### KEA64 Sub-Family Data Sheet

Supports the following:

SKEAZN16AMLC(R),  
SKEAZN32AMLC(R),  
SKEAZN64AMLC(R),  
SKEAZN32AMLH(R), and  
SKEAZN64AMLH(R)

#### Key features

- Operating characteristics
  - Voltage range: 2.7 to 5.5 V
  - Flash write voltage range: 2.7 to 5.5 V
  - Temperature range (ambient): -40 to 125°C
- Performance
  - Up to 40 MHz ARM® Cortex-M0+ core and up to 20 MHz bus clock
  - Single cycle 32-bit x 32-bit multiplier
  - Single cycle I/O access port
- Memories and memory interfaces
  - Up to 64 KB flash
  - Up to 256 B EEPROM
  - Up to 4 KB RAM
- Clocks
  - Oscillator (OSC) - supports 32.768 kHz crystal or 4 MHz to 20 MHz crystal or ceramic resonator; choice of low power or high gain oscillators
  - Internal clock source (ICS) - internal FLL with internal or external reference, precision trimming of internal reference allowing 1% deviation across temperature range of 0 °C to 70 °C and 1.5% deviation across temperature range of -40 °C to 125 °C, up to 40 MHz
  - Internal 1 kHz low-power oscillator (LPO)
- System peripherals
  - Power management module (PMC) with three power modes: Run, Wait, Stop
  - Low-voltage detection (LVD) with reset or interrupt, selectable trip points
  - Watchdog with independent clock source (WDOG)
  - Programmable cyclic redundancy check module (CRC)
  - Serial wire debug interface (SWD)
  - Bit manipulation engine (BME)
- Security and integrity modules
  - 64-bit unique identification (ID) number per chip
- Human-machine interface
  - Up to 57 general-purpose input/output (GPIO)
  - Two 8-bit keyboard interrupt modules (KBI)
  - External interrupt (IRQ)
- Analog modules
  - One 16-channel 12-bit SAR ADC, operation in Stop mode, optional hardware trigger (ADC)
  - Two analog comparators containing a 6-bit DAC and programmable reference input (ACMP)
- Timers
  - One 6-channel FlexTimer/PWM (FTM)
  - Two 2-channel FlexTimer/PWM (FTM)
  - One 2-channel periodic interrupt timer (PIT)
  - One real-time clock (RTC)
- Communication interfaces
  - Two SPI modules (SPI)
  - Three UART modules (UART)
  - Two I2C modules (I2C)

# 1 Ordering parts

## 1.1 Determining valid orderable parts

Valid orderable part numbers are provided on the web. To determine the orderable part numbers for this device, go to [freescale.com](http://freescale.com) and perform a part number search for the following device numbers: KEAZN64.

# 2 Part identification

## 2.1 Description

Part numbers for the chip have fields that identify the specific part. You can use the values of these fields to determine the specific part you have received.

## 2.2 Format

Part numbers for this device have the following format:

Q KEA A C FFF M T PP N

## 2.3 Fields

This table lists the possible values for each field in the part number (not all combinations are valid):

Field	Description	Values
Q	Qualification status	<ul style="list-style-type: none"> <li>S = Automotive qualified</li> <li>P = Prequalification</li> </ul>
KEA	Kinetis Auto family	<ul style="list-style-type: none"> <li>KEA</li> </ul>

## 3 Parameter classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding, the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

**Table 1. Parameter classifications**

P	Those parameters are guaranteed during production testing on each individual device.
C	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
T	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
D	Those parameters are derived mainly from simulations.

### NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

## 4 Ratings

### 4.1 Thermal handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
T <sub>STG</sub>	Storage temperature	–55	150	°C	1
T <sub>SDR</sub>	Solder temperature, lead-free	—	260	°C	2

1. Determined according to JEDEC Standard JESD22-A103, *High Temperature Storage Life*.
2. Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

### 4.2 Moisture handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
MSL	Moisture sensitivity level	—	3	—	1

1. Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

### 4.3 ESD handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
V <sub>HBM</sub>	Electrostatic discharge voltage, human body model	–6000	+6000	V	1
V <sub>CDM</sub>	Electrostatic discharge voltage, charged-device model	–500	+500	V	2
I <sub>LAT</sub>	Latch-up current at ambient temperature of °C	–100	+100	mA	3

1. Determined according to JEDEC Standard JESD22-A114, *Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM)*.
2. Determined according to JEDEC Standard JESD22-C101, *Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components*.
3. Determined according to JEDEC Standard JESD78D, *IC Latch-up Test*.

### 4.4 Voltage and current operating ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in the following table may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this document.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either  $V_{SS}$  or  $V_{DD}$ ) or the programmable pullup resistor associated with the pin is enabled.

**Table 2. Voltage and current operating ratings**

Symbol	Description	Min.	Max.	Unit
$V_{DD}$	Digital supply voltage	-0.3	6.0	V
$I_{DD}$	Maximum current into $V_{DD}$	—	120	mA
$V_{IN}$	Input voltage except true open drain pins	-0.3	$V_{DD} + 0.3$ <sup>1</sup>	V
	Input voltage of true open drain pins	-0.3	6	V
$I_D$	Instantaneous maximum current single pin limit (applies to all port pins)	-25	25	mA
$V_{DDA}$	Analog supply voltage	$V_{DD} - 0.3$	$V_{DD} + 0.3$	V

1. Maximum rating of  $V_{DD}$  also applies to  $V_{IN}$ .

## 5 General

### 5.1 Nonswitching electrical specifications

#### 5.1.1 DC characteristics

This section includes information about power supply requirements and I/O pin characteristics.

**Table 3. DC characteristics**

$I_{OLT}$	D	Output low current	Max total $I_{OL}$ for all ports	5 V	—	—	100	mA
				3 V	—	—	60	
$V_{IH}$	P	Input high voltage	All digital inputs	$4.5 \leq V_{DD} < 5.5$ V	$0.65 \times V_{DD}$	—	—	V
				$2.7 \leq V_{DD} < 4.5$ V	$0.70 \times V_{DD}$	—	—	
$V_{IL}$	P	Input low voltage	All digital inputs	$4.5 \leq V_{DD} < 5.5$ V	—	—	$0.35 \times V_{DD}$	V
				$2.7 \leq V_{DD} < 4.5$ V	—	—	$0.30 \times V_{DD}$	
$V_{hys}$	C	Input hysteresis	All digital inputs	—	$0.06 \times V_{DD}$	—	—	mV
$ I_{In} $	P	Input leakage current	Per pin (pins in high impedance input mode)	$V_{IN} = V_{DD}$ or $V_{SS}$	—	0.1	1	$\mu$ A
$ I_{INTOT} $	C	Total leakage combined for all port pins	Pins in high impedance input mode	$V_{IN} = V_{DD}$ or $V_{SS}$	—	—	2	$\mu$ A
$R_{PU}$	P	Pullup resistors	All digital inputs, when enabled (all I/O pins other than PTA2 and PTA3)	—	30.0	—	50.0	k $\Omega$
$R_{PU}^3$	P	Pullup resistors	PTA2 and PTA3 pins	—	30.0	—	60.0	k $\Omega$
$I_{IC}$	D	DC injection current <sup>4, 5, 6</sup>	Single pin limit	$V_{IN} < V_{SS}$ , $V_{IN} > V_{DD}$	-2	—	2	mA
			Total MCU limit, includes sum of all stressed pins		-5	—	25	
$C_{In}$	C	Input capacitance, all pins		—	—	—	7	pF
$V_{RAM}$	C	RAM retention voltage		—	2.0	—	—	V

- Typical values are measured at 25 °C. Characterized, not tested.
- Only PTB4, PTB5, PTD0, PTD1, PTE0, PTE1, PTH0, and PTH1 support high current output.
- The specified resistor value is the actual value internal to the device. The pullup value may appear higher when measured externally on the pin.
- All functional non-supply pins, except for PTA2 and PTA3, are internally clamped to  $V_{SS}$  and  $V_{DD}$ . PTA2 and PTA3 are true open drain I/O pins that are internally clamped to  $V_{SS}$ .
- Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger value.

6. Power supply must maintain regulation within operating  $V_{DD}$  range during instantaneous and operating maximum current conditions. If the positive injection current ( $V_{IN} > V_{DD}$ ) is higher than  $I_{DD}$ , the injection current may flow out of  $V_{DD}$  and could result in external power supply going out of regulation. Ensure that external  $V_{DD}$  load will shunt current higher than maximum injection current when the MCU is not consuming power, such as when no system clock is present, or clock rate is very low (which would reduce overall power consumption).

1. Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.
2. RTC adder causes I<sub>DD</sub> to increase typically by less than 1 μA; RTC clock source is 1 kHz LPO clock.
3. LVD is periodically woken up from Stop by 5% duty cycle. The period is equal to or less than 2 ms.

### 5.1.3 EMC performance

Electromagnetic compatibility (EMC) performance is highly dependent on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components as well as MCU software operation play a significant role in EMC performance. The system designer must consult the following Freescale applications notes, available on [freescale.com](http://freescale.com) for advice and guidance specifically targeted at optimizing EMC performance.

- AN2321: Designing for Board Level Electromagnetic Compatibility
- AN1050: Designing for Electromagnetic Compatibility (EMC) with HCMOS Microcontrollers
- AN1263: Designing for Electromagnetic Compatibility with Single-Chip Microcontrollers
- AN2764: Improving the Transient Immunity Performance of Microcontroller-Based Applications
- AN1259: System Design and Layout Techniques for Noise Reduction in MCU-Based Systems

1. Typical values are based on characterization data at  $V_{\text{DD}} = 5.0 \text{ V}$ ,  $25^\circ\text{C}$  unless otherwise stated.
2. This is the shortest pulse that is guaranteed to be recognized as a RESET pin request.
3. This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized.
4. Timing is shown with respect to 20%  $V_{\text{DD}}$  and 80%  $V_{\text{DD}}$  levels. Temperature range  $-40^\circ\text{C}$  to  $125^\circ\text{C}$ .

## 5.3 Thermal specifications

### 5.3.1 Thermal characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and voltage regulator circuits, and it is user-determined rather than being controlled by the MCU design. To take  $P_{I/O}$  into account in power calculations, determine the difference between actual pin voltage and  $V_{SS}$  or  $V_{DD}$  and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and  $V_{SS}$  or  $V_{DD}$  will be very small.

**Table 8. Thermal attributes**

Board type	Symbol	Description	64 LQFP	32 LQFP	Unit	Notes

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per JEDEC JESD51-2 with the single layer board (JESD51-3) horizontal.
3. Per JEDEC JESD51-6 with the board (JESD51-7) horizontal.
4. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the solder pad on the bottom of the package. Interface resistance is ignored.
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization.

The average chip-junction temperature ( $T_J$ ) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA})$$

Where:

$T_A$  = Ambient temperature, °C

$\theta_{JA}$  = Package thermal resistance, junction-to-ambient, °C/W

$P_D = P_{int} + P_{I/O}$

$P_{int} = I_{DD} \times V_{DD}$ , Watts - chip internal power

$P_{I/O}$  = Power dissipation on input and output pins - user determined

For most applications,  $P_{I/O} \ll P_{int}$  and can be neglected. An approximate relationship between  $P_D$  and  $T_J$  (if  $P_{I/O}$  is neglected) is:

$P_D = K \div (T_J + 273 \text{ }^\circ\text{C})$

Solving the equations above for K gives:

$K = P_D \times (T_A + 273 \text{ }^\circ\text{C}) + \theta_{JA} \times (P_D)^2$

where K is a constant pertaining to the particular part. K can be determined by measuring  $P_D$  (at equilibrium) for a known  $T_A$ . Using this value of K, the values of  $P_D$  and  $T_J$  can be obtained by solving the above equations iteratively for any value of  $T_A$ .

## Peripheral operating requirements and behaviors

- Load capacitors ( $C_1, C_2$ ), feedback resistor ( $R_F$ ) and series resistor ( $R_S$ ) are incorporated internally when RANGE = HGO = 0.
- This parameter is characterized and not tested on each device.
- Proper PC board layout procedures must be followed to achieve specifications.
- This specification applies to any time the FLL reference source or reference divider is changed, trim value changed, or changing from FLL disabled (FBELP, FBILP) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
- Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum  $f_{Bus}$ . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via  $V_{DD}$  and  $V_{SS}$  and variation in crystal oscillator frequency increase the  $C_{Jitter}$  percentage for a given interval.

## 6.5 Communication interfaces

## 6.5.1 SPI switching specifications

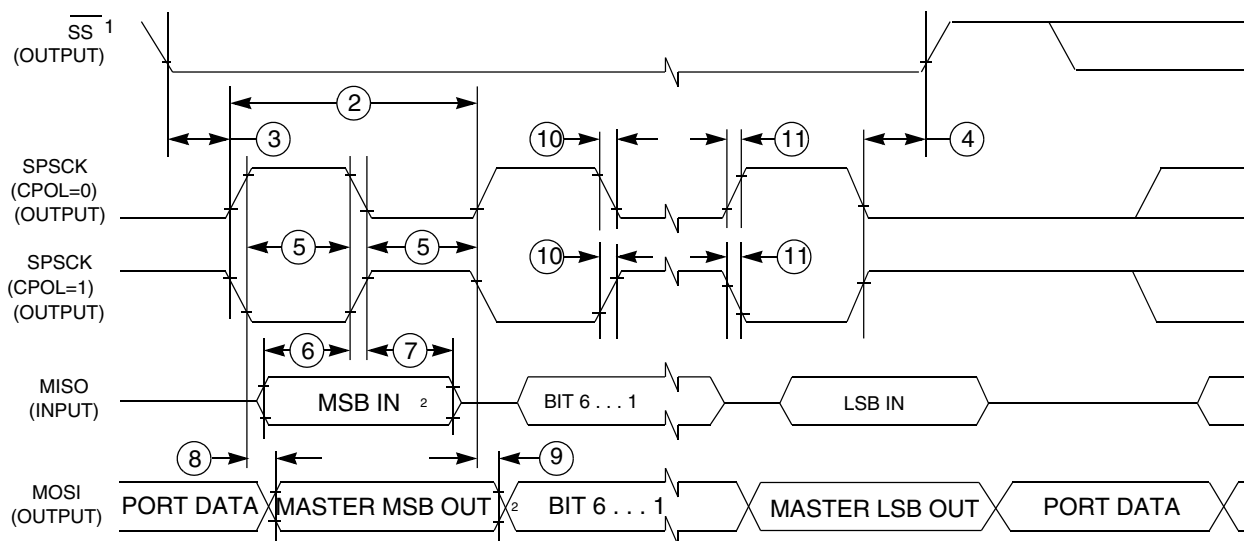

The serial peripheral interface (SPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The following tables provide timing characteristics for classic SPI timing modes. See the SPI chapter of the chip's reference manual for information about the modified transfer formats used for communicating with slower peripheral devices. All timing is shown with respect to 20%  $V_{DD}$  and 80%  $V_{DD}$ , unless noted, and 25 pF load on all SPI pins. All timing assumes slew rate control is disabled and high-drive strength is enabled for SPI output pins.
