V	-	-	5	uA
Temperature	-	-40	25	85	°C
	Temperature=25℃	1.7	2.0	2.3	V
Threshold voltage	Temperature=-40℃	-	2.4	-	V
	Temperature=85℃	-	1.6	-	V
Hysteresis	-	0	0	0	V

### 7.4.4 Specification of Brown-Out Detector

PARAMETER	CONDITION	MIN.	TYP.	MAX.	UNIT
Operation voltage	-	2.5	-	5.5	V
Quiescent current	AV <sub>DD</sub> =5.5 V	-	-	125	μA
Temperature	-	-40	25	85	°C
	BOV_VL[1:0]=11	4.3	4.5	4.7	V
Brown-out voltage	BOV_VL [1:0]=10	3.6	3.8	4.0	V
Drown out voltage	BOV_VL [1:0]=01	2.6	2.7	2.8	V
	BOV_VL [1:0]=00	2.1	2.2	2.3	V
Hysteresis	-	30	-	150	mV

### 7.4.5 Specification of Power-On Reset (5 V)

PARAMETER	CONDITION	MIN.	TYP.	MAX.	UNIT
Temperature	-	-40	25	85	°C
Reset voltage	V+	-	2	-	V
Quiescent current	Vin>reset voltage	-	1	-	nA

### 7.4.6 Specification of Temperature Sensor

PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
Supply voltage <sup>[1]</sup>		2.5	-	5.5	V
Temperature		-40	-	125	°C
Current consumption		6.4	-	10.5	uA
Gain			-1.76		mV/℃
Offset	Temp=0 ℃		720		mV

Note: Internal operation voltage comes from LDO.

### 7.4.7 Specification of Comparator

_						
	PARAMETER	CONDITION	MIN.	TYP.	MAX.	UNIT
	Temperature	-	-40	25	85	°C
	V <sub>DD</sub>	-	2.4	3	5.5	V
	V <sub>DD</sub> current	20 uA@V <sub>DD</sub> =3 V	-	20	40	uA
	Input offset voltage	-	-	5	15	mV
	Output swing	-	0.1	-	V <sub>DD</sub> -0.1	V
	Input common mode range	-	0.1	-	V <sub>DD</sub> -1.2	V
	DC gain	-	-	70	-	dB
	Propagation delay	@VCM=1.2 V and VDIFF=0.1 V	-	200	-	ns
	Comparison voltage	20 mV@VCM=1 V 50 mV@VCM=0.1 V 50 mV@VCM=V <sub>DD</sub> -1.2 @10 mV for non- hysteresis	10	20	-	mV
	Hysteresis	One bit control W/O and W. hysteresis @VCM=0.4 V ~ V <sub>DD</sub> -1.2 V	-	±10	-	mV
	Wake-up time	@CINP=1.3 V CINN=1.2 V	-	-	2	us

### 7.4.8 Specification of USB PHY

7.4.8.1 USB DC Electrical Characteristics

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V <sub>IH</sub>	Input high (driven)		2.0			V
V <sub>IL</sub>	Input low				0.8	V
V <sub>DI</sub>	Differential input sensitivity	PADP-PADM	0.2			V
V <sub>CM</sub>	Differential common-mode range	Includes $V_{DI}$ range	0.8		2.5	v
V <sub>SE</sub>	Single-ended receiver threshold		0.8		2.0	V
	Receiver hysteresis			200		mV
V <sub>OL</sub>	Output low (driven)		0		0.3	V
V <sub>OH</sub>	Output high (driven)		2.8		3.6	V
V <sub>CRS</sub>	Output signal cross voltage		1.3		2.0	V
R <sub>PU</sub>	Pull-up resistor		1.425		1.575	kΩ
V <sub>TRM</sub>	Termination Voltage for upstream port pull up (RPU)		3.0		3.6	V
Z <sub>DRV</sub>	Driver output resistance	Steady state drive*		10		Ω
C <sub>IN</sub>	Transceiver capacitance	Pin to GND			20	pF

\*Driver output resistance doesn't include series resistor resistance.

7.4.8.2 USB Full-Speed Driver Electrical Characteristics

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
T <sub>FR</sub>	Rise Time	C∟=50p	4		20	ns
T <sub>FF</sub>	Fall Time	C∟=50p	4		20	ns
T <sub>FRFF</sub>	Rise and fall time matching	T <sub>FRFF</sub> =T <sub>FR</sub> /T <sub>FF</sub>	90		111.11	%

7.4.8.3 USB Power Dissipation

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
IVDDREG		Standby		50		uA
	V <sub>DDD</sub> and V <sub>DDREG</sub> Supply Current (Steady State)	Input mode				uA
Speed)		Output mode				uA

### 7.5 Flash DC Electrical Characteristics

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
N <sub>endu</sub>	Endurance		10000			cycles <sup>[1]</sup>
T <sub>ret</sub>	Retention time	Temp=25 ℃	100			year
T <sub>erase</sub>	Page erase time		20		40	ms
T <sub>mass</sub>	Mass erase time		40	50	60	ms
T <sub>prog</sub>	Program time		35	40	55	us
V <sub>dd</sub>	Supply voltage		2.25	2.5	2.75	V <sup>[2]</sup>
I <sub>dd1</sub>	Read current				14	mA
I <sub>dd2</sub>	Program/Erase current				7	mA
I <sub>pd</sub>	Power down current				10	uA

Number of program/erase cycles.
 V<sub>dd</sub> is source from chip LDO output voltage.
 This table is guaranteed by design, not test in production.

### 7.6 SPI Dynamic Characteristics

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT	
SPI master mod	de (V <sub>DD</sub> = 4.5V ~ 5.5V, 30pF loading Cap	pacitor)	L			
t <sub>DS</sub>	Data setup time	4	2	-	ns

### 8.2 64L LQFP (10x10x1.4mm footprint 2.0 mm)

### 9 REVISION HISTORY

VERSION	DATE	PAGE/ CHAPTER	DESCRIPTION
V2.00	May 04, 2011	-	1. This document is divided from "NUC100 series TRM.doc"
			2. Update the CAN peripheral to BOSCH C-CAN
		6.10	1. Revise ISPCON.BS and ISPCON.ISPFF description
		7.4.6	2. modify temperature sensor spec
V2.01	June 14, 2011	3.4	<ol> <li>Revise Pin description position for multi-function T2EX, T3EX, nRD, nWR</li> </ol>
		7.6	4. update title of SPI Dynamic Characteristics
		7.4.4	5. update BOD spec
		P. 324	1. Update WDT block diagram for typo
		P. 343	2. Release PDMA/debug register in UA_ISR register
		5.2.7	3. Remove feature "Dynamic priority changing" for NVIC
		P. 265	4. Modify INIR Description in RTC register
		P. 262	5. Modify description for RTC compensation
		5.8.6	6. Revise R/W description for TDR and TCAP
		P. 278	7. Revise description of TWKE
V2.02	Jan. 2, 2012	P. 266	8. Revise description of AER
		5.8.4.3	9. Revise AER effect from 512 clock to 1024 clock
		7.4.1	10. Modify ADC analog characteristic spec
		5.7.4.7	11. Modify description of PWM sample procedure
		5.7.4.10	
		P. 345	<ol> <li>Remove the description of TX_FULL and RX_FULL ,and revise TX_POINTER and RX_POINTER</li> </ol>
		5.9	13. Remove SPI FIFO mode

#### **Important Notice**

Nuvoton Products are neither intended nor warranted for usage in systems or equipment, any malfunction or failure of which may cause loss of human life, bodily injury or severe property damage. Such applications are deemed, "Insecure Usage".

Insecure usage includes, but is not limited to: equipment for surgical implementation, atomic energy control instruments, airplane or spaceship instruments, the control or operation of dynamic, brake or safety systems designed for vehicular use, traffic signal instruments, all types of safety devices, and other applications intended to support or sustain life.

All Insecure Usage shall be made at customer's risk, and in the event that third parties lay claims to Nuvoton as a result of customer's Insecure Usage, customer shall indemnify the damages and liabilities thus incurred by Nuvoton.

Please note that all data and specifications are subject to change without notice. All the trademarks of products and companies mentioned in this datasheet belong to their respective owners.
